The following Articles in this Volume are Copyrighted, 1892, by J. B. Lippincott Company in the United States of America :

Russia.
St Louis (Missouri).
St Paul (Minnesota).
San Francisco.
Scandinavian Mythology.
Scott, Sir Walter.
Sewage.
Seward, W. H.
Sewing-Machine.
Shakers.
Shakespeare.
Shelley.
Sheridan, P. H.
Sherman.
Shipbuilding.
Silk.
Silver.
Slang.
Soda.
South Carolina.
Spain.
Spiritualism.
Sugar.
Sumner.

Among the more important articles in this Volume are the following:

Round Towers	Dr Joseph Anderson.	Sidney, Sir Philip	F. T. Palgrave.
Rousseau	Rev. H. G. Graham.	Siege	Lieut.-Col. H. D. B Dunlop.
Rowing	W. B. Woodgate.	Signalling	James Bolam.
Rubens	J. M. Gray.	Silk	Thomas Wardle, F.C.S.
Rugby	Henry Lee Warner.	Silurian System	Professor James Geikie.
Runes	Canon Isaac Taylor.	Simon Magus	Rev. J. Sutherland Black.
Russia	Prince Kropotkine.	Sisterhoods	Maria Trench.
Sacrifice	Rev. James Strachan.	Skating	T. Maxwell Witham.
St Andrews	D. Hay Fleming.	Skull	Dr David Hepburn.
Sainte-Beuve	P. Hume Brown.	Slang	Charles Godfrey Leland.
St Louis	C. S. Yost.	Slavs	W. R. Morfill.
Saint-Simon, Duc de	Thomas Davidson.	Sleep; Somnambulism	Dr A. W. Macfarlane.
Salisbury	A. R Malden.	Sloyd	John Struthers.
Salisbury, Lord	Frederick Greenwood.	Smith, Adam	John Hill Burton.
Salmon	Archibald Young.	Smoke	Robert Irvine.
Salt; Silver; Soda	A. Galletly.	Smollett	David Herbert.
Salvation Army	Bramwell Booth.	Snail; Slug	T. D. A. Cockerell.
Samoa	C. P. Lucas.	Snakes; Spiders	J. Arthur Thomson.
Sand, George	George Saintsbury.	Snow	W. T. Omond.
San Francisco	*Dr W. C. Bartlett.*	Soap	*John MacArthur.*
Sanskrit	Professor Eggeling.	Socialism	Thomas Kirkup.
Savings-banks	Urquhart A. Forbes.	Socrates; Sophists	D. G. Ritchie.
Scand. Mythology	Professor Rasmus Andersen.	Soils	John Hunter, F.C.S.
Scarlatina	Dr Lundie.	Solicitor	Francis Watt.
Schiller	J. T. Bealby.	Solon	Robert P. Davidson.
Schleiermacher	Professor Pfleiderer.	Somersetshire	F. N. Worth.
Schnitzer (Emin Pasha)	Dr R. W. Felkin.	Sonnet	Theodore Watts.
Scholasticism	P. Hume Brown.	Sophocles	Professor Lewis Campbell.
School Inspectors	John Kerr, LL.D., H.M.I.S.	Sound; Spectrum	Professor Knott.
Schopenhauer	Professor William Caldwell.	Southampton	Captain S. C. N. Grant, R E.
Schubert	*Harry Whitehead.*	South Australia	James Bonwick.
Schumann	Franklin Peterson.	South Carolina	Professor N. B. Webster.
Scotland (History)	Professor George Grub.	Southey	F. Hindes Groome.
" (Language)	Dr J. A. H. Murray.	Spain	Rev. Wentworth Webster.
" (Literature)	P. Hume Brown.	" (Lang. and Lit.)	H. Butler-Clarke.
Scott, General	Professor J. P. Lamberton.	Spencer, Herbert	Professor Sorley.
Scott, Sir Walter	Andrew Lang.	Spenser, Edmund	Professor Hales.
Scottish Philosophy	Professor Seth.	Spinal Cord	Dr Alexander Bruce.
Sculpture	Charles Whibley.	Spinning	James Paton.
Sculptured Stones	Dr Joseph Anderson.	Spinoza	Emanuel Deutsch.
Sea; Sounding	Dr John Murray.	Spiritualism	Alfred Russel Wallace.
Seal; Sole	J. T. Cunningham.	Squirrel	W. E. Hoyle.
Sea-serpent	Dr Andrew Wilson.	Staël, Mme. de	Thomas Davidson.
Seaweeds	R. J. Harvey Gibson.	Stanley, Dean	Professor Story.
Secularism	G. J. Holyoake.	Stanley, H. M.	John S. Keltie, F.R.G.S.
Sévigné, Mme. de	Thomas Davidson.	State Religion	Canon Curteis.
Sewage	Baldwin Latham, M.Inst.C.E.	Statutes	Sir Peter Benson Maxwell.
Seward	Professor W. Hamilton Kirk.	Steam-engine	Professor A. B. W. Kennedy.
Sewing-machine	Mrs Carrie B. Kilgore.	Steam-hammer	Professor T. H. Beare.
Sex	J. Arthur Thomson.	Steel	W Mattieu Williams.
Shakers	Mrs Carrie B. Kilgore.	Steele, Sir Richard	Austin Dobson.
Shakespeare	Professor Dowden.	Sterne, Laurence	H. D. Traill, D.C.L.
Sheep	*James Macdonald*	Stock-exchange	R. Mabson, of the *Statist*.
Sheffield	Rev. Alfred Gatty, D.D.	Storms	Dr Buchan.
Shelley	Professor Dowden.	Strafford	F. Hindes Groome.
Sheridan, R. B.	Mrs Oliphant.	Stratford de Redcl.	Stanley Lane-Poole.
Sherman; Sheridan	General Grant Wilson.	Strawberry	R. D. Blackmore.
Shields, N. and S.	W. W. Tomlinson.	Sugar	Thomas Bayley.
Shipbuilding	David Pollock.	Suicide	Dr Clouston.
Shorthand	Isaac Pitman.	Sumatra	H. A. Webster.
Siam	J. S. Black, H.B.M. *Legation*.	Sumner	*John Foster Kirk, LL.D.*
Siberia	Prince Kropotkine.	Sun; Stars	Rev. E. B. Kirk.
Sicily	W. Dundas Walker.	Sunday-schools	Robert Cochrane.
Siddons, Mrs	R. W. Lowe.	Surgery	Dr J. P. Steele.

The Publishers beg to tender their thanks, for revising articles, to the Principal of St Bees, the Rector of Stonyhurst, the Superiors of the two orders of Christian Brothers in Ireland, the Head-masters of St Paul's, Shrewsbury, and Sherborne Schools, and the town-clerks of Scarborough, Southport, Stafford, Stirling, Stockport, Swansea, &c.; to the Factor of St Kilda; to the Secretary of the Sunday-school Union; to Mr Richard Savage, for revising 'Stratford-on-Avon;' to Mr E. T. Cook, for revising 'Ruskin;' to Mr R. B. Haldane, M.P., for revising 'Adam Smith;' and to Mr Herbert Spencer, for revising the exposition of his philosophy.

CHAMBERS'S
ENCYCLOPÆDIA

A DICTIONARY OF UNIVERSAL KNOWLEDGE

Round, in Music, a short vocal composition, similar to the catch, and like it, peculiar to England. It is in the form of an infinite Canon (q.v.) at the unison or octave, each part in succession taking up the subject at a regular rhythmic interval, and returning from the conclusion to the commencement, and so on, *ad libitum*, till an agreed-on pause. These rounds or *roundelays* are usually termed 'merry,' and many of them deserved the name something too well. The most ancient specimen now extant of vocal composition in polyphony is the famous *Rota* or Round, 'Sumer is icumen in,' of the 13th century. As specimens may be quoted the ancient and well-known 'The Great Bells of Osney,' 'Row the Boat, Whittington,' Aldrich's 'Hark the Bonny Christchurch Bells,' or the well-known 'Three Blind Mice.' There were collections by Ravenscroft, *Pammelia* (1609), *Deuteromelia* (1609); Hilton (1652); and Playford (1667). See Metcalfe's *Rounds, Canons, and Catches of England*, with introduction by Rimbault.

Round Churches. See TEMPLE.

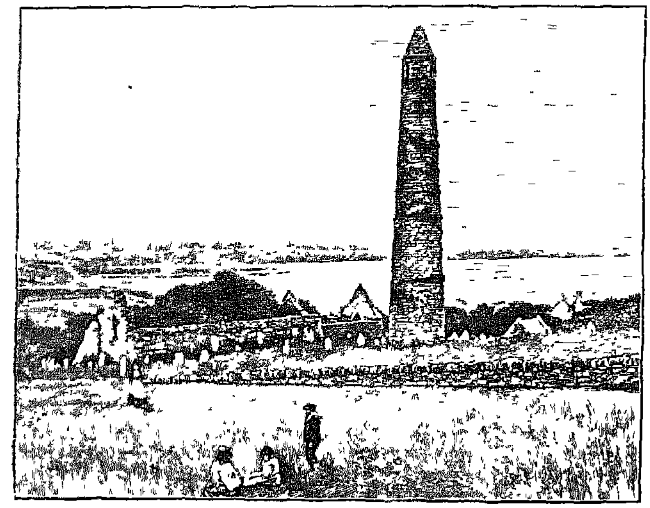
Roundheads, the nickname given by the adherents of Charles I. during the Great Rebellion to the Puritans, or friends of the parliament, who, with Prynne, denounced the 'unloveliness of love-locks,' and were understood to distinguish themselves by having their hair cut close, while the Cavaliers wore theirs in long ringlets. According to Clarendon and Rushworth the term was first publicly used in December 1641 by a Captain David Hine, who, drawing his sword, swore he would 'cut the throats of those round-headed, cropp'd-eared dogs that bawled against the bishops.'

Round-robin (Fr. *rond*, 'round,' and *ruban*, 'ribbon'), a name given to a protest or remonstrance signed by a number of persons in a circular form, so that no one shall be obliged to head the list. It is said to have originated in a usage of the French officers. The most memorable round-robin in literary history is that sent by Burke, Gibbon, Sir Joshua Reynolds, Joseph Warton, and others to Dr Johnson, requesting him to amend the epitaph for Goldsmith's monument, and suggesting that it should be written in English, not Latin. Johnson took it kindly, but told Sir Joshua, who carried it to him, that he would 'never consent to disgrace the walls of Westminster Abbey with an English inscription.'

Round Table. See ARTHUR, and ROMANCES. By the *Round Table Conference* is meant an ineffectual series of meetings begun in January 1887, for the purpose of arranging terms for a reunion of the Gladstonian or Home Rule section of the Liberal party and the Liberal Unionists, the members being Lord Herschell, Mr Morley, Mr Chamberlain, Sir W. V. Harcourt, and Sir George Trevelyan.

Round Towers. Tall narrow circular towers tapering gradually from the base to the summit, found abundantly in Ireland, and occasionally in Scotland, are among the earliest and most remarkable relics of the ecclesiastical architecture of the British Islands. They have long been the subject of conjecture and speculation, but there can be now no doubt that they are the work of Christian architects, and built for religious purposes. They seem to have been in all cases attached to the immediate neighbourhood of a church or monastery, and, like other early church-towers, they were capable of being used as strongholds, into which, in times of danger, the ecclesiastics could retreat with their valuables. In the Irish records, for two centuries after 950 A.D., they are invariably called *Cloictheach* or bell-towers, and are often mentioned as special objects of attack by the Northmen. About 118 towers of this description are yet to be seen in Ireland, twenty of which are entire or nearly so; and Scotland possesses three similar towers—at Brechin, Abernethy, and Eglishay in

Orkney. They are usually capped by a conical roof, and divided into stories, sometimes by yet existing floors of masonry, though oftener the floors have been of wood. Ladders were the means of communication from story to story. There is generally a small window on each story, and four windows immediately below the conical roof. The door is in nearly all cases a considerable height from the ground. The figure represents the tower at Ardmore, County Waterford, which is one of the most remarkable of those remaining in Ireland. Rising from a double plinth course at the bottom to a total height of 95 feet, it is divided into three stages by external bands at the offsets, corresponding to the levels of three floors within, the fourth being also marked by a slight offset. Most of these towers, however, have only a slight batta externally from top to bottom. Some, like that of Devenish, are carefully and strongly built of stones cut to the round, and laid in courses, with little cement; others, such as those at Cashel and Monasterboice, have the stones merely hammer-dressed and irregularly coursed; others, again, like those of Lusk and Clondalkin, are constructed of gathered stones untouched by hammer or chisel, roughly coursed, and jointed with coarse gravelly mortar; while in others, as at Kells and Drumlane, part of the tower is of ashlar, and the rest of rubble masonry. The average height of these towers is from 100 to 120 feet, the average circumference at the base about 50 feet, and the average thickness of the wall at the base from 3 feet 6 inches to 4 feet; the average internal diameter at the level of the doorway is from 7 to 9 feet, and the average height of the doorway above the ground-level about 13 feet. These doorways always face the entrance of the church to which the towers belonged. All the apertures of the towers have inclined instead of perpendicular jambs, which is also an architectural characteristic of the churches of the same period, and the sculptured ornamentation of the apertures or walls of the towers is in the same style as that of the churches. Dr Petrie was inclined to think that a few of these remarkable structures may be as old as the 6th century, but they are now assigned to a period ranging from the 9th to the 12th centuries. The source whence this form of tower was derived, and the cause why it was so long persisted in by the Irish architects, are points, however, on which there is not the same unanimity of opinion. Two round towers, similar to the Irish type, are to be seen in the yet extant plan of the monastery of St Gall in Switzerland, of the first half of the 9th century; and, in the Latin description attached to the plan, they are said to be *ad universa superspicienda*. The church and towers as rebuilt at that date are no longer in existence; but Miss Stokes has pointed out a passage in the life of St Tenenan of Brittany which shows that this type of round tower detached from the church was in use on the Continent in the 7th century, 'wherein to deposit the silver-plate and treasure of the church and protect them from the sacrilegious hands of the barbarians should they wish to pillage the church.' Lord Dunraven has traced the type from Ireland through France to Ravenna, where there are still six remaining out of eleven recorded examples. Hulsch considers the detached round towers or campaniles of the Ravenna churches to be of the same date as the churches themselves, or mostly earlier than the close of the 6th century; but Freeman, on the other hand, maintains that they are all later than the days of Charlemagne, as the local writer Agnellus, writing soon after his time, describes the churches of Ravenna much as they are, but says nothing of bell-towers. Suffolk and Norfolk contain more round-towered churches than does all the rest of England, probably because the flint there prevalent is worked into this form more readily than any other stone. A modern round tower is O'Connell's monument in Glasnevin Cemetery, which is 160 feet in height.



Round Tower, Ardmore.

See Dr G. Petrie's *Ecclesiastical Architecture of Ireland* (Dublin, 1845); vol. ii. of Lord Dunraven's *Notes on Irish Architecture* (Lond. 1877); Dr J. Anderson's *Scotland in Early Christian Times* (Edin. 1881); and Miss Stokes's *Early Christian Art in Ireland* (Lond. 1887).

Roundway Down, a hill about 1½ mile N. of Devizes, in Wiltshire, the scene of Waller's defeat by the royalists under Lord Wilmot in July 1643. Waller was besieging Devizes when Wilmot came up to relieve the town, whereupon he turned at once to meet him, but was quickly crushed between Wilmot on the one side and a sally of the garrison on the other. Waller escaped, but only with the loss of his artillery and most of his men.

Round Worms (*Nematoda*), a class of worms in which the body is elongated and more or less cylindrical. Most are parasitic, such as *Ascaris lumbricoides* and *Oxyuris vermicularis*, common in man, and numerous species of Tylenchus, which infest plants. Many genera, however, live in water or in moist earth, and many of the parasites are free-living during part of their life. They are called round worms, in contrast to the flat worms or Plathelminthes, such as tapeworms and flukes. For classification, see THREAD-WORMS.

Roup is one of the most serious diseases which the poultry or pheasant keeper has to fight, because in it there is generally an affection other than the mere cold which develops and makes it apparent. It is usually found that the system is scrofulous, which is the milder form; but sometimes it takes a diphtheric development, and this is the most severe and deadly disease known to poultry-keepers.

Whether scrofulous or diphtheric, it is highly contagious, and very seldom is any bird in a yard attacked without nearly all the others being also affected. The difference between ordinary cold and roup is very easy to determine, though the symptoms are in some respects the same. But when it is merely cold the running at the eyes and nostrils is not at all offensive, whereas it is strongly so in the case of roup from scrofula, the breath being most repulsive. This fact, as well as the swelling of the face, may be taken at once to determine when it is roup. The cause may generally be sought for in bad feeding, housing, or ventilation, which have charged the blood with scrofulous matter, and the outward symptoms are induced by cold. When first noticed the birds affected should at once be isolated, in order to prevent the spreading of the disease, which will speedily follow if all are kept together. The treatment must be dual, namely to cure the cold and to remove the scrofula from the blood. For the former any of the roup pills sold can be used, or it may be removed by homœopathic tincture of aconite given three or four times a day, the birds being kept in a warm and draughtless place. The scrofula is not so easily eradicated, and will require patience. Ordinary-sized pills made of powdered charcoal 10 parts, dried sulphate of iron 1 part, and capsicum 1 part, made up with butter, and given twice a day, form an excellent medicine, when the roup proper in its more active state is removed. To do this, however, it is desirable to clear the mouth, nostrils, and eyes from the mucus which accumulates there and which will suffocate the bird if not removed. In milder cases it is enough to wash the parts with vinegar and water, but in more severe cases it is better to use solution of chlorinated soda, as it is much more effective. Should the nostrils be very full of mucus, a small bent syringe should be filled with the solution, which must be inserted into the slit in the bird's mouth, through which the liquid is forced, and will effectually clear the passages. It is most essential in returning the birds to the house again to see that they are entirely recovered. When diphtheric roup is present the matter assumes a more serious aspect, because of the danger not only to other birds, but also to human beings, who have been known to contract this fell disease from birds. For that reason the greatest care must be taken, and, except in the case of very valuable fowls, it is much safer to kill those affected and bury them in quicklime. The outward symptoms in diphtheric roup are not nearly so apparent at first sight, because less prominent; still, the bird is noticed to be dull and lethargic. Unless checked the disease runs its course in a few hours, and the bird dies. Very often it is not known that diphtheric roup is present until several deaths have taken place. Its presence is easily distinguished by the skin-like substance formed over the throat. Treatment is doubtful, and Professor Whalley recommends that it should take the heroic form of dabbing the throat with carbolic acid, which will kill or cure.

Roup, in Scotland. See AUCTION.

Rous, FRANCIS, was born at Halton, Cornwall, in 1579, and educated in Oxford at Broadgate Hall, now Pembroke College. He was a member of the Long Parliament, sat in the Westminster Assembly of Divines, and in 1643 was made provost of Eton. He died at Acton, 7th January 1659, his writings having been collected two years before. Wood is abusive even beyond his wont to 'the old illiterate Jew of Eaton' and his 'enthusiastic canting.' His metrical version of the Psalms was recommended by the House of Commons to the Westminster Assembly, and is still substantially the Presbyterian Psalter. It is easy to abuse his version—Sir Walter Scott's verdict was that, though homely, it is 'plain, forcible, and intelligible, and very often possesses a rude sort of majesty, which perhaps would be ill exchanged for mere elegance.'

Rousseau, JEAN BAPTISTE, a great lyric poet of France, was born at Paris, 6th April 1670, the son of a shoemaker who gave him a sound education. At an early age he became acquainted with Boileau, and began to produce pieces for the theatre, with but little success. Among his earliest patrons were Breteuil and Tallard, and the latter carried him in his suite to London. His turn for satire soon brought him troubles as well as reputation, and some lampoons upon the literary frequenters of the Café Laurent, chief of whom were La Motte and Saurin, brought down upon his head a quarrel that distressed the remainder of his life. Defeated by La Motte in 1710 in his canvass for T. Corneille's chair at the French Academy, he was soon after taken by everybody for the author of a fresh series of scurrilous and indecent couplets. He charged Saurin with writing them and attempting to foist the paternity upon him, and raised an action against him. Failing to make good the charge, he found himself in 1712 condemned in absence to perpetual banishment *par contumace*. Henceforth he lived abroad under the patronage of the Comte de Luc, French ambassador to Switzerland, and afterwards of Prince Eugene and the Duc d'Aremberg. At Brussels he made the acquaintance of Voltaire, but from a friend the latter soon became a bitter enemy. Rousseau visited England, and there published in 1723 a new edition of his works. He was never successful in getting his banishment annulled, although once at least he visited Paris incognito. He died at Brussels, March 17, 1741. Rousseau was not a great, only a supremely clever poet. His sacred odes and *cantates* are splendidly elaborate, frigid, and artificial; his epigrams, on the other hand, are bright, vigorous, sharp, with stinging satire, and unerring in their aim.

Editions are by Amar (1820) and A. de Latour (1869). See also his *Œuvres Lyriques*, by Manuel (1852), and *Contes inédits*, by Luzarche (Brussels, 1881).

Rousseau, JEAN JACQUES, was born on June 28, 1712, in Geneva, where his family had been settled since 1550, when Didier Rousseau, a French Protestant, sought shelter from persecution. His mother died immediately after his birth, and he was left to the companionship of his father, Isaac Rousseau, a watchmaker and dancing-master, a man selfish and sentimental, passionate, dissipated, and frivolous. In 1722 his father having involved himself in a brawl fled the city to escape imprisonment, and left him to the charitable care of his relations. When he was thirteen his uncle apprenticed him to a notary, who soon found him utterly incompetent, and sent him back as a fool: and thereafter he was apprenticed to an engraver, whose cruelty during the three years he lived with him, he says, made him stupid by tyranny, cunning from fear, and wretched by ill-treatment. One evening, having rambled beyond the city walls till the gates were closed, he was too terrified to face his master, and resolved never to return, but to seek elsewhere his fortune. Now, in 1728, began his adventurous and vagrant career, for the details of which his *Confessions* form our chief authority, in which with picturesqueness and charming vivacity, with marvellous frankness, if not with scrupulous accuracy, he tells the story of his life. As he wandered on he was entertained by a priest of Savoy, eager for proselytes from heresy, and Jean Jacques, pretending to be eager to espouse the Catholic faith, was sent off to Madame de Warens at Annecy, who should look after the

Calvinistic vagrant. By her he was hospitably received and then transmitted to a hospice in Turin filled with some fellow-catechumens; and soon initiated into the faith and duly baptised, he was discharged with a few francs in his pocket. He in vain sought work as an engraver, till a shopkeeper's wife gave him employment, and to her he acted in the double capacity of servant and lover, till on her husband's return he was kicked out of doors. He next became footman to a Comtesse de Vercellis, and on her death not long after he took service again as lackey to Comte de Gouvon, and as nondescript secretary to the abbé, his master's son, till he became intolerable both to his masters and his fellow-servants, and was summarily dismissed.

Now in 1731 he travelled back to Madame de Warens, who welcomed him and installed him as permanent inmate of her house. Madame de Warens or, as her name was otherwise written and pronounced, Vorrans or Vuarrans, lived apart from her husband a very independent life, having a pension, which late investigation suggests may have been earned by acting as a political spy. She was twenty-eight years old, pretty and piquant, kindly in disposition, not rigid in morals, but rich in sentiment. She was clever and flighty, dabbling in chemistry and alchemy, dabbling also in commercial speculations which made her the dupe of adventurers, and indulging in religious speculations which combined Deism in creed with Roman Catholicism in worship. To her Jean Jacques, now nineteen years old, became pupil and friend, factotum, and ultimately lover, through nearly nine years. This period was diversified by adventurous interruptions: he at one time set himself up in Lausanne as a teacher of music though hardly able to play a tune, and as a composer though not able to write a score; became secretary to an archimandrite of the Greek Church, collecting subscriptions to restore the Holy Sepulchre; and then went to Paris as servant to an officer. Thereafter he returned to live with Madame de Warens at Chambéry, and from 1736 at Charmettes, in which lovely retreat his happiest and idlest years were spent, in desultory reading with his *maman*, in music, indolence and sentiment. This attachment and companionship ceased ingloriously at last when on returning from recruiting his health at Montpellier he found himself supplanted in the heart of Madame de Warens by one Vintzenried, whom he describes as a journeyman wig-maker, ugly and a fool, who as a lover was tyrannising over his facile mistress, mismanaging her affairs and dissipating her money. In disgust in 1740 Jean Jacques quitted his beloved Charmettes, the idyllic memories of which lived in his heart, as by his picturesque description they live immortal in literature. He became now tutor in Lyons to the sons of M. de Mably, the brother of the famous Condillac and of the once well-known Abbé de Mably, where he taught with lamentable incapacity.

In 1741 he set off to seek his fortune in Paris, with a little money, some letters of introduction to Parisian notables, and a system of musical notation by which he expected to make his reputation. He had to live in a dirty, shabby inn, and to earn a meagre livelihood by copying music, while his musical system was pronounced by the Academy of Sciences 'neither useful nor original.' After a sojourn of eighteen months at Venice, where he acted as cheap secretary to the embassy till he quarrelled with the ambassador, he returned to his inn, his copying, and a secretaryship with M. de Francueil. Meanwhile he had formed a companionship with a girl he found acting as drudge at the inn, called Thérèse le Vasseur, utterly illiterate, densely stupid, plain-featured, mean and vulgar, although he imagined her possessed of every grace in body, mind, and soul. By her he had five children, each in turn deserted and consigned by him to the hospital for foundlings. He had gained acquaintance with men of letters, with D'Alembert and Diderot, as needy as himself; and when they were producing the famous encyclopædia he wrote articles, of which the most notable were those on music and political economy. His first distinguished appearance in literature was in 1749 by a *Discourse on Arts and Sciences*, written successfully for a prize offered by the Academy of Dijon on the problem whether science and the arts have corrupted or purified morals. Here with bold paradox he denounces fiercely and eloquently letters, arts, sciences, and all culture as alike proofs of and causes of corruption. The audacious independence of his thought, the freshness of his brilliant style, made him at once celebrated in literary and welcome to fashionable circles of society. In 1753 he next made himself distinguished as a composer by his opera the *Devin du Village*, full of novel and sparkling airs (one of which, slightly modified, is the well-known hymn-tune called *Rousseau's Dream*), which was first played with success before the court at Fontainebleau, and when performed in Paris achieved for him a popularity which was not sustained by subsequent efforts. It was in the same year that there appeared his *Discourse on the Origin of Inequality*, which, though unsuccessful in winning the prize from the Academy at Dijon, was successful in establishing his position as a writer in France. In this discourse he argues that all civilisation is a state of social degradation, that all science and literature, all social institutions and refinements are forms of degeneration from the primeval savage life, which, with all its ignorance and brutishness, he audaciously pronounces the state of human simplicity and perfection. All property is asserted to be derived from confiscation, all wealth is a crime, all government is tyranny, all social laws are unjust.

His brilliant denunciation of society made him the more attractive in society; but hating alike the company of wits and of courtiers, and despising fashionable conventions, he lived poorly, dressed meanly, and acted churlishly to show his independence, with that morose self-consciousness, blended with vanity, which was becoming with him a disease. Gladly he accepted from Madame d'Épinay the offer of a retired cottage, the Hermitage, on the skirts of the forest of Montmorency, near her own château Chevrette. There he retired with Thérèse, her obnoxious mother, and his meagre chattels. Still earning his living by copying music, which produced about £60 a year, he employed his days amidst the woods of Montmorency with conceiving and writing his romance, *The New Héloïse*, inspired in the composition of its rapturous passages by a passion he had formed for Madame d'Houdetot, the sister of Madame d'Épinay. His suspicious temper fostered misunderstandings with his patroness, and bitter quarrels with her friend Baron Grimm, and with his own warm friend Diderot; and he quitted the beloved Hermitage with reluctance for a cottage at Montlouis not far off, where he found kind friends in the Duke and Duchess of Luxemburg. In 1760 the *New Héloïse* was published, and was instantly received with applause, and Rousseau became the idol of the sentimental though artificial society of Paris. His work was followed in 1762 by the treatise on the *Social Contract*, published in Amsterdam in order to escape French censorship; and there two months later also appeared *Émile*. By the first work the recluse rose to the first rank as a writer of the romance of sentiment; by the second as a political socialist; by the third as an educationist.

But the views in *Émile* on kings and government made him obnoxious to the state, and the parlement condemned the author to be arrested and his book to be burned; while its deistic teaching in the Savoyard vicar's confession made him hateful to the church, and called forth a denunciatory pastoral from the Archbishop of Paris. Rousseau in terror fled from France, and found shelter at Motiers, an obscure village in Neuchâtel, where he was safe under the tolerant rule of Frederick the Great, and the friendship of the Earl Marischal, George Keith, the governor of the province. Although he lived unobtrusively in botanising rambles, in making laces, and in writing his aggressive *Letters from the Mountain*, and his powerful reply to the Archbishop of Paris, religious rancour followed him to the remote and peaceful Val de Travers. The ministers stirred up the villagers against the heretic, and to escape their open hostility he took flight in 1764. A residence of delicious quietude in St Pierre on Lake Bienne was ended by threat of prosecution from the government of Berne; and he accepted the offer of a home in England, given through David Hume. Under the charge of the good-natured historian, the irritated and sensitive fugitive came to England in January 1766. During about eighteen months he lived at Wootton in Derbyshire, solitary and quiet; and here he busied himself with botany and his *Botanical Dictionary*, and especially in composing his *Confessions*, in which he determined to write his memoirs, to expose his enemies, to reveal himself—in spite of every fault, which he resolved to own—as one of the very 'best of men.' His suspicious nature, his morbid distrust and fears, had increased with his trials and his years. He had quarrelled with almost every friend, imagining the worst meaning in the best of motives; he believed that his truest friends, like Hume, acted with the most sinister designs, that the English government sought his life, and that he was everywhere dogged by spies. Suddenly he quitted Wootton, and, crossing the Channel, got a shelter from the *doctrinaire* Marquis de Mirabeau, and then from the Prince de Conti at Trye; and there he lived, under the name of 'M. Renon,' till he fancied that he was insulted by the domestics and that he was suspected of poisoning a servant. After various shifty changes he lived at Monquin, a retired, quiet spot, where he composed those later parts of his *Confessions*, in which each incident is coloured by his gathering delusions as to the motives of every one with whom he came in contact. In 1770 he returned to Paris, and remained unmolested, following his old life as copyist at ten sous a page, in a fifth story in the Rue Plâtrière, maintaining a surly independence, distrusting his friends, rebuffing admirers, insulting his customers. During these years, in different moods of mind and changing conditions of his broken health, he wrote the wild, half-mad dialogues, *Rousseau juge de Jean Jacques*, in which he vindicates his character in a strain which casts doubt on his sanity, and his *Rêveries du Promeneur Solitaire*, which, in singular contrast, are calm in their tone, idyllic in their beauty, and perfect in their style. Still the delusions increased, and his mental misery deepened till he even craved for shelter in a hospital; everywhere he felt watched by spies, hated by the very children in the streets. In 1778 he accepted the last of these many offers of shelter, and retired to a cottage given him by M. de Girardin on his estate at Ermenonville, 20 miles from Paris. There he suffered from the misconduct of Thérèse, and from inveterate delusions, till, with a suddenness which has given much ground for suspicion of suicide, Jean Jacques Rousseau died on July 2, 1778. His body now rests in the Panthéon.

If the character of Rousseau can be learned from the judgment of his friends and foes, it can be also discovered from his own writings, which tell the story of his life—his *Confessions*, his *Letters*, his *Rêveries*. We may receive his own version of many of his own acts with doubt, and his interpretation of the acts of others with reserve, while details in the *Confessions* are known to be in many cases inaccurate; but as a picture of the man they are strikingly truthful. He is moved by a daring determination to conceal nothing, believing that every defect will only show the intrinsic beauty of his character as patches show off better the complexion of the face. Therefore he tells his ignoble intrigues and his paltry actions, how he deserted his companion when he fell in a fit, how he basely accused a poor girl, his fellow-servant, of theft to conceal his own dishonesty. He exhibits his jealousies and his hates, his lofty sentiments and his petty practices, his unbounded confidence in himself not only as a man of genius, but as a man of supreme rectitude. In spite of the worst he confesses and the worst charged against him by others, he needs commiseration in his faults, as arising from a mind disordered, and he deserves respect for his sincerity of thought, his independence of conduct in spite of its coarseness, his spirit of reverence, and his generosity of heart and hand. As a writer his influence has been exercised in diverse directions. His *New Héloise*, suggested alike in its clumsy form of letters, its didactic passages, and its fervid romance by Richardson's novels, stirred by its strain of passion a spirit of sentiment in the society and literature of France, Germany, and Italy; by its idyllic pictures and exquisite descriptions it awakened a new admiration for nature in its grand and wild aspects, and touched the fashionable world with interest in rural life and in its simple ways. Amidst all its falsetto passion, it taught an artificial society the rights of the poor and the duties of the rich. The *Social Contract* proceeds on the premise that the basis of society is an original compact by which each member surrenders his will to the will of all, on the condition that he gets protection or defence; and arguing that the community is the true sovereign, that each member of it has equal power and right to make its laws, Rousseau arrives at the conclusion that kings are usurpers, that no laws are binding to which the whole people's assent has not been gained. True to his own Genevan traditions and tastes, he considers a republic in which all the people have personal votes as alone valid, and his doctrines of liberty, equality, and fraternity were adopted by leaders of the people, were carried by demagogues to logical extremes he never dreamt of, and became war-cries of the Revolution. By *Émile*, in which the man who abandoned his own offspring becomes the instructor of the age on the nursing of infants, the rearing of children, and the education of youth, with keen observation of life he pointed out the defects of common methods in the nursery and the schoolroom. The work had marked results in discouraging the faults and neglects in artificial society towards children, and in indicating a more natural and less pedantic method of training and developing the physical, mental, and moral faculties; and his ideas on this head (while many absurdities and whimsicalities in the book were avoided) were in large measure carried out by educationists like Froebel and Pestalozzi, and affected the educational methods of all Europe. By his famous chapter on the Savoyard vicar's confession he gave a confession of his own deistic faith, which disgusted

Voltaire, D'Alembert, and D'Holbach by its strain of religious fervour and conviction, and horrified the church by its scornful denial of orthodoxy and supernaturalism. Meanwhile it kindled in France a spirit of severest theism instead of cynical scepticism or blank denial, and inspired Revolutionists like Robespierre with the doctrine that belief in a God is essential for society and the state.

Information regarding the life and character of Jean Jacques Rousseau abounds in the many French literary memoirs of the end of the 18th century, and these need to be ransacked for diverse judgments by the friends and foes of the author of the *Nouvelle Héloïse*. Although Musset-Pathay's *Histoire de la Vie et des Ouvrages de J. J. Rousseau* (1821) and Streckeisen-Moultou's *Rousseau: ses Amis et ses Ennemis* (1865) are essential, on isolated periods and episodes of his life other works are important, such as Berthoud's *Rousseau au Val de Travers*; *Dernières Années de Madame d'Epinay*, edited by Percy and Maugras (1881); Mahrenholtz, *Rousseau's Leben* (1889); Möbius, Rousseau's *Krankheitsgeschichte* (1889); *Madame de Warens et J. J. Rousseau*, by François Mugnier (1890); and Carteret, *J. J. Rousseau jugé par les Français d'Aujourd'hui* (1890). The best monograph in French on the works and character of J. J. Rousseau is still that by St Marc Girardin.

Rousseau, Pierre Etienne Theodore, one of the most distinguished of the modern landscape-painters of France, was born in Paris on the 15th April 1812, the son of a well-to do merchant tailor of the city, a native of Salines in the Jura. There were several artists among his mother's kinsmen; and one of these, Alexandre Pau de Saint Martin, having seen a landscape, 'The Signal Station on Montmartre,' which the boy painted at the age of fourteen, gave him some instruction, and persuaded his parents to abandon their intention of entering their son at the Ecole Polytechnique for an engineer, and to place him, instead, under Rémond the landscape-painter. The classical ideal and methods of this artist were little to the liking of his pupil, who next worked under Guillon-Lethière, and in the Ecole des Beaux-Arts; but his best teachers were the old masters in the Louvre, and his happiest hours were those spent in sketching from nature in the environs of Paris. In 1830 he was painting in Auvergne and Normandy, and he studied landscape in nearly every district of France; but by 1833 he had begun sketching in the Forest of Fontainebleau, which ever after was his favourite painting-ground, and where he finally settled, in the village of Barbizon, in 1848. He first exhibited in the Salon of 1831, and in 1834 his 'Border of the Forest of Compiègne' gained a third-class medal and was bought by the Duke d'Orleans; but in the following year his 'Descent of Cows in Autumn,' painted in the Jura, afterwards purchased by Ary Scheffer, and 'The Alley of Chestnut Trees,' one of his finest works, were rejected—in excellent company—through the influence of Bidault and Rochette, the president and secretary of the Academy. Some twelve years of more or less complete neglect and discouragement followed, and left such baneful effects upon a mind naturally proud and melancholic as may account for the petulance and acerbity which marked certain passages of Rousseau's later life. But in 1848 the painters themselves assumed the management of the Salon exhibitions: he was elected one of the jury; and in the following year he resumed exhibiting, and gained a first-class medal. His works were prominently hung in the Exposition Universelle of 1855; as also in that of 1867, when he was president of the jury, and the only landscape-painter who won a grand medal. Soon afterwards he was appointed an officer of the Legion of Honour; but before he was decorated he had been attacked by paralysis, and, after lingering six months, he died on the 22d of December 1867. Though Rousseau was most deliberate in his art methods, and would often keep his canvases long in hand, altering and retouching them, he was yet an exceedingly prolific, if a somewhat unequal, painter. At his best his works are characterised by true dignity and originality of style, by noble richness of colouring, and are informed by deep sentiment and emotion. His productions now command immense prices, his 'Early Summer Morning' having sold in New York, at the Probosco sale in 1887, for $21,000. See Sensier, *Souvenirs de Théodore Rousseau* (1872); and D. C. Thomson, *The Barbizon School* (1890).

Rousselaere. See Roulers.

Roussillon, formerly a province of France, surrounded by Languedoc, the Mediterranean, the Pyrenees, and the county of Foix. It now forms the French department of Pyrénées-Orientales. In ancient times the capital was *Ruscino*, which stood in the vicinity of the modern Perpignan.

Routh, Martin Joseph, was born of Yorkshire ancestry at St Margaret's South Elmham, Suffolk, on 18th September 1755. His father, a clergyman, in 1758 settled as schoolmaster at Beccles, whence Martin in 1770 went up to Queen's College, Oxford. In 1771 he was elected a demy, in 1775 a fellow, and in 1791 president, of Magdalen. He took deacon's orders in 1777, but priest's not till 1810, when he was presented to the rectory of Tylehurst, near Reading, worth £1000 a year; ten years later he married Eliza Agnes Blagrave (1790–1869). He died at Magdalen, 22d December 1854, in his hundredth year.

A little shrunken figure, with 'such a wig as one only sees in old pictures,' he had grown very deaf, but till well after ninety retained his eyesight and marvellous memory, could walk six miles and climb a stiffish hill, mount the library steps, and study till past midnight. Newman and Bancroft were among his later friends and acquaintances; the earlier had included Dr Parr, Samuel Johnson, and Porson. He was a great patristic scholar when patristic scholars were few, a Caroline churchman, a liberal Tory, a lover of his dogs and canary and joke, a mighty book-buyer to the last—his 16,000 volumes he bequeathed to Durham University. For just seventy years he was publishing, but his works number only six; and two of these are editions of Burnet ('I know the man to be a liar, and I am determined to prove him so'). He will be remembered by his *Reliquiæ Sacræ* (5 vols. 1814–48), but still more for his sage advice, 'Always verify your references, sir.' And Dr Routh it was who in 1783 induced Dr Seabury of New York to apply for consecration as bishop of Connecticut, not to the Danish Church, but to the Scottish episcopate. See Burgon's *Lives of Twelve Good Men* (1888).

Roveredo, a town of the Austrian Tyrol, stands close to the left bank of the Adige, 14 miles S. of Trent by rail. It has been since the 15th century the centre of the Tyrolese silk industry; it has also leather and tobacco factories, and carries on an active transit trade. Pop. 8864. Here the French defeated the Austrians, September 3–4, 1796. Rosmini was born here in 1797. See Bertanza, *Storia di Roveredo* (1883).

Rovigno, a seaport of Austria, stands on the west side of the peninsula of Istria, opposite the mouth of the Po and 40 miles S. by W. of Trieste. The neighbourhood produces olive-oil and the best Istrian wine. The tunny and sardine fisheries, with oil-pressing and the preparation of pastes and tobacco, are the chief industries. Pop. 9522.

Rovigo, a city in Italy, 27 miles by rail S. of Padua, has a cathedral (1696), an academy of sciences, a library of 80,000 volumes, and a picture-gallery. Pop. 7272.—The *province* has an area of 643 sq. m. and a pop. (1889) of 239,579.

Rovuma, a river of East Africa, rises on the east side of Lake Nyassa, flows eastward, and enters the Indian Ocean, after a course of more than 430 miles, a little north of Cape Delgado. During the greater part of its length it forms the boundary between the German and the Portuguese East African possessions. It was first ascended by Livingstone and Kirk in 1862.

Row (pron. *Roo*), a village of Dumbartonshire, on the east shore of the Gare Loch, 2 miles NW. of Helensburgh, which is included within the parish, and with which it is connected by railway (1892). The saintly John M'Leod Campbell (q.v.) was minister of Row from 1825 till his deposition for alleged heresies in 1831.

Row, JOHN, a Scottish Reformer, was born near Stirling about 1525, studied at St Andrews, and in 1550 was sent by the Scottish clergy as their representative to Rome. While in Italy he took the degree of Doctor of Laws at Padua. In 1558 he returned to Scotland, and next year abandoned the Roman faith. In 1560 he aided in compiling a *Confession of Faith* and the *First Book of Discipline*, became minister of Perth, and sat in the first General Assembly of the Church of Scotland. He was four times moderator, and took a share in preparing the *Second Book of Discipline*.—His eldest son, JOHN ROW, was born at Perth in 1568, studied at Edinburgh, became minister of Carnock in 1592, and died in 1646. He wrote a dull and prolix but reliable *History of the Kirk of Scotland*, which was at length printed by the Maitland Club (2 vols. 1842) and the Wodrow Society (edited by David Laing). The work extends from 1558 to August 1637, but was continued to July 1639 by his second son, JOHN ROW (*c.* 1600), successively rector of Perth grammar-school, minister at Aberdeen, moderator of the provincial assembly there in 1644, and, by appointment of Monk's commission of colonels, principal of King's College in 1651. Like his father and grandfather a learned Hebraist, he published in 1634 *Hebraicæ Linguæ Institutiones*, and in 1644 *Chilias Hebraica seu Vocabularium*.

Rowan Tree, MOUNTAIN ASH, or QUICKEN TREE (*Pyrus aucuparia; Sorbus aucuparia* of many botanists), a tree belonging to the natural order Rosaceæ, abundant in Britain, especially in the Highlands of Scotland, and in many parts of continental Europe. It does not attain a great size, but is one of the most ornamental trees that occur in British woodlands. The wood is valued for its compactness and fine grain, and is capable of taking a high polish. In the superstitions of the Scottish Highlands, and also of the Lowlands, a peculiar importance was assigned to the rowan tree, a mere twig of which was supposed to have great efficacy in scaring away evil spirits. The fruit (*Rowan berries*) is sometimes used for preserves. It has much acidity, and a peculiar bitterness. In some parts of northern Europe the berries are dried and ground into flour as a substitute for wheaten flour in times of scarcity of the latter. By fermentation they yield an agreeable liqueur, and by distillation a powerful spirit. In Russia a tincture is formed of the ripe berries, which is greatly esteemed as a stomachic. It is made by filling a cask two-thirds full with berries, which have been carefully picked and cleaned. The cask is then filled up with brandy, gin, or rum, and allowed to stand in a cool cellar for twelve months, when the liqueur is run off, and is found impregnated with both the colour and the flavour of the fruit. The fruit of the rowan tree is generally red, but there is a variety with yellow fruit, and a very nearly allied species, *P. americana*, a native of North America, has purple fruit.

Rowan (*Pyrus aucuparia*) in flower.

Rowe, NICHOLAS, dramatist and translator, a contemporary and friend of Congreve, Pope, Addison, and Steele, was the son of a serjeant-at-law, and was born at Little Barford, in Bedfordshire, June 30, 1674. He was educated at Westminster under Busby, and studied law in the Middle Temple; but early inheriting a small competency by the death of his father, he devoted himself to literature. Between 1700 and 1714 he produced eight plays, of which three were long popular, and deservedly: *Tamerlane* (1702), *The Fair Penitent* (1703), and *Jane Shore* (1714). The character of Lothario in *The Fair Penitent* was the prototype of Lovelace in Richardson's *Clarissa Harlowe*, and indeed the name is still the proverbial synonym for a fashionable rake. Rowe translated Lucan's *Pharsalia*, and his work, says Dr Johnson, 'deserves more notice than it obtains, and as it is more read will be more esteemed.' His edition of Shakespeare (7 vols. 1709–10) at least contributed to the popularity of his author. Rowe's comedy, *The Biter* (1705), lived only to be damned as it deserved. Rowe, we are told, had no heart, yet his vivacity and engaging manners procured him many friends and several lucrative offices. The Duke of Queensberry made him his Under-secretary of State. In 1715 he succeeded Tate as poet-laureate; and the same year he was appointed one of the surveyors of customs to the port of London; the Prince of Wales made him Clerk of his Council, and the Lord Chancellor Parker secretary of Presentations in Chancery. He died December 6, 1718, and was buried in Westminster Abbey.

Rowing. The oarsman sits with his face to the stern of the boat, his feet planted flush against his 'stretcher' or footboard, and the handle of his oar in his hands, the loom of the oar resting in the rowlock, the 'button' being inside the thowl-pin. He should sit upright, with a rigid back, and do his work mainly with his back and legs, using his arms as couplings between his body and the oar-handle, and only bending them towards the finish of his stroke. To row a stroke, swing the body forward from the hips straight towards the toes; extend the arms rigidly, brace the shoulders, and keep the head up. The hands should be holding the oar-handle about $3\frac{1}{2}$ inches apart. The grasp should be with fingers and not fist—i.e. the lower knuckles of the hand should be very slightly bent, almost straight, the hold being retained by the upper joints of the fingers and by the thumb. This mode of holding the oar gives freer play to the wrist-joints for the 'feather,' of which more anon. The body being thus extended, and the legs opened at the knees to allow the body free swing forward, and the hands thus grasping the oar-handle, then the stroke is begun by raising the hands enough to allow the blade of the oar to sink into the water *square*. (It is most important that the blade should be square to the plane of the surface of the water; otherwise, as soon as the stroke commences, the blade fails to preserve its own plane, and sinks too deep, or springs out of water, according as the face of it is inclined at an obtuse or acute angle to the water.) When the oar has been thus lowered into the water, by raising the hands over the stretcher, the stroke should commence—sharply, by bracing the muscles of back, loins, shoulders, and legs, and throwing the body backwards, swinging from the hips, the feet firmly pressing against the stretcher, the arms rigid; so that the weight of the body is eased as much as possible off the seat, and is transferred to the oar-handle and the stretcher. When the body has reached the perpendicular, in the swing, back the arms should begin to come in. The action of bringing them in should be from the shoulders, the elbow-joints gradually bending, but the forearm remaining as near as possible parallel to the water. The 'biceps' should not be exerted, else the forearms bend upwards, the hands rise, and the blade buries. The body should not 'wait' for the arms and hands to overtake it: it should be still swinging back till the hands overtake it.

When the hands reach the breast-bone they should be sharply dropped about two inches: this raises the oar out of the water. After this drop of hands they should be turned sharply from the wrists till the knuckles touch the body. This turn produces the 'feather.' If the turn is made too soon, before the hands have reached the chest, the action is faulty, and produces what is called 'feather under water,' by turning the oar edgewise *in* the water instead of after the oar has left the water. So soon as the drop and turn of wrists has ended and 'feather' has been performed, the 'recovery' should commence. The body should instantly, and without 'hang' or delay, commence to swing forward again like a pendulum. The hands should at the same instant be shot out and the arms extended, reaching their extension by the time that the body has once more attained the perpendicular in its forward swing. The swing should continue forward till full reach has been attained for a new stroke; then once more the hands should be raised, the oar lowered into the water, and a new stroke rowed. In rowing behind another oarsman the eyes should catch the back in front of the oarsman, who should take time and swing from it—keeping 'eyes in the boat.' The oarsman at first finds it difficult to 'govern' his blade—i.e. to keep it in the right plane—and at the correct elevation or depression, according to whether he is rowing the stroke or is 'recovering.' In time his wrists become more apt, and time their action to the ever-varying positions of the body. The more he attends to a correct grasp of his oar-handle the easier will be the play of his wrists, and the greater facility will he find in regulating the plane of his blade. It has been said before that the blade should be 'square' to the water throughout the stroke. So it appears to the oarsman; but in well-constructed boats the 'thowl' is slightly inclined in the direction in which the oarsman is looking; this inclination gives the oar-blade a correspondingly slight inclination forward, making it describe a trifle less than a rectangle with the water, and so obviates any tendency to row 'deep.' It will suffice if the beginner thinks of keeping his blade 'square;' and the small deviation from the square, reducing the angle that is effected by the slope of the thowl for his benefit, will then be produced naturally by the mechanism of his work. If this inclination of the thowl is made too great the oar has a tendency to fly out of the water.

To stop the way of a boat she should be 'held.' This is done by laying the blade flat, and thus slightly sinking the edge which lies towards the direction in which the boat is travelling. This causes the blade to bury at an acute angle to the plane of the water. This checks the way until it is reduced enough to allow the oarsman to turn the blade square, reverse way, and to 'back' water. If he tries to back water with any pace on, before he has first 'held' the boat, the resistance to his blade not only risks fracture, but is likely to be beyond his strength, to lay him flat on his back, and to make him 'catch a crab.' In backing water the process of the stroke, described above, should be reversed, so far as circumstances will allow—i.e. the oarsman has no stretcher to press against, and is 'pushing' with his weight instead of 'pulling.' In most 'tub' boats, and in all racing boats, straps are laid across the stretcher, to hold the feet at the instep, and so to facilitate recovery. The strap should only be used as an adjunct to recovery, not as the sole means: the loins should play their part in swinging the body forwards; and the arms, by being rapidly shot out, should aid the action of the loins. If a tyro is found to rely too much on his strap, a mentor may with advantage remove the strap until proper use of the loins has been effected.

Sculling.—In sculling each hand holds one scull, instead of there being two hands on one oar as in 'rowing.' The principles of action of body, legs, and arms are the same as in rowing, except that the body, when sculling, may with advantage be swung farther back at each stroke than in rowing. The grip of a scull should be on the same principle, as regards holding in fingers and not in fist. The thumb should not clasp under the handle, but cap the butt of the scull with the top joint. In rowing this would be wrong; but in sculling it is found to secure the better hold, and to give freer play to the wrists for feathering. It is important that both hands should work together, both blades entering and quitting the water together, and both wrists feathering simultaneously. If one hand is later than the other the course of the boat is distorted at each stroke.

BOAT-RACING.—Virgil, in *Æneid*, v., describes a boat-race between four Trojan galleys; and the word 'regatta' is of Italian origin. But boat-racing may be said to be almost exclusively an Anglo-Saxon sport. Germans of late have slightly taken it up, but 95 per cent. of the sport is found in Britain and her colonies and the United States.

Eton and Westminster schools practised boat-racing in the early part of the century; thence the pastime seems to have spread to the universities. One of the earliest races of the century was between Westminster boys and the 'Temple' crew, in six oars, the boys winning. As early as 1815 college 'bumping' races in eight oars had begun at Oxford. In those days only three or four colleges manned eight. Cambridge adopted a similar sport at much the same date, or a year or so later. In 1829 the first Oxford and Cambridge match was rowed—Hambledon lock to Henley Bridge. The next was in 1836, Westminster to Putney; after that at intervals till 1856, since which date these matches have been annual. Up to 1891 Oxford had won 25 and Cambridge 22 of them. There was one 'dead heat' (1877). Also, five times have the U.B.C.'s been drawn together in the same heat for the 'Grand Challenge' at Henley, of which Oxford won 3 and Cambridge 2 encounters; and once Oxford beat Cambridge in an encounter for the 'Gold Cup' at the now extinct Thames regatta of the 'forties.' 'Outriggers' were first used by the two university crews in 1846. Sliding seats were first used by them in 1873. 'Keelless' eights were first used by them in 1857. In 1845 the Putney to Mortlake course was first adopted for these matches. Outriggers are a contrivance for artificially extending the gunwales of a boat, so as to give the required leverage for the oar in the rowlock, while the rest of the hull is narrowed to offer less resistance to the water. The earliest application of the principle was with wooden outriggers on the Tyne before 1836. Iron outriggers were first used by H. Clasper for a Tyne firm in a Thames regatta in 1844.

Professional Racing.—The earliest recorded professional champion sculling race was in 1831, when one Campbell, Thames waterman, beat one Williams for the championship of the Thames from Westminster to Putney. In 1847 the Putney to Mortlake course was first adopted for these watermen's matches. In 1859 the title first left the Thames, and was won by R. Chambers of the Tyne. It oscillated between the representatives of these rivers, aliens and colonials now and then competing unsuccessfully, until 1876, when E. Trickett of Australia beat J. Sadler of the Thames. Since that date the sculling premiership has oscillated between Canada and Australia; E. Hanlan of Toronto, W. Beach of Sydney, and W. Searle of Sydney being the most noted holders. In 1889 Searle the holder died; and there being no tribunal to decide which two of various aspirants had the first claim to compete for the vacancy, or how many must compete before a new premier could be recognised, some doubt arose as to which, M'Lean or Stansbury of Australia or O'Connor, United States, had the best claim at this moment to the honour.

The 'Amateur Sculling Championship' is symbolised by the 'Wingfield Sculls,' established in 1830. The trophy now carries with it the amateur championship of England. The holder has to meet the best of all challengers once a year, on a date fixed by a committee of old champions, about July, or to abandon in favour of the best challenger.

Regattas.—Henley regatta was founded 1839. In 1886 the course was changed as to some 300 yards of its length, to avoid a corner which gave unfair advantages. It is now a three days' meeting, and comes off early in July each year. The prizes are 'Grand Challenge,' for best eight oars; 'Stewards' Cup,' for best four oars; 'Ladies' Plate,' for college and school eights; 'Thames Cup,' for second-class eights; 'Wyfold Cup,' for second-class fours; 'Visitors,' for college and school fours; 'Silver Goblets,' for any pair of oarsmen; and 'Diamond,' for sculls. By first and second class eights and fours are meant the classes which usually compete at the races referred to—e.g. no one who rows for 'Grand Challenge' may row for 'Thames Cup' the same year; nor if he rows for 'Stewards'' fours may he row in a Wyfold crew; and as the 'Grand' and 'Steward' are the more valuable prizes, the better eights and fours usually elect to do battle for them, and the weaker reserve themselves for the lesser races. There are other regattas of less importance—e.g. 'Metropolitan,' on the Thames tideway, Kingston-on-Thames, Walton-on-Thames, Moulsey, Reading, &c.; and provincial regattas at Tewkesbury, Bridgnorth, Worcester, Tyne, Durham, Burton-on-Trent, Bedford, &c.

The best regattas affiliate themselves to the 'Amateur Rowing Association,' a sort of jockey club of oarsmanship, the object of which is to promote rowing, and to put a stop to performances inconsistent with amateur status—e.g. rowing for money prizes, and the introduction of competitions against artisans, mechanics, &c. Such classes, by making a business of muscular toil, have an advantage for muscular development over amateurs, whose more sedentary vocations give them less opportunity for developing muscle. At the same time it is the opinion of good judges that at the present day the best amateur oarsmen would in rowing defeat the best professional oarsmen. In sculling, apparently, the best colonial professional scullers are still superior to the best British amateur scullers; but the British professionals are probably no better than, if so good as, the average amateur Wingfield sculler of the present day. The Amateur Rowing Association publishes a code of regatta rules. All regattas which are affiliated to the Amateur Rowing Association adopt this code. Oarsmen who row at regattas where this code is not in force become thereby ineligible to row afterwards at regattas where it holds good.

Professional Regattas and Prizes.—A professional regatta for watermen was revived in 1890 and promises to continue. It is under the patronage of the leading amateurs of the day. There were similar regattas between 1843 and 1849 inclusive, again between 1854 and 1866 inclusive, and again between 1868 and 1876 inclusive. In the other years not specified no local professional regattas were conducted by leading amateurs; but in 1876–77–78 a 'speculative' regatta for gate-money and traffic purposes was got up by the Steamboat Company and contingent railways. 'Doggett's Coat and Badge' is an old-established race dating from 1719. Mr Doggett, a comedian, provided it. It is for watermen's apprentices; the winner gets an ornamental red coat, a silver badge, and 'freedom' of the Thames—i.e. his fees for taking up his freedom as a waterman are paid for him. No one who is not 'free' of the Thames may ply for hire upon it to carry passengers. This regulation dates from days when the Thames was more of a highway for passenger rowing boats than it now is. Watermen's wherries then plied from numerous stairs, and it was important that none but competent and certified oarsmen should have the charge of passengers. There are other coats and badges extant, given at divers times by philanthropists to encourage watermen's apprentices. An apprentice has to serve seven years to a waterman before he is qualified to be 'free' of the river.

Bumping Races.—In 'bumping' races at the universities the various boats start in line, 120 feet apart, by signal of cannon. The order of starting depends on order of precedence in the last previous race, whether the same year or the year before. If a boat is touched from behind in the race, both boats row into the bank, and the 'bumped' boat loses a place and changes order next time with the boat that so 'bumped' it. The head boat of the river at Oxford holds a challenge cup given in 1862 by the late Mr G. Morrison.

Time Races.—At Oxford and Cambridge, owing to the narrowness and curvatures of their respective rivers, other races, such as for four oars or sculls, are rowed as 'time' races. The boats start two at a time, 80 yards apart, their respective winning-posts are the like distance apart, and their respective arrivals at their goals are announced by pistol shots.

Level Racing Rules, &c.—In regattas and matches boats start abreast, and in modern times to ensure equal starting the rudder of each competitor is held from a starting-boat, one for each racing crew, moored in line. 'Fouling' is not allowed; each boat has to keep its own water; the umpire is sole judge of the course and of fouling, and usually follows the race in a fast eight or steam-launch.

All boats abide by their accidents—e.g. of broken gear or upsets.

Sliding Seats.—The use of sliding seats began in 1871 in England. Americans had previously used but thought little of the novelties. A Tyne crew, captained by F. Taylor, matched against another Tyne crew, used such seats in a match, November 1871, and won with them. Next year four Henley crews adopted them with marked success, and the London Rowing Club used them in a winning match *v.* Atalanta Rowing Club, of New York. In 1873 they became universally adopted. Leading amateur clubs prohibit use of slides by their beginners, till swing on fixed seats has been first mastered, else there is a tendency in a tyro to sacrifice swing to slide. Slide should conclude with swing. The slide should be *held* till the body is nearly or quite perpendicular in the swing back. Then the slide may be released, and the legs should be extended gradually, the extension to terminate contemporaneously with the oar reaching the chest.

Faults in Rowing.—A 'coach' or tutor of a crew endeavours to cure faults by admonition, so as to get his crew into 'form' and style. Uniformity of oars and of action of bodies has much to do with pace in a racing boat, though, of course, strength is also an important factor. Still a strong oar who mars uniformity among his comrades often does more harm than good, and is well replaced by a lighter and neater oarsman. Among salient faults may be specified 'rowing out of time,' by letting the oar enter or leave the water too soon or too late; 'rowing light'—i.e. not covering the blade; 'rowing deep'—i.e. burying the shank as well as the blade of the oar; 'feathering under water;' 'sliding too soon' or too suddenly. Among 'faults of swing' are 'hanging' with the body before recovery, or when forward before dropping the oar in; delay in shooting out the hands; 'bending the arms' too soon; bending the back in the middle of the stroke instead of swinging from hips; hunching the shoulders; 'screwing'—i.e. not swinging straight in a line with the keel; 'meeting the oar'—i.e. swinging to meet the oar-handle instead of rowing it well home; 'rowing short'—i.e. not swinging to full reach forward.

Stroke and 'No. 7.'—A 'stroke' is selected to set a good style to the men who are to copy him. Hence style more than rough strength is of importance for this post. A stroke should be lively in swing; sharp in catching hold of the first part of the stroke; long in reach; even in swing; even in time, like a pendulum; a good judge of the pace of stroke which he is rowing; capable of 'spurting'—i.e. of quickening the pace of stroke when extra speed is needed, and this without getting short in reach. Thirty strokes a minute is a fair practice stroke. In racing for a mile or mile-and-half course as many as forty-four a minute can be rowed long by good crews. Over a four mile course thirty-seven a minute, well rowed at full length of reach, is about as much as can be done, excepting a final 'spurt.' 'No. 7' is second to none in importance in an eight oar. He couples stroke to the crew. The best man in the team should if possible be placed here; a weak No. 7 takes many points of merit off a crew, and cripples the work of good but rough men behind him.

Steering.—Four oars are now rowed without coxswains, except in junior or second-class races. One of the oarsmen steers with levers attached to his stretcher and connected with the rudder by wires. In an eight, a coxswain is an important factor; he should have nerve and judgment, and be capable of reminding his crew of faults, when, as in a race, no 'coach' or mentor can attend them. The main art in steering is to keep the boat in a straight course by gentle touch and adjustment of the rudder lines, not by hard pulls, which tend to spoil equilibrium, and to bring the boat round too sharply. In going round a curve the bows should not be expected to point in the direction required. They must of necessity point outwards, because the boat lies as a tangent to a curve.

Rowing Clubs.—Among leading amateur rowing clubs, besides the universities, may be mentioned the Leander, the London Rowing Club, Thames Rowing Club, Kingston, Moulsey; these usually supply the competitors at Henley, together with the universities. There are good provincial clubs at Durham, Worcester, Bridgnorth, Bedford, Huntingdon, Burton, &c. Among schools Eton, Radley, Westminster, Magdalen (Oxford) Bedford 'Grammar' and Bedford 'Modern' supply good oarsmen—Eton especially. Of university crews nearly one-half are made up on the average of old Etonians.

Training.—'Condition' promotes endurance in a contest, whether of horse or man. Hence training is an important item in preparation for a boat-race. Hard work trains; regulated diet keeps the oarsman up to this hard work, and puts on extra muscle to replace fat which hard work has sweated off. Five weeks is a minimum time for full training where oarsmen have been out of work for some time; a shorter period may suffice if they have not been inactive for long. Professionals usually train for three months before a match. The usual rules are early rising—say 7 A.M.—a short morning walk, bath, breakfast, morning row (if studies or business hours admit of it), luncheon or mid-day dinner, afternoon or evening row (according to season of year), late dinner or supper, a short post-prandial stroll, a cup of gruel or chocolate, and bed for nine hours. After each row the body should be well washed and rubbed down. As to diet. For breakfast: beef or mutton, cold or broiled; some fish, if wanted; an egg; watercress or lettuce; and two cups of tea; stale bread or toast. Luncheon: cold meat and some green food; or broiled meat and vegetables. Dinner: fish; joints of beef or mutton; vegetables—any greens, asparagus, spinach, a potato or two, &c.; now and then a modicum of poultry as an extra course; stewed fruit; rice or plain farinaceous pudding. Drink: at luncheon or dinner, ale, claret and water, or champagne. A pint at each meal usually suffices; in sultry weather a little more fluid may be allowed, in which case it is best to let the extra supply be water only. Oranges or strawberries are allowed for dessert, and a glass or two of claret or one of port. Pork and veal are tabooed, as being indigestible in the large quantities which hungry men consume. Such is modern training. In earlier decades less liberality was allowed. Steaks, chops, and plain joints formed the staple supplies, and the hobby was to have them 'underdone,' almost to semi-rawness. This system often produces disorder of blood, resulting in boils, the effect of too much animal food without sufficient green meat. Professionals still adhere to old creeds of training more tenaciously than do modern amateurs.

See *Boating* (Badminton series, 1888), *Rowing and Sculling* (1889), and *Oars and Sculls* (2d ed. 1889), all three by the present writer; also Treherne and Goldie's *Record of University Boat-race* (new ed. 1884).

Rowlandson, THOMAS, caricaturist, was born in the Old Jewry in July 1756. He was sent to Paris at fifteen, and here he studied art and gained a taste for the pleasures of the town. The over-indulgence of a wealthy French aunt first taught him improvidence, and the £7000 she left him he quickly gambled away, once continuing at the gaming-table, we are told, for thirty-six hours continuously. Yet he maintained his uprightness of character, hated debt, and when he had played the fool turned to his work as his resource. He travelled over England and Wales, often visited Plymouth, Portsmouth, Southampton, and especially Yarmouth, and, being a humorist to the marrow, enjoyed life to the full in his tavern, with his tankard and his pipe, and the company of friends like Moreland, Gillray, and Bunbury. He died April 22, 1827. Rowlandson took little pains over his work, yet his drawings never lack the essential elements of his strength, variety, and humour. He possessed rare dexterity of touch, fertility of imagination, and knowledge of the human figure, and, though he was not seldom vulgar, he was never feeble. He was a relentless hater of Napoleon to his fall, belittling his greatness by countless travesties; and though he took his part in many of the political contests of his day, he was never a mere party satirist. His strength lay in broadly human humour, as seen at its richest among the lower orders of the population, as in his famous Vauxhall drawing. Some of his best-known works are his *Imitations of Modern Drawings* (1784–88), and his caricature illustrations to Syntax's *Three Tours*, the *Dance of Death*, the *Military Adventures of Johnny Newcome*, Sterne's *Sentimental Journey*, *Peter Pindar*, the *Bath Guide*, *Munchausen's Travels*, &c.

See Joseph Grego's exhaustive *Rowlandson the Caricaturist* (2 vols. 1880).

Rowley, WILLIAM, an actor and playwright under James I., of whose life but little is known, save that he was honoured by collaborating with such illustrious dramatists as Dekker, Middleton, Heywood, Webster, Massinger, and Ford, most probably for his skill in stage situation, not less than the amiability of his character. Four plays connected with his name are extant: *A New Wonder, a Woman never vext* (1632, in vol. xii. of Dodsley); *All's Lost by Lust*, a tragedy (1633); *A Match at Midnight* (1633); and *A Shoemaker a Gentleman* (1638).

Rowley Regis, a town of Staffordshire, 3 miles SE. of Dudley, within whose parliamentary limits it partly lies. The parish church dates from the 13th century, but was rebuilt in 1840 (the tower in 1858). There are collieries, ironworks, stone-quarries, potteries, implement-works, and breweries. Pop. (1851) 14,249; (1891) 30,791.

Rowton Heath, a battle of the Great Rebellion, fought under the walls of Chester, September 24, 1645. After the crushing disaster of Naseby the king fled to Wales, and next formed the desperate project to march northwards to Montrose. The city of Chester was then being besieged by Sir William Brereton, but the king succeeded in finding an entrance, and charged Sir Marmaduke Langdale to raise the siege. The parliamentarians had just been reinforced by Poyntz's Yorkshire horse when Sir Marmaduke attacked them. He was utterly defeated, with a loss of 300 killed and 1000 prisoners, and the disaster, added to Philiphaugh, stripped the unhappy king of his last hope.

Roxburghe Club. See BOOK-CLUB.

Roxburghiaceæ, a natural order of monocotyledonous plants, perhaps better called Stemonaceæ. The species are very few, natives of the hotter parts of the East Indies. The stems of *Roxburghia* (Stemona) *viridiflora*, a native of Chittagong, the Malayan Islands, &c., are sometimes 100 fathoms long. The thick tuberous roots are boiled and soaked in lime-water, to remove their acridity, and are then candied with sugar and taken with tea, but are considered rather insipid. The name was given by Sir Joseph Banks, in honour of the botanist Roxburgh.

Roxburghshire, a Scotch Border county, bounded by Berwickshire, Northumberland and Cumberland, Dumfriesshire, Selkirkshire, and Midlothian. Its greatest length is 42 miles; its greatest breadth 30 miles; and its area 670 sq. m., or 428,494 acres. In the north the Tweed winds 25 miles eastward, receiving in this course Gala and Leader Waters and the Teviot, which last runs 37 miles north-eastward from above Hawick to Kelso, and itself receives the Ale, Slitrig, Rule, Jed, &c. Thus the whole county, often called Teviotdale, drains to the German Ocean, with the exception only of Liddesdale, or Castleton parish, in the extreme south, whose 106 sq. m. belong to the western basin of the Solway Firth. The Cheviots (q.v.) extend along the south-eastern boundary, their highest point here Auchopecairn (2382 feet); in the interior rise Ruberslaw (1392) and the triple Eildons (1385). Much of the low ground is of fair fertility, and great improvements have been made in agriculture; but rather less than two-thirds of the entire area is in cultivation, and the raising of crops is of much less importance than the grazing of half a million sheep. Rents, however, increased two- or threefold, or even fourfold, between 1750 and 1815, and the county valuation advanced steadily from £254,130 in that year to a maximum of £439,860 in 1877, since which date it has again declined considerably owing to agricultural depression. Roxburgh, which gave the county its name, has been quite superseded by Kelso (q.v.); and Jedburgh, the county town, is very much smaller than Hawick; other places are Melrose, Denholm, St Boswells, Yetholm, &c. Chief seats are Floors Castle, Mount Teviot, Minto House, and Abbotsford; and the dukes of Buccleuch and Roxburghe are much the largest proprietors. The antiquities include hill-forts; long stretches of the Catrail and Watling Street; the castles or peel-towers of Hermitage, Branxholm, Harden, Ferniehirst, Smailholm, &c.; and the noble monastic ruins of Melrose, Jedburgh, and Kelso. Besides many more worthies, four poets—James Thomson, Jean Elliot, Leyden, and Aird—were natives; but, although not his birthplace, Roxburghshire is pre-eminently the land of Scott. It witnessed many a fray, but no battle greater than Ancrum Moor (q.v.). The county returns one member to parliament. Pop. (1801) 33,721; (1831) 43,663; (1861) 54,119; (1891) 53,726.

See Jeffrey's *History of Roxburghshire* (4 vols. 1857–64), and other works cited at BORDERS, BALLAD, HAWICK, TWEED, MELROSE, &c.

Roxbury, formerly a separate city of Massachusetts, annexed in 1867 to Boston (q.v.), of which it forms the 13th, 14th, and 15th wards. Pop. (1870) 34,772.

Roy, WILLIAM, the first of British geodesists, was born May 4, 1726, at Miltonhead, in Carluke parish, Lanarkshire, his father being factor and gardener to the Hamiltons of Hallcraig. He was educated at the parish school and Lanark grammar-school, and in 1747 is found acting as deputy-quartermaster in the Royal Engineers corps, engaged on the survey of Scotland. His name first figures in the *Army List* in 1757, and he gradually rose to be lieutenant-colonel (1764), colonel (1777), and major-general (1781). In 1783 he undertook as a labour of love to measure a base line (see ORDNANCE SURVEY) on Hounslow Heath, of 27,404¾ feet, or about 5⅕ miles, which, though the first measurement of the kind in Britain pretending to accuracy, was executed with such care that, on being remeasured after Roy's death, the difference between the two results was found to be only 2¾ inches. For this splendid labour Roy received the Royal Society's Copley medal. His labours connected with the work extended from July 1787 till September 1788, when he returned to London in ill-health, which necessitated his removal to the warmer latitude of Lisbon in the winter of 1789; but he returned to London, and died there suddenly, 30th June 1790. In 1767 Roy was elected a Fellow of the Royal Society, to whose *Transactions* he contributed, in 1777, 'Experiments made in Britain to obtain a Rule for Measuring Heights with the Barometer.' He had also during survey-work in Scotland (1764) paid particular attention to the camps and other Roman remains in that country, and his *Military Antiquities of the Romans in Britain* was published in 1793 by the Society of Antiquaries. Roy was also surveyor-general of the coasts of Great Britain.

See two articles in the *Proc. Soc. Antiquaries Scot.* (i. p. 147, 1855; and ix. p. 562, 1873).

Royal Academy. Previous to the foundation of the Royal Academy various more or less successful attempts had been made in England to raise the status of artists, to consolidate their aims and efforts, to provide means for presenting their works to the public, and to furnish systematic art instruction. The succession of art schools from Kneller to Shipley has been given at ART INSTRUCTION. In 1745 Hogarth and other painters, with the view of making their works known, presented certain of them to the Foundling Hospital. The public having been greatly attracted, they, in 1760, opened a free exhibition in the rooms of the Society of Arts; and, in the following year, a series of exhibitions was begun in Spring Gardens, and its promoters, styled 'The Incorporated Society of Artists of Great Britain,' received a royal charter in 1765. Disputes having arisen, twenty-nine members of this society (not—according to Redgrave—twenty-two only, as stated by Sandby) memorialised George III. to establish an academy for the encouragement of the arts of design, and the plan they submitted having been approved, the 'Royal Academy of Arts in London' was founded, 10th December 1768. The 'Instrument' of foundation provided for forty academicians, from whom the president and other officials, including professors of fine art in its various branches, should be elected; and annual exhibitions were stipulated for, their proceeds to be devoted to the aid of indigent artists and to the support of the Academy. In 1769 a class of twenty associates (to have no share in the government of the body, a restriction since modified) was created, and also a class of six associate-engravers, on the same footing, excepting that they were ineligible for election as academicians, a restriction now withdrawn. In 1780 George III. assigned rooms to the academy in Somerset House, and during twelve years he contributed £5116 to its funds from the privy purse. As tersely stated by Redgrave, 'the strength of the new institution consisted in its combining, under a well-framed code of laws, the most esteemed artists of the day, empowered to manage their own affairs.' Thirty-nine artists are named in the instrument of incorporation, including Reynolds, Gainsborough, and Richard Wilson, and ten of them were foreigners; Sir Joshua was, by acclamation, elected the first president. The management and results of the Royal Academy formed the subject of parliamentary inquiry in 1835-36, and in 1863. See Sandby's *History of the Royal Academy* (1862).

The Royal Hibernian Academy was founded by charter in 1823, consisting of fourteen academicians and ten associates, and its first president, Francis Johnston, presented ground and erected buildings thereon for the use of the body.

The Scottish Academy, the successor of such exhibiting bodies as the society of 'Associated Artists' and the Royal Institution, was founded in 1826, under the presidentship of George Watson, consisting of thirty academicians and sixteen associates (the latter increased in 1830 to twenty). In 1838 it received a charter, entitling it to the style of 'The Royal Scottish Academy of Painting, Sculpture, and Architecture;' and in 1891 a supplementary charter was granted, admitting associates to a share in the management of the body, and removing any limit to their numbers (but providing that only twenty shall participate in the pension fund), and granting extended powers for dealing with non-resident and non-exhibiting members. See Sir G. Harvey's *Notes of the Early History of the Royal Scottish Academy* (2d ed. 1873).

Royal Academy of Music, the name first given in England to an association for performing operas, mainly those of Handel, founded by the king and the principal nobility and gentry of the country, which survived for but a few years. The well-known educational institute now bearing the name was founded in 1823 by Lord Burghersh (1784–1859, afterwards eleventh Earl of Westmorland, and not less distinguished as a musician than as soldier and diplomatist), who saw with regret the great disadvantages under which natives of Great Britain suffered as compared with those of foreign countries in respect of musical education. The institution, which received a charter in 1830, was designed to give concerts as well as to provide musical education; and it has instructed many of the leading instrumentalists and vocalists of both sexes. Since its reconstitution in 1866 the most distinguished principals have been Sir George Macfarren (1876–87) and Dr A. C. Mackenzie (appointed 1888). The Royal Academy of Music is distinct from the Royal College of Music (see CONSERVATOIRE), though allied with it for promoting musical education throughout the country by means of an 'Associated Board.'

Royal Assent. See PARLIAMENT; and for royal prerogative, &c., see SOVEREIGN, WARRANT, SUPREMACY, COMMISSIONS, CHARTER, BOUNTY, HOUSEHOLD, HUMANE SOCIETY. For the Royal Asiatic, Geographical, &c. societies, see SOCIETIES.

Royal Family. By the law of England royal rank is conceded to the wife or husband, children or other descendants, and collateral relatives of the sovereign. For the position and rights of a Queen-consort or Queen-dowager, see the article QUEEN. The husband of a reigning queen does not acquire any share in her prerogative rights, but it is usual to grant him special precedence; King Philip and William III. were associated in title and power with their wives by act of parliament. Of the sovereign's children the eldest son is, of course, heir-apparent; he is born Duke of Cornwall, and he is always created Prince of Wales (q.v.). The Prince and Princess of Wales and the Princess Royal (the eldest daughter of the sovereign) are within the protection of the statute of Edward III. relating to Treason (q.v.). An heir-presumptive to the throne has no special rank or precedence as such. The younger children of the sovereign take rank after the heir-apparent; by a statute of 1540 a place is assigned to them at the side of the cloth of estate in the parliament chamber; it is customary to confer peerages on all the younger sons. On a reference by George II. to the House of Lords it was held that Edward, Duke of York, second son of the Prince of Wales, was entitled to a place among the king's children. Members of the royal family enjoy considerable privileges; they pay no tolls or duties, and they are exempted from succession duty and some other taxes. See also SOVEREIGN.

In order to protect the succession to the crown against the dangers which might arise from unsuitable alliances, the following special rules are applied to members of the royal family: (1) By the Royal Marriage Act of 1772 it is enacted that no descendant of George II. (other than the issue of princesses married into foreign families) may marry without the consent of the sovereign; any marriage contracted without such consent is void. But any such descendant, if above the age of twenty-five, may, after twelve months' notice to the Privy-council, contract marriage without such consent, unless both Houses of Parliament declare their disapproval. All persons who solemnise or are present at a marriage contrary to the act are liable to the penalties of præmunire. The act was passed in consequence of the marriage of the Duke of Gloucester with the widow of Lord Waldegrave and of the Duke of Cumberland with the widow of Colonel Horton. In 1793 the Duke of Sussex was married at Rome to Lady Augusta Murray; the marriage was declared void by the Prerogative Court, and the claims of Sir Augustus d'Este, eldest son of the marriage, were rejected by the House of Lords in 1844. (2) The grandchildren of the sovereign (not being the issue of princesses married to foreigners and residing abroad) are under the control of the sovereign, who may order the place of their abode, without regard to the wishes of their parents. The law was so laid down by a majority of the judges in the case of the children of Frederick, Prince of Wales, in 1737. The policy of these rules has been much questioned, and the conduct of George IV. in regard to his marriage with Mrs Fitzherbert (q.v.) in 1785 affords a strong argument against the existing law.

The civil list being found inadequate to the maintenance of the royal family, the sovereign has been empowered to grant annuities, payable out of the Consolidated Fund, to various members of her family; the aggregate amount of these allowances is now £188,000 per annum. Any proposed grant to a royal personage is tolerably certain to be opposed in the House of Commons; the arguments in favour of such grants were forcibly stated by Mr Gladstone in his speech on the proposal to make provision for the children of the Prince of Wales, delivered during the session of 1890.

Royal Fern (*Osmunda*), the most striking of British ferns; it grows in damp places, and used to be fairly common in the districts of Scotland and Ireland of a very moist climate, but is disappearing before collectors. It has two kinds of leaves, sterile and fertile; the sterile are bipinnate; the fertile, covered with spore cases, have the appearance of a panicled inflorescence, due to the absorption of the central tissues—hence the name Flowering Fern. The genus is allied to another, Todea, which has only one kind of leaf, and the two are included in the order Osmundaceæ. There are only a very few species. The order occupies a position between the typical ferns and the Marattiaceæ. The spores give rise at once to the prothallium without the intervention of a protonema; and the prothalli tend to be unisexual—i.e. to have the male and female organs on separate plants; or the male organs appear on the prothallus before the female. The bases of the leaves and root-stocks are rich in mucilage, which, being extracted by boiling water, is sometimes used in north Europe instead of starch.

Royal Fern (*Osmunda regalis*):
a, leaflet of barren frond; *b*, portion of fertile frond.

Royal George. See WRECKS.

Royal Institution, founded in 1799 by Count Rumford, Sir Joseph Banks, and others, received a royal charter in 1800, and had for its objects the facilitating of mechanical inventions, the promotion of their use, and the teaching of science and its applications by means of lectures and experiments. It was reconstituted in 1810. Among its lecturers have been Thomas Young, Davy, Brande, Faraday, Tyndall, Frankland, and Rayleigh. Since 1833 it maintains also two professors of chemistry and physiology; and since 1863 a fund for the promotion of experimental research.

Royal Military Asylum, an educational government institution at Chelsea, giving a suitable education for trade, &c. to sons—generally orphans—of British soldiers. For these there are a model school and an infant school, and the boys have a completely military organisation, with scarlet uniform, band, &c. The school was originally established in 1803 by the Duke of York, whence it is still commonly known as the 'Duke of York's School.' There is a similar institution, the Royal Hibernian Military School, at the Phœnix Park, Dublin. As a result of their training a large proportion of the pupils ultimately volunteer into the army; and the military bands are largely recruited from these schools. See MILITARY SCHOOLS, BAND.

Royal Society. The origin of this society may be traced back to those stirring years of civil strife that brought in the Commonwealth. Clubs for political, theological, and sectarian purposes were then numerous and active; and in the year 1645 'divers worthy persons, inquisitive into natural philosophy, and other parts of human learning, did, by agreements, meet weekly in London on a certain day, to treat and discourse of such affairs.' Among these worthy persons were certain medical men, Dr Wilkins, afterwards Bishop of Chester; Foster, professor of astronomy in Gresham College; Wallis, the mathematician; and others, including Haak, a learned German from the Palatinate; and out of their meetings arose the now world-famous Royal Society. Wallis records that the subjects discoursed of were 'the circulation of the blood; the valves in the veins; the venæ lacteæ; the lymphatic vessels; the Copernican hypothesis; the nature of comets and new stars; the satellites of Jupiter; the oval shape of Saturn; the spots in the sun, and its turning on its own axis; the inequalities and selenography of the moon; the several phases of Venus and Mercury; the improvement of telescopes, and grinding of glasses for that purpose; the weight of air; the possibility or impossibility of vacuities, and nature's abhorrence thereof; the Torricellian experiment in quicksilver; the descent of heavy bodies, and the degrees of acceleration therein; and divers other things of like nature.' In 1662 the persevering 'philosophers' (as students of the mathematical and natural sciences were then usually called) were, through the 'grace and favour' of Charles II., incorporated by charter, in which they were described as the Royal Society of London for the Promotion of Natural Knowledge. The king gave them also a mace, and subsequently granted two other charters conferring additional powers and privileges. They are inscribed in a handsome volume known as the Charter Book, which, containing, as it does, the sign-manual of the founder, of other royal personages, and of nearly every Fellow elected into the society, presents a collection of autographs unequalled in the world.

Through many difficulties the young society pursued their way. Their meetings were interrupted by the plague and the great fire; but in March 1664-65 they had published the first number of the *Philosophical Transactions*, and thus commenced a record of their labours and researches, and at the same time a history of science of the highest value, which now comprises upwards of one hundred and eighty quarto volumes. Besides this, the society publish an octavo serial entitled *Proceedings*, in which an account of the ordinary meetings is set forth. This serial was commenced in 1800, and now fills over forty-eight volumes. Another publication, in eleven quarto volumes, is the *Catalogue of Scientific Papers*, containing the titles of scientific papers published in all parts of the world from 1800 downwards. This great work, invaluable for purposes of reference, was compiled at the cost of the society, and gives in methodical form a record of the scientific progress of the century. These works are not restricted to the Fellows, but are sold to the general public. By increase of numbers—including scientific men on the Continent, who were elected as foreign members—the society widened their sphere of usefulness. They promoted the publication of Newton's *Principia* and optical works; they lent instruments to Greenwich Observatory in its early days, and were appointed visitors of that establishment by Queen Anne—a function which they still exercise; they aided travellers and scientific investigators; through force of circumstances, they became the advisers of the government on scientific subjects; Cook's celebrated voyage to observe the transit of Venus was undertaken at their instance; and from the voyage of the *Endeavour* down to the voyage of the *Challenger* it would be difficult to specify a scientific expedition which had not been equipped under the advice of the Royal Society. In 1710 the society removed to a house which they bought in Crane Court, Fleet Street. In 1780, by order of George III., quarters were assigned to them in the then new palatial building, Somerset House. There they abode until 1857, when, at the request of the government, they migrated westward to Burlington House, a wing of which they now occupy.

The society's session commences on the third Thursday in November, and ends on the third Thursday in June. During this period meetings are held weekly at 4.30 P.M. for the reading and discussion of papers, and these papers are for the most part afterwards published in the *Proceedings* or the *Philosophical Transactions*. The anniversary meeting is held on November 30. At that meeting the society elect a council to carry on their work through the ensuing year. This council, comprising president, treasurer, and secretaries, numbers twenty-one persons. The number of candidates for election into the society averages between fifty and sixty every year. From these the council elects fifteen, whose names are printed and sent to every Fellow, and in June the annual meeting takes place at which the fifteen are elected; but any Fellow is at liberty to alter the list of names. There are in all about 500 Fellows, including 50 foreign members. The society's income is derived from funded and landed property, and the annual contributions of the Fellows. Each Fellow contributed £4 yearly, or paid a life-composition of £60, with an admission fee of £10, till, a few years ago, a fund was raised to abolish admission fees and reduce the annual contribution to £3. Each Fellow is entitled to the *Philosophical Transactions* and *Proceedings*, and to the use of the library of about 45,000 volumes. The society formerly undertook the administration of the £1000 annually voted by parliament for scientific purposes, and also assisted in the administration of an additional grant. In 1882 a single grant of £4000 was substituted for the fund and grant of past years. The society also assists in the naming of the Meteorological Council, which receives a government grant. The president is a trustee of the British Museum. In fulfilment of trusts the society award annually, in recognition of scientific work and discoveries, the Copley medal and two Royal medals; the Rumford medal every two years for researches in light or heat; and the Davy medal for chemical investigations. Some of the most illustrious names in the annals of science appear on the roll of presidents of the Royal Society.

The ROYAL SOCIETY OF EDINBURGH, which took the place of the Philosophical Society of that city, was incorporated by royal charter in 1783. It owed its origin to Principal Robertson the historian, who successfully laboured to found in Edinburgh a society on the model of the Berlin Academy, for the investigation and discussion of subjects in every branch of science, erudition, and taste. In obtaining the royal charter the Principal was aided by the influence of Henry, Duke of Buccleuch, who zealously co-operated in the foundation of the society. The society was formally constituted at a meeting held in the College Library on the 23d June 1783, where the subsequent meetings were held till 1810, when the society purchased a house in George Street. In 1826 the society removed to its present apartments, leased from government, in the Royal Institution buildings in Princes Street. The original list of members included the names of most of the literati of Scotland—such as David Hume, Dugald Stewart, Henry Mackenzie, Adam Smith, Thomas Reid, Joseph Home, Sir James Hall, Joseph Black, James Hutton, and James Watt. The first president was Henry, Duke of Buccleuch; and amongst his successors have been Sir Walter Scott, the Duke of Argyll, Sir David Brewster, and Sir William Thomson.

The meetings of the society are held on the first and third Mondays of every month from December to July. The funds derived from fees are supplemented by an annual grant of £300 voted by parliament. The papers read before this learned body are published in its *Transactions*, of which thirty-five volumes have been published in quarto. Abstracts of the papers also appear in its *Proceedings*, of which seventeen volumes have appeared in octavo. The number of *ordinary* Fellows is about 490, of *honorary* British Fellows 20, and of honorary Foreign Fellows 36. The society has the disposal of some valuable prizes, which are bestowed on the authors of the best communications on scientific and other subjects. These are the Keith Prize, founded by Alexander Keith of Dunnottar; the M'Dougall Brisbane Prize, by Sir Thomas M. Brisbane; the Neill Prize, by Dr Patrick Neill; and the Gunning Victoria Jubilee Prize, by Dr R. H. Gunning. See the history of the society in Neill's index to the *Transactions*.

Royalty, originally the seigniorage paid to the crown for a manor of which the king is lord, or a tax paid to the king for lands or to a superior as representing the crown; but most familiar nowadays in two derived senses of modified signification. Royalty is the term for the sum paid on minerals removed from a mine, not necessarily to the crown, but to the landlord, on the theory that the landlord owns the soil to the centre of the earth, and accordingly all the minerals found beneath his land (see MINING). This burden is frequently regarded as a grievance, and its abolition, with or without compensation, advocated by advanced politicians. Another sense of the word is the sum paid to the holder of a patent, by percentage for each article manufactured under the patent, or for the use of patent articles hired out by the patentee (see PATENT).

Royan, a small seaport of France (dept. Charente-Inférieure), stands on the north side of the estuary of the Gironde, 60 miles NW. of Bordeaux. It is one of the most frequented seaside places on the Atlantic coast of France, attracting 80,000 visitors every year. Its people catch sardines (called *royans* locally). There are beautiful woods, a museum, a casino, &c. Pop. 5629.

Royat, a watering-place in the French department of Puy de Dôme, occupies a beautiful site 3 miles SW. of Clermont-Ferrand, and has numerous chalybeate, alkaline, and arsenical springs, (80°–95° F.), the waters of which have been used since Roman times. Pop. 1499.

Roy Bareilly. See RAI BARELI.

Royer-Collard, PIERRE PAUL, a French statesman, was born 21st June 1763, at Sompuis (dept. Marne). On the outbreak of the Revolution he was elected a member of the municipality of Paris, and from 1790 to 1792 acted as joint-secretary. Having incurred the enmity of the Jacobins, he lived in hiding at Sompuis during the Reign of Terror. Three years afterwards (1797) chosen to the Council of the Five Hundred, he took an active part in the work of that assembly, until the 18th Fructidor. In 1811 he was appointed professor of Philosophy in Paris, and exercised an immense influence on the philosophy of France. Rejecting the purely sensuous system of Condillac, he proceeded eclectically, giving special prominence to the principles of the Scottish School (q.v.) of Reid and Stewart. Strongly 'spiritualist' as opposed to materialism, he originated the 'Doctrinaire' school, of which Jouffroy and Cousin were the chief representatives. He was appointed president of the Commission of Public Instruction in 1815, but resigned that post in 1820; in 1815 also he returned to political life as deputy for the department of Marne. The French Academy opened its doors to him in 1827; and in 1828 he was named president of the Chamber of Representatives, and in that capacity presented the address of the 221 deputies (March 1830) withdrawing their support from the government, which the king refused to hear read. Next day the Chamber was prorogued. From 1842 Royer-Collard completely withdrew from public life; he died, 4th September 1845, at his country seat of Châteauvieux, near St Aignan (Loir-et-Cher). His salon was latterly the resort of such men as Cousin, Guizot, De Broglie, Casimir Périer, Villemain, De Rémusat, and others. He never was a writer, and he became a philosopher only by accident: his true interest in life was politics, his real eminence as a political orator after the ancient pattern, rather than that of the modern parliamentary debater. His idea of the monarchy was utopian; the famous *charte* was found impracticable as the sheet-anchor of liberty; even his best speeches, triumphs of dialectic as they often were, fell short of the effect that seemed secure, whether because ever in human things facts overturn the conclusions of reason, or because reason does not reach the profound depths in which are generated the opinions of men, to wit, their passions and their interests.

See the biographies by Philippe (1857) and Barante (new ed. 1878), the latter mainly a collection of its subject's speeches; also Scherer's *Études sur la Litt. Contemp.* vol. i., and Faguet, *Politiques et Monarchistes du XIX^{e} Siècle* (1891).

Royton, a town of Lancashire, 2 miles NNW. of Oldham, with large cotton-factories. Pop. (1851) 6974; (1891) 13,395.

Rsheff, or RJEV, a town of European Russia, on the Volga, 135 miles NW. of Moscow, is a river-port with a very extensive transit trade in agricultural produce, collected from the governments of Orel, Kaluga, and Smolensk, and sent to Riga and St Petersburg. Hemp is spun and boats are built. Pop. 35,810.

Ruabon, a town of Denbighshire, 4½ miles SSW. of Wrexham, with collieries and ironworks. Pop. of parish (1851) 11,507; (1891) 17,609.

Ruatan', or RATTAN, a long, narrow island in the Bay of Honduras in the Caribbean Sea, belonging since 1860 to the republic of Honduras. Area, 106 sq. m.; estimated pop. 2000, mostly Negroes.

Rubasse, a mineral prized for ornamental uses, is rock-crystal, limpid or slightly amethystine, filled internally with minute brown spangles of specular iron, which reflect a bright red, equal to that of the most brilliant ruby. There is an artificial rubasse, made by heating very pure rock-crystal red hot, and repeatedly plunging it into a coloured liquid.

Rubble, a common kind of masonry, in which the stones are irregular in size and shape. Walls faced with ashlar are generally packed with rubble at the back. Rubble is of various kinds, according to the amount of dressing given to the stones. Common rubble is built with stones left almost as they come from the quarry. Hammer-dressed rubble is so called when the stones are squared with the mason's hammer; coursed rubble, when the stones are squared and equal in height, &c.

Rubefacients are external agents employed in medicine for the purpose of stimulating, and consequently reddening, the part to which they are applied. All agents which, after a certain period, act as Blisters (q.v.) may be made to act as rubefacients, if their time of action is shortened. The mildest rubefacients are hot poultices, cloths soaked in very hot water, moderately stimulating liniments—as, for example, soap-liniment, with various proportions of liniment of ammonia, or chloroform, &c. Spanish fly, in the form of *Emplastrum Calefaciens*, or warm plaster, in which the active ingredient is blunted by the free admixture of soap-plaster, resin-plaster, &c., is a good form of this class of agents. Capsicum or Cayenne pepper, in the form of a poultice, is an excellent rubefacient; it is much used in the West Indies, but is seldom employed in this country. Mustard, in the form of *Cataplasma Sinapis*, or mustard poultice, and oil of turpentine are perhaps the best of the ordinary rubefacients. The former is applied to the soles of the feet and the calves of the legs in the low stage of typhus fever, in apoplexy and coma, in narcotic poisoning, &c. It is also applied to the chest, with much advantage, in many cases of pulmonary and cardiac disease, and to the surface of the abdomen in various affections of the abdominal viscera. The best method of employing turpentine is to sprinkle it freely on three or four folds of clean flannel, wrung out of boiling water. The sprinkled surface of this pad is placed upon the skin, and a warm dry towel is laid over the flannel. Two or three such applications will produce a powerful rubefacient effect. Turpentine thus applied is serviceable in all the cases mentioned in the remarks on Mustard, as well as in sore throat, chronic rheumatism, neuralgia, &c.

Rubens, PETER PAUL, the most celebrated painter of the Flemish school, was born on the 29th of June 1577 at Siegen, in Westphalia, where his father, John Rubens, an eminent lawyer, was living in disgrace, in consequence of his intrigue with Anne of Saxony, second wife of William the Silent. In 1578 his parents settled in Cologne; and upon the death of her husband in the following year, his mother returned to her native city of Antwerp, where the boy was educated in the Jesuits' college. He served for a short time as a page in the household of Margaret de Ligne, widow of the Count of Lanaing, and was intended for the profession of law; but he was animated by a strong desire to become a painter, and at the age of thirteen he began the study of art, first, for a brief period, under Tobias van Haeght, a skilful landscape-painter; then for four years under Adam van Noort, a painter of religious subjects, distinguished for his excellent colouring; until finally, in his nineteenth year, he passed into the studio of Othon van Veen, court-painter to the Archduke Albert, governor of the Netherlands.

In 1599 he was admitted a master of the Brotherhood of St Luke in Antwerp; and in the following year he started for Italy, making his way to Venice, where he studied the works of Titian and Veronese. He next entered the service of Vincenzo Gonzaga, the magnificent and luxurious Duke of Mantua, as gentleman of the chamber and court-painter; and in 1605 was despatched on a mission to Philip III. of Spain, thus beginning the career of a diplomatist, for which his keen intellect, his polished urbanity, and his linguistic attainments so admirably qualified him. While at Madrid he executed portraits of many of the Spanish nobility, as well as several historical subjects. On his return from Spain he travelled in Italy, copying celebrated works for the Duke of Mantua; and to this period is referable the sketch, now in the National Gallery, London, from one of the subjects of Mantegna's 'Triumph of Julius Cæsar.' In 1608, while in Genoa, he received news of his mother's illness, and returned home, but too late to see her alive. Settling in Antwerp, he was appointed in 1609 court-painter to the Archduke Albert and his wife Isabella, and soon afterwards married his first wife, Isabella Brant, whom his pencil has often portrayed, and who appears, seated hand in hand with himself, in the famous full-length group at Munich.

The painter was now rapidly approaching his full artistic maturity, and his 'Descent from the Cross' in the cathedral of Antwerp, begun in 1611 and completed in 1614, and usually regarded as his masterpiece, is a work in which both his earlier and later manner may be traced. It is a triptych, showing on the interior of its wings The Visitation and The Presentation in the Temple, and on their exterior subjects of St Christopher and a Hermit bearing a lantern.

In 1620 Rubens was invited to France by Marie de' Medici, the queen-mother, who was then engaged in decorating the palace of the Luxembourg in Paris; and he undertook for her twenty-one large subjects commemorating her marriage to Henry IV., works, completed with the aid of assistants in 1625, which are now in the Louvre, most of the sketches by the master's own hand being at Munich. In 1628 he was despatched by the Infanta Isabella upon a diplomatic mission to Philip IV. of Spain. He remained for nine months in Madrid, and there he made the acquaintance of Velasquez, and executed some forty works, including five portraits of the Spanish monarch. In 1629 he was appointed envoy to Charles I. of England, to treat for peace; and, while he conducted a delicate negotiation with perfect tact and success, his brush was not idle, for he painted the 'Peace and War,' now in the National Gallery, London, and the portrait of the king and his queen as St George and Cleolinde, a work now at Windsor, and also made sketches for the Apotheosis of James I. for the Banqueting-hall at Whitehall, completing the pictures on his return to Antwerp. In acknowledgment of his services he was knighted by Charles I.; and he received a similar honour from Philip IV.

In 1630 Rubens married his second wife, Helena Fourment, a beautiful girl of sixteen; in 1635 he designed the decorations which celebrated the entry of the Cardinal Infant Ferdinand into Antwerp as governor of the Netherlands; and, having with much difficulty completed a picture of 'The Crucifixion of St Peter' for the church dedicated to that saint in Cologne, he died at Antwerp on the 30th of May 1640, and was interred with great pomp in the church of St Jacques, his body being deposited, two years afterwards, in a chapel specially built there for its reception.

Not only was Rubens great as a subject-painter, but he was equally distinguished as a portraitist, an animal-painter, and a landscapist. The main characteristics of his productions are their power, spirit, and vivacity, their sense of energy, of exuberant life. As Reynolds has truly said, 'Rubens was perhaps the greatest master in the mechanical part of the art; the best workman with his tools that ever used a pencil;' and he was great alike in handling and as a colourist. It is, however, mainly on technical grounds that he claims supremacy, for his works are wanting in the dignity, quietude, refinement, and in the profound imagination which distinguish the greatest Italian painters. He was a most prolific artist; his works number in all several thousands, of which Smith in his *Catalogue* has described over thirteen hundred; and about twelve hundred prints have been executed after his paintings and designs, frequently under his personal supervision by such of the best contemporary engravers as Pontius, Vosterman, Soutman, and the Bolswerts. Many of his finest works are still at Antwerp; but his art may probably be most adequately studied in the Pinakothek at Munich, which contains nearly a hundred examples of his brush, several of them ranking with his noblest efforts. Among the most distinguished of his many pupils were Van Dyck, Van Diepenbeck, Jordaens, and Snyders.

Rubiaceæ, a natural order of dicotyledonous plants, in which, according to many botanists, the Cinchonaceæ are included as a sub-order; but which, as restricted by others (Stellatæ of Ray, Galiaceæ of Lindley), consists entirely of herbaceous plants, with whorled leaves, angular stems, and numerous very small flowers; the calyx superior, with four, five, or six lobes, or almost wanting; the corolla wheel-shaped, or tubular, regular, inserted into the calyx, and with the same number of divisions as the calyx; the stamens equal in number with the lobes of the corolla; two styles; the fruit a dry pericarp with two cells, and one seed in each cell. There are between 300 and 400 known species, chiefly abounding in the northern parts of the northern hemisphere, and on the mountains of tropical regions. The most important plant of the order is Madder (q.v.). To this order belong also Bedstraw (q.v.) and Woodruff (q.v.).

Rubicon, a stream of Central Italy, falling into the Adriatic a little north of Ariminum, has obtained a proverbial celebrity from the well-known story of its passage by Cæsar, in the middle of January, 49 B.C. It formed the southern boundary of his province, so that by crossing it he virtually declared war against the Republic. Cæsar himself makes no mention of its passage; Suetonius, Plutarch, and Lucan tell how he hesitated awhile on the bank and then crossed with the words, *Jacta est alea.* A papal bull of 1756 identified the Rubicon with the modern Luso, but a comparison of distances shows that it must rather have been the Fiamicino or Rujone.

Rubidium (sym. Rb; atom. wt. 85) is one of the alkali metals. Its salts exist in very minute quantities in numerous mineral waters, and in these rubidium salts, along with cæsium salts, were detected by Bunsen and Kirchhoff by means of spectrum analysis. The mineral lepidolite is the best material from which to prepare rubidium compounds. The metal is, like cæsium, silver-white. It melts at 38·5° C., but is still soft at −10° C. Its sp. gr. is 1·52. Like cæsium, it takes fire spontaneously in the air, and it decomposes water at the ordinary temperature, in the latter respect resembling all the other alkali metals. The salts of rubidium resemble generally those of potassium. The name rubidium is derived from *rubidus*, 'dark red,' in allusion to the colour imparted to a flame by the salts of the metal.

Rubinstein, ANTON, pianist and musical composer, was born, the son of a Polish Jew and a German Jewess, near Jassy in Moldavia, on 28th November 1829, and was trained to music in Moscow by his mother and a master. Liszt heard him, 'an infant prodigy,' play in Paris in 1841, recognised his genius, and encouraged him to go on and play in other cities. After some further 'touring,' he gave himself to serious study in Berlin and Vienna, and in 1848 settled in St Petersburg as teacher of music. In 1854 he set off on another musical tour, with the reputation of being a second Liszt, and 'the coming' composer. On his return to St Petersburg he succeeded in getting a musical conservatoire founded (1862) there, and became its director. But his concert tours engrossed a good deal of his time, and in 1867 he resigned the directorship of the conservatoire. In 1872 he went to the United States and had an enthusiastic reception. He wound up his concert tours in 1886, his last having had for its object a series of seven pianoforte recitals illustrating the great masters of music historically. He was induced in the following year to resume the directorship of the conservatoire at St Petersburg. Rubinstein is both a composer and a player. Amongst his best musical productions are the operas, *The Maccabees*, *The Demon*, *Feramors* (the libretto from Moore's *Lalla Rookh*), and *Kalaschnikoff;* the two symphonies, *Ocean* and *Dramatic;* and the sacred operas, *Paradise Lost*, *The Tower of Babel*, and *Sulamith.* His numerous songs and pieces of chamber music are highly esteemed and more widely known. His style, while of course embracing fuller modern developments, presents several points of likeness to Schubert's; there is the same predominance of the lyric, rhythmic, and formal elements over the dramatic; an exuberant melodiousness, frequently charming, but sometimes falling below the mark; an absence of meretricious effects, and a tendency to protracted length, not to say occasional prolixity; while in feeling he is more akin to Mendelssohn. He is a strongly pronounced opponent of the principles of Wagner. As a pianist he holds the highest rank, being usually reckoned the greatest since Liszt. His mastery of technique is supreme; and while opinions may differ as to his fidelity to a composer's intentions, the depth of feeling and significance he can impart to even the simplest piece evince a rare musical susceptibility at once intense and widely sympathetic. He has now retired from the public platform. See *Autobiography of Anton Rubinstein*, trans. by A. Delano (1891), and *Anton Rubinstein*, by A. M'Arthur (Lond. 1889).

Ruble. See ROUBLE.

Rubrics (Lat. *rubrica*, from *ruber*, 'red'), in classic use, meant the titles or headings of chapters in law-books, and is derived from the red colour of the ink in which these titles were written, in order to distinguish them from the text. In mediæval and modern use the name is restricted to the directions in the service-books of the church as to the ordering of the prayers and the performance of the ceremonies that accompany them. The first printed missals have few rubrics, and the printing of both the words and ceremonies of the mass in full dates only from 1485. The same name, together with the usage itself, is retained in the Book of Common Prayer; and in all cases, even where the direction has ceased to be printed in red ink, the name rubric is still retained. Where red ink is not employed the rubric is distinguished from the text by italics or some other variety of print.

Rubruquis, WILLIAM DE, a mediæval traveller, was born, it is pretty certain, at Rubrouck (8 miles NE. of St Omer, in northern France), and not at Ruysbroeck, near Brussels, early in the 13th century. He entered the Franciscan order, and was sent by Louis IX. of France into central Asia for the purpose of opening up communications with Sartak, the son of the Mongol prince, Batû Khan, a supposed Christian. Friar William travelled (1253) by way of Constantinople across the Black Sea and the Crimea to the Volga. Sartak referred him to his father, Batû, and that prince sent him forward to the Mongol emperor, Mangû Khan, whom he found on 27th December, about 10 days' journey south of Karakorum in Mongolia. With that sovereign he remained until July 1254, then returned to the Volga, penetrated the defiles of the Caucasus, proceeded through Armenia, Persia, and Asia Minor, to Syria, and arrived at Tripoli in August 1255. King Louis had meanwhile returned to France, and Friar William wrote him the account of his journey which has come down to us. The best edition is that of D'Avezac in vol. iv. of *Recueil de Voyages* (1839) of the Paris Geographical Society. Of the later history of Rubruquis the only fact known is that he was living in 1293, when Marco Polo was returning from the East.

Rubus (Blackberry or Bramble, &c.), a genus of plants of the natural order Rosaceæ, sub-order Rubeæ, distinguished by a 5-lobed calyx without bracts, and the fruit formed by an aggregation of small drupes adhering to each other upon a long *torus.* The fruit is eatable in all, or almost all, the species. The genus is a large one, comprising, according to Bentham and Hooker, about 100 species, widely distributed over nearly every part of the globe. Among the most important species are *R. Chamæmorus*, the Cloudberry (q.v.); *R. Idæus*, the Raspberry; *R. cæsius*, the Dewberry; *R. arcticus*, characterised by Linnæus as the prince of wild berries; *R. fruticosus*, the Common Bramble (q.v.); and *R. saxatilis*, the Stone Bramble. Of the Common Bramble a number of varieties having very large luscious fruit have been introduced into Britain from North America within the last few years with the view of cultivating them for their fruit. The opinion of gardeners as to their merits for profitable culture in Britain is varied, but they are much appreciated in Canada and in the United States of America. The varieties which are most approved are the Lawton, Wilson Junior, Early Harvest, and Mammoth. The ornamental species frequently planted in British gardens are *R. odoratus*, the Virginian Raspberry; *R. laciniatus*, with large flowers and elegant leaves; and *R. biflorus*, whose snow-white bark contrasts strikingly with the dark-green leaves.

Ruby, a gem much prized, is a pure transparent, red-coloured Corundum (q.v.), just as Sapphire (q.v.) is a blue variety of the same mineral. It is inferior in hardness to the diamond only among gems. Although usually red, yet violet, pink, and purple rubies are met with, but the most highly esteemed are those which have the colour of pigeon's blood. The finest true oriental rubies are more highly prized than diamonds of similar size and quality; those over a carat in weight are worth from £20 to £100 per carat, and no stone increases so much in value in proportion to increase in size. But perfect specimens, as regards colour, transparency, and freedom from flaws, are much less common than good diamonds. Gems of this character seldom exceed 8 or 10 carats; but Gustavus III. of Sweden presented one, now in the Russian regalia, to the Empress Catharine, which was of the size of a pigeon's egg. The throne of the Great Mogul, according to Tavernier, was adorned with 108 rubies of from 100 to 200 carats each. One possessed by the king of Ceylon was, according to Marco Polo, a span in length, as thick as a man's arm, and without a flaw; Kublai Khan offered for it the value of a city, but the king would not part with it. The Burmese government sent two rubies to London in 1875, one of which, reduced by recutting to $32\frac{5}{16}$ carats, was sold for £10,000; the other, of $38\frac{9}{16}$ carats, was sold for £20,000. The specific gravity of the ruby (3·900 to 4·2833) exceeds that of all other gems. When rubbed it becomes electrical, and remains so for some time. The finest rubies—those having the colour of pigeon's blood—come from Upper Burma, near Mogok, north of Mandalay (see BURMA, Vol. II. p. 563). Dark-red rubies, sometimes with a brownish tint, are found in Siam, and purplish rubies in Ceylon. Rubies are also met with in the mountain-region of Yunnan in China, in Afghanistan, and in the basin of the Oxus. The true or oriental ruby, as above described, occurs in crystalline limestone in Burma, and in alluvial deposits which have been derived from the denudation of granitoid igneous and schistose rocks. Ruby-bearing gravels and sands occur sparingly in Europe, as in Auvergne, Bohemia, the Urals, &c. Small rubies have also been detected in such rocks as basalt, as in Victoria and New South Wales; and fine rubies have been reported to be found in New Guinea. Many of the so-called rubies of jewellers are not true or oriental rubies, but varieties of Spinel (q.v.), a mineral composed chiefly of alumina and magnesia, inferior in hardness and of less specific gravity than the oriental ruby, and crystallising in the cubical system. Oriental rubies belong to the hexagonal system, and, unlike the spinel, are always dichroic. Spinel rubies are found in the form of crystals or rounded pebbles in alluvial deposits and in the beds of rivers in Ceylon, Siam, Pegu, Badakshan, and other eastern countries, having been derived like the true ruby from crystalline igneous and schistose rocks. They occur also in crystalline limestone and in serpentine. Small rounded spinel-rubies occur in the sands of mountain-streams in Wicklow; and large crystals have been found in various parts of North America, but rarely, if ever, fit for the purposes of the jeweller. Spinels are also found in Australia. *Spinel-ruby* is the name given by jewellers to a stone of a deep carmine-red; a rose-red stone is distinguished as *Balas-ruby;* red with a decided tinge of orange is *Vermeil* or *Vermeille;* yellow or orange-red is *Rubicelle;* violet is *Almandine ruby.* There are also transparent spinels, which when large and fine are treated as jewels. All these, however, are merely variously-tinted varieties of one and the same mineral—spinel—which is allied to Corundum (q.v.), being composed mainly of alumina, with a smaller proportion of magnesia.

As early as 1837 small rubies were produced chemically by fusion of alumina; but it was not till 1878 that Fremy and Verneuil produced rubies on a scale of commercial importance, though less brilliant than oriental rubies. In 1890 they succeeded in making larger and finer stones, which for the purposes of the watchmaker quite equalled natural rubies.

Rückert, FRIEDRICH, German poet, was born at Schweinfurt, 16th May 1788, and educated there and at Würzburg. For some years he led a wandering life, studying philology and poetry, and cultivating the muses. During this period of his life he helped Arndt and Theodor Körner to fan the flame of German patriotism by his *Deutsche Gedichte* (1814), especially by the *Geharnischte Sonette* included in this volume. From 1826 to 1841 he filled the chair of Oriental Languages at Erlangen; but the greater part of his summers were passed at the country seat of his wife's parents, Neuses near Coburg. After learning Persian, Arabic, and Turkish, incited thereto by Hammer-Purgstall at Vienna (1818), Rückert recast in German verse, with great skill, several of the famous books of the East, as *Die Verwandlungen des Abu Seid* of Hariri (1826), *Nal und Damajanti* from the *Mahábhárata* (1828), *Rostem und Suhrab* from Firdausi's *Shah-Nameh* (1838), *Amrilkais* (1843), *Hamása* (1846), a collection of Arabic folk-songs, and others. His most popular books are the collection of lyrics entitled *Liebesfrühling* (1844; 14th ed. 1888) and the reflective poems gathered together as *Die Weisheit des Brahmanen* (1836–39; 12th ed. 1886). In 1841 Frederick-William IV. invited him to Berlin, making him professor of Oriental Languages; but the poet preferred his idyllic life at Neuses, and went back there in 1848. There he died on 31st January 1866. Rückert wrote with fatal ease; he tried nearly all forms of poetical composition, and produced too much. Nevertheless he penned several charming little lyrics, which may be read in the selected *Gedichte* (1841; 22d ed. 1886). Two qualities distinguish his work in general—a marvellous command of language and rhyme, and the gift of giving poetic expression to philosophic thought. The former has sometimes led him into mannerisms of form and unpleasing *tours de force;* the latter often betrays him into throwing a poetic glamour over dull, pedantic, and unimportant ideas. His posthumously published work includes German adaptations of Theocritus, Aristophanes, Kálidása's *Sákuntala* (1867), Sádi's *Bostán* (1882), and a good deal of original poetry.

See biographical works by Beyer (3 vols. 1868–77), Boxberger (1878), Konrad Fischer (1889), and F. Reuter's *Rückert in Erlangen und Joseph Kopp* (1891).

Rudd. See Red-eye.

Rudder. See Steering.

Rudder-fish, a name loosely applied to at least three different kinds of fish, of which the Pilot-fish (q.v.) is one.

Ruddiman, Thomas, Latin grammarian, was born near Banff in 1674, and in 1690 gained a bursary at King's College, Aberdeen, taking his M.A. four years later. In 1695 he became parish schoolmaster of Laurencekirk, and here in 1699 accidentally made the acquaintance of the celebrated physician and Latinist, Dr Archibald Pitcairne, who was so impressed with his learning and sagacity that he got him appointed assistant-keeper of the Advocates' Library, Edinburgh. His new office gave him ample opportunity for prosecuting his favourite studies, but the remuneration was so small (£8, 6s. 8d. *per annum*) that, in 1707, he started business as a book auctioneer. In that year he edited Florence Wilson's Latin *Dialogue on the Tranquillity of the Mind*, to which he prefixed a life of the author; in 1709 Arthur Johnston's *Poetical Paraphrase of the Song of Solomon* and *Cantica*—both also in Latin. In 1714 appeared his well known *Rudiments of the Latin Tongue*: in 1715 his great edition of Buchanan's works. He now exchanged the calling of a book auctioneer for the more congenial one of printer; and in 1728 he was appointed printer to the university, in 1730 principal keeper of the Advocates' Library. In 1725–32 he published his great *Grammaticæ Latinæ Institutiones*, on which his philological reputation mainly rests; in 1739 he completed Anderson's magnificent *Diplomata et Numismata Scotiæ*, writing the learned Latin introduction and appendices. Controversy as to the respective merit of the Latin verse of Johnston and Buchanan, and as to the hereditary right of the kings of Scotland to the crown, consumed a great part of his time, but did not so preoccupy his thoughts as to prevent him from publishing in 1751 an edition of Livy, still known as the 'immaculate,' from its entire exemption from errors of the press. Ruddiman died in Edinburgh, January 19, 1757. He was in politics, like his friend Pitcairne, an ardent Jacobite, and in private life a most upright and estimable man. Besides the publications already noted, and a multitude of minor tracts, he edited Gawin Douglas' translation of the *Æneid*, and appended a very valuable glossary (folio, 1710). He also founded the *Caledonian Mercury* newspaper. See his Life by George Chalmers (1794).

Rüdesheim, a town of Prussia, on the right bank of the Rhine, opposite Bingen, at the foot of the Niederwald (q.v.), and 16 miles W. of Mainz. Round Rüdesheim is grown one of the most esteemed of the Rhine-wines, the Rüdesheimer. Pop. 4040.

Rudolf, or Rudolph, German king and founder of the present imperial dynasty of Austria, was born in Limburg castle in the Breisgau, on 1st May 1218. He became a warm partisan of Frederick II., distinguished himself in arms, and spent much of the early years of his manhood in quarrels with the bishops of Basel and Strasburg. His possessions were greatly increased by inheritance and by his marriage, until he was the most powerful prince in Swabia. In 1273 the electors chose him to be German king; as never having been crowned by the pope, he was not entitled to be called kaiser or emperor. His accession was opposed by none; the pope's consent was secured at the price of certain rights already parted with by Rudolf's predecessors. Ottocar of Bohemia, however, refused to tender his allegiance. He was put under the ban of the empire in 1276, but, submitting on Rudolf's approach with an army, was invested with Bohemia. Having soon afterwards taken the field against his suzerain, he was defeated and slain in 1278 at Marchfeld beside the Danube. Rudolf spent the greater part of his life that remained in suppressing the castles of the robber knights and putting an end to their lawless practices. He died at Spires, 15th July 1291, and was buried in the cathedral there. His son Albert, to whom (and his brother Rudolf) Austria, Styria, and Carniola had been given in 1278, succeeded him as German king. Rudolf was a pattern knight, tall in person, upright, pious, valiant, and energetic. See Lives by Schönhuth (1844), Kopp (1845), and Hirn (1874); Lorenz, *Deutsche Geschichte im 13. und 14. Jahrhundert* (1863–67); and a work by Kaltenbrunner (Prague, 1890).

Rudolf II., eldest son of the Emperor Maximilian II., was born at Vienna on 18th July 1552, and educated at the Spanish court by the Jesuits. He was made king of Hungary in 1572, king of Bohemia, with the title King of the Romans, in 1575, and on the death of his father in 1576 succeeded to the imperial crown. Gloomy, taciturn, bigoted, indolent both in body and mind, he put himself in the hands of the Jesuits and low favourites, and left the empire to govern itself. His attention was given to his curiosities, his stable, his alchemical and magical studies; nevertheless his taste for astrology and the occult sciences, and his desire to discover the philosopher's stone, made him extend his patronage to Kepler and Tycho Brahé. The astronomical calculations begun by Tycho, and continued by Kepler, known as *The Rudolphine Tables*, derive their name from this emperor. Meanwhile the Protestants were bitterly persecuted by the Jesuits throughout the empire; the Turks invaded Hungary and defeated the archduke Maximilian (1596); Transylvania and Hungary rose in revolt; and at last Rudolf's brother Matthias wrested from him the crowns of Hungary and Bohemia, and the states of Austria and Moravia. Less than a year after losing the crown of Bohemia he died, unmarried, on 20th January 1612, and was succeeded by Matthias. See historical works by Gindely (2 vols. 1863–65) and Von Bezold (Munich, 1885).

Rudolf, Lake, situated in the Galla lands of East Africa, is long and narrow, stretching from 2° 16′ to 4° 47′ N. lat. In some places the shores are rocky; the entire region is desolate and scantily supplied with vegetation. Its waters are strongly impregnated with soda. Area, 3500 sq. m.; 1548 feet above sea-level. Two streams enter it at its northern end. It was discovered by Count Teleki and Lieutenant von Höhnel in 1888.

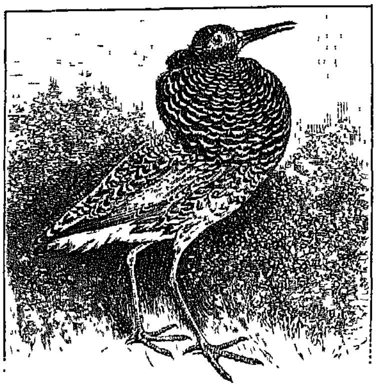
Rudolstadt, the chief town of the German principality of Schwarzburg-Rudolstadt, lies in a hill-girt valley, on the left bank of the Saale, 18 miles S. of Weimar. There are two royal castles, a library, picture-gallery, &c., and factories for porcelain, chemicals, and wool. Pop. 10,562.

Rudra is, in Vedic mythology, a collective name of the gods of the tempest, or Maruts. In later and Puranic mythology Rudra ('the terrible') is a name of Siva, and the Rudras are his offspring.

Rue (*Ruta*), a genus of plants of the natural order Rutaceæ. The species are half-shrubby plants, natives of the south of Europe, the north of Africa, the Canary Isles, and the temperate parts of Asia. Common Rue, or Garden Rue (*R. graveolens*), grows in sunny stony places in the countries near the Mediterranean. It has greenish-yellow flowers, the first of which that open have ten stamens, the others eight only (they are of unequal length, and each one is bent inwards in turn to touch the pistil, and when the pollen is shed it bends back again), and glaucous evergreen leaves with small oblong leaflets, the terminal leaflets obovate. It is not a native of Britain, but is frequently cultivated in gardens. It was formerly called *Herb of Grace* (see *Hamlet*, act iv. scene 5), because it was used for sprinkling the people with holy water. It was in great repute among the ancients, having been hung about the neck as an amulet against witchcraft in the time of Aristotle. It is the *Peganon* of Hippocrates. Rue is still employed in medicine as a powerful stimulant, but the leaves must be used fresh, as they lose their virtues by drying. The smell of rue, when fresh, is very strong, and to many very disagreeable; yet the Romans used it much for flavouring food, and it is still so used in some parts of Europe. The leaves chopped small are also eaten with bread and butter as a stomachic, but they must be used sparingly, as they are acrid enough to blister the skin if much handled, and in large doses act as a narcotic poison. All their properties depend on an acrid volatile oil, which is itself used for making *Syrup of Rue*, eight or ten drops of oil to a pint of syrup; and this, in doses of a teaspoonful or two, is found a useful medicine in flatulent colic of children. The expressed juice of rue, mixed with water, and employed as a wash, is believed to promote the growth of the hair.

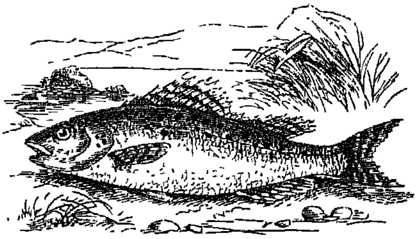
Common Rue (*Ruta graveolens*).

Ruff (*Machetes pugnax*), a bird, the sole representative of the genus, belonging to the Sandpiper (q.v.) sub-family of the Snipe family (Scolopacidæ). In the British Isles it is now little more than a visitor in its spring and autumn migrations, owing to the draining of its marshy breeding-places and the practice of capturing it in spring when game is out of season. It is more common on the east than on the west coast of England. The same is true of the east coast of Scotland, where it is found from Berwick to the Orkneys and Shetlands, but it has been recorded from the Outer Hebrides. As a straggler it is found on the Faroes and Iceland, in Canada, in some of the eastern United States, and it has been found once in Barbadoes and once on the Upper Orinoco. It breeds over the greater part of northern Europe; it is found as a migrant over the rest of Europe, the southern shores of the Mediterranean, and the east and west coasts of Africa as far as the Cape; in Asia it extends from Siberia to Japan, Burma, and India. The male bird, the *Ruff*, is about a foot long. In spring it sheds the feathers of the face; curled tufts of feathers appear on the sides of the head; and an erectile ruff is developed which lasts for a couple of months. This ruff, as well as the feathers on the back, shows every variation of colour in different birds; but each bird annually regains its own peculiar colour. After moulting the neck and upper breast are of a buff colour; the under parts dull white; the feathers of the upper parts are dark brown with buff margins; and the primary wing-feathers are dusky brown. The female, the *Reeve*, is about one-fourth smaller in size, and shows very much the same colours as the moulted male. In habit these birds are polygamous; the males fight for possession of the females, and in battle the ruff serves for defence. The nest is made among the coarse grass of a dry tussock in a moist swampy place. The eggs, four in number, are grayish green marked with reddish brown. The food consists of insects and their larvæ, worms, seeds, rice, and other vegetable substances. When captured and being fattened for the table, the birds are fed on boiled wheat, bread and milk, and bruised hemp-seed.



Ruff (*Machētes pugnax*).

Ruffe, or Pope (*Acerina cernua*), a small freshwater fish of the Perch family (Percidæ), abundant in the lakes, slow rivers, and ditches of many parts of the middle of Europe and of England. It is five or six inches in length, of an olive-green colour mottled with brown, and has only one dorsal fin. The flesh of the ruffe is highly esteemed for the table.



Ruffe, or Pope (*Acerina cernua*).

Rufiji, or Lufiji, the chief river of German East Africa, which rising far in the interior enters the sea through a delta opposite the island of Mafia. Shoals and bars at the mouth prevent the access of large ships; but the river is navigable by smaller boats throughout great part of its course. The valley is extremely fertile.

Rugby, a town giving name to the south-east division of Warwickshire, of which it stands at the northern corner, is situated at the junction of several railways in the middle of country such as George Eliot describes in *Felix Holt*. By rail it is 83 miles NW. of London and 30 ESE. of Birmingham. At the foot of the hill on which it stands the Swift gave John Wyclif's ashes to the Avon; close by at Ashby and at Dunchurch the Gunpowder Plot was hatched; the battlefield of Naseby was visited by Carlyle from its schoolhouse in 1842 a few days before Arnold's death; it is within a drive of Stratford-on-Avon, Coventry, Kenilworth. It is at once the centre of a great hunting district and the seat of a public school. This probably accounts for the large number of residential houses there. John Moultrie (q.v.) was long rector of the parish. Pop. (1851) 6317; (1891) 11,262.

The school was founded in 1567 by Lawrence Sheriff, a grocer and a staunch supporter of Queen Elizabeth, by a gift of property in Manchester Square, London. After maintaining its position for some time as a good school for the Warwickshire gentry and a few others, specially under Dr James and Dr Wool, it became of national reputation under Dr Arnold, who in raising his school raised at the same time the dignity of his whole profession. Since his time the school has never lacked able teachers, remarkable for independence of mind. When Arnold died in 1842, Archbishop Tait succeeded him, having as coadjutors Lord Lingen, Dean Bradley, Principal Shairp, Thomas Evans, Theodore Walrond, Bishop Cotton. He in turn was succeeded by Dean Goulburn, who had as one of his assistants the future Archbishop Benson. The Crimean war reduced the numbers of the school to three hundred, and Dr Goulburn resigned in 1857. He was succeeded by the future Bishop of London, Dr Temple, who remained twelve years. The Public Schools Commission reported of Rugby in his days that the general teaching of classics was absolutely unsurpassed; that Rugby School was the only public school in which physical science was a regular part of the curriculum; that only Harrow had done as much as Rugby in awakening interest in history. Having secured this tribute for his teaching and having collected enough money to rebuild the chapel, to erect a gymnasium, and to build new schools, Dr Temple was succeeded by Dr Hayman. To him succeeded Dr Jex-Blake, who inaugurated a still greater building era. When he resigned in 1887 he left behind him a school simply unrivalled in its appointments. He was succeeded by Dr Percival. Of illustrious Rugbeians may be named the poets Landor, Clough, and Matthew Arnold; Dean Stanley, who had the rare privilege of recording the work of his great head-master in biography; Judge Hughes, who did the same equally felicitously in *Tom Brown's School-days*; Dean Vaughan, Lord Derby, Lord Cross, Mr Goschen, Sir R. Temple, Franck Bright and York Powell the historians, Justice Bowen, Sir W. Palliser, Professor Sidgwick, Robinson Ellis and Arthur Sidgwick, C. Stuart-Wortley, and Arthur Acland. From Rugby went the first head-master to Marlborough, Wellington, Clifton, Haileybury, Fettes College, and Newcastle High School. Mission work found its Rugby worker in Fox, in whose memory the school still keeps up a missionary at Masulipatam. The learned author of *Gothic Architecture*, Matthew H. Bloxam, was taught and lived at Rugby, where he died in 1888, leaving his valuable collection of antiquities and books to the school. The school possesses an observatory, given by Archdeacon Wilson, and the Natural History Reports, written by members of the school, have often been of exceptional value.

See, besides Stanley's *Life of Arnold* and *Tom Brown's School-days*, *The Book of Rugby School*, edited by Dean Goulburn (1856); M. H. Bloxam and Rev. W. H. Payne Smith, *Rugby: Its School and Neighbourhood* (1889); *Rugby School Registers Annotated, 1567–1887* (3 vols. 1881–91); Alfred Rimmer, *Summer Rambles round Rugby* (1891).

Rugby, TENNESSEE. See HUGHES, THOMAS.

Ruge, ARNOLD, German writer, was born at Bergen on the island of Rügen, on 13th September 1802, studied philosophy at Jena and Halle, and took such a warm interest in the Burschenschaft (q.v.) agitations of 1821-24 as to bring down upon himself a sentence of six years' imprisonment in a fortress. After his release he taught at Halle, from 1832 as a *privat-docent* at the university. Along with Echtermeyer he founded in 1837 the critical journal *Hallesche Jahrbücher* (later *Deutsche Jahrbücher*), which as the organ of Young Germany and the Young Hegelian School filled an influential place in the world of letters. Its liberal political tendencies drew upon it the condemnation of the Prussian censor, and after an attempt to transplant it to Dresden, thwarted by the censorship, Ruge withdrew to Paris. After spending some years there and in Switzerland, he started a bookseller's business in Leipzig, until the stormy revolutionary movement of 1848 drew him into its vortex. He published the democratic journal *Die Reform*, took his seat in the Frankfort parliament for Breslau, attended the Democratic Congress in Berlin, and took part in the disturbances at Leipzig in May 1849. In the following year he found it expedient to repair to England. In London he organised along with Mazzini and Ledru-Rollin the Central European Democratic Committee, but in 1850 withdrew to Brighton, where he lived by teaching and writing. For the services he rendered the Prussian government, by supporting it against Austria in 1866 and against France in 1870, he was rewarded with a yearly pension of £150. He died at Brighton on 31st December 1880. A thorough doctrinaire, Ruge advocated a universal democratic state, of which the several nations should be provinces, and put cosmopolitan dreams above national ideals. Unstable by nature, he readily changed his political opinions; and he was intemperate in language, and brimful of the shallow humours and prejudices of a little nature. Ruge wrote numerous books, plays, novels, &c., including the outlines of a *Geschichte unserer Zeit* (1881), *Manifest an die Deutsche Nation* (1866), his autobiography in *Aus früherer Zeit* (4 vols. 1863–67), and translations into German of Buckle's *History of Civilisation*, the *Letters of Junius*, Bulwer's *Lord Palmerston*, &c. See Ruge's *Briefwechsel*, &c., ed. by Nerrlich (2 vols. 1885–86).

Rugeley, a market-town of Staffordshire, on the Trent, 10 miles ESE. of Stafford. It has good public buildings (1879), a grammar-school, iron-works, and neighbouring collieries. Pop. (1851) 3054; (1881) 4249; (1891) 4181.

Rügen, an island of Prussia, lies in the Baltic, off the coast of Hither Pomerania. Greatest length, 33 miles; greatest breadth, 25 miles; area, 374 sq. m. Pop. (1885) 45,039. It is separated from the mainland by a strait about a mile in width. The island, which is deeply indented by the sea, terminates at the north-eastern extremity in the precipitous cliff called the *Stubbenkammer* (400 feet). Erratic boulders are common all over the island. Numerous barrows exist. Hertha Lake is believed to be the place where, according to Tacitus, the ancient Germanic goddess Hertha (Earth) was worshipped. The soil is productive, and yields good wheat; cattle are reared; and fishing is carried on. The scenery, everywhere pleasing, is frequently romantic, and, together with the facilities for sea-bathing, attracts numerous visitors. Chief town, Bergen (pop. 3761), in the middle of the island. Rugen was occupied originally by Germanic tribes, then by Slavs, was conquered by the Danes in 1168, threw off their supremacy in 1209, and formed an independent principality until 1478, when it was incorporated with Pomerania (q.v.).

Ruhmkorff, Heinrich Daniel, electrician, born at Hanover in 1803, in 1839 settled in Paris, and died there 21st December 1877. His Induction Coil, exhibited in 1855, is described and figured in Vol. VI. p. 129.

Ruhnken, David, classical philologist, was born 2d January 1723 at Stolpe, in Pomerania, received his education at Konigsberg, at Wittenberg University, and at Leyden under Hemsterhuis, who taught him Greek. Ruhnken's first works were to prepare a new edition of Plato, to collect the scholia on that author, and publish an edition of Timæus' *Lexicon Vocum Platonicarum* (Leyden, 1754; a much improved edition, 1789). In 1755 he went to Paris, and spent a whole year there examining the MSS. of the Royal Library and of the Library of St Germain. Hemsterhuis then got him appointed assistant to himself (1757) at Leyden. In 1761 he succeeded Oudendorp in the chair of Eloquence and History. In 1774 he succeeded Gronovius as librarian to the university, which he enriched with a multitude of valuable books and MSS. He died 14th May 1798. One of the best scholars and critics of the 18th century, Ruhnken possessed fine taste and sagacity, vast learning, and a remarkably lucid and graceful Latin style. His principal literary works embraced *Epistolæ Criticæ* (1749-51), an edition of Rutilius Lupus (1768), of Velleius Paterculus (1779), of Muretus (1789), &c. His pupil Wyttenbach wrote his Life (Leyden, 1799).

Ruhr, a right-hand affluent of the Rhine, rises in Westphalia, near the south-west frontier of Waldeck, flows generally west, and, after a course of 144 miles, joins the Rhine at Ruhrort.

Ruhrort, a town of Rhenish Prussia, situated at the influx of the Ruhr into the Rhine, 26 miles by rail N. of Düsseldorf, is one of the busiest river-ports on the Rhine, carrying on a large trade in corn, timber, iron, &c. In the vicinity there are large ironworks and coal-mines. Pop. 9866.

Ruisdael. See Ruysdael.

Rule, St. See Regulus.

Rule Nisi. See Divorce.

Rule of Faith, not the sum of the Christian faith as laid down in Creeds (q.v.) and Confessions (q.v.); but, in polemical theology, the sources whence the doctrines of the faith are to be authoritatively derived—the Scriptures, the tradition of the Church, the teaching of the fathers, &c. See Roman Catholic Church, Reformation, Chillingworth, Newman, &c.

Rule of the Road. This phrase includes the regulations to be observed in the movements of conveyances either on land or at sea. *On Land:* In England drivers, riders, and cyclists keep the side of the road next their left hand when meeting, and that next their right when overtaking and passing other horses or conveyances. The person neglecting this rule is liable for any damage that may happen through such neglect. A man riding against a horse, or a conveyance driving against another that is standing still, is answerable for any damage that may ensue. On the Continent and in America drivers and riders keep to the right. *At Sea:* If two steamers are meeting end on or nearly end on, both alter their courses to starboard—i.e. both turn to their right hand. If two steamers are crossing each other, the one which has the other on the starboard (right hand) side keeps out of the way. A steamer must keep out of the way of a sailing ship. A steamer shall slacken speed or stop and reverse if necessary. If two sailing ships are approaching each other, whether meeting or crossing, one running free keeps out of the way of one close-hauled; one close-hauled on the port tack keeps out of the way of one close-hauled on the starboard tack; one with the wind free on the port side keeps out of the way of one with the wind free on the starboard side; where both have the wind free on the same side the one to windward keeps out of the way of the one to leeward; and a ship with the wind aft keeps out of the way of the other ship. Notwithstanding the above rules, a ship, whether a sailing ship or steamship, overtaking any other must keep out of the way of the overtaken ship. Where one ship is to keep out of the way, the other must keep her course. Regard, however, is to be paid to all dangers of navigation, and to any special circumstances which may render a departure from the rules necessary to avoid immediate danger. See Marsden on *Collisions.*

Rullion Green. See Pentland Hills.

Rum, a mountainous island of Argyllshire, belonging to the group of the Inner Hebrides, 15 miles N. by W. of Ardnamurchan Point. It is 8½ miles long, 8 miles broad, and 42 sq. m. in area, only 300 acres being arable, and the rest deer-forest and moorland. The surface presents a mass of high sharp-peaked mountains, rising in Halival and Haiskeval to the height of 2368 and 2659 feet. In 1826 the crofters, numbering fully 400, were, all but one family, cleared off to America, and Rum was converted into a single sheep-farm; but in 1845 it was sold (as again in 1888) for a deer-forest. Pop. (1851) 162; (1881) 89.

Rum, a kind of spirit made by fermenting and distilling the 'sweets' that accrue in making sugar from cane-juice. The scummings from the sugar-pans give the best rum that any particular plantation can produce; scummings and molasses the next quality; and molasses the lowest. Before fermentation water is added, till the 'sett' or wort is of the strength of about 12 per cent. of sugar; and every ten gallons yields one gallon of rum, or rather more. The flavour of rum depends mainly on soil and climate, and is not good where canes grow rankly. Pine-apples and guavas are at times thrown into the still, but on the great scale no attempt is made to influence flavour artificially. The finest-flavoured rums are produced by the old-fashioned small stills. The modern stills, which produce a strong spirit at one operation, are unfavourable to flavour. The colour of rum is imparted after distillation by adding a certain proportion (varying with the varying taste of the market) of caramel, or sugar melted without water, and thus slightly charred. Rum is usually distilled at about 40 per cent. overproof; and it is calculated that from nine to ten acres of land will produce two hogsheads of sugar as well as about a puncheon of rum. Rum is greatly improved by age, and old rum is very often highly prized; at a sale in Carlisle in 1865 rum known to be 140 years old sold for three guineas per bottle. It forms a very important part of colonial produce: the quantity imported into Britain in 1848 was 6,858,981 gallons; in 1875, 8,815,681 gallons; in 1881, 4,816,887 gallons (value £485,685); in 1889, 4,087,109 gallons (value £340,026). In the production of rum Jamaica claims the first place and Demerara the second. It is produced also in some of the French possessions.

Rum Shrub, a liqueur in which the alcoholic base is rum, and the other materials are sugar, lime or lemon juice, and the rind of these fruits added to give flavour. Almost every maker has his own receipt, and much credit is assumed by each for his own especial mixture.

Rumania. See ROUMANIA.

Rumford, COUNT. Benjamin Thompson, a man of many talents, was born of an old colonial stock at Woburn, in Massachusetts, on 26th March 1753. His youth was spent as an assistant in a goods store at Salem and at Boston, and as a school teacher. But having married a lady of standing, he was made major in a New Hampshire regiment, and, through his royalist opinions, incurred the hostility of the colonists to such an extent that he found it best to cross the ocean to England (1775). In London he gave valuable information to the government as to the state of the colony, and was rewarded with an appointment in the Colonial Office. From his boyhood he had had a passion for physical investigations; in England he experimented largely with gunpowder, and was elected a Fellow of the Royal Society (1779). In 1782 he was back in America, with a lieutenant-colonel's commission in the king's army. After peace was concluded he was knighted, and entered the service of the Elector of Bavaria. In this new sphere he showed great reforming energy: he thoroughly reformed the army, drained the marshes round Mannheim, established in Munich a cannon-foundry and a military academy, cleared the country of the swarms of beggars and planned a poor-law system, spread widely the cultivation of the potato, disseminated a knowledge of cheap and good dishes (especially the Rumford soup) and foods, devised an economical fireplace, kitchen, and oven (the Rumford roaster), improved the breeds of horses and cattle in Bavaria, and laid out the English Garden in Munich. For these services he was rewarded by election to membership of the Academies of Science in Munich, Mannheim, and Berlin, by being put at the head of the War Department of Bavaria, and by being made a count of the Holy Roman Empire—he chose the title of Rumford, the former name of the town of Concord in Massachusetts. During the course of a visit to England in 1796 he endowed the two Rumford medals of the Royal Society of London, and he also endowed two similar medals of the American Academy of Science and Art, all four for researches in light and heat. Three years later was founded on his initiative the Royal Institution (q.v.) for diffusing the knowledge of mechanical inventions. Going back to Munich in the same year, he found it threatened by the opposing French and Austrian armies. The Elector fled, leaving Count Rumford president of the Council of Regency, generalissimo of the forces, and head of the police. In 1799 he retired from the service of the Elector. His remaining years were principally occupied with physical investigations, especially in heat, which he clearly recognised to be some form of motion, besides showing that a definite quantity of heat could be produced by a definite amount of mechanical work. In 1804 he married the widow of Lavoisier, the celebrated chemist, and soon after settled at Auteuil, near Paris, where he died on 21st August 1814. See the *Memoir* prefixed to his Scientific Writings (5 vols. London, 1876), and the biography by Bauernfeind (Munich, 1889).

Ruminants, a name applied to those even-toed or Artiodactyl Ungulates which 'chew the cud.' These are (*a*) the Tragulidæ, often called musk-deer; (*b*) the Cotylophora, including antelopes, sheep, goats, oxen, giraffes, deer; (*c*) the Camelidæ, or camels and llamas. Their characteristics and the process of rumination are described in the article ARTIODACTYLA, with which those on DIGESTION and on CATTLE should be compared.

Rump Parliament. See LONG PARLIAMENT, CROMWELL.

Runcorn, a thriving market and manufacturing town and river-port of Cheshire, on the left bank of the tidal Mersey, 12 miles ESE. of Liverpool and 28 WSW. of Manchester. The river is crossed here by a railway viaduct, which, erected in 1864-69 at a cost of over £300,000, is 1500 feet long and 95 feet above high-water mark. An ancient place, where a castle was founded by the Princess Ethelfleda in 916, and a priory in 1133, it yet dates all its prosperity from the construction of the Bridgewater Canal (1762-72), which at Runcorn descends to the Mersey by a succession of locks. More canal-boats plied to and from Runcorn than from anywhere else in the kingdom even before the opening of the Manchester Ship-canal (1887-93; see MANCHESTER, and CANAL, Vol. II. p. 700); and there are besides spacious docks with considerable shipping, Runcorn having been made a head-port in 1847. The industries include shipbuilding, iron-founding, rope-making, the manufacture of chemicals, quarrying, &c. Pop. (1851) 8049; (1871) 12,443; (1891) 20,050.

Runeberg, JOHAN LUDVIG, the greatest poet who has written in Swedish, and the national poet of Finland, was born in that country, at Jacobstad on the Gulf of Bothnia, on 5th February 1804. His father, a retired sea-captain, gave him a good education; though from the time he entered (1822) the university of Åbo he supported himself. In 1830, after three years of private 'coaching,' Runeberg was given a secretaryship in the university (removed to Helsingfors in 1827) and was named reader in Eloquence (Latin literature), and in the following year added to these offices that of teacher in the lyceum. In these years he published his first books—in 1830 a volume of *Lyric Poems* and in 1831 a narrative poem, *The Grave in Perrho*, for which the Swedish Academy gave him its minor gold medal. Other books followed in quick succession, as a beautiful epic idyll, *The Elk-hunters* (1832), one of his finest pieces of work; a second volume of *Poems* (1833), containing amongst other things a second epic idyll, *Christmas Eve*: and a third epic idyll, *Hanna*, which is almost equal to *The Elk-hunters* in beauty and finish of style. All three are written in hexameters, which Runeberg manages with admirable effect; like other poems of the same class, they deal with the rural life of the interior of Finland, *Hanna* with the joys and sorrows of the quiet parsonage, *The Elk-hunters* with the peasantry and country-folk, and *Christmas Eve* with the manor-house and its dependents. Runeberg describes the fresh, unconventional manners and the old-world, patriarchal style of living of these people with great wealth of picturesque detail, with excellent taste, with tender sympathy, with grace and simplicity and beauty of form. The atmosphere that envelops his poetry was the immediate creation of his own wholesome, healthy, manly temperament and genius; one sterling ingredient is a quaint natural humour, deep-seated and pure in quality. Runeberg's poetry is moreover the written embodiment of the deepest feelings and sentiments of the dual people of Finland, of the Finns no less than of the descendants of the Swedish immigrants, and with his name all Finlanders associate their passionate devotion to their country.

From 1832 Runeberg added to his already numerous duties those of editor of the bi-weekly *Helsingfors Morning News*. But, with all these irons in the fire, he had too much work and too little pay, and there was little prospect of a good permanent position in the university; so in 1837 he applied for, and obtained, the post of reader of Roman Literature in the college of Borgå, where he spent the rest of his life, and died 6th May 1877. During these last years he wrote an epic of Russian life, *Nadeschda* (1841); a third volume of *Poems* (1843); an epic of old Norse times, *King Fjalar* (1844); *Ensign Stål's Stories* (2 vols. 1848 and 1860); a slight but merry little comedy, *Can't* (1862); a fine tragedy in the old Greek spirit, *The Kings in Salamis* (1863); and some short *Prose Writings* (1854). *King Fjalar* is, artistically, his greatest achievement, if not the greatest achievement in Swedish literature; but its fame has been eclipsed by Ensign Stål's glowing stories of Finland's heroic struggle against the giant Russia in 1809. The opening poem of the series, 'Our land, our land,' has been fittingly chosen as the national song of Finland. The very heart of the people throbs in these stirring songs. In 1857, after four years' labour, Runeberg edited for the Lutheran Church of Finland a *Psalm-book*, in which were included above sixty pieces from his own pen. He also excelled as a translator of folk-songs from Servian, German, and other languages. There is only one single poem in all his longer works that lacks the finished simplicity, beauty, and classic restraint which are so characteristic of him; that is a cycle entitled *Nights of Jealousy*, written in early youth.

The best biography (but only reaching down to 1837) is J. E. Strömborg's (3 parts, Helsingfors, 1880-89). This must be supplemented by Nyblom's preface to Runeberg's *Samlade Skrifter* (6 vols. Stockholm, 1873-74) and monographs (in Swedish) by Dietrichson and Rancken (Stockholm, 1864), Cygnäus (Helsingfors, 1873), and Vasenius (Helsingfors, 1890), a Life (in German) by Peschier (Stuttgart, 1881), and the preface to Eigenbrodt's excellent German translation of Runeberg's epic poems (2 vols. Halle, 1891). English readers will find a useful account of Runeberg's life, with specimens of his poems translated, in E. W. Gosse's *Northern Studies* (1879); a fairly faithful translation of his lyric poems, with a biographical notice, in Magnusson and Palmer's *Runeberg's Lyrical Songs* (1878); and an indifferent translation of *Nadeschda* by Mrs Shipley (1891).

Runes. In the Scandinavian lands, Sweden, Denmark, and Norway, thousands of inscriptions have been found written in the ancient alphabet of the heathen Northmen. Similar records are scattered sparsely and sporadically over the regions which were overrun or settled by the Baltic tribes between the 2d century and the 10th. A few are found in Kent, which was conquered by the Jutes, others in Cumberland, Dumfriesshire, Orkney, and the Isle of Man, which were occupied by the Norwegians, and in Yorkshire, which was settled by the Angles. One or two have been found in the valley of the Danube, which was the earliest halting place of the Goths in their migration southwards; and there is reason to believe that a similar alphabet was used by the Visigoths and Burgundians in Spain and France, while it is noteworthy that there is no trace of this writing having been used in Germany, or by the Saxons and Franks.

The writing is called Runic, the individual letters are called rune-staves, or less correctly runes, and the runic alphabet is called the Futhorc, from the first six letters *f, u, th, o, r, c*. The Old Norse word *run* originally meant something 'secret' or magical. The oldest extant runic records may date from the 1st century A.D., the latest from the 15th or 16th, the greater number being older than the 11th century, when after the conversion of the Scandinavians the futhorc was superseded by the Latin alphabet. The form, number, and value of the runic letters changed considerably during the many centuries they were in use, the runes of different periods and countries exhibiting considerable differences. They may, however, be arranged in three main divisions: (1) the Gothic or old Scandinavian runes, which are chiefly found in inscriptions earlier than the 6th century; (2) the Anglian runes, used in Northumbria from the 7th to the 9th century; (3) the later Scandinavian runes, used in Sweden and Norway in the 7th and following centuries. These futhorcs are shown in the table. The oldest is the Gothic futhorc of twenty-four runes, divided into three families, each of eight runes. This is used in about 200 inscriptions, several of which can be approximately dated from the 3d century to the 5th, while others, from the more archaic forms of the runes, must belong to an earlier period. The oldest to which a date can be assigned is on a golden torque from a temple of the heathen Goths in Wallachia, which must be earlier than the conversion of the Goths in the 3d century. In the Anglian futhorc, which was derived from the Gothic, many new runes were obtained by differentiation, and the phonetic values underwent considerable changes. The Anglian runes are from 25 to 40 in number. The later Scandinavian futhorc, in which the greater number of runic inscriptions were written, consists of a definite alphabet of 16 runes.

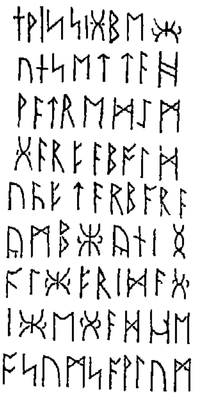
The origin of the runic writing has been a matter of prolonged controversy. The runes were formerly supposed to have originated out of the Phœnician or the Latin letters, but it is now generally agreed that they must have been derived about the 6th century B.C., from an early form of the Greek alphabet which was employed by the Milesian traders and colonists of Olbia and other towns on the northern shores of the Black Sea. These traders, as we know from Herodotus, penetrated to the north by the trade-route of the Dnieper, as far probably as the territory occupied by the Goths on the head-waters of the Vistula. This conjecture is confirmed by the fact that Greek coins struck in the 5th century B.C. have been found in the region of the Baltic. The oldest runic inscriptions being retrograde, the Goths must have obtained the art of writing from the Greeks at a time when Greek was still written in the retrograde direction from right to left, which gives us a date earlier than the 5th century, but after the new letters *omega* and *chi* had been evolved, and while H retained the value both of *h*, which it has in the Latin alphabet, and of *ē*, which it has in the Greek, and also before *koppa*, which became Q in Latin, fell into disuse among the Greeks. From these and similar data it appears that the runic writing must have been obtained from the Greeks after the 7th and earlier than the 5th century B.C. That the runic alphabet was developed from the Greek is proved among other things by the facts that it contains a symbol for *ō* which was developed from *omega*, a letter peculiar to the Greeks, and that it contains a symbol for *ng*, which proves to be a ligature of two *gammas*, Greek being the only language in which *gg* has the phonetic value of *ng*. The value of the runes must have changed to some extent after the symbols were obtained from the Greeks, owing to the sound changes tabulated in Grimm's Law (q.v.) not having been completed at the time when the runic writing was obtained. Thus, according to Grimm's Law, a Greek *th* answers to a Gothic *d*, and a Greek *ch* to a Gothic *g*, and we find, as we should expect, that the *d* rune was derived from *theta*, and the *g* rune from *chi*. The forms of the runes were considerably modified by the fact that they were cut with a knife on wooden slabs; consequently horizontal strokes, which would follow the grain of the wood, are necessarily avoided, and all the strokes are either vertical or slanting.



There are several interesting runic inscriptions in England, among which may be mentioned that on the Ruthwell (q.v.) cross in Dumfriesshire, and that on the Bewcastle (q.v.) cross in Cumberland, a fac-simile of which is given here. It is a memorial of Alcfrid, son of Oswin, king of Northumbria, and dates from the 7th century. Several crosses in the Isle of Man are carved with the old Irish interlaced ornament, and are in the form of the old Irish cross. As they have also runic inscriptions, this style of Irish ornament has wrongly acquired the name of runic knot-work, and the Irish form of cross is often called the runic cross. These names originated at a time when archæological knowledge was less advanced than it is now, and should be rejected.

Fac-similes of the chief runic inscriptions have been conveniently collected by Dr G. Stephens of Copenhagen in his *Handbook of Runic Monuments* (1884), which is an abridgment of his larger work on the *Old Northern Runic Monuments* (3 vols. 1866-68-84). The origin of the runes is discussed by the present author in his book on *The Alphabet* (1883), and at greater length in a monograph entitled *Greeks and Goths: a Study on the Runes* (1879). The works of Dr Wimmer, Dr Bugge, Mr Haigh, and Dr Kirchhoff may also be consulted.

Runjeet-Singh. See RANJIT.

Runn of Cutch. See CUTCH.

Runner, in Botany, is a long, slender branch proceeding from a lateral bud of a herbaceous plant with very short axis, or, in popular language, without stem. It extends along the ground, and produces buds as it proceeds, which often take root and form new plants. Strawberries afford a familiar example. Another is found in *Potentilla anserina.* Runners are common in the genus Ranunculus.

Runners. See BEAN.

Runnimede, a long stretch of green meadow, lying along the right bank of the Thames, 1 mile above Staines and 36 miles by river WSW. of London. Here, or on Charta Island, a little way off the shore, Magna Charta (q.v.) was signed by King John, June 15, 1215. It bears to have been signed '*per manum nostram in prato quod vocatur Runnimede.*'

Running. See ATHLETIC SPORTS.

Runrig Lands are a species of ownership, still existing in different parts of Scotland and Ireland, under which the alternate ridges of a field belong to separate proprietors. The right of the several parties to the alternate ridges is absolute, and thus this kind of possession differs from common property. These runrig, runridge, or rundale lands, as they are variously called, are survivals of the simple form of open-field husbandry, under the tribal system once universally prevalent in the western districts of Britain, and well suited to the precarious and shifting agriculture of those times. The form of rural economy which gave rise to this mode of tenure has lately been carefully and successfully investigated by several students, prominent among whom is Mr Frederic Seebohm, who has published the results of his researches in his well-known work on the *English Village Community.* The obstruction to agricultural improvement resulting from the land being thus dispersed in small pieces intermixed with each other led, in the end of the 17th century, to the introduction of a mode of compulsory division or allotment of such lands. By statute 1695, chap. 23, it was provided that, 'wherever lands of different heritors be runrig,' application may be made to the judge ordinary or justices of the peace 'to the effect that these lands may be divided according to their respective interests.' This remedy, however, does not apply to burgh acres or to patches of land less than four acres in extent.

Rupee′, a silver coin current in India, of the value of 2s. English (see INDIA, Vol. VI. p. 114). Owing to the depreciation of silver, the present average value of the rupee is 1s. 4½d. A lac (or lakh) of rupees is 100,000 (at the old value of 2s. = £10,000), and a crore is 10,000,000. Coins are struck in silver of the value of 1, 2, ½, ¼, and ⅛ rupee. The first rupee was struck by Sher Shah, the Afghan emperor of Delhi (1540-45), and was adopted by Akbar and his successors; but in the decline of the Mohammedan empire every petty chief coined his own rupee, varying in weight and value, though usually bearing the name and titles of the reigning emperor. The rupee is the official money of account in the island of Mauritius.

Rupert, PRINCE, third son of the Elector Palatine Frederick V. and Elizabeth, daughter of James I. of England, was born at Prague on 18th December 1619, his parents having the month before been crowned king and queen of Bohemia. He studied at Leyden, and became well grounded in mathematics and religion ('indeed, made Jesuit-proof'), as well as in French, Spanish, and Italian, and above all the art of war. After a year and a half at the English court, where it was proposed to make a bishop of him or viceroy of Madagascar, he served in 1637-38, during the Thirty Years' War, against the Imperialists, until at Lemgo he was taken prisoner, and confined for nearly three years at Linz. In 1642 he returned to England, in time to be present at the raising of the king's standard at Nottingham; and for the next three years the 'Mad Cavalier' was the life and soul of the royalist cause, winning many a battle by his resistless charge, to lose it as often by a too headlong pursuit. He had fought at Worcester, Edgehill, Brentford, Chalgrove, Newbury, Bolton, Marston Moor, Newbury again, and Naseby, when in August 1645 his surrender of Bristol after a three weeks' siege so irritated Charles, who the year before had created him Duke of Cumberland and generalissimo, that he curtly dismissed him, and sent him his passport to quit the kingdom. A court martial, however, completely cleared him, and he resumed his duties, only to surrender at Oxford to Fairfax in the following June. He now took service with France, but in 1648 accepted the command of that portion of the English fleet which had espoused the king's cause. As admiral or corsair, Prince Rupert acquitted himself with all his old daring and somewhat more caution; and for three years he kept his ships afloat, escaping at last the blockade in which for nearly a twelvemonth he was held at Kinsale on the Irish coast by Blake. But in 1651 the latter attacked his squadron, and burned or sunk most of his vessels. With the remnant the prince escaped to the West Indies, where, along with his brother Maurice, till the loss of the latter in a hurricane (1652), he led a buccaneering life, maintaining himself as before by the seizure of English and other merchantmen. In 1653 he was back in France, where and in Germany he chiefly resided till the Restoration. Thereafter he served with distinction under the Duke of York, and, in concert with the Duke of Albemarle, in naval operations against the Dutch; and he died at his house in Spring Gardens, 29th November 1682, in the enjoyment of various offices and dignities, being a privy-councillor, governor of Windsor, an F.R.S., &c. He left a natural daughter, Ruperta, born to him in 1673 by Margaret Hughes, actress. His last ten years had been spent in retirement in the pursuit of chemical, physical, and mechanical researches, for which he evinced considerable aptitude. Though he was not the inventor of mezzotint (see ENGRAVING, Vol. IV. p. 381), Prince Rupert no doubt improved the processes of the art, which he described to the Royal Society in 1662, after executing several interesting engravings on the new principle. Among his discoveries were an improved gunpowder, the composition known as 'Prince's metal,' and perhaps the 'Prince Rupert's Drops,' or curious glass bubbles described under Annealing (q.v.).

See Eliot Warburton's *Memoirs of Prince Rupert and the Cavaliers* (3 vols. 1849); Lord Ronald Gower's *Rupert of the Rhine* (1890); and other works cited at ELIZABETH (of Bohemia), CHARLES I., and CHARLES II.

Rupert's Land. See HUDSON BAY COMPANY.

Rupia is a somewhat severe form of skin disease. It is characterised by flattish, distinct *bullæ* or blebs, containing a serous, purulent, or sanious fluid, which become changed into thick scabs. Several varieties of this disease have been established by dermatologists. In its simplest form the blebs are not preceded by any inflammatory symptoms, are about an inch in diameter, and contain a fluid which is originally thin and transparent, but soon thickens, becomes purulent, and dries into brown, ragged scabs, which are elevated in the centre. The scabs are easily separated, and leave ulcerated surfaces, on which several successive scabs usually form before healing ensues. In a more severe form, known as *Rupia prominens*, the scab projects so much in the centre as to resemble a limpet-shell in form.

Rupia is a chronic disease, and is usually limited to the limbs, the loins, and the nates. It is not contagious, and generally attacks persons debilitated by old age, intemperance, bad living, or previous diseases, especially smallpox, scarlatina, and syphilis. The general treatment consists mainly in the administration of tonics (e.g. quinia), the mineral acids, ale, wine, animal food, &c. Some writers strongly recommend the tincture of serpentaria; and there is no doubt that certain cases which will not yield to tonics rapidly improve when treated with iodide of potassium. The local treatment consists in puncturing the blebs as soon as they arise, in removing the scabs by poulticing, and in applying a slightly stimulating application—such as a solution of nitrate of silver—to the subjacent ulcers. The disease is frequently tedious and obstinate, but the patient almost always ultimately recovers.

Ruppin, NEU, a town of Prussia, on a small lake of the same name, which communicates with the Elbe, 48 miles by rail NW. of Berlin. It was built by Frederick William II. after a fire in 1787, and is a handsome town with (1885) 14,677 inhabitants, who manufacture cloth, picture-books, machinery, starch, brushes, &c.

Rupture. See HERNIA.

Rural Dean. See DEAN.

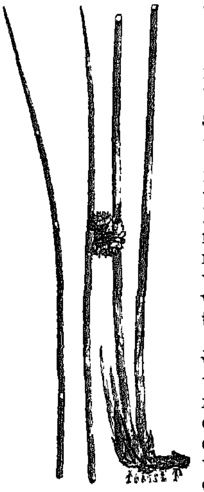
Rurik, the founder of the Russian monarchy. See NORTHMEN, and RUSSIA.

Rurki, a town in the North-west Provinces of India, 22 miles E. of Saharanpur, with the Thomason Engineering College, a station for British troops, mission school, and meteorological observatory. Pop. 15,953.

Rush, BENJAMIN, an American physician, was born in what is now the twenty-third ward of Philadelphia, December 24, 1745, graduated at Princeton in 1760, studied medicine in Philadelphia, Edinburgh, London, and Paris, and in 1769 was made professor of Chemistry in the Philadelphia Medical College. Elected a member of the Continental Congress, he signed the Declaration of Independence (1776). In April 1777 he was appointed Surgeon-general, and in July Physician-general, of the Continental army. His duties did not prevent him from writing a series of letters against the articles of confederation of 1776. In 1778 he resigned his post in the army, because he could not prevent frauds upon soldiers in the hospital stores, and returned to his professorship. He was a founder of the Philadelphia dispensary, the first in the United States, and of the College of Physicians, was active in the establishment of public schools, was a member of the state conventions which ratified the Federal constitution and formed the state constitution. He next became professor of the Theory and Practice of Medicine at Philadelphia, to which chair he added those of the Institutes and Practice of Medicine and Clinical Practice (1791), and of the Practice of Physic (1797); and during the epidemic of 1793 he was as successful as devoted in the treatment of yellow fever. Virulently attacked, owing to his methods of practice, by William Cobbett, who published a newspaper in Philadelphia, he prosecuted him for libel, and recovered $5000 damages. In 1799 Rush was appointed treasurer of the United States Mint, which post he held till his death, 19th April 1813. He was called 'the Sydenham of America,' and his medical works brought him honours from several European sovereigns. The chief of them were *Medical Inquiries and Observations* (5 vols. 1789-93), *Essays* (1798), and *Diseases of the Mind* (1821; 5th ed. 1835).—His son, RICHARD (1780-1859), a lawyer and statesman, was minister to England in 1817-25, where he negotiated the important Fisheries and North-eastern Boundary Treaties, and was Secretary of the Treasury from 1825 to 1829. In 1828 he was an unsuccessful candidate for the vice-presidency of the United States; and in 1836-38 he secured for his country the whole of the legacy which James Smithson had left to found the Smithsonian Institution.

Rush, a seaport of Ireland, 16 miles by rail NE. of Dublin. Pop. 1071.

Rush (*Juncus*), a genus of plants of the natural order Junceæ, having a glume-like (not coloured) perianth, smooth filaments, and a many-seeded, generally three-celled capsule. The species are numerous, mostly natives of wet or marshy places in the colder parts of the world; some are found in tropical regions. Some are absolutely destitute of leaves, but have barren scapes (flower-stems) resembling leaves; some have leafy stems, the leaves rounded or somewhat compressed, and usually jointed internally; some have plane or grooved leaves on the stems; some have very narrow leaves, all from the root. The name Rush perhaps properly belongs to those species which have no proper leaves; the round stems of which, bearing or not bearing small lateral heads of flowers, are popularly known as *Rushes.* The Soft Rush (*J. effusus*) is a native of Japan as well as of Britain, and is cultivated in Japan for making mats. The Common Rush (*J. conglomeratus*) and the Soft Rush are largely used for the bottoms of chairs and for mats, and in ruder times, when carpets were little known, they were much used for covering the floors of rooms; to this many allusions will be found in early English writers. The stems of the true rushes contain a large *pith* or soft central substance, which is sometimes used for wicks to small candles, called rushlights. There are twenty or twenty-two British species of rush, some of which are very rare, some found only on the highest mountains, but some are among the most common of plants. They are often very troublesome weeds to the farmer. Thorough drainage is the best means of getting rid of them. Lime, dry ashes, road scrapings, &c. are also useful. Tufts of rushes in pasture are a sure sign of insufficient drainage. Many marshy and boggy places abound in some of the species having leafy stems and the leaves jointed internally, popularly called *Sprots* or *Sprits*, as *J. acutiflorus*, *J. lamprocarpus*, and *J. obtusiflorus.* They afford very little nourishment to cattle; but are useful for making coarse ropes for ricks, &c., which are stronger than those made of hay.—Rushlights or candles with rush-wicks were anciently much in use, and Gilbert White tells us how, by carefully dipping the rush in grease with a little wax added, the poor man might enjoy five and a half hours of comfortable light for a farthing. Rushes, with a few sweet herbs, were used to strew the floors before carpets came into use, and, as they were seldom entirely renewed, the insanitary consequences may be imagined. The stage was also strewed with rushes in Shakespeare's time, as well as the churches with rushes or straw according to the season of the year—a custom still honoured at the Hull Trinity House—and anciently rushes were scattered in the way where processions were to pass. To order fresh rushes was a sincere mark of honour to a guest. The strewing of the churches grew into a religious festival conducted with much pomp and circumstance. This ceremonious rush-bearing lingered long in the northern counties, and has been occasionally revived in modern times, as at Grasmere in 1884, &c.



Common Rush (*Juncus conglomeratus*).

Rush-nut (*Cyperus esculentus*). See CYPERUS.

Rushworth, JOHN, whose *Historical Collections of Private Passages of State, Weighty Matters of Law, Remarkable Proceedings in Five Parliaments*, is an important contribution to our knowledge of the Civil War, and the events that led to it, belonged to an ancient family in Northumberland, and was born there about 1607. He studied at Oxford, and settled in London as a barrister. He appears to have spent a great deal of his time for many years in attending the Star Chamber, the Court of Honour, the Exchequer Chamber, Parliament, &c., and in taking down shorthand notes of the proceedings. When the Long Parliament met in 1640 he was appointed assistant to Henry Elsynge, clerk of the House of Commons. He sat in parliament as member for Berwick; was in 1645 secretary to Sir Thomas Fairfax, and in 1677 to the Lord Keeper of the Great Seal. In 1684 he was flung into the King's Bench for debt, and here he died, 12th May 1690. Rushworth's *Historical Collections* cover the period 1618-48, and were published in four instalments—in 1659, 1680, 1692, and 1701. The whole was republished in 1721 in 7 vols. Rushworth had the instinct of perpetuity, for he sets forth as the motive for his labour 'the impossibility for any man in after ages to ground a true History, by relying on the printed pamphlets of our days, which passed the press while it was without control.' The work has been blamed by royalist authors as unfair, and Carlyle often rails on its worthy author as a Dryasdust.

Ruskin, JOHN, the most eloquent and original of all writers upon art, and a strenuous preacher of righteousness, was born in London, 8th February 1819. He was an only child; his father (1785-1864), a wealthy wine-merchant, was an Edinburgh man settled in London. He was educated in his father's house, first in London and afterwards at Denmark-hill, till he went, as a gentleman commoner of Christ Church, to Oxford. There he gained the Newdigate prize for English poetry—by a poem on *Salsette and Elephanta*—in 1839, and took his degree in 1842. He studied painting under Copley Fielding and Harding; but his masters in the art were, he says, Rubens and Rembrandt. The story of the earlier years of his life has been told by Ruskin himself very fully in his *Præterita*, one of the most charming autobiographies in the language. In 1843 appeared the first volume of his *Modern Painters*, the primary design of which (in reply to a criticism of Turner in *Blackwood's Magazine*) was to prove the superiority of modern landscape-painters, and more especially of Turner, to the Old Masters; but in the later volumes (the fifth and last was published in 1860) the work expanded into a vast discursive treatise on the principles of art, interspersed with artistic and symbolical descriptions of nature, more elaborate and imaginative than any writer, prose or poetic, had ever before attempted. *Modern Painters* was essentially revolutionary in its spirit and aim, many of the most distinguished landscape-painters, both of old and new schools, being summarily dealt with and condemned; and the work naturally excited the aversion and hostility of the conservatives in art. But the unequalled splendour of its style gave it a place in literature; the originality of its views, the lofty conception of the painter's art displayed in it, and the evident justness of much of the criticism, secured recognition. Disciples soon appeared; and the views of art enunciated by Ruskin gradually made way, and have largely determined the course and character of later English art. The first volume was published in a much altered form in 1846. The last three volumes contained illustrations by the author. A revised and altered edition appeared in 1860-67; another in 1873; and an edition in six volumes, with some additional plates, an epilogue, and new index, in 1889. In 1849 appeared *The Seven Lamps of Architecture*; and in 1851-53 *The Stones of Venice*, both being efforts to introduce a new and loftier conception of the significance of domestic architecture. They were exquisitely illustrated by the author himself. About this time Pre-Raphaelitism (q.v.) began to develop itself as a distinctive phase of modern art, and Ruskin warmly espoused its cause in letters, pamphlets, and *Notes* on the Academy Exhibition (1855-60). He was the earliest literary advocate of this school, whose leading principle he defined as the resolve 'to paint things as they probably did look and happen, not as, by rules of art developed under Raphael, they might be supposed gracefully, deliciously, or sublimely to have happened.'

In 1854 he published four admirable and suggestive *Lectures on Architecture and Painting*; and in 1858 two *Lectures on the Political Economy of Art*. The *Notes on the Construction of Sheepfolds* (1851), dealing with the discipline of the church, illustrate his ingenuity in devising picturesque titles that suggest no notion of the subject treated. *The King of the Golden River*, a fairy story, was published in 1851; and in 1854 *The Two Paths*, lectures on art and its application to decoration and manufacture. The *Elements of Drawing* and the *Elements of Perspective* appeared in 1857 and 1859. The *Crown of Wild Olive* is a series of four essays on work, traffic, war, and the future of England; *Sesame and Lilies*, lectures on good literature. *The Queen of the Air* is a study of the Greek myths of cloud and storm; *Ethics of the Dust*, lectures on crystallisation; *Ariadne Florentina*, on wood and metal engraving; *Aratra Pentelici*, on the principles of sculpture. The *Laws of Fesolé* are the elements of painting and drawing; *Frondes Agrestes* are readings from 'Modern Painters;' *Giotto and His Works*, *Love's Meinie* (on Birds), and *Deucalion* (on Geology) are other publications. *Munera Pulveris* contains the elements of political economy according to Ruskin; while *Unto this Last*—in Ruskin's opinion, the best of his works—attacks the current doctrines of the 'dismal science.' *Val d'Arno* contains lectures on the art of the 13th century in Pisa and Florence; later courses dealt with the modern art of England and English history (*Pleasures of England*). *Mornings in Florence* are studies of Christian art for English travellers; and *St Mark's Rest* is on the history of Venice. *The Eagle's Nest* discusses the relation of natural science to art; *Time and Tide* are letters to a working-man of Sunderland. *Arrows of the Chace* is a selection of his letters; *On the Old Road* is the title of a republication of his miscellaneous pamphlets, articles, and essays contributed to various reviews and magazines, containing famous utterances on Samuel Prout, the History of Christian Art, the Lord's Prayer, the 'Cestus of Aglaia,' &c. An early volume of poems, issued for private circulation, became a much sought after bibliographical treasure; in 1891 it was reprinted (in 2 vols.) with many additional pieces and illustrations from the author's drawings. *Fors Clavigera* appeared as a sort of periodical at irregular intervals for several years, in the form of letters to the workmen and labourers of Great Britain, on a great variety of topics (vols. i.–viii. with full index, 1887). *Proserpina*, published in the same way, gives studies of wayside flowers. *Hortus Inclusus* (1887) is a series of letters 'to the ladies of the Thwaite.' Second-hand copies of the early works are still eagerly bought up at high prices: thus, the old edition of *Modern Painters*, worth £6, 10s. at its publication in 1860-67, has repeatedly been sold since 1880 for £30 or £35. All Mr Ruskin's books were for a time published privately at Orpington in Kent; but they are now published through an agent of his own in the usual way, except that the author insists on their being sold at net prices. From 1869 till 1879 Ruskin was Slade professor of Art at Oxford; in 1871 he gave £5000 for the endowment of a master of drawing there; in 1883 he was re-elected professor, but resigned in the following year. He is a D.C.L. of Oxford, and an honorary student of Christ Church. In 1871 the degree of LL.D. was bestowed upon him by the university of Cambridge. Subsequently he founded a museum at Walkley, near Sheffield (in 1890 transferred to Sheffield itself), where he bestowed part of his own priceless library and art treasures. In his later years he established himself at Brantwood, on Coniston Lake, in the Lake Country.

Ruskin is or was primarily a critic of art; but, as the titles of his works indicate, his teaching has extended over a wide area. Art for him is closely and inseparably bound up with truth, with morals, with religion; and in most departments of political philosophy, in social and political economy, Ruskin has been constant, in season and out of season, in lifting up his testimony against what he conceives to be low views, perverted ideals, coarse and vulgar complacencies. Like Carlyle, whose pupil he professes to be, he holds the world in these later days to have gone on a wrong tack; in his views of nature and life he is, he says, 'alone in the midst of a modern crowd, which rejects them all,' and has to 'maintain himself against the contradiction of every one of his best friends.' Within the sphere of art criticism he declares that an important part of his life-work has been to teach 'the supremacy of five great painters, despised till he spoke of them—Turner, Tintoret, Luini, Botticelli, and Carpaccio.' His life-long contention with political economy is based on the belief that the science has been used to inculcate the unchecked and competitive pursuit of merely material wealth. He affirms broadly that his *Munera Pulveris* contains the first accurate analysis of the laws of political economy which has been published in England. What is usually called political economy is in reality nothing more than the investigation of some accidental phenomena of modern commercial operations, and has no connection with political economy as treated by the great thinkers of the past—such as Plato, Xenophon, Cicero, Bacon. True political economy regulates the acts and habits of a society or state, with reference to its maintenance, as domestic economy does those of a household. It is neither an art nor a science, but a system of conduct and legislation, founded on the sciences, directing the arts, and impossible except under certain conditions of moral culture. By the maintenance of the state, which is the object of political economy, is to be understood the support of its population in healthy and happy life, and the increase of their numbers, so far as is consistent with their happiness. It is the 'multiplication of human life at the highest standard,' cherishing and developing the noblest type of manhood, alike in beauty, in intelligence, and in character. The wealth of which Ruskin takes cognisance is not mere exchangeable value, but intrinsic and effectual wealth, consisting of things contributing to the support of life in its fullest sense—as land, houses, furniture, instruments, food, medicine, clothing, books, works of art. The subject of political economy, therefore, embraces a large part of the sphere of private and public morals, and of political philosophy. It deals with the relation of master to servant, employer to workman, of the state to its subjects, with the province of sanitary and commercial legislation, and with the duty of the state in promoting education, suppressing luxury, regulating the hours and wages of labour. He is as confident as the most revolutionary reformer that the conditions of modern society must be completely changed and reconstructed; his ideals coincide in many points with those of some Socialists, though many of his aims would be regarded as distinctly reactionary. A 'violent illiberal' rather than a conservative, Ruskin regards reverence for natural beauty, truth, and godliness as the highest elements in life, and would give properly constituted authority extensive powers; usury of any kind is as indefensible as avarice or dishonesty. Till of late he was seldom treated as a serious political economist; but it has recently been admitted that he has actually pointed out some real weaknesses of the old abstract political economy as a scientific theory. He devoted a great part of his originally large fortune to founding the St George's Guild, which was intended to be a kind of primitive agricultural community, where the old-world virtues should be strenuously inculcated on young and old, and where ancient and homely methods might be cherished in defiance of all modern mechanical and manufacturing processes. He has also striven to promote home industries in various places. Not more remarkable than the eloquence, power, and richness of his English style are the confidence and dogmatism of his assertions, the audacity of his paradoxes, the fearlessness of his denunciations; while his earnestness, conviction, and self-denying honesty of purpose are undisputed. His influence in creating a new interest in the beauty of nature and of art in England has been profound; and although the world rejects his theories of social economy as perverse, paradoxical, and impracticable, he has done much to vivify ideals of life, and ennoble our standards of conduct.

See E. T. Cook, *Studies on Ruskin* (1890); Shepherd's *Bibliography* (5th ed. 1882); J. P. Smart, Junr., *A Ruskin Bibliography* (1890-91); W. G. Collingwood, (editor of the poems), *The Art Teaching of John Ruskin* (1891). A collection of papers contributed to architectural magazines has also been published. The Ruskin Society, London, was founded in 1881; the Ruskin Reading Guild, founded 1887, publishes a quarterly magazine, *Igdrasil*.

Russell, a great Whig house, whose origin has been traced back to Thor, through 'Olaf the sharp-eyed, king of Rerik,' Drogo, brother of Rollo, the first Duke of Normandy, and Hugh Bertrand, lord of Le Rozel, a follower of the Conqueror's. Anyhow, a John Russell was constable of Corfe Castle in Dorsetshire in 1221; and from him have sprung twenty-two generations of Russells, whose seats have been Kingston Russell, near Dorchester; Cheneys, in Bucks, near Amersham; and Woburn Abbey, in Bedfordshire. Among them, besides William Lord Russell and Earl Russell (both noticed separately below), the following may be mentioned: Sir John Russell, Speaker of the House of Commons in 1424 and 1432; John, created in 1539 Baron Russell of Cheneys, and in 1550 Earl of Bedford, who got the abbey lands of Tavistock and Woburn; Sir William Russell, who in 1594 became Lord Deputy of Ireland, and in 1603 was created Baron Russell of Thornhaugh; Francis, fourth Earl (died 1641), the drainer of the Bedford Level; William, fifth Earl, created in 1694 Marquis of Tavistock and Duke of Bedford; Admiral Edward Russell (1651-1727), who, semi-Jacobite though he was, beat the French at La Hogue in 1692, and for his victory was made Earl of Orford; John, fourth Duke (1710-71), Lord-lieutenant of Ireland; his grandson, Lord William Russell (1767-1840), who was murdered by his valet Courvoisier; Francis, ninth Duke (1819-91); and his brother Odo (1829-84), who from 1871 was ambassador to the German court, and in 1881 was made Baron Ampthill.

See J. H. Wiffen's *Historical Memoirs of the House of Russell* (2 vols. 1833); and Froude's 'Cheneys and the House of Russell' (*Short Studies*, 4th series, 1884).

William Russell, Lord Russell, patriot, was born 29th September 1639, the third son of the fifth Earl of Bedford by Lady Anne Carr, daughter of the poisoner Countess of Somerset. He was educated at Cambridge, and then travelled on the Continent, visiting Lyons, Geneva, Augsburg, Paris, &c. (1656-59). At the Restoration he was elected M.P. for Tavistock, and was 'drawn by the court into some disorders' (debts and duelling), from which he was rescued by his marriage in 1669 with Lady Rachel Wriothesley (1636-1723), second daughter and co-heiress of the Earl of Southampton and widow of Lord Vaughan. He was a silent member till 1674, when he spoke against the doings of the Cabal, and thenceforth we find him an active adherent of the Country party. He dallied unwisely with France, but took no bribe; he shared honestly in the delusion of the Popish Plot; he presented the Duke of York as a recusant; and he carried the Exclusion Bill up to the House of Lords. The king and his brother resolved to be revenged on him and the other leaders of the Whig party; and he, Essex, and Sidney were arrested as participators in the Rye-house Plot. On 13th July 1683 he was arraigned of high-treason at the Old Bailey, and, infamous witnesses easily satisfying a packed jury, was found guilty. His father's proffer, through the Duchess of Portsmouth, of £100,000 for his life availed nothing, nor his own solemn disavowal of any idea against the king's life or any contrivance of altering the government; and on the 21st he was beheaded in Lincoln's Inn Fields. The pity of his judicial murder, the pathos of Burnet's story of his end, and the exquisite letters of his noble wife, who at his trial appeared in court as his secretary, have secured him a place in history that else he had never attained to, for he was a man of virtues, not genius, a Christian hero rather than a statesman.

See his life by Lord John Russell (1819; 4th ed. 1853); the Letters of Lady Russell (1773; 14th ed. 1853); and the Lives of her by Miss Berry (1819), Lord John Russell (1820), and Guizot (Eng. trans. 1855).

John Russell, Earl Russell, K.G., was born on 18th August 1792, in Hertford Street, Mayfair, London, the third son of the sixth Duke of Bedford. A sickly child, he was educated at Sunbury, at Westminster (1803-4), and then at Woodnesborough vicarage, near Sandwich, until, in 1809, after a nine months' visit with Lord and Lady Holland to Spain and Portugal, he entered the university of Edinburgh. He lived there three years with Professor Playfair, studying under Dugald Stewart and Dr Thomas Brown, first exercising his powers of debate at the meetings of the Speculative Society, and paying two more visits to the Peninsula. In July 1813, while still a minor, he was returned for the family borough of Tavistock, but, though he spoke in 1815 against the renewal of war with France, foreign travel and literature for some years engrossed him rather than politics. He made his first motion in favour of parliamentary reform in 1819, and continued to bring the subject almost annually before the House. He was also the strenuous advocate of the repeal of the Test and Corporation Acts, of Catholic Emancipation, and of other measures of civil and religious liberty. At the general election of 1830, caused by the death of George IV., the rallying cry of reform won many fresh seats for the Liberals; the 'Great Duke' was driven from office, and Earl Grey proceeded to form a ministry. Lord John became Paymaster of the Forces, without a seat in the cabinet; but he was one of the four members of the government entrusted with the task of framing the first Reform Bill, and on him devolved the great and memorable honour of proposing it. The fortunes of the measure belong to the history of the day; enough that on 4th June 1832 it received the royal assent, and the country was saved from the throes of revolution that at one time seemed imminent. In November 1834 Lord John left office with the Melbourne government, which had succeeded Grey's; in March 1835 he brought forward a motion in favour of applying the surplus revenues of the Irish Church to educational purposes; and the success of his motion caused the downfall of Peel and the return of Melbourne to power.

As Home Secretary and leader of the Lower House Lord John now attained the zenith of his career, four measures with which his name is associated being the Municipal Reform Act (1835), and the Tithes Commutation, Registration, and Marriage Acts (1836). In 1839 he exchanged the seals of the Home for those of the Colonial Office; in 1841 he proposed a fixed duty of 8s. per quarter on foreign corn and a reduction of the duties on sugar and timber. Defeated by the opposition, the Melbourne government appealed to the country without success, so once more made way for Peel. In this general election Lord John, who meanwhile had sat for Hunts, Bandon Bridge, Devon, and Stroud, boldly challenged the verdict of London on free trade by standing for the City. He was returned by the narrow majority of 9, and continued to represent the City until his elevation to the Upper House.

In November 1845 he wrote a letter from Edinburgh to his London constituents, announcing his conversion to the total and immediate repeal of the Corn Laws. This letter led to Peel's resignation; and Lord John on 11th December was commissioned by the Queen to form an administration. He failed, however, owing to Lord Grey's antipathy to Palmerston, so Peel was forced back to office, and carried the repeal. On the very day on which the bill passed the Lords the Peel ministry was defeated in the Commons on a question of Irish coercion by a coalition of Whigs and Protectionists, whereupon a Whig ministry succeeded, with Lord John for prime-minister (1846). It succeeded to a difficult position. In Ireland there was the famine, followed by a foolish rebellion, whilst at home there was Chartism and the so-called 'Papal aggression,' which evoked from Lord John an indignant protest, first in the form of a letter to the Bishop of Durham, and next in the Ecclesiastical Titles Bill of 1851. In the winter of that year Lord Palmerston's approval of the French *coup d'état* without the Queen's or Lord John Russell's knowledge procured him his dismissal from the office of Foreign Secretary; within two months he 'gave Russell his tit-for-tat,' defeating him over a militia bill (February 1852). After a short-lived Derby government, Lord Aberdeen in December formed a coalition ministry of Whigs and Peelites, with Russell for Foreign Secretary and leader in the Commons.

His inopportune Reform Bill (1854), the Crimean mismanagement, his resignation (January 1855), and his bungling that same year at the Vienna Conference, all combined to render him thoroughly unpopular; and for four years he remained out of office. But in June 1859, in the second Palmerston administration, he became Foreign Secretary, which office he held six years, having meanwhile in 1861 been created Earl Russell. He did much for the cause of Italian unity; still, non-intervention was his leading principle—e.g. during the American civil war and the Sleswick-Holstein difficulty. On Palmerston's death in 1865 Earl Russell for the second time became prime-minister, but the defeat in the following June of his new Reform Bill left no alternative but resignation. He continued, however, busy with tongue and pen till his death, which took place at his residence, Pembroke Lodge, Richmond Park, on 28th May 1878. He is buried at Cheneys. Earl Russell was twice married, and by his second wife, a daughter of the Earl of Minto, was the father of John Viscount Amberley (1842-76), who was author of the posthumous *Analysis of Religious Belief*, and whose son succeeded as second earl.

The 'Lycurgus of the Lower House,' as Sydney Smith dubbed him, this 'little great man' was honest in all his convictions, in none more so than in his belief in himself. 'He knew he was right' gives the key to both his career and his character. Of his voluminous works, a score in number, and including a tale and two tragedies, need only be mentioned his *Life of William Lord Russell* (1819), *Memoirs of the Affairs of Europe* (1824), *The Correspondence of John, fourth Duke of Bedford* (3 vols. 1842-46), and the Memoirs of Fox and Moore.

See his Selections from *Speeches and Despatches* (1870), his *Recollections and Suggestions* (1875), and Spencer Walpole's *Life of Lord John Russell* (2 vols. 1889).

Russell, William Clark, a popular nautical novelist, was born in New York, 24th February 1844, son of the vocalist Henry Russell (born *c.* 1810), the composer of 'Cheer, Boys, Cheer,' 'There's a Good Time Coming,' 'A Life on the Ocean Wave,' &c. He had his schooling at Winchester and in France, and went to sea at thirteen. After about eight years' service he left the sea to devote himself to the life of letters. He was employed writing for the Newcastle *Daily Chronicle* and the London *Daily Telegraph*, but from 1887 reserved his energies mainly for fiction, in which he had already scored a remarkable success with *John Holdsworth, Chief Mate* (1874), *The Wreck of the Grosvenor* (1877), *An Ocean Free Lance* (1880), *The Lady Maud* (1882), *Jack's Courtship* (1884), and *A Strange Voyage* (1885). Later novels were *The Death-ship* (1888), *Marooned* (1889), *My Shipmate Louise* (1890), *An Ocean Tragedy* (1890), and *My Danish Sweetheart* (1891). Other works are his collections of papers: *Round the Galley Fire* (1883), *In the Middle Watch* (1885), and *On the Fok'sle Head* (1884); a short Life of Nelson (1890), and another of Collingwood (1891).

Russell, William Howard, the first and the most famous of 'special correspondents,' was born at Lilyvale in County Dublin, 28th March 1821, had his education at Trinity College, Dublin, joined the staff of the *Times* in 1843, and was called to the bar in 1850. He went out to the Crimea at the beginning of the war, and there remained till the close, writing home those famous letters which opened the eyes of Englishmen to the shameful sufferings of the soldiers during the winter siege of 1854-55, and quickly brought about the fall of the Aberdeen ministry. He next witnessed the events of the Indian Mutiny, returning to England in 1858. He established the *Army and Navy Gazette* in 1860, and next year the opening of the civil war drew him to America, which he soon made too hot for him by a too truthful account of the Federal defeat at Bull Run. He at once returned to England; accompanied the Austrians during the war with Prussia (1866), and the Prussians during the war with France (1870–71); visited Egypt and the East (1874) and India (1877), as private secretary to the Prince of Wales; and went with Wolseley to South Africa in 1879. He contested Chelsea without success in the Conservative interest in 1869. Most of his letters were collected into volumes, which had great success in their day; three books that may be named are *The Adventures of Doctor Brady* (1868); a novel, *Hesperothen, or Notes from the West* (1882); and *A Visit to Chile and the Nitrate Fields of Tarapaca* (1890). Besides holding many medals and decorations, he is a Knight of the Iron Cross, and a Commander of the Legion of Honour.

Russia, EMPIRE OF, an immense territory extending over eastern Europe, the whole of northern Asia, and a part of central Asia. It is bounded on the N. by the Arctic Ocean; on the E. by the North Pacific Ocean and Chinese empire; on the W. by Sweden, the Baltic Sea, Prussia, Austria, and Roumania; and on the S. by the Black Sea, Asiatic Turkey, Persia, Afghanistan, East Turkestan, and the Chinese empire. Its extreme limits are 38° 30′ and 78° N. lat. and 17° 19′ and 190° E. long. This territory, which covers an area more than twice as large as the entire area of Europe, and embraces one-sixth of the land-surface of the globe, has a population estimated at more than 115,000,000, the annual increase of which usually exceeds 1,500,000. The Russian empire consists of several well-defined parts—viz. European Russia, which embraces a little less than one-fourth of the whole, but includes nearly three-fourths of its population; Finland; Poland; Caucasia; Siberia; Turkestan; and the Transcaspian region. Two central Asian states, Khiva and Bokhara (112,000 sq. m., 3,200,000 inhabitants), are vassal states of Russia. The Russian dominions in America (Alaska) were sold to the United States in 1867 for $7,200,000.

Copyright 1892 in U.S. by J. B Lippincott Company.

The territory of the empire, however different its separate parts as regards latitude and climate, is more homogeneous than it appears at the first sight. It belongs to the great orographical division of Eurasia, which embodies both the plains of European Russia and the lowlands and plains that extend in the north of the two great plateaus of Asia—the high plateau of east Asia and the western plateau of Persia and Armenia (see ASIA, Vol. I. p. 486). However, the Russians are rapidly passing the limits of the lowlands. They crossed the narrow northern extremity of the plateau, and established themselves on the coasts of the Sea of Okhotsk. In 1855-59 they spread over the Pacific slope of the plateau, down the Amur and up the Usuri. The high steppes of Mongolia also gradually fell under their influence; and in Turkestan their military outposts are already stationed amid the icy deserts of the Pamir, within two days' march of the British outposts; while in Transcaucasia Russia slowly invades the plateau of Armenia. The comparative size of the Asiatic and European portions of the empire will be seen in the map of Asia; the extent of the Russian territory in Asia as compared with that held by Britain and by China is indicated by shading on the map at the article ASIA, Vol. I. p. 494.

The areas of the different administrative divisions and their populations for 1887-89 are given in the subjoined table.

Seaboard, Islands.—Until the end of the 17th century Russia's seaboard was limited to the Arctic Ocean, and she had to wage a long series of wars before she secured a firm footing on the Baltic and the Black Sea. The latter, however, still remains an inland sea, the entrance to which is in the hands of a foreign power. The Arctic Ocean, which offers excellent fishing grounds in its western part, makes a deep indentation on the north coast of Russia—viz. the White Sea (q.v.); but its gulfs, Kandalaksha, Onega, and Dwina, are ice-bound for nine months every year. The only port of any moment, Archangel, has now lost its former importance. Farther east, Tchesskaya and Petchora bays are surrounded by frozen deserts. The Kara Sea, between the crescent-shaped island of Novaya Zemlya (Nova Zembla) and the coast of Siberia, is navigable for a few weeks only every year (see SIBERIA). The islands of Kolgueff, Vaigatch, Novaya Zemlya, and the islands of Siberia—New Siberia, Medvyezhii, and others—are uninhabited. As to the Behring Sea and the Sea of Okhotsk, which contain good fishing and hunting grounds, their coasts are most inhospitable. The same is true of that part of the Japanese Sea which belongs to Russia. Its only great gulf, Peter the Great's, has in Vladivostok one of the finest roadsteads in the world; but this gulf is separated from the interior by wide tracts of uninhabited marshes and forests. The Baltic Sea, with the Gulfs of Bothnia, Finland, and Riga, is the chief sea of Russia; but it nowhere touches purely Russian territory, its coasts being peopled by Finns, Letts, Esthonians, and Germans. Nevertheless, four out of the five chief ports of Russia—St Petersburg, Reval, Libau, and Riga—are situated on the Baltic Sea. Three of them are frozen for from four to five months every year; and Libau is the only one which has its roadsteads open nearly all the year round. The chief islands of the Baltic are the Aland archipelago, belonging to Finland; Dagö, Oesel, Mohn, and Worms at the entrance of the Gulf of Riga; Hochland and Kotlin (with the fortress of Cronstadt) in the Gulf of Finland.

The Black Sea acquires more and more importance every year. The fertile steppes of its littoral are being rapidly settled, and the centre of gravity of Russia's population is gradually shifting south. The Black Sea suffers, however, from a lack of good ports. Its great gulf, the Sea of Azov (ports Taganrog and Rostoff), is very shallow; the fine ports of the Crimea are too remote from the mainland; and the seaboard of Northern Caucasia is separated from the interior by a high chain of mountains. Odessa is the chief port of this sea; and it has no rival in Russia except St Petersburg. Nikolaieff is the principal naval arsenal; and Sebastopol remains a naval station. Batoum, the chief port of Transcaucasia, is of great importance for the export of petroleum.—The Caspian Sea, which receives the chief river of European Russia—the Volga—is an excellent medium of communication between the central Asian dominions of the empire and the Caucasus, as also for trade with Persia (to which the south coast belongs); but it has no outlet to the ocean, nor is there any probability of connecting it advantageously by canal with the Black Sea, because its level is 70 feet below the level of the ocean. The fisheries in the Caspian supply Russia with considerable quantities of fish.

Colonies.—Russia has no colonies properly so called. Its possessions in Asia are mere reserve-grounds for surplus population. Russian immigrants are already the prevailing element in the population of Siberia and Northern Caucasia, numbering about 4,500,000 against less than 700,000 natives in Siberia, and about 2,000,000 in Caucasia.

Orography.—The geographical features of Finland, Poland, Caucasus, Siberia, and Turkestan being dealt with under those respective headings, the following remarks relate only to European Russia. The leading feature in its physical structure is a broad, flat swelling about 700 miles wide, with an average height of 800 feet, which crosses it from south-west to north-east and connects the elevated plains of middle Europe with the Urals. A belt of lowlands stretching from East Prussia to the White Sea fringes this central plateau on the north-west, separating it from the hilly tracts of Finland; while the plains of Bessarabia, Kherson, the Sea of Azov, and the lower Volga limit it on the south-east. The highest parts of the central plateau, hardly attaining 1000 to 1100 feet above the sea, lie along its north-western border—viz. the Kielce mountains of Poland, the plateaus of Grodno and Minsk, the Valdai Hills, and the hilly tracts of the Sukhona and Vytchegda (upper Dwina). In middle Russia the same altitude is attained by the flat eminences of the plateau about Kursk, in the hills on the right bank of the Volga, and in the spurs of the Carpathians. In all these places the country assumes a hilly aspect on account of the deep ravines which intersect it. The central plateau is, however, diversified by three depressions. One of these stretches south-east to north-west up the broad valley of the Dnieper and thence to the Vistula; another follows the Don and joins the valley of the Oka; and the third extends from the north shore of the Caspian along the left bank of the Volga to the bend it makes at Samara. During the Postglacial period an elongated gulf of the Caspian Sea extended in that direction up the valleys of the Volga and the Kama as far as 55° N. lat. A fourth depression, about Nijni-Novgorod,

bears traces of a great lake which was filled up during the same epoch.

The Urals, which separate the lowlands of European Russia from those of Siberia, are not the narrow chain of mountains running north and south which they appear to be on many maps. In the south they consist of a series of parallel ridges running south-west to north-east, their chief summits reaching 4680 feet in Iremel, and 3260 in Taganai. Farther north, up to the latitude of 61°, they must be considered as a continuation of the central plateau, bordered by several low ridges (north-west to south-east) which become more distinctly apparent between the Denejkin-kameñ (4950 feet) and the Toll-poss (5115 feet). They connect with a ridge that runs north-east into the Yalmal peninsula. And finally, in the extreme north, a low ridge, the Pai-kho, crosses over into the island of Vaigatch and the southern part of Novaya Zemlya. Thus the Urals exhibit the same great lines of upheaval—in a south-western and a north-eastern direction—which are characteristic features in the orographical structure of the great continent of Europe and Asia.

Rivers.—The chief rivers of Russia take their origins along the north-western border of the plateau, and some of them flow, broadly speaking, north-westwards, while the others, though describing great curves over the surface of the plateau, take a general direction towards the south-east. The Niemen, the Dwina, the Lovat (continued by the Volkhoff and the Neva), and the two chief streams that reach the White Sea, the Onega and the North Dwina, are in the first case; while the Dnieper, the Don, and the Volga belong to the second category. The Dniester and the Pruth on the Roumanian frontier are the only rivers of Russia that rise on foreign territory; the Vistula has its mouth in Prussia.—The tributaries of distant seas thus rising amidst the same marshes, on the same level of the plateau, and flowing in opposite directions, boats that have been brought up one river can easily be carried across a flat and marshy water-parting (*volok*) into the basin of another river and be floated towards another sea. The advantages that can be derived from such a disposition of the rivers are evident at a glance. At an early epoch of history it favoured the progress of the Russians from their cradle in Novgorod and Kieff towards the east; and later on it facilitated intercourse between distant parts of the territory upon which they had settled, and so maintained the unity of the separate parts. The whole making of Russia was closely dependent upon the courses of its rivers. At the present time vast quantities of corn, timber, and other heavy or bulky goods are shipped up and down the rivers—the total length of the navigable river-net reaching 33,500 miles. Several of them have been improved for navigation and connected by canals (total length, 453 miles), and many more could be, and certainly will be, improved. By means of three lines of canals and canalised rivers, which connect the upper tributaries of the Volga with the streams that flow into lakes Onega and Ladoga, the real mouth of the chief artery of Russia, the Volga, has been transferred from the Caspian to the Gulf of Finland—St Petersburg being the chief port of the Volga basin. The upper Volga and the upper Kama are also connected by canals with the North Dwina, and the Dnieper with the Düna, the Niemen, and the Vistula. Yet navigable rivers are unequally distributed over the territory; and the rivers of Russia, though exceeding in length those of western Europe, discharge a comparatively smaller volume of water. The rainfall all over Russia is small, and as part of it falls in the shape of snow, which is rapidly thawed in the spring, the rivers are flooded at that season and in early summer, and they grow shallow by the autumn. It has been estimated that one-third of the total volume of water discharged during the whole year by the rivers is carried during the spring and early summer floods. The amount of water discharged by the rivers also varies very much from year to year—a river which is navigable one year being often reduced next year to a small streamlet. During the winter navigation of course ceases.

Climate.—All over European Russia, with the exception of the Baltic Provinces, the south of the Crimea, and a narrow strip of land on the Black Sea, the climate is decidedly continental. A very cold winter, followed by a spring which sets in rapidly, and has therefore a charm hardly known to western Europe; a hot summer, the duration of which varies with the latitude; an autumn that is cooler than the corresponding months of advanced spring; early frosts; and a small rainfall, chiefly during the summer and the autumn—such are the characteristics of the climate of Russia. The winter is cold everywhere. All over Russia the average temperature of January is below the freezing-point, and it only varies between 22° F. in the west and 5° to 7° in the east. To find in Russia a winter as mild as at Königsberg (28° being the average of the three winter months) it is necessary to go as far south as Odessa. As for the southern Urals, they have a winter as cold as it is at Archangel. Even in south-west Russia the average temperature of March is a couple of degrees below the freezing-point, while in the south-east it falls as low as 16° and 20°. All the rivers are frozen over in the first part of December, and they remain under ice for an average of from 100 days in the south to 150, and even 167, days in the north. At Astrakhan ice remains on the Volga for 90 days every year, while on the Vistula at Warsaw it lasts only 77 days. On the other hand, in summer the temperature is so high all over Russia that it is only beyond the 60th degree of latitude that the average temperature of July is less than 62°. In middle Russia it rises to between 64° and 70°, and it reaches 78° at Astrakhan. The yearly temperature averages only 54° in the south and 32° in the north. The annual rainfall is very low as a rule. It averages from 14 inches in the east to 22 inches and occasionally 28 inches in the west. The moderating influence of the western winds is felt to some extent all over the country. But their tempering influence decreases very rapidly as they make their way across the cold, dry plains. The strength of the wind, especially in winter, is greater, as a rule, than in western Europe; by the end of winter blizzards often bury the railways under snow, and are very destructive to cattle.

Flora and Fauna.—With regard to its flora Russia may be subdivided into four regions: (*a*) The *tundras* of the Arctic littoral, which are devoid of tree vegetation. They are chiefly covered with mosses, lichens, and shrubs—the dwarf birch, the dwarf willow, and so forth, with the addition of a few herbaceous plants in the dryer and more sheltered places, wherever sufficient humus has accumulated; the whole flora of the *tundras* does not embrace more than 280 flowering plants. (*b*) The *forest-region*, which covers the whole of northern and middle Russia, from the *tundras* to the Steppes, and must be subdivided into two parts, the forest-region proper and the intermediate region of prairies dotted with forests. The forest-region has again two distinct parts—that of the coniferous forests, which cover nearly the whole of northern Russia beyond the upper and middle Volga, and the oak region. The forests of the latter class consist of various deciduous trees (birch, aspen, oak, &c., as well as the ash and the hornbeam farther casus (q.v.), inhabited by a great variety of races and tribes, has a population estimated at 7,500,000. Jews are very numerous in the towns of west Russia (about 2,500,000) and Poland (1,000,000). Contrary to the current opinion that all Jews are merchants or money-lenders, it is the fact that nearly three-fourths of the Russian Jews are artisans or factory-workers, while the 30,000 Jews settled on the land in Bessarabia and Kherson have proved themselves good agriculturists. The Finnish stems include the Finns and the Karelians (1,850,000 in Finland and 350,000 in European Russia); the Esthonians, the people of Livonia, and other Western Finns in the Baltic Provinces (about 1,000,000); the Lapps and the Samoyedes in the far north; and the Volga Finns and the Ugrians (1,750,000 in European Russia and 50,000 in Siberia). The Eastern Finns are being rapidly absorbed by the Russians; but the Western Finns still maintain and warmly foster their nationality. The Turko-Tartars—i.e. Tartars, Bashkirs, Kirghizes, &c.—are mere feeble remnants of the tribes who once conquered Russia. They number, however, no less than 3,500,000 in European Russia, 4,500,000 in central Asia, 1,500,000 in the Caucasus, and 350,000 (Tartars and Yakuts) in Siberia. The Mongol race is represented by some 480,000 Kalmucks in Russia and central Asia, as well as by 250,000 Buriats in Siberia; while the Manchurian tribes of the Tunguses, Golds, &c., and the Hyperboreans number respectively about 50,000 and 12,000 in Siberia (q.v.). Of west Europeans the Germans (about 1,000,000, out of whom 500,000 in Poland) are the most numerous. They have prosperous colonies in south Russia; and in the chief towns there are numbers of Germans, artisans and merchants. The Swedes number about 300,000 in Finland. There are, besides, nearly 900,000 Roumanians in south-west Russia, and about 1,000,000 Europeans of various nationalities scattered throughout the empire.

Density and Increase of Population.—No census has been taken in Russia since 1859, and great uncertainty prevails as to the figures obtained from various estimates. It is certain, however, that European Russia is thinly peopled on the whole, the average density being not more than 45 to the square mile; but it increases to 148 in the south-west, and exceeds 100 in the fertile parts of the plateaus. Owing to the prevalence of early marriages among the peasants the birth-rate is very high—from 35 to 63 in the thousand, the average having been of late about 47. But the death-rate is also very high—viz. about 33. It is only in the Baltic and western provinces, which have also a lower birth-rate, that it falls to 20 and 18 in the thousand; in the east, however, it goes up to 45, and occasionally is even more. The mortality is terrible among the children of the peasantry; on an average more than two-fifths die before reaching five years of age. In spite of this the surplus of births over deaths varies between 1,600,000 and 2,000,000 throughout the empire, and between 1,300,000 and 1,660,000 in European Russia. The population is thus rapidly increasing; and while it was 74,000,000 in 1859, it exceeded 115,000,000 in 1891. The Russians proper emigrate but little from the empire; but great numbers of European Russians emigrate every year to the Asiatic dominions.

Religion.—The great bulk of the Russians—excepting a few White Russians professing the Union—belong to the Græco-Russian Church, officially styled the Orthodox-Catholic Church, or to one of its numberless sects of dissenters (*raskol*). The Poles and most of the Lithuanians are Roman Catholics (8,500,000); while the Finns, the Esthonians, and other Western Finns, the Swedes, and the Germans are Protestants (about 4,000,000). Nearly all the Jews obey the injunctions of the Talmud, with the exception of a few Karaites in the Crimea and west Russia. Islam has a large number of followers—all the Turco-Tartars, Bashkirs, and Kirghizes. Buddhism has its followers in the Kalmucks and the Buriats. Shamanism is the religion of most of the natives of Siberia, as well as of the nominally Christian Mordvins, Votyaks, Tchuvashes, and the nominally Moslem Mescheryaks, and (partly) the Kirghizes. The Voguls, the Samoyedes, and other inhabitants of the far north are fetich worshippers. For the relations of the Russian Church with the rest of the Orthodox Eastern Church, see GREEK CHURCH.

All these religions are recognised by the government, and the Græco-Russian, Roman Catholic, Lutheran, Moslem, Jewish, and Buddhist clergy are maintained or protected by the state. As a rule religious intolerance is not a part of the national character. The government, however, from time to time proceeds to 'Russianise' this or the other part of the empire, and, without openly persecuting this or that religion, imposes all sorts of vexatious measures upon its followers. One or two nonconformist sects are the only ones who are openly persecuted. The making of proselytes from among the adherents of the Greek Church is severely punished.

The Dissenters.—A most important part is played in the popular life of Russia by the numerous sects of dissenters, or *raskolniks*, to which nearly one-third, or more, of the so-called Orthodox Russians belong. New sects arise every year, and even among the Little Russians, who used so piously to preserve their traditional religion in the face of the Catholic propaganda, a nonconformist movement has sprung up of late and spread with wonderful rapidity under the name of the 'Stunda.'

The Russian dissenters may be classed under three divisions, all equally numerous: the 'Popovtsy' (who have priests), the 'Bezpopovtsy' (who have none), and the 'Dukhovnyie Khristiane' (spiritualist Christians). The first named object to the revision of the sacred books which was accomplished under the patriarch Nikon (see *History*, below), as well as to the hierarchy of the Russian Church. They are hostile to all kinds of 'novelties,' maintain the patriarchal style of family arrangement, and get their priests either from Austria or from priests who have left the Orthodox Græco-Russian Church. A branch of the Popovtsy, the 'Yedinovyertsy,' recognise Russian priests on condition of their keeping to the unrevised books.

The Bezpopovtsy repudiate the Orthodox ritual and the sacraments, and have no priests. Any man or woman may conduct divine service if recognised by the community. The state is considered by them as an entire invention of the Antichrist, and the tsar is Antichrist himself. Yet very few amongst them really break off all connection with the state, and lead a life of outcasts, as the 'Stranniki' (the Errants) do.

The 'Spiritualists' comprise very many sects, all more or less imbued with either Protestant or rationalist teachings, as well as with communist tendencies more or less carried into practice. The chief of them are the 'Dukhobortsy' (warriors of the spirit), the 'Molokany' (Milk-eaters), both a kind of Baptists—the former have a strong leaven of practical communism—and the 'Stundists,' who are much under Protestant influence. The 'Khlysty,' or Flagellants, and the 'Skakuny,' or Shakers, belong to the same division. The Skoptsy (Castrati) have isolated adherents everywhere, even among the Lutheran Finns.

The Popovtsy draw their adherents chiefly from the merchant class and the wealthier trading peasants; while the Bezpopovtsy and the Spiritualists reckon their adherents by the million among the masses of the peasants. Mutual aid is the rule among all dissenters, and the peasants who belong to some dissenting sect are, as a rule, wealthier than those who belong to the Orthodox Church. Several sects practise partial communism; and in all of them, especially among the Bezpopovtsy and Spiritualists, women occupy a higher position. The 'seeking of truth' being limited to the interpretation of the Bible, many absurd practices prevail ('love-feasts,' flagellation, and so forth), but free-thought also finds its way among them. Besides, most of the *raskolniks* are imbued with a Mennonite spirit of opposition to the authority of the state, its military service, taxation, and similar institutions. In the colonisation of the wildernesses of the Urals and, later on, of Siberia, the dissenters were the most numerous and most successful pioneers.

Government.—The political organisation of Russia is a very heterogeneous structure. It has at bottom a very great deal of self-government, based upon quite democratic principles. But above this stands the imperial authority, represented by an army of officials, whose powers, down to those of the very humblest rural policeman, are extremely vague and very extensive; and these officials are constantly interfering with the local self-government, and paralysing it, without, however, being able either to destroy it or to reduce it entirely into submission to the central authority. The entire legislation has this double character. The empire is an absolute and hereditary monarchy. The final decision in all legislative, executive, and judicial questions rests with the emperor, whose will is law. He nominates the ministers, and they practically enjoy wide latitude in interpreting the laws. A state council, composed of about sixty members, nominated by the emperor, discusses the legislative measures elaborated and proposed by the separate ministries, but the final decision is always given by the head of the state. The senate promulgates the laws; and the Holy Synod, composed of bishops nominated by the emperor, has the superintendence in religious affairs.

For administrative purposes the empire is divided into governments and territories, the names of which are given in the table on pp. 31-32. Each is ruled by a governor, whose rights are very extensive and ill defined, and who has direct control of the police in the eight to twelve districts into which each government is divided. Poland, Finland, Moscow, Kieff, and Vilna in Russia in Europe, and Caucasia, Turkestan, the Kirghiz Steppes, East Siberia, and the Amur region in Asia have governors-general, who are at the same time the commanders of the local troops. For military purposes the empire is divided into districts; so also for judicial and educational purposes.

Finland (q.v.) is a separate state, having its own money, finance, and representative institutions; but its autonomy has been much curtailed, especially since the summer of 1890.

Local Government.—The population of Russia still remains divided into social orders or classes, each of which enjoys separate and distinctive rights. The bulk of the population (over four-fifths) belong to the 'peasants.' Next come the burghers and the 'merchants' (9 per cent. in European Russia), the clergy (less than 1 per cent.), the nobility (1·3 per cent,), the military (6·1), foreigners (0·3), and lastly, the 'various.' The peasants, including those who are settled upon the state domains and the liberated serfs, have from time immemorial had institutions of their own, recently recognised by law. They are grouped in village communes (107,943 in European Russia and Poland); and the assembly of all the householders of the commune, the *mir*, enjoys a certain degree of self-government. The land being held in common throughout Great Russia and Siberia, it is the *mir* that periodically distributes the land into allotments and then assigns them to the several households according to their respective working capacities. The *mir* can also open schools, support a midwife or a doctor, and undertake all kinds of works of public utility. It always elects its own executive, the *starosta* (elder), the tax-collector, and so on. This institution of the *mir* forms the basis of village life among all Great Russians, and traces of it are found among the Little Russians as well. All investigators of the *mir* are unanimous in recognising that, though the growing difference of fortune tends to undermine the institution, nevertheless it shows a wonderful elasticity in accommodating itself to new conditions. Some village communities buy in common modern agricultural machinery, others (in the industrial regions) form productive associations, while others again cultivate part of the land in common to supply the village stores, or undertake the boring of Artesian wells, and similar matters. The *mir*, they conclude, is not a superannuated institution; it can adapt itself to further economical progress. Several communes make a canton; and the cantonal assembly, composed of one delegate for every ten households, enjoys similar prerogatives. It also elects an elder, and a peasants' tribunal, composed of ten to twelve judges, who settle disputes amongst the peasants in accordance with the local common law. Special boards 'for peasants' affairs' are maintained in each province by the ministry of the Interior. Minor criminal charges, as well as civil causes up to the value of £30, are adjudicated upon by the justices of peace, in central Russia elected and elsewhere nominated. Appeal against their decisions can be made to the session of all the judges of the district, and from them to the senate. The justices of the peace, who materially contributed to the eradication of the old practices in vogue in the days of serfdom, are a most popular institution. But they were abolished in 1889 nearly all over Russia, and in their place were substituted 'chiefs of the district,' who combine in their hands judicial and administrative powers and are nominated by the governor from among candidates selected by the nobility, who have their own institutions—viz. district and provincial assemblies, each presided over by a marshal of the nobility.

The Zemstvos.—The administration of the economic affairs of the district and the province was in 1866 committed to the district and provincial assemblies, or *zemstvos*. Their members are elected by the peasantry, the householders in the towns, the clergy, and the landed proprietors—the census being so adjusted as to always give to the nobles and the householders the same number of representatives, or even more than the number sent by the peasantry. The *zemstvos*, both in the district and the province, elect their own executive. Although very much hampered by their limited powers of taxation, and still more by the heavy drain upon them for imperial purposes (justice, police, prisons, barracks, conscription expenses, roads, &c.), the *zemstvos*, which have been introduced in thirty-four governments of European Russia, have rendered great services to the country. They have opened numbers of schools, general and special, elementary and technical, created hospitals, and organised sanitary stations regularly visited once a week by a doctor; they have introduced mutual insurance against fire, and created the village postal institutions. Certain of the *zemstvos* have devoted their attention to the opening of new channels for national prosperity, by supplying the villages with agricultural machinery, agricultural inspectors, and so on, or by supporting the domestic trades, and the productive associations. Many *zemstvos* have gathered really valuable statistical information by means of detailed house-to-house inquiries. Unhappily their rights were much curtailed in 1890.

A similar form of self-government, similarly hampered in its actions, has been introduced in the cities and towns; the *dumas* are composed in like manner of representatives of the population, and they elect their own executive officers. But, except in the greater cities, the municipal institutions have shown much less vitality than the *zemstvos*.

Judicial System.—This was entirely reformed in 1864. Trial by jury was introduced, proceedings in the law-courts were to be public, and corporal punishment by law was abolished. The preliminary inquiry was, however, maintained secret, as in France, and the benefits of the new law have not been extended over all Russia. Political affairs and political offences are still in the hands of the department of State Police in the ministry of the Interior. Certain political cases are brought from time to time before a special department of the senate, and heard with closed doors, but the greater number are disposed of by the department mentioned, suspect persons being transported to Siberia without bringing them to trial before a court. The prisons of Russia are extremely overcrowded, and on the whole in a very deplorable condition. Every year from 15,000 to 20,000 offenders against the common law are transported to Siberia, one-half in consequence of decisions of the courts, and the remainder by order of the administration (see SIBERIA). Capital punishment for common-law offences was abolished about 1770; murder is punished by hard labour in Siberia. But death is still inflicted for political offences.

Army and Navy.—Since 1874 military service has been rendered obligatory upon all able citizens between twenty-one and forty-three, though the duration of service is shortened in proportion to the education of the conscript. But of the actual total (860,000) liable for conscription every year little more than one-third (260,000) are selected for an effective four years' service with the colours; the remainder are inscribed either in the reserve troops (Landwehr) or the militia. In time of peace the army numbers nearly 814,000 men scattered all over the empire; the war-footing is reckoned at 2,221,000, with 550,000 horses and 5100 guns. In reality these last figures ought to be very greatly reduced. Russia might drag on a war for a long time by levying new armies in succession; but, with the present organisation, she could hardly have a sufficiently numerous force to oppose successfully the shock of a rapid invasion. The navy, much improved of late, consists of 327 ships and torpedo boats, manned by 27,100 sailors; of the former 44 are ironclads.

Education.—When the serfs were liberated in 1861, and all the institutions of old Russia were being remodelled, a great movement for spreading education among the illiterate peasants was started by the richer and educated classes. Schools, Sunday-schools, and evening classes were opened in great numbers; methods of teaching were elaborated; and a rich literature of class-books and books for popular reading was brought into existence. The universities were thrown open to students, male and female. But the government soon put a stop to the movement, and placed all matters appertaining to education under the jealous control of the ministry of Public Instruction. Later on, when the *zemstvos* were introduced, they sought to promote education into the country districts by opening various kinds of schools. All these efforts were bitterly opposed by the ministry, which directed its attention chiefly to spreading classical education among the privileged classes, whilst elementary, scientific, and technical education were totally neglected. During the present reign the ministry has begun to show special favour to the parish schools, which are conducted by the clergy. Schoolmasters of these schools are not required to pass the regulation examinations, since they are nominated by the bishops, as the clerical schoolmasters were in France before the school reform of 1880. Some progress has undoubtedly been made during the last thirty years in the education of the masses; but in 1888 only one-fifth of the army recruits could read and write. At the present time there are in the empire about 50,000 elementary schools with 2¼ million pupils; nearly 1000 middle schools (classical gymnasiums, *Realschulen*, &c.) with 140,000 boys and 80,000 girls; and 31 higher institutions, of which eight are universities, with 20,000 male and 600 female students.

The education of women stands better than in many European countries, owing to the persistent efforts of the Russian women themselves. They managed to get by 1886 four university colleges for ladies with 1442 students, one medical academy with 500 students, and numerous intermediate schools between the gymnasium and the university. All these high schools, though maintained by private subscription, were closed by Alexander III. in 1886; but two colleges were reopened again in 1890, and they now have about 500 lady students. There are on the lists of the medical department no less than 695 lady doctors, of whom nearly one-half are employed in the civil service, chiefly by the *zemstvos*.

Finance.—The finances of Russia are in a precarious state. Though the state revenue increased from £58,700,000 in 1877 to £94,800,000 in 1890, the interest and annuities on the public debt increased during the same period from £11,400,000 to £26,600,000. The total of the public debt amounted on January 1, 1890, to the sum of £552,524,000, or nearly £5 per inhabitant. The peasantry are taxed so heavily that arrears accumulate every year, and attain formidable proportions after every failure of the crops.

Land-tenure.—European Russia, exclusive of Finland, covers nearly 1237 million acres; 1019 millions of these have been registered, and it appears that nearly one-fifth of that surface is unproductive and two-fifths are under forests. The remainder is partly meadow or pasture-ground and partly arable land, in the proportion of two to three. Two-fifths of the registered area belongs to the crown, one-third (317½ million acres) is held by the peasants' communes, representing an aggregate of nearly 25,000,000 men, and one-fourth part (252 million acres) is held by 481,400 private proprietors. Most of the land that is private property belongs to the nobility (197 million acres, 115,000 landlords) and to 'merchants' (31½ million acres, 70,630 owners), who in recent years have bought large estates, especially in the steppe-region, chiefly in order to rent land to the peasants. The estates of the nobles are well cultivated only in west Russia.

Agriculture.—Agriculture is the chief occupation of the people of Russia; only in central Russia (Moscow, Vladimir, Nijni) does industry take the lead. The conditions of agriculture are obviously very different in different parts of the country. A line drawn across European Russia, from Kieff to Nijni-Novgorod and Vyatka, will divide the country into two parts, of which the south-eastern has a surplus of wheat and rye and exports them, while the other has to import both. More than one-half of European Russia thus produces less wheat and rye than is needed for home consumption. If all the wheat and rye produced by Russia in an average year were consumed within the country itself, the annual consumption of wheat, which is now very low (85 lb. per inhabitant), would only be increased by 40 lb. per inhabitant; and that of rye, which is now 330 lb. per inhabitant, would be increased by 36 lb. only. The total annual consumption of wheat and rye per inhabitant would then be 491 lb. instead of 415 lb., which it is now—i.e. if no corn at all were exported from Russia the consumption of bread throughout the country altogether would be about the same as what is habitual in France (505 lb.). These facts, the result of recent and careful investigation, dispose at once of the theory that Russia may be regarded as the granary of Europe. Moreover, the crops of Russia are subject to great fluctuations, and bad years recur, as in India, at intervals of from ten to twelve years. The year 1891 was a time of extreme famine in many provinces.

During the average years 1883-87, 161,930,000 acres were under the various corn crops in European Russia (excluding Poland and Finland), and 3,712,000 acres under potatoes. The total yield reached on an average 81,100,000 quarters of rye, 27,014,400 of wheat, 64,255,000 of oats, 16,269,000 of barley, 12,150,000 of various other cereals, and 33,935,000 of potatoes; in 1889, however, all the crops were fully 25 per cent. below these figures. Flax and hemp are extensively cultivated in the west, the sugar-beet is grown in the south and south-west, and tobacco is produced in the south. The vine is widely cultivated on the Black Sea littoral and in Caucasia, but less than 360,000 acres are under proper culture, and the wine-production is still in its infancy. Cotton is beginning to be widely planted in Turkestan.

Mining.—The empire is very rich in all kinds of minerals; and its mining industry, which gives employment to nearly 400,000 hands, has of late years begun to advance with rapid strides. Gold is obtained in Siberia and the Ural Mountains, in quantities varying between 871,000 and 1,702,800 ounces every year. Silver (264,000 to 396,000 oz.) and lead are obtained in Siberia, the Kirghiz Steppes, the Caucasus, and Finland; platinum (4840 to 9460 lb.) in the Urals. Iron ores are found in profusion both in the Asiatic dominions and in European Russia (Olonetz, central Russia, south Russia), and the raising of iron has increased from 448,000 tons in 1880 to 734,000 tons in 1889 (steel, 258,000 tons). Zinc is mined in Poland, tin in Finland, and cobalt and manganese ore in Caucasia. Salt is obtained from the salt-lakes of Asia and south Russia. Russia has excellent coal-basins, especially in the Don region, but, owing to the immense forests and the facilities for shipping firewood on the rivers, the raising of coal, notwithstanding high protective tariffs, develops rather slowly; the total output in both Poland (which has good coal-mines in Kielce) and Russia reaches only 3½ to 4½ million tons. The exceedingly rich oil-wells of Baku supply Russia with both petroleum and fuel; the latter is largely used on the steamers of the Volga, on some railways, and in various manufactures. The total output of crude petroleum averages about 3,300,000 tons.

Manufactures and Petty Trades.—The manufacturing industry of Russia has grown up since the abolition of serfdom. Although handicapped by the protective duties upon foreign imports (e.g. machinery) it nevertheless has attained an average yearly production of £142 for each workman employed; in 1887 the aggregate production of the 21,247 manufacturing establishments of the empire, which gave employment to 790,000 workmen, was valued at £112,000,000. The mining industry and the industries which pay excise duties (tobacco, sugar, spirits, beer, petroleum and matches) are not included in the above. The chief industrial centres are Moscow and the surrounding governments, St Petersburg, and Poland. The woollen trade is taking firm root in the south, chiefly through English capital and enterprise. The production of alcohol (chiefly *vodka*, the national spirit) averages 80 to 95 million gallons of pure alcohol every year. There are over 200 sugar-mills and nearly 400 tallow-factories in Russia.

The domestic industries, which are carried on by the peasants of central Russia contemporaneously with agriculture, are of much greater importance in Russia comparatively than they are in western Europe. It is estimated that no less than 7,500,000 peasants are engaged in these domestic trades, and that their yearly produce (£180,000,000) exceeds in value that of the aggregate produce of the manufactures. The greatest conceivable variety of products are thus manufactured in the villages, from the roughest article used by the millions of peasants to the finest articles of luxury. Co-operation, which enters into the essence of Russian peasant life—the *artel*, or co-operative productive or consuming association being constituted by Russian peasants and factory-workers for every possible purpose—finds a wide field for application among the domestic trades, and would spread much more rapidly were it not for the extreme poverty of the producers, who are entirely in the hands of the 'sweaters.'

Commerce.—The exports of Russia to foreign countries consist principally of corn and flour (55 per cent. of the total exports), various articles of food (butter, eggs, &c.), flax, timber, oleaginous grain (chiefly linseed), raw wool, naphtha, and illuminating oils. These commodities and others not named reach an annual value of £54,000,000 to £79,000,000; but the total depends entirely upon the yield of the crops. The imports (about £40,000,000 every year) consist chiefly of raw cotton (£7,000,000 to £10,000,000), tea, raw metals, machinery, raw wool, colours, iron and steel goods, and coal. Tea and coffee, wines, and fruits are also considerable items; but the aggregate value of the imported manufactured goods hardly reaches £4,500,000. The character of the imports into Russia has totally changed during recent years, partly in consequence of the nearly prohibitive tariffs, but especially on account of the development of industries in Russia. The cotton, sugar, and iron goods—all formerly imported from abroad, but now made and prepared at home—are not dearer in Russia than they are in western Europe.—The inland trade of Russia is characterised by many interesting peculiarities, chiefly connected with its great fairs (at Nijni-Novgorod, Kharkoff, Irbit, &c.), which are still of immense importance.

Navigation.—The ports of Russia are entered every year by about 12,500 vessels of 7½ million tons, of which only 1100 to 1200 (chiefly belonging to Finns or Greeks) sail under the Russian flag. Many vessels come in ballast to take cargoes of grain. In the coasting trade the ports were entered by 27,763 vessels of 7,825,000 tons in 1889.

Communications.—The importance of the Russian rivers for traffic has already been mentioned. It may be added that over 1500 steamers ply on the rivers of European Russia, and that every year some 67,000 boats and barges and 90,000 rafts are unloaded at the river ports, the total amount of goods shipped exceeding 9 million tons, as against 55 million tons carried by rail. About 1860 Russia had less than 1000 miles of railways; but in 1891 she had a network measuring 20,115 miles, out of which 1166 miles are in Finland and 890 in the Transcaspian region. This extensive system (exclusive of the Finnish and Transcaspian railways) has cost more than £300,000,000, nine-tenths of which has been supplied by the state by means of loans. Besides paying a high interest for these loans, the state has also bound itself to guarantee to most railway companies a revenue of five per cent. upon the capital employed, which capital, as a rule, very greatly exceeded the real expenses. Thus the state pays every year to the railway companies sums varying from £700,000 to £6,500,000. Several lines of railway have recently been bought by the state, which now owns, in Russia proper and Poland, 5426 miles. A little over 40 million passengers are transported every year by rail. Corn is the chief item in the nearly 55 million tons of goods carried every year. A long series of railways is now being planned to reach right across Siberia (q.v.), from the Urals to the Pacific.

Post and Telegraph.—An extensive organisation of nearly 4220 stations and 38,400 post-horses is maintained by the state between all the towns of the empire not yet connected by rail, for the conveyance of the post and passengers. The total length of this post system is over 100,000 miles. The 5881 post-offices of the empire transmitted in 1888 no less than 216,000,000 letters and post-cards; and in the same year 3800 telegraph-offices transmitted 10,805,000 telegrams. The length of the state telegraph lines attained at the same time 88,280 miles.

Architecture.—Russian architecture is directly descended from the Byzantine (q.v.), but modified by native and Asiatic influences. The first church-building tsars, such as Vladimir (981-1015), employed Greek architects; but their churches were mainly of wood and have disappeared. The usual Russian church has a central dome, surrounded by four (or more) smaller cupolas, whose form has been, under Tartar influence, changed to the onion-shape that appears in Mongol-Indian mosques on the Ganges. In the famous cathedral of St Basil, of which an illustration is given at MOSCOW, the central tower is surrounded by eight smaller ones, crowned by various bizarre cupolas, and painted with the most brilliant colours. This church was built by Ivan the Terrible about 1554. After the time of Peter the Great the native type gave way to reproductions—often bad—of various classical models; the architecture of St Petersburg is characterised at RENAISSANCE, Vol. VIII. p. 644.

History.—The Slavs were not the primitive inhabitants of the plains of eastern Europe; in the first centuries of our era their abodes were on the Danube, the Elbe, and the south shore of the Baltic Sea, and they entered what is now Russia from the west. The southern Slavonians took possession of the upper Bug, Dniester, and Dnieper, while the northern Slavs occupied the lake-region of Pskov and Novgorod. The date of that immigration is not known, but it is certain that in the 9th century their small tribes occupied—besides part of what is now Poland—a territory stretching north and south from lakes Peipus and Ilmen to the mouth of the Dniester. Various Finnish tribes were then living in Finland, and the basins of the Dwina, Petchora, and upper Volga; the space between the Düna and the Vistula was inhabited by the Lithuanians; while several Finno-Turkish tribes, mostly nomads, had taken possession of the southern slopes of the central plateau; the Bulgars were at Kazan; the Mordvins, the Mescheryaks, the Tchuvashes, and the Tcheremisses on the middle Volga; and the Khazars in the southern Steppes. Finally, the Turkish stems of the Polovtsy, the Petchenegs, and the Turks camped in the Caspian Steppes to the east of the Volga. Already at that time the Slavs were agriculturists, and their country was dotted with numerous small forts. Like all primitive inhabitants of Europe, they were organised in 'gentes'—the family once having been matriarchal. The land was held in common by each clan and tribe, and the common affairs were decided at folkmotes, or assemblies of the clan, the tribe, or the 'land.' Cæsar and Tacitus found the same organisation among the ancient Germans.

The territory of the eastern Slavs was the great highway from Scandinavia to Greece; and caravans of Scandinavian merchants followed the route from Novgorod to Kieff on their frequent journeys to Constantinople. The same route was followed by the Norman warriors (Varingiar, Varyagues, Varangians), who, reinforced by Slav adventurers, used to engage in the service of the Greek emperors. The Greeks used to call them Rosses or Russes, but it remains uncertain whether the name was borrowed from some locality in Scandinavia (Ros, Roslagen; Ruotsi = Swedes), or, what seems more probable if Arab testimony is taken into account, from a territory on the Dnieper. It is more than probable that from a remote antiquity the Slavs used to apply to leaders of such military bands for protection, and the oldest Russian chronicle, known as Nestor's (it was probably compiled from older chronicles and epic traditions about 1115, by the Kieff monk Sylvester), says that the folkmotes of the northern Slavs, after having sent away in 859 the Varangians to whom they paid a tribute, summoned again the Varangian rulers in 862 'from beyond the sea,' 'to command and judge them according to law.' The first historians of Russia, who used to interpret facts of a remote past according to modern conceptions, were disposed to regard the Varangian dukes as a sort of modern kings, and spared no effort in tracing a 'Rurik dynasty' down to our own times. But it has now been proved by careful research (by Professors Kostomaroff, Solovieff, Serguéevitch, Byelyaeff, Bestuzheff-Riumin, and many others) that the supposed kings were simply military chiefs, to whom the military defence of the cities was entrusted, like the *podestà* of the Italian cities in the 15th century.

Three brothers, Rurik, Sineus, and Truvor, were thus invited, according to tradition, and they settled respectively in Ladoga, Byelozersk, and Izborsk—i.e. on the borders of a territory which had to be defended against the Finns and the Lithuanians. They and their successors built new forts, and took part in wars, the description of which in Nestor's chronicle has all the characters of an epic poem. Rurik's brother, Oleg, is said to have imposed his authority upon Kieff and Smolensk; he, as well as Rurik's son Igor, made campaigns against Constantinople; and Oleg's widow, Olga, who ruled after his death, was baptised in the Greek capital. Wars were waged, under Svyatoslav's leadership, against the Khazars and the Greeks. The Russians conquered Bulgaria, took possession of all its fortresses, and nearly captured Constantinople. The campaign (fully described by Byzantine historians) ended, however, in a disaster. The times of the 'Sunny Vladimir' (980-1015) are the 'heroic' epoch of early Russian history, and the feats and feasts of Vladimir and his *drujina* ('war companions') have been handed down through ages in legend and song; while his conversion to Christianity made him the hero of the annals written by monks. He and his *drujina* were baptised at Kieff in 988, and the people of Kieff soon followed him. The first half of the 11th century, during which Yaroslav the Wise was grand prince at Kieff, while his brothers and nephews ruled at Novgorod, Polotsk, Murom, Vladimir in

Volhynia, and even Tmutorakañ in north Caucasia, was the most brilliant time for Kieff. The 'mother of the Russian towns' grew to be a populous city, visited by numerous caravans of merchants, and Adam of Bremen described it as 'a rival to the supremacy of Constantinople.' The great cathedral of St Sophia was built at that time; as also many other churches. Schools were opened, and the first written Russian law—the 'Russkaya Pravda,' or, at least, its essential parts—was compiled. It corresponds to the *leges barbarorum* of the ancient Germans and Scandinavians. By the end of his life Yaroslav was ruling over most of the Russian towns, and his daughters were married, one to the king of Poland, another to Harold in Norway, a third to Henry I. in France, and a fourth to the king of Hungary. He died in 1054.

The next two centuries of Russian history correspond to the feudal period of western Europe. In the annals they appear as an uninterrupted succession of petty wars between the descendants of Yaroslav for the right of ruling in this or that city, or for the supremacy at Kieff. But modern research has disclosed the real characters of the epoch. The Russians at that time were steadily extending their territory towards the east; they colonised the Oka, the Don, and the Finnish territories in the north-east. Between the numerous clans and territories into which they were divided there were no exterior bonds of unity save the unity of language and religion, and the common idea that no princes must be taken by any Russian territory except from among the descendants of Yaroslav. The natural centres of the territory were its fortified towns, which offered a refuge to the population in case of need. In each town the folkmote remained supreme; it decided upon war and peace; it invited a prince to defend the territory, and the prince, before being recognised as such, had to sign a covenant (*ryad*), and to take the engagement to rule according to law. He was bound to keep a band of warriors (*drujina*) to protect the territory, and was entitled to levy for that purpose a tribute as well as the usual judicial fines: the disputes among the citizens being settled by twelve jurors (six for the defendant and six for the plaintiff), the prince or his deputy had to pronounce the sentence and to levy the fine when the parties applied before the prince's court instead of the folkmote. The cities usually were divided into sections and 'streets,' corresponding to the trade and artisans' guilds, and each of them had its own self-government; it elected its priests and functionaries, while the folkmote of the whole city elected the *posadnik* or mayor, the *tysiatskiy* (*millenarium*) or commander of the militia, and the bishop. The fortifications of the cities were mostly built out of the wealth accumulated by the cathedral church, which was the exchequer of the city. The guilds of the merchants in larger trading cities, like Novgorod and Pskov, used to carry on trade in the name, and, at the outset, for the benefit of the whole city. The city—not the individual—sent out its caravans and boats, and it also used to send out parties of young men into the lands of the Finnish tribes to carry on trade, to levy tribute, and to colonise them. In this way Novgorod conquered the north-east of Russia, and founded there its daughter-republics of Vyatka, Dwina, and Vologda; and later on its men crossed the Urals to trade with Siberia. Kieff was recognised as the eldest of the cities, and the eldest of the kin of the princes had to rule at Kieff. But this unwritten agreement was not always obeyed, and consequently numberless petty wars took place between the princes. The country, however, took no part in these wars, with the exception of a few isolated cases always specified in the annals. In each territory there was the chief city (*gorod*), and the subordinate ones (*prigorod*), but no traces of submission of the latter to the former can be discovered in the documents of the times, the annals simply mentioning that the *prigorods* take the same decisions as the *gorod*. The soil belonged to the freemen who cultivated it; but slavery existed, and there was some trade in slaves, chiefly prisoners of war. A free man who entered into any one's service without agreement and remained in a servant's position for more than one year was also considered *kholop* or slave, as well as he who sold himself into slavery under the pressure of necessity. Trade prospered at that time, especially at Kieff, which was the great storehouse for trade with Greece and Asia, and Novgorod (which later on joined the Hanseatic League) for the trade with Germany and Scandinavia. Pskov, Smolensk, and Polotsk also were important centres of commerce.

During the 10th, 11th, and 12th centuries Russia was thus covered with a number of free democratic republics. But the Greek Church already worked hard at introducing into Russian life the conception of the state and the authority of the monarch. Instead of the common-law view of justice as amends made by the offender for the wrongs he has done to the individual or the community, the church introduced the Roman conception of justice as established by the state, and with it the idea of cruel corporal and capital punishments. At the same time it spread education and developed the taste for reading, and its monasteries were centres of further colonisation. But it also introduced the Byzantine ideas of asceticism and submission, and subsequently its influence, reinforced by that of the Mongols and the Tartars, contributed to give to woman a subordinate position quite contrary to the spirit of the Slav laws. And finally a new power grew up during the same centuries—viz. that of the *boyars* or *bolars*. Formerly they simply were the chief warriors and counsellors of the *drujina*; but later on, as some of them grew wealthier through trade and war, they acquired more and more importance in the cities as well as in the country. Thither they attracted peasants to settle on the free lands, and gradually reduced them to the condition of tenants. Such was the state of Russian society during the *udyelnyi* or feudal period before the Mongol invasion. Of all the princes who ruled at Kieff during that period Vladimir Monomachus (1113-25) deserves special mention as a ruler whose paternal authority was recognised by most Russian princes, whom he succeeded in bringing together for the defence of the territory against the Polovtsy. With him really ended the supremacy of Kieff, south-west Russia becoming more and more the prey of its nomad neighbours, as well as of its western neighbours, the princes of Volhynia and Galicia.

Owing to the gradual colonisation of the basin of the Oka and the upper Volga, a new Russian territory had grown in importance in the meantime. Suzdal and Rostov were its chief centres. It differed from south-west Russia in many respects: its inhabitants were Great Russians—a hard-working race, less poetical and less gifted, but more active than their southern brethren. Besides, a good many of its inhabitants were peasants settled on the lands of the boyars—country-people, not accustomed to the folkmotes of old; and the cities themselves, being of recent creation—like Vladimir and, later on, Moscow—had not those traditions of independence which characterised Kieff or Novgorod. It was therefore easier for the authority of the prince to develop in the north-east, under the guidance of the church and the boyars, without being interfered with by the *vetche*. The Suzdal prince, Andrei Bogolubskiy (1157-74), was the first representative of that policy. He and his churchly advisers founded a new town, Vladimir, on the Klazma, a tributary of the Oka, and sanctified it by transporting thither from Kieff an icon of the Virgin, which had come from Constantinople, and was reputed to have been painted by St Luke. He invited many Kieff boyars to settle in the land of Suzdal, and finally he undertook to strike the last blow at the supremacy of Kieff. He induced the land of Suzdal to levy an army, which took Kieff in 1169, plundered and burned it, massacred numbers of its inhabitants, and carried others away into slavery. The supremacy of Kieff was thus destroyed, and the land of Suzdal became the Île-de-France of Russia—the nucleus of the future Russian state. Andrei was killed by his own boyars; but the Suzdal land continued to grow and to enjoy prosperity during the next fifty years; economical, educational, and literary progress were marked, and the Russian territory extended farther eastwards. A rival was given to Novgorod in Nijni-Novgorod, at the junction of the Oka with the Volga. But in the 13th century a great calamity visited Russia; a Mongol invasion suddenly put a stop to the development of the country and threw it into a totally new direction.

For several centuries past the rapid desiccation of central Asia (see ASIA) had been compelling the inhabitants of the high plateau to migrate into the lowlands, and thence-westwards towards Europe.

Under this pressure of Asia upon Europe the Ugrians, who inhabited the Urals, moved over the south Russian steppes to Hungary; and the Polovtsy, the Petchenegs, and other tribes were making in succession their raids upon south-west Russia. Now it was the turn of the nomads, who inhabited the very heart of Asia, and whom Genghis Khan (q.v.) had united into a great confederation, to enter Europe. They already had conquered Manchuria, part of north China, Turkestan, and Bokhara, and devastated the encampments of the Polovtsy. The Polovtsy applied for aid to the Russians, and their united forces met the invaders on the Kalka River (a tributary of the Don) in 1224. The Mongols and Tartars were completely victorious, but retreated and did not return to Russia till after thirteen years. In 1238 the hordes of Batu-khan invaded the whole of east and central Russia. Ryazan, Rostov, Yaroslav, Tver, and Torjok were burned; only the marshes of Novgorod protected the north-western republic from the same fate. In 1239-40 they ravaged the south-west, destroying Tchernigov, Galicia, and Kieff, and entered Poland and Hungary. But, being checked in Moravia, and receiving at the same time the news of the Khan's death, Batu-khan returned to Asia, and built his palace at Sarai on the lower Volga. Thither the Russian princes had to go to pay tribute and receive their investiture by kissing the stirrup of the khan.

After having ravaged Russia the Mongols did not interfere much with her internal organisation. They respected the church; they left the peasants in possession of their lands, and the princes in possession of their authority; but every prince had to receive his investiture from the khan, and it was at the khan's court, sometimes on the banks of a tributary of the Amur, that intrigues for supremacy between the Russian princes were settled—sometimes through the assassination of the prince who was not rich enough to buy the support of the advisers of the khan. It was especially with Mongol aid, and often with Mongol armies, that the wealthy princes of Moscow succeeded in destroying the autonomy of the surrounding principalities, and imposed upon them their own yoke.

The taxes of Russia were originally farmed out by the khan to oriental merchants; but, to avoid popular revolts, the princes undertook to collect them with the aid of the Tartars. The courts of the Russian princes, who surrounded themselves with Tartar and Mongol advisers, took an oriental character. The industrial, artistic, and literary development of Russia was totally arrested. On the whole, Mongol rule threw the country more than 200 years behind the other states of Europe. The principalities of Kieff and Tchernigov never recovered afterwards. Their decline, however, made room for the rise of Galitch to pre-eminence in western Russia, and, amidst wars against Hungary and the Tartars, it preserved greater independence than any of the Russian principalities till, in the later half of the 13th century, it was taken possession of by Casimir III. of Poland. About the same time Volhynia was joined to Lithuania. The rise of this latter state was much favoured by the prostration into which Russia had fallen; and after an existence of several centuries, during which it extended its power so as to include Livonia proper, the Russian provinces of White Russia, Volhynia, Podolia, and the Ukraine, it was joined in 1569 to Poland (q.v.). On the north of Lithuania arose in the beginning of the 13th century another power, the Livonian Knights Sword-bearers, who took possession of Livoniæ, Courland, and Esthonia, as well as some portions of the territory of Novgorod and Pskov; while the Scandinavians, blessed by Pope Gregory IX., undertook a crusade against Novgorod. They were, however, defeated by Alexander Nevski (q.v.; 1252-63).

In the beginning of the 14th century eastern Russia consisted of the principalities of Suzdal, Nijni-Novgorod, Ryazan, Tver, and Moscow, and long contests took place between them, especially between the latter two. At last Moscow—a small village fortified by Yuriy Dolgorouki (1147)—took the upper hand. It was entirely free of municipal traditions, and the powers of the prince could freely develop there, unchecked by the *vetche*. It occupied an advantageous position at the junction of several main routes, and on a then navigable river, amidst a territory thickly peopled by boyars' peasants, who enriched the prince and the boyars. The church, always prosecuting its aim of creating a monarchy in Russia, soon perceived the importance of Moscow as a centre of a future state, and its head, the metropolitan, removed thither from Vladimir in 1325. The church, the boyars, and the princes thus created at Moscow the power which was necessary at that moment to oppose the encroachments of Catholic Lithuania, Poland, and Livonia. Ivan Kalita (1328-40), Simeon the Proud (1340-53), and the regency of boyars which administered the affairs under his weak-minded son Ivan II. (1353-59), as also during the minority of Ivan's son Dmitri Donskoi (1359-89), all pursued the same policy of increasing the powers of Moscow by weakening the neighbouring principalities—Nijni-Novgorod, Tver, and Ryazan. Taking advantage of the weakness of the Mongol khanate, now divided into the hordes of Nogai, Crimea, Kazan, and Astrakhan, the east Russians made in 1380 the first attempt at throwing off the yoke; their armies federated under Dmitri, and they ventured for the first time to meet the Mongol armies in a battle on the field of Kulikovo, on the banks of the Don. The battle was not decisive, but the church ascribed the victory to the holy icons of the Moscow monasteries and to Dmitri. True, next year the Khan Tokhtamysh advanced suddenly on Moscow, burned it, killed no less than 24,000 people, and exacted a heavy tribute. But this was the last time that Moscow fell into the hands of the Tartars. Its Kreml (citadel), which had resisted in 1368 and 1371 the assaults of the Lithuanians under Olgerd, was more strongly fortified, and when Khan Edighei besieged it in 1408 he could only ravage the suburbs.

The gradual increase of the Moscow principality continued under Vassili I. (1389-1425)—who bought from the khan the right of ruling at Nijni-Novgorod, and conquered Rostov and Murom—and Vassili II. the Blind (1425-62). Still the prince, though assuming the title of Great Prince, was merely recognised as the eldest by other princes, and the cities maintained their independence, simply paying to his delegates a tribute in exchange for military protection, while Moscow was ruled in reality by the *duma* (council) of the boyars, especially after Vassili II. became blind. It was under Ivan III. (1462-1505), named 'the Great' by some historians, that the prince of Moscow, after having for forty years seized every opportunity for abolishing the autonomy of other principalities, and having married Sophia, a niece of Constantine Palæologus (who came to Moscow with a numerous following of Greeks imbued with ideas of Roman autocracy), assumed the title of 'Ruler of all Russia' (*Hospodar Vseya Rossii*), and adopted the arms of the Byzantine empire. He took advantage of the divisions at Novgorod between the oligarchy of merchants, who were appealing for assistance to the Poles, and the people, and, supported by Tartar cavalry, marched against the republic (1471). Novgorod was defeated and submitted; but new difficulties arose, and, after having preached a national war 'against the pope and his allies the Novgorodians,' Ivan took possession of the city (1481), decapitated numbers of boyars and rich people, and transported 8000 Novgorodians into the cities of eastern Russia. The colonies of Novgorod (Vyatka, Dvina) were conquered next, and in 1495 the Hanseatic market of Novgorod was pillaged by Ivan's men, and all the goods taken to Moscow. Novgorod thus lost both its independence and its trade.

The Tartar-Mongols being divided at this time, the Russians took advantage of the fact to refuse tribute; and when thereupon the khan of the Golden Horde, stimulated by Casimir's promises of support, marched against Moscow, an army of 150,000 men was sent to meet him on the Oka. Both armies stood there for months inactive, till, finally, the Tartars, seeing no support from Lithuania, and probably learning that Sarai had been plundered by a straggling band of Russians, suddenly retreated to ravage Lithuanian territory. This retreat is considered as the liberation of Russia from the Tartar-Mongol yoke (1480).

Russia's chief enemy, however, was Lithuania, united at that time with Poland. It stood at the very gates of Moscow, keeping garrisons in towns 150 miles distant from the Russian capital, and always ready to employ the Tartars against the Russians. A protracted war ensued, with the result that several princes on the upper Oka and Desna (tributary to the Dnieper) surrendered to Ivan. Smolensk, however, remained under the Lithuanians. Vassili III. (1505–33) followed his father's policy. He continued the war with Lithuania, and retook Smolensk. He annexed Ryazan and Novgorod-Syeversk, and conquered, by taking advantage of its internal dissensions, the last north-western republic, Pskov. The *vetche* was abolished, its bell taken to Moscow, and 300 wealthy families transported to east Russia.

Vassili's son, Ivan IV. (1533–84), was proclaimed Great Prince when he was only three years old. His reign is still the subject of the most contradictory estimates by historians. The fact is that by that time the boyars of Moscow, reinforced by all the dethroned princes and their descendants, had grown all-powerful. Not only the laws were issued by the boyar *duma* (council) in the name of 'the Great Prince and the boyars,' but their authority within the palace overshadowed that of the prince. In his childhood Ivan IV., though surrounded with adulation at official receptions, was kept in neglect and almost hunger. Russia was like to become another Poland ruled by the rival parties of nobles. During the first years of his reign Ivan ruled with their support and under the influence of the priest Sylvester and the minor noble Adashev. The states-general were convoked twice (1549 and 1550), the code (*Sudebnik*) of his grandfather was revised, and church matters were settled in 'The Hundred Articles' (*Stoglav*) by a council. Kazan was conquered in 1552, and Astrakhan two years later. But within the palace affairs stood at their worst. Ivan's two advisers, grown very powerful, were gained over to a party hostile to Ivan and favourable to his cousin, and when Ivan fell ill (1553) he witnessed during his sufferings the intrigues of his advisers. Once recovered, he exiled them. At the same time a mighty feudal prince, Andrei Kurbski, openly went over to the service of Lithuania, while other boyars maintained a secret understanding with Poland to place on the throne a ruler who might be their tool. Ivan IV. began most cruelly to persecute the boyars, and his cruelty soon attained the pitch of real madness. No less than 3470 victims, out of whom 986 are mentioned by name, were inscribed by Ivan IV. himself in his prayer-book, and among them are whole families 'with sons and daughters,' as well as 1505 Novgorodians, 'whose names, Almighty, Thou knowest.' Ivan's historical position appears very much like that of Louis XI.; it was the royal power struggling against the feudal oligarchy; but the struggle took a truly Asiatic character of refined cruelty, mingled with orgies and acts of monastic devotion. In order to carry on the struggle more successfully Ivan gave liberties to the towns and later on divided all Russia into two parts—the country as a whole and, on the other hand, what he claimed as his own part of the country (*opritchnina*)—the latter having the right of oppressing the former, peasants and boyars alike. Ivan IV. was the first autocrat in Russia, and he assumed the title of *tsar* (erroneously spelt *Czar*, q.v.), which is the name given in the Russian translations of the Bible to the kings of Judea and the Roman emperors. Contrary to the advice of his boyars, but with the approval of the states-general, he carried on a long and protracted war against Livonia, successful at the beginning, but most disastrous when Livonia was supported by the newly-elected king of Poland, Stephen Bathory. At the same time the khan Devlet Ghirei, crossing the Oka with 120,000 men, appeared before Moscow, and burned its suburbs. The Kreml only resisted, and the khan retreated ravaging the country and carrying away countless prisoners. By the end of Ivan's reign Siberia (q.v.) was conquered by bands of Cossacks under Yermak, and the English opened the trade by sea with Archangel.

Ivan IV., who had himself killed his eldest son in a fit of rage, left but a feeble-minded son, Feodor (1584–98), during whose reign the boyars recovered their former power. Feodor's brother-in-law, Boris Godunoff, was nominated regent, and the old struggles between rival parties began afresh. Godunoff, though an able administrator, was generally hated by both the boyars and the people of Moscow, and he endeavoured to gain popularity among the minor nobility, in the interests of whom he promulgated (1597) a law which ultimately, especially after the law of 1648, developed into serfdom. Until that time the peasants remained free—nominally, at least. They were free to settle wherever they were offered the most advantageous conditions, and once a year (on St George's day) they were entitled to abandon their farms and to remove elsewhere if they had succeeded in finding better terms, and had contracted no debts with the landowner. Boris Godunoff abolished that right of free removal, thus attaching the peasants to the land, and the institution, developing into full serfdom, became the curse of Russia for the next 270 years. To secure the throne for himself and his dynasty, Godunoff first exiled Feodor and his mother to Uglitch, and later on sent assassins to murder the seven years' old child Dmitri in 1591. After Feodor's death the *duma* of boyars proclaimed Boris Godunoff (1598–1605) tsar of Russia, but he reigned six years only.

The most extraordinary thing then happened in Russia. A young man, supposed to be Grigoriy Otrepieff—a runaway monk from a Moscow monastery who had afterwards spent several years among the Zaporogian Cossacks—appeared in Poland under the name of the assassinated Dmitri. The Jesuits and some of the Polish nobility at once supported him; also King Sigismund; and when he appeared, with an army of Polish volunteers, under the walls of a Russian frontier fortress, he was received as the very son of Ivan IV. All over Russia the people rose to support the pretender. The mother of the murdered Dmitri recognised him as her son, and when Boris Godunoff suddenly died at this juncture, Dmitri was proclaimed tsar; he was received as such at Moscow, and crowned (1605). He returned to the peasants the freedom they had lost under Godunoff; but the people of Russia did not find in him the Russian tsar they expected to find. He was a mere instrument in the hands of the Poles, he married a Pole, and his Polish garrison exasperated the people of Moscow. A revolt headed by Prince Vassili Shouisky (1606–10) broke out. The impostor was murdered, and Shouisky proclaimed tsar by the boyars. But Russia did not recognise him. New impostors appeared and were supported by the revolted peasants, while bands of runaway peasants who had gathered during the preceding decades on the banks of the Don and Dnieper under the name of Cossacks ('free men'), invaded Russia, devastating the provinces, and robbing the nobles, the towns, and the wealthier peasants. Sigismund of Poland, taking advantage of the confusion, invaded Russia, and with the consent of the Moscow boyars proclaimed his son Vladislav tsar; but he preferred to have Russia for himself, and took possession of Moscow (1610). Shouisky was taken to Poland, where he died in a prison.

All this would appear difficult to explain, unless the following be taken into account. Russia by that time was receiving western civilisation from Poland, and the boyars were the first to accept it in appearance, imitating the extravagant life of the Polish nobles, ruining the peasantry, and aiming at an oligarchy of nobles such as they saw in Poland. The great rising of the people of Russia, which began in 1601 under the banner of the false Dmitri, and continued during the next eleven years, was a rising of the toiling masses and small traders against the boyars. But this rising had, at the same time, opened Russia to Polish invasion, and left the whole territory—landlords and peasants alike—at the mercy of predatory gangs of Cossack and Polish robbers. A reaction was inevitable, and it came from the cities supported by the church. A cattle-trader of Nijni-Novgorod, Minin, aroused his fellow-citizens to march for the delivery of Moscow, which was held by the Poles and besieged by the Cossacks. The same movement took place in all Russian cities, and their folkmotes (*vetche*) entered into agreements to levy militias and unite them into one army, and convoked a 'General Council of the Land,' composed of representatives of all classes, at Yaroslavl. Under the leadership of Prince Pojarskiy and Lapunoff they retook Moscow, drove the Poles out of Russia, and the council (*Sobor*), now moving to Moscow, was urged to elect a tsar. The boyars were inclined to elect a Swedish or Polish prince, but the lower orders and the clergy opposed this, and the *Sobor* elected Mikhael Romanoff (1612–45). The boyars finally acquiesced in the hope of maintaining the power under a sixteen years' old tsar; but the *Sobor* remained quasi-permanent at Moscow during the first ten years of Mikhael's reign, and all decisions were issued conjointly in the name of the tsar and of the *Sobor*. Mikhael Romanoff belonged to a family (the ancestors of which had emigrated in olden times from Prussia) which was very popular now in Russia. His father, the Rostoff metropolitan Philarete, who had been sent as an envoy to Poland, was kept imprisoned by the Poles; his uncles had died in prisons under Boris Godunoff; and his grandmother, who was the first wife of Ivan IV., had left a very good memory behind her.

The first years of the reign of Mikhael Romanoff were characterised by a general movement on the part of the Russian towns to crush the peasants' insurrection and to extirpate the bands of robbers. Peace was obtained from Gustavus Adolphus of Sweden by abandoning Schlüsselburg; but the war against Poland continued, notwithstanding a short armistice. The states-general, convoked again (1632 and 1642), freely voted fresh subsidies, but no success was obtained, and the very existence of Russia was menaced when the revolts of the Cossacks of the Dnieper against the Polish nobles changed the face of affairs in favour of Russia.

Under Mikhael's son Alexei (1645–76) the work of modelling Russia into a state continued, and the local administration was entirely reformed. But the revolts of the people began anew, especially since serfdom was enforced by the law elaborated by the states-general of 1648, and the first half of Alexei's reign was marked by a series of popular revolts at Moscow, Nijni, Pskov, and finally in south-east Russia, under Stenko Razin, when the runaway serfs and the free Cossacks of the Volga rose fiercely against Russia, hanging the landlords, and aiming at 'settling their accounts with the boyars in the Kreml itself.' At the same time came the great disruption (*raskol*) in the church. The patriarch Nikon was striving to acquire in the East the same supremacy as the pope had in the West. Being himself one of the richest serf-owners in Russia, he made a display of extravagant luxury in his life; he surrounded himself with a kind of ecclesiastical court which plundered the lower clergy; he built under Moscow a 'New Jerusalem,' and in processions went preceded by a 'Latin cross' (with one cross-bar only) like the pope. In short, he was considered 'Latin' (i.e. Polish) in all his arrogant behaviour. His attempt at completing the already undertaken revision of the sacred books, into which many errors had crept through illiterate copyists, became the signal of a revolt of the bulk of the nation against the state's 'Latin' Church. A popular church, having priests elected by the parishioners, and taking the 'old faith' for its watchword, was opposed by the people to 'Nikon's Church,' although its followers were pitilessly tortured and exterminated by the state. All great subsequent risings of the peasants (Razin's, Pougatchev's, and many smaller ones) were therefore made under the cross with eight ends (three cross-bars) of the 'old faith.'

Nikon's attempts at subduing the tsar to his arrogant supremacy ended in his deposition and exile, and later on Peter I. abolished even the dignity of patriarch, substituting for it the Holy Synod. Alexei frequently convoked the states-general, first to confirm his accession to the throne (1645), then to revise the existing laws and to compile (1648) a new code (*Sobornoie Ulojenie*), and next (1651 and 1653) to pronounce upon the annexation of Little Russia. Under Alexei Russia finally gained the mastery over Poland, and reconquered Smolensk; but her success was chiefly due to the revolt, under Bogdan Hmelnitsky, of the Orthodox Cossacks of Little Russia, who were terribly oppressed by their Catholic landlords. After seeing the impossibility of resisting Poland single-handed, the Cossacks appealed for protection to Russia, and recognised her supremacy. This event decidedly turned the scales in favour of Russia in the long struggle between the two chief Slav powers. But in order to maintain her rights on the Dnieper Russia had now to sustain a war with Turkey, which continued till after the accession of Feodor (1676–82), when it was terminated (1681) by the treaty of Bakhtchisarai, by which Turkey gave up all claims upon Little Russia. After Feodor's death the states-general chose his half-brother Peter as tsar, but his half-sister Sophia, an able and ambitious princess (see Peter the Great), succeeded in obtaining the reins of power as princess-regent. She concluded peace with Poland in 1686, made two unsuccessful campaigns against the Tartars of the Crimea; and after an attempt to deprive Peter of his right to the throne, and, this failing, to assassinate him and his mother, she was forced to resign all power and retire to a convent. Nearly a thousand of her accomplices were executed; and Peter (1689–1725) ascended the throne as sole ruler, his half-brother Ivan being allowed to retain the title of tsar conjointly, and to appear as such at public ceremonies, but without any real authority.

The history of Peter I.'s reign is almost entirely his own biography, and it is given under his name, the following remarks being only intended to give a general view of the importance of his reforms.

The powers of the tsar, the *duma* of boyars, and the church have already been mentioned above; but since Ivan IV.'s time, and especially since the 'troubled times' of 1601–12, a new power had come into existence—viz. the *Sobor*, or states-general. The *Sobors* consisted of representatives of either 'the whole land,' or special classes—merchants or military—or the inhabitants of Moscow only, and they exercised a decided influence upon legislation. But even in Alexei's reign steps were taken towards centralising all powers in the hands of various boards (*prikazy*) corresponding to modern ministries, under the guidance of the tsar, and the *Sobors* were convoked less and less frequently. Peter I. totally destroyed the powers of the boyars and the church, and convoked the states-general but once, to condemn his sister Sophia. He proclaimed himself emperor, abolished the rank of patriarch, and introduced, instead of the *duma* and the *Sobor*, a senate, whose members he nominated himself. By transporting his capital to St Petersburg, a city of his own creation, he entirely freed himself from the interference of the boyars, the church, and the people of Moscow, which often made its voice heard by means of rebellions. He ruled with absolute power, supported by men of his own choice. All Russians became in an equal degree his own subjects, though class-distinctions continued to prevail in their mutual relations, and serfdom grew worse and worse, taking all the characters of slavery. Of a standing army under Peter's predecessors only the *Stryeltsy* (military settlements in the suburbs of the cities) and the Cossacks deserved the name. The former were abolished after their revolts in favour of Sophia, and the privileges of the latter were curtailed. A standing army, completed by recruiting, was introduced. The whole administration was reorganised upon German models, or on strongly hierarchical and centralised principles. A secret state police, endowed with extensive powers of imprisonment, torture, and exile, was introduced, and among its victims was Peter's only son, Alexei, convicted of having plotted with the old party against his father. He died under torture. The old taxes by household were superseded by capitation taxes, and formidably increased. Written procedure was introduced in the justice courts, stamp-duties were imposed. Faith was made a state affair, and attendance at church on Sundays and communion once a year was rendered obligatory.

Agriculture and industry were at a low ebb in the tsardom of Moscow. Civilisation and learning, which had been introduced during the federative period, had never recovered the shock they had received from the Mongol invasion. The education even of the higher classes was confined to reading and writing, and the first school for classics and theology only made its appearance during Feodor's reign. Fine arts were limited to architecture and painting (of sacred subjects) after the Byzantine school. The first newspaper appeared (in Moscow), and the first theatre was established, during the reign of Alexei. The influence of the Mongols left deep traces on the domestic manners and habits of the Russians, among which was the low position of women in domestic life; those of higher rank were completely excluded from social intercourse with the other sex, and were condemned to pass a dull and dreary existence in their 'terems.' Peter I. did his best to improve the state of affairs in all these directions. He organised the army, created mining and manufactures, chiefly for state purposes, imported improved races of cattle, traced and caused to be dug the canals which now are so important for Russia, created schools, chiefly technical, and introduced more social intercourse between the different classes of society, in which women were allotted a share. It must, however, be noted, that in the carrying out of his well-meant schemes he forgot the people for the state, and imposed upon the former the most terrible burdens. Thousands and thousands of his subjects perished in erecting St Petersburg and its fortress and in digging canals, not to say a word of the wars they had to maintain, and the revolts crushed with Asiatic cruelty.

In accordance with the terms of his will, his second wife, Catharine I. (1725–27), succeeded him; but the old or anti-reform party of the nobility supported the claims of the only son of the unfortunate Alexei, Peter II. (1727–30), who soon after obtained the imperial throne. The reigns of both of these sovereigns were occupied with court quarrels and intrigues, Menschikoff (q.v.) during the former, and Dolgorouki during the latter, being the real rulers. On the death of Peter II. the privy-council, setting aside the other descendants of Peter I., conferred the crown on Anna, Duchess of Courland, the daughter of Ivan. Her reign (1730–40) was marked by the predominance of the German party at court, who, unchecked by the weak sovereign, treated Russia as a great emporium of plunder (see BIRON). Under their influence Russia restored to Persia her lost Caspian provinces, and was led into a most ruinous war with Turkey. Anna's successor was Ivan (1740–41), the son of her niece, the Duchess of Brunswick, Anna Carlovna; but he was speedily dethroned by Elizabeth (1741–62), the daughter of Peter I., who deprived the German party of the influence it had so shamefully abused, restored the senate to the power with which it had been entrusted by Peter the Great, established a regular system of recruiting, abolished tolls, and increased the duties on imports. Russia gained by the treaty of Abo (1743) a portion of Finland, and took part in the Seven Years' War (q.v.).

Elizabeth's nephew and successor, Peter III. (q.v.; 1762), was a devoted admirer of Frederick the Great of Prussia. His first act on his accession to the throne was to order the Russian army which supported the Austrians against Prussia to join Frederick against the Austrians. Prussia, reduced to the last extremity, was thus saved from dismemberment. At home he abolished the prescriptions of Peter I. which imposed upon each noble the duty of entering the state's service; he abolished the secret state police, gave full liberty to the *raskolniks*, proclaimed an amnesty to the serfs who had revolted against their owners, and proposed to seize the estates of the convents—a measure which Peter I. did not dare to take, and which was partially accomplished subsequently under Catharine II. But he was disliked at the court, and his wife, Catharine II. (1762–96), easily dethroned him. He was arrested and murdered by Catharine's associates.

Under Catharine II. (q.v.) successful wars were carried on against Turkey, Persia, Sweden, and Poland, which largely extended the limits of the empire. The acquisition of the Crimea, which gave Russia a firm footing on the Black Sea, and the first partition of Poland, were two most important steps towards the consolidation of the empire. In home affairs the work of further centralisation was prosecuted. But, notwithstanding Catharine's friendship with the 'Encyclopædists' of France and the excellent ideas expressed both in her correspondence and in various 'Instructions' (*nakazy*), her reign was exceedingly oppressive for the peasants. The rights of the landlords over their serfs were extended; no less than 800,000 free peasants were distributed as serfs among Catharine's favourites; serfdom, abolished in Little Russia by Bogdan Hmelnitsky, was reintroduced there as well as among the Don Cossacks; and once again the whole state was shaken by the impostor Pugatchev, who, supported by the *raskolnik* Ural Cossacks, pitilessly hanged the landlords and officials in east Russia, ravaging the country under the assumed name of Peter III.

Catharine's son and successor, Paul I. (1796-1801), at first, through apprehension of the revolution in France, joined the Austrians and British against France, but soon after capriciously withdrew, and was about to commence war with Britain when his assassination took place. He gave freedom of worship to the 'Old Ritualists,' but recklessly turned free crown peasants into serfs for his favourites. He established a severe censorship of the press, prohibited the introduction of foreign publications, reorganised the secret police, and altogether treated his subjects in the most contemptuous way. A palace conspiracy put an end to his reign and life. His eldest son, Alexander I. (1801-25), was at the outset desirous of peace, but was soon drawn into the vortex of the great struggle with France, in which he played a prominent part. The character of his rule is sketched under his name, and an outline of the warlike operations—the great French invasion of 1812, the burning of Moscow, and the disastrous retreat—is given in the article NAPOLEON. The Holy Alliance (q.v.) and the example of conservative policy set by Austria exercised a pernicious influence on the later part of his reign; and the higher classes, who had looked for the introduction of at least a portion of the liberal institutions they had seen and admired in western Europe, became so dissatisfied that, when his youngest brother, Nicholas I. (1825-55), from whom they had nothing to hope, succeeded, they broke out into open rebellion, which was speedily crushed. A full stop was now put to the intellectual development of Russia. Wars were declared with Persia and Turkey; and a long and deadly struggle commenced with the Caucasian mountaineers. The cession of Erivan and Nahitchevan by Persia, of the plain of the Kubañ, of the protectorate of the Danubian principalities, and of the free right of navigation of the Black Sea, the Dardanelles, and the Danube by Turkey only induced him to further prosecute his aim of conquering for Russia a free issue from the Black Sea in the Dardanelles. In 1830 he converted Poland (q.v.) into a Russian province; in 1849 he aided Austria in quelling the insurrection of the Magyars; and in 1853 he began a war with Turkey which became the Crimean War (q.v.), and in which, though the allies, Britain, France, and Sardinia, did not obtain any decided success, Russia suffered immense loss.

The accession of Nicholas's son, Alexander II. (1855-81)—one of whose first acts was the conclusion of the peace of Paris (1856), by which Russia lost the right of navigation on the Danube, a strip of territory to the north of that river, and the right of keeping a navy in the Black Sea—was the signal for a general revival of intellectual life in Russia. Public opinion broke the bonds of censorship and constrained the well-meaning but weak emperor to carry through the long-expected abolition of serfdom. It was abolished in 1861 after many hesitations. Corporal punishment was abolished and the judicial organisation was completely revised (1864). Unhappily the insurrection of Poland (1863-64) put an end to the reform period. The old serf-owners' party took again upper hand, and the last great reform, by which self-government (*zemstvo*) was granted to the provinces (1866), did not receive the importance which it formerly was proposed to give to it, as a preparatory step to constitutional government. Obligatory military service for all Russians was introduced in 1874.

The insurrection in Poland was suppressed with extreme severity; and in 1868 the last relics of Polish independence disappeared in the thorough incorporation of the kingdom with the Russian empire. The subjugation of the Caucasus was completed in 1859. Russian supremacy was established over all the states of Turkestan. In 1876 the administration of the Baltic Provinces was merged in that of the central government; but the autonomy of Finland was respected and even extended. In 1870, during the Franco-German war, Russia declared that she considered herself bound no more to the obligation of keeping no navy in the Black Sea, and in a conference at London in 1871 her claims were recognised. The misgovernment of her Christian subjects by Turkey, and her cruel suppression of incipient rebellion in 1876, led to a conference of the European Powers at Constantinople. Turkey rejected the proposals made by the conference with a view to the better administration of the subject provinces; and Russia, to enforce these concessions on Turkey, declared war in April 1877. At first the Russian progress was rapid; but the energy displayed by the Turks during the summer, and the resolute defence of Plevna by Osman Pasha from July till December, checked the progress of the Russian army. During the winter, however, she crossed the Balkans, and her vanguard reaching the Sea of Marmora, stood in view of Constantinople. The armistice signed in January 1878 was followed in March by the treaty of San Stefano; and after diplomatic difficulties that seemed for a time not unlikely to issue in war between Russia and England, a Congress of the Great Powers met at Berlin in June 1878, sanctioned the re-arrangement of the Ottoman empire explained under the article TURKEY, and the cession to Russia of the part of Bessarabia given to Moldavia in 1856, as also of the port of Batoum, of Kars, and of Ardahan. The growth of revolutionary discontent (see NIHILISM), leading to severe repressive measures, has been marked by several murders of high officials; and on March 13, 1881, Alexander II. was killed by the revolutionists. Panslavism (q.v.) has influenced Russian thought and policy to some extent.

The reign of Alexander III. has been characterised, in contrast to the liberal reforms of the last reign, by numerous reactionary steps; though strenuous efforts have been made to put an end to the colossal plundering of state money and appropriation of state lands common in the last half of the reign of Alexander II. The self-government of the *zemstvo* has been limited and put under the authority of the nobility; the justices of peace were abolished, and an attempt at reintroducing manorial rights has been made. The redemption taxes imposed upon the liberated serfs were slightly reduced, and banks for facilitating the purchase of land by the richer peasants were created; a special bank for simplifying mortgages by the nobles was created with the support of the state. Literature was submitted to a most rigorous censorship, and education to a still closer supervision; public expressions of sympathy with the last reign's reforms have been severely repressed. Rigorous measures were taken against the Jewish population of the empire, leading to wholesale and compulsory emigration, and the autonomy of Finland has been curtailed—the ideal of the reign being a return to Nicholas I.'s views upon the centralisation of the state. The external policy is that of armed peace.

See works on Russia, the land and people, by Sir D. M. Wallace (1877; new ed. 1888), Sutherland Edwards (1879), Geddie (1881), Morfill (1882), A. J. C. Hare (1888), Stepniak (from the Nihilist point of view, 1885–88), and Tikhomirov (1887). For history, see the articles on the principal Russian sovereigns, notably those on Peter I., Catharine I. and II., Paul, Alexander I. and II., and Nicholas; also the articles on Bagration, Barclay de Tolly, Gortschakoff, Kutusoff, Orloff, Potemkin, Suvarof, &c.; on Charles XII. of Sweden; and those on Nihilism, Panslavism, and Poland. And consult besides the Russian historians Karamzin, Soloviev, Kostomarov, Bestuzhef-Riumin, &c.; Rambaud, *History of Russia* (1878; Eng. trans. 1879; 2d ed. 1887); the shorter history by Morfill (1890); Sutherland Edwards, *The Romanoffs* (1890); and Howorth's *History of the Mongols* (1876–88).

Language and Literature.—The Russian language belongs to the eastern branch of the Slavonic family. It is extremely copious, and resembles ancient Greek in being both synthetical and analytical; thus it has seven cases, and yet in no language are the prepositions used with more delicate precision. It has lost the imperfect and aorist, which are to be found in old Slavonic, but has preserved the great Slavonic feature of the *aspects* of the verbs. Although Russia was under Mongolian rule for upwards of two centuries, yet the Tartar words are few, and are employed only for articles of dress and some other things of everyday use. A few Latin and French words have been incorporated, but the tendency at the present time is to eject foreignisms as much as possible. The language has great capabilities for forming compounds and derivatives. There are many dialects, but the predominant literary language is that of Moscow. The first Russian grammar was published at Oxford in 1696 by Henry Ludolf; in Russian may be mentioned those of Vostokov (10th ed. 1859) and Buslaev, *Historical Grammar of the Russian Language* (1875). For understanding the principles of Russian philology we must betake ourselves to the great work of Miklosich, *Vergleichende Grammatik der Slavischen Sprachen* (4 vols. 1879). The best dictionaries are those of the Russian Academy (Russe-Français, Makarov, 1874; new ed. 1892; Russian-English, Alexandrov, 1879). In English there are Russian grammars by Morfill (1889) and Riola (new. ed. 1890).

The earliest Russian literature consists of the *bilini*, or legendary poems, which were orally communicated till they were committed to writing in modern times. These are divided into cycles—e.g. those of Vladimir, the prince of Kieff, of Novgorod, and of Moscow. There are large collections of them, and also of the *skazki*, or popular tales. The earliest manuscript which has been preserved of anything which can be said to be distinctly Russian is the codex of the Ostromir Gospels, written at Novgorod in the years 1056–57 by the deacon Gregory, for Ostromir the *posadnik* of Novgorod. After this we get *sborniki*, or collections of miscellaneous works, such as those compiled for the Grand-duke Sviatoslav, and some sermons by Luke, bishop of Novgorod, and others. With the so-called chronicle of Nestor begins the series of Russian annalists. Nestor is supposed to have died about 1114. We have also chronicles of separate parts of Russia, such as Novgorod, Kieff, Pskov, and Volhynia. There is also the *Pouchenie*, or book of instruction, of Vladimir Monomakh, and the prose-poem called 'The Story of the Expedition of Igor' (*Slovo o Polku Igorevě*). The original manuscript of this production was burned in the fire at Moscow in 1812. Important are the Russian legal codes, the *Russkaya Pravda* of Yaroslav in the 12th century, and the *sudebniks* of Ivan III. and IV. In 1504 the first Russian book was printed at Moscow. To the reign of Ivan IV. (the Terrible) belongs the 'Book of Household Management,' assigned to the priest Sylvester. We also have the *Stoglav*, or book of church regulations, issued by Ivan in 1551. At the beginning of the 17th century we have the chronicle of Sergius Kubasov, and towards the close of the same century the interesting work of Kotishikhin on Russia, which was discovered in manuscript in 1840. To the same period belong the writings of Ivan Krizhanich, who is generally reputed to be the father of Panslavism, and the poems and plays of Simeon Polotski (1628–80), who was the tutor to the children of the Emperor Alexei. In the reign of the latter monarch the Russians got back Kieff, which had long been in the hands of the Poles, and thus the culture of the West became accessible to them. With Polotski may be said to terminate the first period of Russian literature with its Byzantine influence.

The second period was to be commenced by the reforming measures of Peter the Great; and Russia now began to look to the West for her models. He established schools, and founded the celebrated Academy of St Petersburg. The first Russian poet of the new era was Antiokh Kantemir (1708–44), who wrote some good satires in the style of Pope and Boileau. But the writer that exercised the greatest influence on Russian literature was Michael Lomonosov, who established the supremacy of the dialect of Great Russia. He was an indefatigable worker in many branches of learning, and earned his chief laurels in natural science. Trediakovski (1683–1769) did something for Russian versification, but was hardly more than a poetaster. Basil Tatistchev (1686–1750) laid the foundations of historical writing, as opposed to the mere chronicler, and Sumarokov (1718–77) those of the drama. A real national comedy was created by Denis von Visin (1745–92) and Kniazhnin also wrote plays with ability. Michael Kheraskov (1733–1801) composed two large epics, the *Rossiada* in twelve books, and *Vladimir* in eighteen, but they have now almost sunk into oblivion. The *Dushenka* of Bogdanovich (1743–1803) was at one time very popular. With Khemnitser begins the series of Russian fabulists. Gabriel Derzhavin (q.v.; 1743–1816) was the great poet of the age of Catharine. He celebrated her glories in many spirited odes. Prose literature was more slow in developing itself. An elegant style can hardly be said to have existed before the time of Nicholas Karamzin (q.v.; 1766–1826), renowned for his history of Russia. On the accession of Alexander I. literature advanced rapidly. The founder of the romantic school of poetry was Basil Zhukovski, who, although he wrote but few original pieces, was beneficial to his countrymen by his translations from English and German. Other poets of the period were Dmitriev and Batiushkov. The most brilliant author, however, of the new school was Alexander Pushkin (q.v.), the greatest poet whom Russia has yet produced, who has left some charming narratives in verse, and other works. The fables of Ivan

Krilof (1768–1844) have always enjoyed considerable reputation among the Russians. A clever writer of comedy was Griboyedov, killed at Teheran in 1829. Since the death of Pushkin the Russians have had Michael Lermontoff (q.v.; 1814–41), author of the *Demon* and some graceful lyrics, and Nicholas Nekrasov, who died in 1877. There are many minor poets; thus Koltsov (1809–42) wrote some of the most national lyrics which have appeared in Russia. Among novelists, the Russians have produced Zagoskin and Lazhechnikov, who imitated Scott; but the foundation of the realistic school among them was begun by Nicholas Gogol (q.v.), one of the most powerful writers of his country. Dostoieffsky (q.v.) and Pisemski, who died in 1881, were also celebrated as novelists; but the first to gain a European fame was Ivan Turgenief (q.v.), who died in 1883. Count Leo Tolstoi (q.v.), though two months older than Turgenief, survived him; he is the author of 'War and Peace' (*Voina i Mir*) and other well-known works. It is in romantic fiction that the Russians have gained their greatest laurels. A celebrated political writer was Alexander Herzen (q.v.), who died at Paris in 1870. Great attention has been paid in Russia to the collection of the national songs (*bilini*), tales, folklore, and proverbs; and among them the works of Sakharov, Ribnikov, and Afanasiev are especially to be mentioned. In history the Russians have produced some eminent names: Karamzin was followed by Ustrialov and Pogodin; and later we have the great work on Russian history in upwards of 28 volumes by Sergius Solovieff, which he did not live to complete, and the still unfinished production of Professor Bestuzhef-Riumin. The Russians have produced few writers on philosophy. In philology we have the names of Vostokov, Sreznevski, and Buslaev.

Russniaks. See RUTHENIANS.

Rust. Neither malleable iron, nor steel, nor cast-iron can be exposed to a moist atmosphere for more than a brief time without becoming rusted. But malleable or wrought iron, being nearly pure iron, rusts rather more readily than either of the others, which essentially contain a certain proportion of carbon (see IRON and STEEL). In a paper read before the Iron and Steel Institute in 1888 Professor Crum Brown explains the chemical processes involved in the rusting of iron. He says that, when a drop of rain falls on a clean bright surface of iron, for a short time the drop remains clear, showing the bright surface of the iron through it. But soon a greenish precipitate forms in the drop, and this rapidly becomes reddish brown. The brown precipitate (peroxide of iron or rust) does not adhere to the iron, but is suspended in the water, and becomes a loosely adherent coating only when the water has evaporated. He further states that iron remains quite free from rust in an atmosphere containing oxygen, carbonic acid, and water vapour (all present in a normal atmosphere except water vapour, which is rarely absent) as long as the water vapour does not condense as liquid water on the surface of the iron. Owing to the hygroscopic character of rust, when it once forms on iron the rusting process will continue in an atmosphere not saturated with water vapour. In other words, the iron in this case will continue rusting in an atmosphere in which a piece of clean iron will not rust, because liquid water will condense on rust when it will not on bright iron. The fact that under ordinary atmospheric conditions the rusting process, when once begun, continues, has been long known. It follows that it is much easier to prevent the first formation of rust than to stop the process.

It is customary to coat with oil paint all kinds of ironwork which are to be exposed to the weather, and this is usually a sufficient protection. But paint is liable to scale off, so that it is necessary to recoat the iron at longer or shorter intervals. A light iron fence, for example, would not long escape destruction by rusting if it were not frequently painted. It is, however, usual to 'galvanise' wire-work and thin sheets of iron, as the zinc coating retards oxidation. A coating of tin also protects the surface of iron from rusting, but it would appear that for this purpose it cannot be so much relied upon as zinc. Japanning (q.v.) is another way of preserving iron. The iron and steel plates forming the sides of ships receive four or five coats of a paint composed of red lead and boiled linseed-oil to protect them from the corrosive action of sea-water, and the sides of these ships are generally repainted after a long voyage. Some of our lighthouses have water-tanks constructed of iron which is not only galvanised, but is also painted with three coats of this red lead paint above the zinc coating. The patent paints depend for their efficiency on the red lead and boiled oil in them. Unlike the peroxide, the magnetic oxide of iron forms an adherent coating to the metal, and only when it is detached can water gain access to the iron beneath it. In 1878 a patent (No. 1280) was taken out by G. & A. Bower for a process of producing a thin film of magnetic oxide on iron articles to protect them from rusting, but the colour of this oxide, which somewhat resembles that of the metal itself, is not attractive. In the comparatively dry atmosphere of occupied rooms the bright surface of iron or steel objects will often keep many years without rusting. Where such objects are care should be taken to keep away from them all volatile corrosive acids, such as nitric, hydrochloric, or acetic acid, or bleaching powder (chloride of lime). Polished surfaces of iron are often coated with tallow mixed with a little white lead for their temporary protection while they are being conveyed from place to place, but this sometimes fails to keep away rust. A more recent and better plan is to coat the bright iron with some varnish soluble in naphtha or paraffin-oil—Brunswick black, for example. A mixture of common rosin with a little pure olive-oil and spirits of turpentine has also been found to be a good preservative in such cases. Iron immersed in an alkaline solution does not rust unless it is very dilute. Very delicate steel instruments are often protected from the action of moist air by placing them in drawers or cases along with chloride of calcium or lime hydrate, but as these substances absorb moisture and swell they require to be occasionally looked at. When bright iron or steel objects are already partially rusted, the rust, if not very deep into the metal, may be rubbed off with paraffin-oil, which contains no oxygen. Should this fail, a rub with fine emery will be necessary. Iron rust stains on linen or cotton are usually removed either with oxalic acid or binoxalate of potash (salt of sorrel). The fabric should be well washed after treatment with any of these substances.

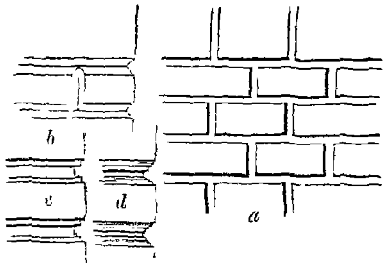
Rust, the common name of *Trichobasis rubigo vera,* a parasitic fungus of the natural order Pucciniæi, which preys upon the leaves, glumes, and stalks of cereals and other grasses. It has been supposed to be a mere condition or stage of

Puccinia graminis, but this is not fully borne out by closer inquiry. Rust does not appear to be very injurious so long as its attack is confined to the leaves only, but it becomes a formidable pest when it attacks the inflorescence or ear; the more so because no effectual remedy can be suggested for it. Every *protospore* is shed before the grain is ripe, therefore steeping the seed is of no avail. The application of any dressing to the soil appears to be equally useless. White wheat is more subject to be attacked by it than red, and some varieties are hardly ever entirely free from it. The use of rank manures is said to induce or aggravate the disease.

Rustam. See FIRDAUSÍ.

Rustchuk, a town of Bulgaria, stands on the south bank of the Danube, opposite Giurgevo, 140 miles by rail NW. of Varna (on the Black Sea) and 40 S. by W. of Bucharest. It has numerous churches and mosques, and manufactures cloth, shoes, pottery, gold and silver ornaments, and furniture. Owing to its situation it possessed, until its fortifications were dismantled after 1877, considerable strategic importance. It was captured by the Russians in 1810 and 1877, and played a prominent part in the Russo-Turkish wars of 1773-90 and 1853-54. Pop. (1887) 27,198.

Rustic Work is the name of that kind of masonry in which the various stones or courses are marked at the joints by splays or recesses. The surface of the stone is sometimes left rough, and sometimes polished or otherwise dressed. Rustication is chiefly used in classical or Italian architecture, although rustic Quoins (q.v.) are often used in rough Gothic work. In the figure *a* and *b* show forms of rustication usually applied to surfaces, *c* and *d* show rustic quoins with mouldings on the angles.



Rustication.

Rutaceæ, a natural order of exogenous plants, consisting mostly of perennial or suffruticose species rarely herbaceous. They are all found in the temperate regions of the northern hemisphere, and are abundant along the shores of the Mediterranean. A bitter taste and powerful odour are general characteristics. Rue (q.v.) is a familiar example of the order.

Rutebeuf, or RUSTEBEUF, a great 13th-century trouvère, of whose life we know but little, the dates of his birth and death being both unknown. His earliest extant poems are anterior to the final crusade of St Louis; his latest belong to the close of the reign of Philippe le Hardi. He lived a Bohemian life in Paris, amid poverty, debt, and constant distress, his miseries the fruit of an easy temper, lavish habits, a passion for gambling, and an unhappy marriage. His poems include *chansons*, satiric and religious, but not amatory; *complaintes* of death, in the name of contemporary great men; animal and moral allegories; dramatic monologues, among them the *Miracle de Théophile*, a clever drama of a compact concluded with the devil, from the consequences of which the victim is saved by the Virgin; metrical lives of St Mary of Egypt and St Elizabeth of Hungary; and fabliaux, full of honest gaiety. Rutebeuf was inspired by the crusading fever, and took part in the great quarrel between the Dominicans and the regular clergy in the university of Paris, some of his best work being his satires against the religious orders, the mendicant friars, Dominicans and Minorites, and indeed all clerics, students alone excepted. His most striking qualities are strength, spirit, and colour, and some of his satires reveal a touching note of personality that reminds the reader of Villon.

His poems were edited by A. Kressner (Wolfenbüttel, 1885). See the study by Léon Clédat (1891) in *Les Grands Écrivains Français*.

Ruten, a Palestinian people, Aramæan or at least Semitic, with whom the Egyptians waged war under the 18th and 19th dynasties. See EGYPT, Vol. IV. p. 240.

Ruth, BOOK OF. The four chapters of this canonical book tell how Ruth, a young Moabitess, after the early death of her Hebrew husband Mahlon, for the sake of her mother-in-law Naomi came to settle in Bethlehem, and there became the wife of a 'near kinsman' (*gôēl*), Boaz, and the mother of Obed, grandfather of king David. The story is placed 'in the days when the judges judged' (i. 1), about a century before the time of David; but on its own showing it was not written till long after the events it describes (iv. 7). How long afterwards is a question on which critics are not agreed; most of them consider it to be exilic (Ewald) or post-exilic (Bertheau, Wellhausen, Kuenen), mainly on the linguistic and genealogical evidence; but Driver (*Introd. to Old Testament*, 1891) thinks that the general beauty and purity of the style, which stand on a level with the best parts of Samuel, point rather to a date, which he does not seek to fix more definitely, before the exile. That the book was not received into the canon till a very long time after the captivity is shown by its place in the original Hebrew, where it occurs as one of the Hagiographa or 'writings' (see BIBLE), standing second among the five Megilloth or Festal Rolls, between Canticles and Lamentations, a position which proves that it did not become canonical till after the series of 'former prophets,' extending from Joshua to 2 Kings, had been finally closed. In the Septuagint, however, which gives it the place it claims in the historical order, it comes between Judges and Samuel, and the same order is observed in the Vulgate and in the English Authorised Version. That Josephus also must have reckoned it as an appendix to Judges is shown by his enumeration of the books of the Old Testament as numbering only twenty-two. The purpose of the book has been variously explained. Some think that it was intended to inculcate the duty of Levirate marriage (Deut. xxv. 5-10, and see MARRIAGE); to this theory it is perhaps enough to reply that Boaz was not Mahlon's brother, and that David was never reckoned as the descendant of Mahlon. But the story undoubtedly has a bearing on the rights, duties, and privileges of *gôēlîm* or 'near kinsmen,' if these be taken in a somewhat wider sense. Others will have it that with the framers of the canon the interest of the book was chiefly genealogical. It certainly supplements the genealogy of David as given in the older books; in 1 Samuel, though relations with Moab are alluded to (xxii. 3), his ancestry is not traced beyond Jesse, and that the tendency of later ages was to greater amplification is shown incidentally by Matt. i. 5. But perhaps this little idyll of upright happy life in the good old God-fearing times, set forth with a simplicity and directness the charm of which no one can fail to feel, does not need any special vindication of its claim to rank with the narratives of Genesis, Judges, or Kings.

See the Old Testament introductions, especially those of Reuss, De Wette-Schrader, Bleek-Wellhausen, and Driver; also the commentaries on Judges and Ruth by Bertheau and by Keil, that in the *Speaker's Commentary*, and others.

Ruthenians, a branch of the Little Russian division of the Slav race, dwell on both sides of the Carpathians, in Galicia and north-eastern Hungary, about 2,800,000 in the former and some 360,000 in the latter region. They are of medium stature, but somewhat slim in build. Nevertheless they make hardy farmers, herdsmen, wood-cutters, and charcoal-burners—their favourite occupations. For various reasons—great subdivision of the soil, years of subjection to the Polish nobles, the extortion of the Jews, addiction to drink, and the lack of industries, though the house industries flourish—they are sunk in great poverty. The clergy of the Greek United Church, to which they are greatly devoted, are their intellectual and political leaders. The people cling to traditional usages and customs, and have a leaning to fatalism and melancholy. Since 1848 the native language has begun to take vigorous root again, and to blossom out into a literature. See the article SLAVS; Szuski, *Die Polen und Ruthenen in Galicien* (1882); and Kupczanko, *Die Schicksale der Ruthenen* (1887).

Ruthenium (sym. Ru; atom. wt. 103·5; sp. gr. 12·3) is a metal discovered in 1843 by Claus in the ore of platinum. It forms no fewer than four different oxides. Of these the tetroxide, RuO_4, is remarkable for its volatility, boiling at a little above 100° C. For details regarding the metal, which is of no practical importance, the reader may consult Deville and Debray's *Memoir on Platinum and its Ores.*

Rutherford, SAMUEL, Scottish preacher and divine, was born at the hamlet of Nisbet, near Jedburgh, about 1600. He attended school at Jedburgh, and entered Edinburgh College in 1617, obtained a town bursary in 1618, and took his M.A. degree in 1621. Two years afterwards his extraordinary talent led to his appointment as regent or professor of Humanity, but an antenuptial irregularity with his wife caused his resignation in 1625, when he turned his attention to theological study. Through the influence of Gordon of Kenmure, afterwards Viscount Kenmure, he settled as minister of Anwoth in 1627. Here it was his habit to rise at three A.M. for study and prayer, and of his ministry it has been said that he was always praying, always preaching, always visiting the sick, always catechising, and always writing and studying. Though he had a kind of *skreigh* in his voice, Wodrow says he was 'one of the most moving and affectionate preachers in his time, or perhaps in any age of the church.' Here he began that correspondence with his godly friends, chiefly in Galloway and Ayrshire, which made him beloved, useful, and famous, and which earned the title when published of being 'the most seraphic book in our literature.' 'Hold off the Bible,' said Baxter, 'such a book the world never saw the like;' while Mr Spurgeon has pronounced it 'the nearest thing to inspiration which can be found in all the writings of mere man.' In 1636 his *Exercitationes de Gratia* came out at Amsterdam, a book directed against the Arminians; a second edition appeared in the same year, and he was invited to fill a Divinity chair in Holland. Because of this work and non-compliance with Episcopal ceremonies, he was summoned before the High Commission Court at Wigtown on July 27, 1636, deprived of his ministerial office, and banished to Aberdeen. Here he remained from September 1636 to February 1638, writing letters, disputing with Episcopalians, and bewailing his 'dumb Sabbaths.' He was restored to Anwoth, but was appointed by the Assembly professor of Divinity at St Andrews in 1639, became colleague to Robert Blair in the church of St Andrews, and afterwards principal of the New College (1647). Here he was as industrious as ever, performing the duties of both preacher and professor. In 1643 he was sent to the Westminster Assembly as a commissioner from the Church of Scotland, and there is a draft of a *Shorter Catechism* in his handwriting in Edinburgh University Library. During his four years' attendance he seems to have been prominent enough to be singled out for mention by Milton. His *Due Right of Presbyteries* (1644), *Lex Rex* (1644), *Trial and Triumph of Faith* (1645), *Christ Dying and Drawing Sinners to Himself* (1647) belong to this period. Rutherford's *Lex Rex* was conceived in too bold a spirit of freedom for the government of Charles II.; it was burned by the hangman in Edinburgh and by Sharpe at St Andrews in 1661. Its author was deposed from all his offices, and summoned to answer a charge of high-treason at next parliament. Rutherford received the citation on his death-bed, and sent answer, 'I behove to obey my first summons,' and went to a higher tribunal on 29th March 1661 (not 20th March, as his tombstone states); he was buried at St Andrews. There is a monument to his memory at Anwoth. No portrait of Rutherford exists, but he has been described as a 'little fair man' with 'two quick eyes;' when he walked he held his face upward. He was extremely charitable in private, and was much looked up to and consulted in matters of personal religion. Livingston, who knew him well, said 'he had most sharp piercing wit and fruitful invention and solid judgment.' He was twice married, and of seven children by his second wife, one daughter alone survived him. No divine in the first half of the 17th century has left a greater reputation for sanctity. He was twice offered a professor's chair in Holland. Freedom and breadth theologically, along with hardness and narrowness ecclesiastically, meet in Rutherford's published works.

Rutherford's religious genius is seen at its highest in his *Letters*, which, to the number of 284, were collected and published under the title of *Joshua Redivivus* by his secretary M'Ward (Rotterdam, 1664). A third edition in 1675 had 68 additional letters. Over twenty-five different editions have since appeared, the best being that by Andrew A. Bonar, D.D., with biographical sketch of his life and notes regarding his correspondents (Edin. 1891). Sixteen works, controversial or theological, were issued in his lifetime; his *Lex Rex*, dealing with the prerogative of king and people, is as keenly logical and controversial as his letters are unworldly and full of sweetness, fancy, and spiritual life. Among his posthumous works are *Twelve Communion Sermons* (1876), and *Quaint Sermons*, edited by Bonar (1885).

See Taylor Innes in the Evangelical Succession Lectures, 2d series; M'Adam Muir in the St Giles' Lectures, 3d series; Livingston's *Characteristics;* and Lives by Murray (1828) and Thomson (1884). For the scandal of his youth, see the Edinburgh Town Council Records of date 3d February 1626.

Rutherglen (popularly *Ruglen*), a town in Lanarkshire, on the Clyde, 3 miles SE. of Glasgow, with whose eastern extremity it is connected by a bridge, built in 1890–91 at a cost of £29,000. It consists of one long wide street, with several narrow streets branching off at right angles; and its principal building is a handsome town-hall (1862). In ancient times Rutherglen was a place of much importance, carrying on a large traffic on the river, and embracing great part of Glasgow within its municipal boundaries. It was the seat of a royal castle, which was captured by Edward Bruce about 1313, burned by Moray in 1568, and finally demolished in the 18th century. At Rutherglen, on 29th May 1679, the Covenanters published a 'Declaration and Testimony of the true Presbyterian Party in Scotland'—the prelude to Drumclog and Bothwell Bridge. The trade is now mainly dependent upon that of Glasgow, and its inhabitants are employed in the mills, print, chemical, and dye-works, and collieries of the burgh and vicinity. A royal burgh since 1126, it unites with Kilmarnock, &c. to return one member to parliament. Pop. (1831) 4741; (1861) 8062; (1891) 13,361. See Ure's *History of Rutherglen* (1793).

Ruthin, a town of Denbighshire, North Wales, on the Clwyd, 8 miles SSE. of Denbigh by rail. The 13th-century castle which gave it name (Cym. *rhyd-din,* 'red fortress') surrendered in 1646 to the Roundheads, and was afterwards dismantled, part of its site being now occupied by a castellated mansion. A grammar-school, founded by Dean Goodman of Westminster in 1594, was reconstituted in 1881; and there are also an interesting collegiate church, a county hall, a corn exchange, &c. Chartered by Henry VII. in 1507, Ruthin unites with Denbigh, &c. to return one member. Pop. (1851) 3373; (1891) 2760. See Newcome's *Castle and Town of Ruthin* (2d ed. 1836).

Ruthven, Raid of, a Scottish conspiracy contrived and executed in 1582 by William, first Earl of Gowrie, father of the chief actor in the Gowrie Conspiracy (q.v.), in conjunction with Lord Lyndsay of the Byres, the Earl of Mar, and the Master of Glammis. The boy-king James VI., then under the influence of Lennox and Arran, was invited to Gowrie's seat, Castle Ruthven (pron. *Rivven*) or Huntingtower, 3 miles WNW. of Perth, to hunt; but the next morning (23d August) he found himself a prisoner in the midst of a thousand armed men. He tried to get out, but the Master of Glammis detained him, and said when he wept, 'Better bairns greet than bearded men.' Arran was thrown into prison, and Lennox retired to France, where he died broken-hearted. The Presbyterian clergy warmly espoused the cause of the Ruthven lords, who received the thanks of the General Assembly, and full indemnity from a Convention of Estates. Nearly a year elapsed before the king regained his freedom. His feigned acquiescence in his position led the confederates so to relax their vigilance that, on 20th May 1583, he was enabled to escape from Falkland to the castle of St Andrews. Gowrie and the other lords made their submission, and were pardoned; but soon afterwards a royal proclamation branded their enterprise as treason. Gowrie was commanded to leave Scotland; but in April 1584, while waiting for a vessel at Dundee, he was drawn into a conspiracy to surprise Stirling Castle, for which he was tried and executed.

Ruthwell, a Dumfriesshire coast parish, 9 miles ESE. of Dumfries. Its famous sandstone cross, 17¾ feet high, bears carvings in front and behind of the Crucifixion, Annunciation, &c., with corresponding Latin inscriptions in the Roman character, and on the sides of scroll-work, with runic verses from 'The Dream of the Holy Rood' (see Cædmon). Dating possibly from about 680 A.D., the cross was cast down and broken in 1642 as a monument of idolatry; but in 1802 was re-erected in the manse garden by the Rev. Henry Duncan (q.v.), and in 1887 removed to an apse adjoining the church. See Dr J. Anderson's *Scotland in Early Christian Times* (2d series, 1881).

Rutile (Lat. *rutilus,* 'reddish'), a mineral, which is essentially *Oxide of Titanium* or *Titanic Acid,* although generally containing a little peroxide of iron. It crystallises in tetragonal forms, generally as slender four-sided or six-sided prisms and needles. Now and again it occurs massive. It varies in colour from yellow to brown and red. Sometimes it presents a curious interlaced character, known as *Sagenite.* It not infrequently occurs as an endomorph in rock-crystal. As a rock-forming mineral it is not of much importance, but occurs generally as minute granules and aggregates or prismatic crystals in schistose rocks, gabbro, and other rocks. Massive rutile is used to give a yellow colour to porcelain.

Rutlam, a small Indian native state in the Western Malwa agency (see Central India), with a pop. of 100,000. The capital, Rutlam, is a great opium mart, and has a college; pop. 31,000.

Rutland, the smallest county in England, bounded by Leicester, Lincoln, and Northampton shires. It measures 18 by 15 miles, and has an area of 150 sq. m. or 95,805 acres. The Gwash or Wash, flowing to the Welland (which traces the south-east boundary), divides it into two portions—the northern a somewhat elevated tableland, while the southern consists of a number of valleys running east and west, and separated by low hills. Limestone is plentiful; and the soil is mostly a deep clay. Half the whole area is permanent pasture, and woods occupy some 3000 acres. Towns are Oakham and Uppingham, and there are fifty-one parishes. Rutland gives the title of duke to the family of Manners (q.v.). Its representation was reduced to one in 1885. Pop. (1801) 16,380; (1861) 21,861; (1891) 20,659. See Murray's *Northamptonshire and Rutland* (1878).

Rutland, capital of Rutland county, Vermont, is on Otter Creek, close to the Green Mountains, and 67 miles by rail SSE. of Burlington. The chief industry is the quarrying and working of marble; the place has also several foundries and railroad shops, and contains the state workhouse. From 1784 to 1804 Rutland was one of the capitals of Vermont. Pop. (1880) 7502; (of township) 12,149; (1890) 11,760.

Rütli, or Grütli, a meadow on the west side of the southern arm of Lake Lucerne, the traditional cradle of Swiss independence: here the representatives of the three cantons, Uri, Schwyz, and Unterwalden, took the oath (1307) to drive out the Austrians. It is national property, having been purchased with the pence of Swiss school-children, and is adorned with a monument (1860) to Schiller, the author of *Wilhelm Tell,* and with another (1884) in commemoration of the oath.

Ruvo in Apulia, a cathedral city of Southern Italy, 22 miles W. of Bari. Here, on the site of the Roman Rubi, numerous ancient vases and sepulchral treasures have been dug up. Pop. 17,728.

Ruwenzori, a mountain in the centre of Africa, just north of the Equator, between Lakes Albert Nyanza and Albert Edward Nyanza. It was discovered by Stanley in 1888, and is estimated to reach 19,000 feet in altitude. Its summit is covered with perpetual snow. Stanley identifies this peak and some neighbouring ones (Mount Gordon Bennett, Mackinnon Peak) with the Mountains of the Moon of ancient geographers.

Ruysbroek, Johannes, Flemish mystic, born at Ruysbroek near Brussels in 1293, was vicar of S. Gudule's in Brussels, but in 1353 withdrew to the Augustinian monastery of Groenendael near Waterloo, and died its prior in 1381. His mysticism, mainly derived from Eckhart (q.v.), but directed in the channels of practical charity, gained for him the title of *Doctor ecstaticus.* Gerhard Groot (q.v.) was his friend. Ruysbroek wrote in Latin and in Flemish; his works were published in Latin in 1552, and in German in 1701. See Lives by Engelhardt (Erlangen, 1838), Ch. Schmidt (Strasburg, 1859), and Otterloo (Amsterdam, 1874).

Ruysdael, or RUISDAEL, JAKOB, the greatest landscape-painter of the Dutch school, was born at Haarlem about 1628. In 1648 he was enrolled a member of the guild of St Luke at Haarlem, and in 1659 was granted the freedom of the city of Amsterdam. He died in the almshouse of Haarlem on 14th March 1682. He loved to paint forest glades with oak-trees; sleeping pools beneath clusters of trees, with an old picturesque building, a mill or a ruined temple, or a glimpse of a distant town; a waterfall with rugged rocks, and coast scenes, where sea and earth meet. The scenes were mainly taken from the neighbourhood of Haarlem, partly from the districts of Germany that border on Holland. His work shows that he had a fine feeling for the poetic spirit of nature, which he embodies with great skill. His pictures exist in Dresden, Berlin (probably the two best collections), the Louvre, the London National Gallery, Amsterdam, and the Hague. See E. Michel, *Ruysdael et les Paysagistes d'Harlem* (Paris, 1890).

Ruysselede, a town in the Belgian province of West Flanders, 14 miles SE. of Bruges, has a large reformatory for boys (1849). Pop. 6793.

Ruyter, MICHAEL ADRIANSZOON (afterwards De Ruyter), Dutch admiral, was born at Flushing on 24th March 1607 of poor parents, who sent him to sea as a cabin-boy when only eleven. He changed into the navy, and by 1635 had risen to the rank of captain. From 1643 to 1652 he was again in the merchant service, and fought against the pirates of Barbary. When war broke out between England and Holland in 1652, a fleet was given to Ruyter; with it he beat off an attack made upon him (20th August) by Sir G. Ayscue off the Lizard, but in conjunction with De Witt was compelled to retire after vainly attacking Blake off the mouth of the Thames (28th September). They had their revenge, however, two months later, when they defeated Blake off Dover. In the following year Ruyter took part in the running fight in the English Channel of 18th–20th February against Blake; in that of Solebay or Southwold (2d–3d June) against Monk and Deane and Blake; in the indecisive battle off Katwyk; and in that off the Texel (29th July), in which his superior, Tromp, was killed and the Dutch fleet defeated. After this Ruyter was made vice-admiral of Holland. In 1654 peace was concluded between the two countries. In the years immediately following Ruyter was sent to blockade the coasts of Portugal, and then those of Sweden (on behalf of Denmark); he compelled the Swedes to surrender Nyborg in Fünen in 1659. On the conclusion of the Dano-Swedish war (1660) the king of Denmark ennobled him. The years 1661–63 were principally occupied with checking in the Mediterranean the piracy of the Turkish states of North Africa. In 1664 war broke out again between England and Holland, and De Ruyter steered his fleet to the west coast of Africa, and took from the English Gorée and some forts on the Guinea coast; in 1665 he preyed upon English merchant-vessels in the West Indies, made his way home round Scotland, and was chosen admiral-in-chief of the Dutch fleet; in 1666 he fought for four days (June 1-4) against Monk and Prince Rupert off Dunkirk, neither side gaining the victory, though the English were the first to retire; nevertheless in July he was beaten by Monk, and driven back to Holland. In 1667 he caused great consternation in London by sailing up the Medway as far as Rochester, and burning some of the English ships, and entering the Thames a second time as high as Gravesend, besides attacking Harwich. Then came peace again; and in 1672 war once more, this time against England and France combined. De Ruyter's principal achievements in this war were to attack the English and French fleets under the Duke of York, the Earl of Sandwich, and Count d'Estrées in Solebay (28th May 1672), after which he retired to Holland; to defeat Prince Rupert and D'Estrées off Schooneveldt in June 1673, and again off Kijkduin and Helder in August. Peace was then made with England; but the war with France still went on. In the end of 1675 De Ruyter set sail for the Mediterranean, to go and help the Spaniards against the French. He encountered the French fleet under Duquesne near the Lipari Islands a few days before the New Year, and again in April in the Bay of Catania, on the east of Sicily. After the first encounter the Dutch-Spanish fleet drew off towards Palermo; in the second they were routed, and De Ruyter was seriously wounded in the right leg, the first serious wound in his life of battles. He died exactly a week later, on 29th April, in Syracuse. His body was buried in the New Church at Amsterdam. De Ruyter was a man of unaffected piety, simple in his manners, and of unflinching courage; as a seaman he deserves to take rank along with Blake and Nelson.

See Life (anon. Amsterdam, 1677), by Brandt (Amst. 1698), and by Richer (1783), all in French.

Ryan, LOCH, an arm of the sea, extending in a south-easterly direction into Wigtownshire from the southern entrance of the Firth of Clyde, fully 8 miles in length, with a breadth of from 1½ to almost 3 miles. From about the middle of its western side a broad sandbank called the Scar projects diagonally across it for about 2½ miles; opposite is Cairn Point with a lighthouse (1847). At its south-western corner stands the port of Stranraer, with daily steamers plying to and from Larne; two miles west of its northern extremity is Corsewall Point, a bold headland with a fine lighthouse (1816). Loch Ryan affords safe and commodious anchorage, being very deep close to its eastern shores, which are sheltered by the high hills of Finnart and Craigcaffie, as its western are by the beautifully wooded heights of Kirkcolm and Leswalt. The *Rerigonius Sinus* of Ptolemy, Loch Ryan has been rendered classic, in name at least, by the pathetic traditional ballad, 'Fair Annie of Lochryan'—the question of its localisation is quite another matter. Hew Ainslie's spirited song, 'The Rover o' Lochryan,' deserves mention also.

Rybinsk, a town of Russia, stands on the right bank of the Volga, at the termination of a branch-line (174 miles) of the Moscow and St Petersburg Railway, and 48 miles NW. of Yaroslav. It has a very large trade in transhipping and forwarding to the capital by canal the goods brought hither by large vessels up the Volga. Those goods are corn, flour, tallow, spirits, metals, timber, potash, salt, &c. Boat-building, rope-making, brewing, and distilling are the chief industries. Pop. 19,571, increased to 100,000 in the busy summer season.

Rydal Mount. See LAKE DISTRICT.

Ryde, a flourishing and fashionable watering-place on the north-east coast of the Isle of Wight, 4¼ miles SSW. of Portsmouth, from which it is separated by the roadstead of Spithead. It consists of Upper and Lower Ryde, the former occupying the site of an ancient village, *La Rye* or *La Riche*, destroyed by the French in 1377, and the latter of quite modern construction. Fielding in 1753 described Ryde as 'a pleasant village, separated at low-water from the sea by an impassable gulf of mud;' but now there are excellent sands, and the appearance of the town with its streets and villas interspersed with trees is pleasing and picturesque. The longer of the two piers (768 feet) was constructed in 1813-61; of the buildings may be noticed the town-hall (1831); All Saints' Church (1870), by Scott, with a spire 173 feet high; St Mary's Roman Catholic Church (1846), by Hansom; and the Royal Victoria Yacht Club-house (1847). Ryde was made a municipal borough in 1868. Pop. (1811) 1601; (1851) 7147; (1881) 11,461; (1891) 10,952.

Rye, a decayed seaport of Sussex, 11 miles NE. of Hastings, and 2 miles inland now owing to the retirement of the sea. It stands on an eminence bounded east by the Rother, south and west by the Tillingham, and presents a quaint, old-world aspect. On a rock overlooking the confluence of the streams is the 12th-century Ypres Tower (now a police station), built in Stephen's reign by William de Ypres; the church, mainly Norman and Early English in style, and one of the largest in the kingdom, was restored in 1883. Then there are the old Land Gate, a former Carmelite chapel, and a grammar-school (1638). The *Novus Portus* of Ptolemy, Rye was granted by the Confessor to Fécamp Abbey, and by Henry III. was made a Cinque Port (q.v.). It became a Huguenot asylum after 1562 and 1685 (Thackeray's *Denis Duval* is laid here); and it returned two members till 1832, and then one till 1885. Fletcher the dramatist was a native. Pop. (1841) 4071; (1881) 4224; (1891) 3871. See Holloway's *History of Rye* (1847).

Rye (*Secale*), a genus of grasses, allied to Wheat and Barley, and having spikes which generally consist of two-flowered, rarely of three-flowered, spikelets; the florets furnished with terminal awns, only the upper floret stalked. One species (*S. cereale*) is a well-known grain. It has, when in fruit, a roundish-quadrangular spike, with a tough rachis. Its native country, as in the case of the other most important cereals, is somewhat doubtful; but it is said to be found wild in the desert regions near the Caspian Sea, and on the highest mountains of the Crimea. It has long been cultivated as a cereal plant; although the supposed mention of it in Exodus, ix. 32, is doubtful, spelt being perhaps intended. It is much cultivated in the north of Europe and in some parts of Asia. Its cultivation does not extend so far north as that of barley; but it grows in regions too cold for wheat, and on soils too poor and sandy for any other grain. Its ripening can also be more confidently reckoned upon in cold regions than that of any other grain. But rye succeeds best, and is most productive, in a climate where wheat still ripens. It delights in sandy soils. The varieties of rye are numerous, although much less so than those of other important cereals. Some are best fitted for sowing in autumn, others for sowing in spring. The former kinds (Winter Rye) are most extensively cultivated, being generally the most productive. In some places on the continent of Europe rye is sown at midsummer, mowed for green fodder in autumn, and left to shoot in spring, which it does at the same time with autumn-sown rye, producing a good crop of small but very mealy grain. In Britain rye is not a common grain-crop, and is cultivated to a smaller extent than it formerly was; the sandy soils, to which it is best adapted, being improved and fitted for other kinds of corn. It is, however, sometimes sown to be used as a green crop, for feeding sheep and oxen in winter, and is found particularly good for milch cows. It is sometimes also mown for horses and other animals. Bread made of rye is much used in the north of Europe; it is the familiar 'black-bread' of Germany, and the main sustenance of the Russian peasant throughout large regions. It is of a dark colour, more laxative than that made of wheat-flour, and, perhaps, rather less nutritious. Rye is much used for fermentation and distillation, particularly for the making of *Hollands*. The Russian beer called *kvass* is made from rye-meal. Rye affected with Ergot (q.v.) is a very dangerous article of food. The straw of rye is tougher than that of any other corn-plant, and is much valued for straw-plait. Perennial Rye (*S. perenne*) differs from common rye in having a very hard, red-like culm; ears, 3 to 5 inches long, flatly compressed, with a brittle rachis, and fifty to sixty closely imbricated spikelets. It endures for many years, but is not much cultivated, as its grain is slender, and does not yield an easily separable flour.

Rye-grass (*Lolium*), a genus of grasses, having a two-rowed, flatly-compressed spike, the spikelets appressed edgewise to the rachis. Perennial Rye (*L. perenne*), the *Ray-grass* of the older English authors, is frequent on waysides, and in meadows and pastures, in Britain and on the continent of Europe. The leaf is highly glazed, narrow tipped, has an obtuse ligule, surrounded by an auricle or collar-like portion of blade; whilst the younger leaves are folded throughout their length on the midrib when emerging from the purple sheath. The spikelets are much longer than their solitary external glume, six to eight flowered; the florets awnless or nearly so; the culm flattened, from 1 foot to 2 feet high; the root producing leafy barren shoots, which add much to the agricultural value of the grass. This grass is highly valued for forage and hay, and is more extensively sown for these uses than any other grass, not only in Britain, but also on the continent of Europe and in North America. It grows well even on very poor soils. The Perennial Rye is the kind most generally cultivated. Between 1882 and 1890 there was much discussion in England as to whether or not rye-grass is really

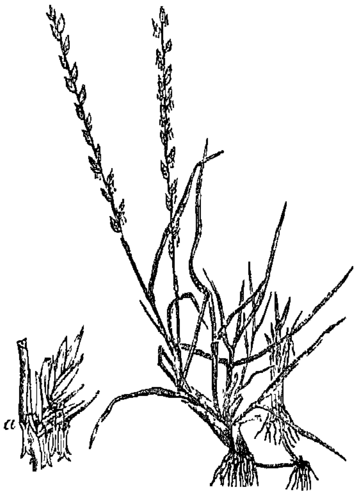


Fig. 1.—Perennial Rye-grass (*Lolium perenne*) in flower, showing united root tufts: *a*, a spikelet in flower.

perennial. It is admitted to be of short duration on poor, dry soils, or in soils soaked with stagnant water, but its claim to be ranked as a lasting plant where the circumstances are even moderately favourable has been incontestibly established. A kind called Common or Annual Rye (*L. vulgare*, *L. annum*), not really an annual plant, although useful only for one year, is sometimes cultivated, but is, in almost every respect, inferior. Italian Rye (*L. italicum*, or *L. multiflorum*, or *L. bouchianum*), a native of the south of Europe, is much esteemed as a forage and hay grass, and is preferred by cattle to the perennial rye-grass. In many soils and situations in Britain it succeeds extremely well, and is remarkable for its verdure and luxuriance in early spring. There are many varieties of rye-grass. It is nowhere so much valued or cultivated as in Britain, and was grown as a crop in England before the end of the 17th century. Rye, along with other grass seeds and the seeds of clovers, is generally sown along with some kind of corn, and, vegetating for the first year amongst the corn, appears in the second year with the other grasses and clovers as the proper crop of the field. See Stebler and Schröter, *The Best Forage Plants* (Eng. trans. by M'Alpine, 1889), from which our illustrations are copied.

Rye-house Plot. In 1682-83, whilst a scheme was formed among the leading Whigs to raise the nation in arms against Charles II., a subordinate scheme was planned by a few fiercer spirits of the party—including Colonel Rumsey and Lieut.-colonel Walcot, two military adventurers; Goodenough, under-sheriff of London; Ferguson, 'the Plotter;' and several attorneys, merchants, and tradesmen of London—the object of which was to waylay and assassinate the king on his return from Newmarket. The deed was to be perpetrated at a farm near Hertford, belonging to Rumbold, one of the conspirators, called Rye-house, whence the plot got its name. The Rye-house Plot is supposed to have been kept concealed from Monmouth, Russell, Shaftesbury, and the rest of those who took the lead in the greater conspiracy. It owed its defeat to the circumstance that the house which the king occupied at Newmarket took fire accidentally, and Charles was thus obliged to leave that place eight days sooner than 22d March. Both the greater and lesser conspiracy were discovered before long, and from the connection subsisting between the two it was difficult altogether to dissever them. The indignation excited by the Rye-house Plot was extended to the whole Whig party; Russell, Algernon Sidney, and Walcot were brought to the block for treason; John Hampden, grandson of the patriot, was fined £40,000; and scarcely one escaped who had been concerned in either plot. See *Ferguson the Plotter*, by J. Ferguson (1887).

Ryle, John Charles, Bishop of Liverpool, was born at Macclesfield, May 10, 1816, studied at Christ Church, Oxford, carried off the Craven Scholarship, and graduated with a classical first-class in 1837. He took orders, and was successively curate at Exbury, Hants; rector of St Thomas', Winchester (1843), of Helmingham, Suffolk (1844); vicar of Stradbroke, Suffolk (1861); rural dean (1870), honorary canon of Norwich (1872); select preacher at Cambridge (1873-74), and at Oxford (1874-76). In 1880 he was nominated by Beaconsfield Dean of Salisbury, and before he had taken possession was raised to the newly-formed see of Liverpool. A prominent member of the Evangelical party, Bishop Ryle has written countless tracts of vast popularity, and the following books: *Coming Events and Present Duties* (1867); *Bishops and Clergy of Other Days* (1868); *The Christian Leaders of the Last Century* (1869); and *Expository Thoughts on the Gospels* (7 vols. 1856-69).

Rymer, Thomas, compiler of the *Fœdera*, was born at Northallerton in 1639, studied at Sidney Sussex College, Cambridge, and entered at Gray's Inn in 1666. He published translations, critical discussions on poetry, dramas of his own, and works on history, and was appointed historiographer royal; but he died in poverty, 14th December 1714. Pope considered him 'one of the best critics we ever had;' Macaulay 'the worst critic that ever lived'—both rather overstating the case. His principal critical work is *The Tragedies of the Last Age Considered* (1678); but he is chiefly remembered as the compiler of the invaluable collection of historical materials called *Fœdera, Conventiones, Literæ et cujuscumque generis Acta Publica inter Reges Angliæ et alios quosvis Imperatores, Reges, Pontifices, Principes vel Communitates*, extending from the 11th century to his own time. Vols. i.-xv. were published before Rymer's death; vols. xvi.-xx. by his assistant, Sanderson, in 1715-35; Tonson's reprint of the first 17 vols. in 1727-29; the Hague edition in 1737-45; that (incomplete, 4 vols.) of the Record Commission in 1816-69; and Sir Thomas Hardy's *Syllabus* of the whole, in 2 vols., in 1869-73.

Rymour. See Thomas the Rhymer.

Ryot. See India, Vol. VI. p. 115.

Rysbrach, Michael, sculptor, born at Antwerp on 24th June 1693, settled in London in 1720, and executed numerous works, in particular the monument to Sir Isaac Newton in Westminster Abbey (1731), that to the Duke and Duchess of Marlborough at Blenheim, a bronze equestrian statue of William III. for Bristol (1733), a colossal statue of George II. for the parade at Greenwich Hospital (1735), a Hercules at Stourhead, a statue of Queen Anne at Blenheim, one of Locke in Christ Church, Oxford (1757), and busts of Admiral Vernon, Earl Stanhope, Kneller, Gay, Rowe, Milton, Ben Jonson, Palladio, Inigo Jones, the Dukes of Somerset, Beaufort, and Argyll, Sir Hans Sloane, Pope, Sir R. Walpole, Bolingbroke, &c. He died 8th January 1770.

Ryswick, Peace of, was signed at Ryswick, a Dutch village, 2 miles S. of the Hague, by France, England, the Netherlands, and Spain, on September 20, and by Germany on October 30, 1697. It wound up the sanguinary contest in which England and her allies had been engaged with France, by putting an effectual check upon the power and overweening ambition of France.

Rytina. See Rhytina.

S

S the nineteenth letter in our own and most western alphabets, is descended through the Greek *sigma* from *shin*, the twenty-first Semitic letter. The Phœnician symbol, W, arose out of the hieratic form of the hieroglyphic picture of plants growing in an inundated garden (see ALPHABET). The Semites called the letter *shin*, the 'teeth,' a name explained by the hieratic form, which resembles a row of teeth in the lower jaw. Though the form of the Greek letter *sigma* was derived from that of *shin*, the name was obtained from that of the Semitic sibilant *samech*. This must be attributed to the fact that, while the Semitic languages require four sibilants, Greek needs only three. One of the four was consequently disused, but, the usage differing in different dialects, a confusion arose, so that in the final or classical Greek alphabet it came to pass that the name used in one dialect was applied to the symbol adopted in another. The form of the Phœnician letter resembled our W. This, in the early Greek alphabets, became ≨ or ≤. In the Latin alphabet this was rounded, giving S. Our long *s* was derived from the old Roman cursive, the tick on the left of ſ being a surviving vestige of the lower curve of *s*. The sound of *s* is that of the hard open sibilant—a hiss formed by bringing the blade of the tongue near the front of the palate—the sound of *z* being the corresponding soft open sibilant. In Latin the sound of *z* did not exist, consequently the letter disappeared, and its place in the alphabet was taken by the new letter *g*. In the time of Cicero it was reintroduced for the transliteration of Greek words. Anglo-Saxon, also, had no *z*, the letter being introduced for the representation of Greek or French words, such as *zone*, *zest*, or *zeal*. But, although we now possess the letter, we are chary of its use, and its sound is constantly represented by *s*, as in *reason*, *rose*, *rise*. We use *s* both in *hiss* and *his*, in *hearse* and *hers*, in *curse* and *curs*, in *loose* and *lose*, though in one case the sound is that of *s* and in the other of *z*. Few genuine English words have *z*, though in some cases, such as *freeze* and *dizzy*, owing to Norman influence, a *z* has replaced an Old English *s*. Sometimes, as in *sugar* and *sure*, *s* has the sound of *sh* or *zh*, a sound which usually arises from the softening of the Anglo-Saxon *sc*, as in 'shall' from *sceal*, 'shame' from *scamu*, 'fish' from *fisc*, 'shade' from *scadu*, or 'sheep' from *sceap*. This change is characteristic of the southern dialects, the northern *Skipton* (sheep-tun) answering to the southern *Shipton*. So *skipper* and *shipper* are doublets, obtained from northern and southern forms of the same word. Occasionally the Anglo-Saxon form is preserved, as in *scar* and *score*, or is replaced by *sk*, as in *skin*. Owing to French influence *c* acquired a sibilant sound before *e* and *i*, and hence in a few words an Anglo-Saxon *s* has been replaced by c, as in 'mice,' from A.S. *mys*, or 'once' from *ones*. A final *s* sometimes disappears owing to its having been mistaken for the sign of the plural, as in 'pea,' from the O.F. *peis* (Lat. *pisum*), 'peas' or 'pease' being regarded as a plural, of which 'pea' was erroneously supposed to be the singular. In the same way the French *cerise* and *relais* have given us 'cherry' and 'relay,' the final *s* in 'cherries' and 'relays' being regarded as the plural sign.

Occasionally *s* is intrusive, as in 'island,' from A.S. *ea-land*, an error due to the false analogy of 'isle' which comes from *insula*; or in 'aisle,' from the French *aile*, or in 'splash' for *plash*, where the *s* seems to be an intensitive. In Greek and Welsh *s* weakens to *h*, as is seen by comparing the Greek *hepta* with the Latin *septem*, or the Welsh *hen* with the Irish *sen*. A German *s* may represent an English *t*, as in *wasser* for 'water,' or *heiss* for 'hot.' In Latin an *s* changed a preceding *b* to *p* and *m* to *n*, as in *scripsi* from *scribo*, and *consul* from *comsul*; and it assimilated a preceding *t* or *d*, as in *cessum* for *cedsum*, and *mons* for *monts*. Before *m*, *n*, *d*, *l*, *r* a medial *s* disappears, as in *judex* for *jusdex*, or *idem* for *isdem*. A final *s* sometimes disappears, as in *ipse* for *ipsus*; and between two vowels it becomes *r*, as in *aurum* for *ausum*, or *aurora* for *ausosa*.

SS, COLLAR OF, a collar composed of a series of the letter S in gold, either linked together or set in close order. Such collars have been much worn in England by persons holding great offices in the state.

Saadi. See SADI.

Saale, a river of Germany, distinguished from smaller rivers of the same name as the Saxon or Thuringian Saale, rises on the western slope of the Fichtelgebirge (Bavaria), and, flowing northward through several minor states, finally across Prussian Saxony, past the towns of Hof, Rudolstadt, Jena, Naumburg, Weissenfels, Merseburg, and Halle, falls into the Elbe, about 18 miles above Magdeburg, after a course of 226 miles. It is navigable from Naumburg to its confluence with the Elbe, a distance of 99 miles, for vessels up to 200 tons.

Saalfeld, a town of Saxe-Meiningen, on the Saale, 31 miles by rail SSW. of Jena, has ruins of a castle built by Charlemagne against the Sorbs, and possesses graphite, machinery, and other works. Pop. 8371.

Saarbrück, a town of Rhenish Prussia, on the Saar, 40 miles SE. of Treves, is the centre of a large coalfield, and of iron and glass works, with manufactures of tobacco, chemicals, metal utensils, &c. Pop. 10,453. Here, on 2d August 1870, the first engagement took place between the French and Germans, the latter retreating.

Saardam. See ZAANDAM.

Saargemünd (Fr. *Sarreguemines*), a town in the German province of Alsace-Lorraine, 41 miles E. of Metz. It is famous for its pottery; silk plush and velvet are also made. Pop. 10,719.

Saarlouis, a fortified town of Rhenish Prussia, 31 miles S. of Treves, on the left bank of the Saar. Fortified (1681–85) by Vauban, it was in the possession of France until 1815, when the Congress of Vienna gave it to Prussia. Here Marshal Ney was born. Pop. 6788.

Saaz, a town of Bohemia, on the Eger, 66 miles by rail NW. of Prague. Pop. 10,425, principally engaged in growing and trading in hops, and in manufacturing sugar, leather, &c.

Saba, a Dutch West Indian island, in the Leeward group, 40 miles NW. of St Kitts. A volcanic cone, 1500 feet high, it is known from its shape as 'Napoleon's cocked hat.' Area, 5 sq. m.; pop. 2421.

Sabadell, a town of Spain, 14 miles by railway NW. of Barcelona. It has risen into importance only within recent years, and is the Manchester of Catalonia. Woollen and cotton fabrics are the staple manufactures. Pop. 18,121.

Sabadilla, CEBADILLA, or CEVADILLA (*Schœnocaulon officinale*), a Mexican plant of the natural order Melanthaceæ, the seeds of which are employed in medicine. In the British Pharmacopœia the dried ripe seeds receive the name of Sabadilla. They contain an alkaloid, veratrine, which is officinal, and probably other closely allied substances. When applied externally the powdered sabadilla or veratrine is first irritant and then anæsthetic; both forms are used in rheumatic and neuralgic pains. Snuffed into the nostrils they cause violent sneezing and irritation. Taken by the mouth they are also irritant, if in too large a dose, and induce pain, vomiting, and diarrhœa. After absorption into the blood in medicinal doses they act chiefly on the muscles, and depress the heart and circulation and the body temperature. They are employed chiefly in acute febrile diseases in strong, healthy persons, but must be used with great caution on account of their marked depressant effects. The dose of veratrine is $\frac{1}{30}$ to $\frac{1}{10}$ grain.

Sabæans, or SABA', were the ancient inhabitants of Yemen in southern Arabia. They are the people called Sheba in Gen. x. 28, xxv. 3; Job, vi. 19; and other passages in the prophets; and it was probably the sovereign of this people who paid the celebrated visit to Solomon. The Sabæans were a powerful and wealthy people, who from long before the days of Solomon down to the beginning of the Christian era controlled the sea and caravan traffic in gold, sweet spices, ivory, ebony, and valuable tissues, that came from India and Africa, and were despatched northwards to Syria. To protect and watch over this trade they had stations or colonies in northern Arabia and in Ethiopia. The capital of their country was Mariaba (Marib), the ruins of which, including vast dams, lie north-east of Sanaa (q.v.). Their religion included the worship of the sun and moon, and a number of other deities. Their language is intermediate between Arabic and Ethiopian, but nearer akin to the former. In the 8th century B.C. the people of Saba' paid tribute to the kings of Assyria (Tiglath-Pileser and Sargon). The Roman governor of Egypt in 24 B.C., tempted by the fame of the great wealth of the Sabæans, sent an expedition under command of Ælius Gallus to invade their country; but it met with little success. Not long after this event, however, the trade upon which the Sabæans relied began to take a sea-route and go up the Red Sea, and from that cause their prosperity and power seem to have declined. Soon afterwards they appear to have been subject to the sovereignty of the king of the Himyarites. Then, in the 2d century, and again in the 4th, and yet again in the 6th, we read that kings of Ethiopia were lords over the Sabæans. See MANDÆANS, ZABISM; and various works, published since 1877, by D. H. Müller.

Sabah, a name for British North Borneo. See BORNEO, and SANDAKAN.

Sabbatai Zevi (also spelt *Sabbathais Zevi* and *Sabtai Zefi*), a false messiah, the founder of a wide-spread sect of semi-Christians and semi-Jews throughout Europe, Asia, and Africa, was born at Smyrna in 1641. By his personal magnetism, his character, his extraordinary learning, and his brilliant abilities, he led thousands of followers, mainly in Smyrna, Salonica, Alexandria, and Jerusalem, where he successively laboured, to believe in him as the Messiah (see MAHDI). In 1664 no fewer than about 80,000 people belonged to the new empire; and in the following year the beginning of the Messianic reign within a few months and the rebuilding of the Temple in the next year were proclaimed aloud in the streets of Alexandria by Sabbatai and six disciples, all clad in white raiments, with garlands on their heads. Somewhat later he returned to Jerusalem; and the general resurrection, to take place within six years, and the deposition of the sultan, whose crown would be placed upon Sabbatai's head, were proclaimed far and near. But three years later, having provoked serious alarm at Constantinople, he was apprehended at Smyrna, and terrified into something like a recantation of his mission. He was said to have declared that his sole object had been all along to embrace Islam, and to carry over all the Jews with him. The sultan declared himself satisfied, and honoured him with the title of an effendi, giving him an honorary post at the same time. But the movement was far from having reached its end. A fictitious man was supposed by some to have embraced Islam, while the real Messiah had ascended heavenwards. Finally the grand vizier was persuaded to imprison Sabbatai once more, and to send him to Albania or Servia, where he died in prison —according to some, in consequence of poison, while according to others he was executed in 1677, ten years after his conversion.

Sabbath (Heb. *shabbath*, from *shabath*, 'to rest, cease, or leave off;' Gr. *sabbaton*), the seventh day of the week, set aside, in the Old Testament, as a period of cessation from work. When it was instituted is not known. Many have contended that from its moral and religious importance it must have been instituted at the Creation, and made binding on Adam in paradise and all his posterity. There is certainly no evidence in the Pentateuch of its having been kept in patriarchal times. The celebration of the seventh day is first mentioned after the Exodus from Egypt; though the circumstances connected with the gathering of quails recorded in Ex. xvi. 23 is sometimes held to presuppose the solemnisation of the Sabbath before the Sinaitic legislation (Ex. xx.); and the formula 'Remember' with which the commandment begins has been interpreted as implying that it was known before, and only required to be emphatically recalled to memory. The reason given for the observance in Ex. xx. 11 cannot be taken as deciding the point; for the reason appended to the fourth commandment in Deut. v. 15 is wholly different.

The weekly division of time was of course in no way peculiar to the Jews, nor was the religious solemnisation of the seventh day. As we learn from Sayce (*Ancient Empires of the East*), 'in Babylonia and Assyria the week of seven days was an Accadian or Babylonian invention, the days of the week being dedicated to the moon, sun, and five planets. The 7th, 14th, 21st, and 28th days of the lunar month were kept like the Jewish Sabbath, and were actually so named in Assyrian. They were termed *dies nefasti* in Accadian, rendered "days of completion (of labour)" in Assyrian; the Assyrian *Sabattu* or "Sabbath" itself being further defined as meaning "completion of work" and "a day of rest for the soul." In those days it was forbidden, at all events in the Accadian period, to cook food, to change one's dress or wear white robes, to offer sacrifice, to ride in a chariot, to legislate, to practise augury, or even to use medicine.'

But it was the Jewish Sabbath that left its mark on the religious history of the world. Even on the traditional view of the date and origin of the several parts of the Pentateuch and the Old Testament, it seems obvious that, whatever may have been the date of its institution, the laws and customs regulating its observance grew greatly in detail and in strictness. But if the Deuteronomic and priestly legislation (see BIBLE, PENTATEUCH) be regarded as much later than the Jehovist documents, the gradual development in stringency of the Sabbath ordinances becomes still more patent. Wellhausen and his school hold that new moon and Sabbaths were originally lunar festivals, regulated by the phases of the moon; and that, although there is little about the new moon in the Pentateuch, it originally stood on a somewhat similar footing with the Sabbaths, and was celebrated in the same manner (see Amos, viii. 5; 2 Kings, iv. 22, 23)—viz. with such rest from labour as was the natural accompaniment of a festival, a festival, too, originally marked even by mirth (Hosea, ii. 13). The new-moon feast was probably allowed to fall into desuetude as being so constantly associated with idolatrous and unholy rites by the heathen. The Jehovist and the Deuteronomist in dealing with the Sabbath have chiefly agricultural labour in their eye: the masters who can rest when they will are not commanded to rest themselves, but to let their servants and cattle rest. But in the priestly legislation the Sabbath is less of a festival and more of an ascetic observance, rest being inculcated in and for itself, not as relief and refreshment from toil, but as a kind of offering to God; a pious duty of self-restraint and self-repression as incumbent on master as on man. To go out of the camp to gather manna or wood is a transgression: it is Sabbath-breaking to kindle a fire or cook food (Ex. xxxv. 2, 3; xvi. 23). Jeremiah is the earliest of the prophets to insist on stricter Sabbath-keeping, followed by Ezekiel and the Deutero-Isaiah. During the Captivity the Sabbath was wholly separated from the sacrificial service of the festival, and increased in significance as a holy rest-day, becoming along with circumcision the mark of the Jew as distinguished from the Gentile. The builders of the second temple had a severe struggle to secure the strict sanctification of the seventh day; but as the pharisaical party increased in power the day became more and more burdensome—the rest of the week was but a preparation for the Sabbath, so that man seemed to be made for the Sabbath. When Jerusalem was stormed by Ptolemy I. the inhabitants would not stir in self-defence; those who had fled to escape the persecution of Antiochus Epiphanes allowed themselves to be butchered wholesale rather than resist on the holy day. Both Pompey and Titus seem to have made arrangements for attacking Jerusalem, relying on the strict observance of the day by the Jews. There are, however, cases during the Maccabee period of Jewish armies not merely defending themselves, but making fierce attacks. The Mishna enumerates thirty-nine principal works which are forbidden on Sabbath; and to each of them are attached several minor ones which might *lead* to Sabbath-breaking. The 'Sabbath-day's journey'—the prohibition of walking more than the 2000 yards supposed to represent the distance between the ark and the end of the camp—seems to belong to Roman times. The Essenes were specially strict in their Sabbath-keeping.

On Sabbath the faithful assembled in the synagogue in every town and hamlet within and without Palestine, especially after the exile. Parts of the Pentateuch and of the Prophets were read, translated into the vernacular, and expounded. Special prayers were said and sung, and the rest of the day was devoted to pious meditation, study of the law, and serene joyfulness. For even in the later Jewish period the Sabbath was still distinctly a festival, 'a day of joy and delight.' Certain bodily indulgences were inculcated: fasting, mourning, and self-mortification were expressly prohibited. The day was to be honoured by wearing of finer garments, by taking of three meals of the best cheer available (though not of warm viands), accompanied with wine. The Karaites alone abstained from all fire and light for twenty-four hours. It should be added that by the Jews the Sabbath is reckoned from Friday evening to Saturday evening.

The analogy of the weekly Sabbath helped doubtless to mould the observance of a *Sabbatical Year*, which was apparently kept with strictness after the exile, though unknown to the early legislation. It was indeed enjoined that Hebrew slaves should be set free in the seventh year (Ex. xxi. 2–6), and that the seventh-year's crop should be left for the poor (Ex. xxiii. 10). But there is no hint that the seventh years coincided for any two persons or places: still less, that one Sabbath-year was held by the whole nation at the same time once in seven years. But after the Exile a periodic time was fairly established, the fields were left absolutely fallow, and no crops sown or harvested, to the severe suffering of many in evil times.

Christ and the apostles nowhere enjoin the observance of the Sabbath, but did themselves observe it, though acting on the principle that the 'Sabbath was made for man, and not man for the Sabbath,' and that 'the Son of man was lord also of the Sabbath.' Christ came into collision with the Pharisaic worshippers of the letter, and was more than once in danger of His life as a Sabbath-breaker. Even after the death of Christ there is no formal abrogation of the Sabbath: the apostles seem still themselves to have kept it in the Jewish manner. But its observance was not merely not enjoined on Christian proselytes: Paul most energetically insists that Gentile Christians should hold themselves absolutely free to observe it or not as seemed best. There were, however, Judaisers in the Christian church, whom Paul resisted; and the Ebionites (q.v.) insisted on the keeping of the Sabbath.

Nor is there anywhere in the New Testament any express statement that the first day of the week was to be kept in place of the seventh, or that the Lord's day represented or was in any way the Sabbath; though at a very early date Christians met for worship on the day on which Christ rose from the dead. The only mention of a Christian Sabbath in the New Testament is Heb. iv. 9: 'There remaineth therefore a Sabbath rest for the people of God' (New Translation), where obviously the reference is not to any one day of seven. A large body of Christians maintain that with the death of Christ the seventh-day Sabbath ceased for Christians, and that (apart from what Jewish Christians might have felt it their duty to do in the way of keeping the seventh day) the first day or Christian Sabbath naturally and inevitably took its place. Without citing any explicit authority for the substitution, they insist that the fourth commandment was a perpetual obligation as regards keeping holy one day in seven, and that the early Christian church could have no difficulty or hesitation in accepting at once the guidance of Providence in transferring the religious significance of the Sabbath of the law to the Sabbath of the new covenant; and that the Christian Sabbath has ever since continued, and to the end of the world will continue, obligatory on all Christians, all that was essentially moral and religious in the Jewish observances being applicable to the first day.

It must certainly be admitted that the earliest Christian writers do not identify the Sabbath and the Lord's day; none of the Fathers before the 4th century ground the duty of observing Sunday on the fourth commandment, or on the precept or example of Jesus or the apostles, or on an ante-Mosaic law promulgated at the Creation. Justin Martyr speaks of the regular assemblies of Christians on Sunday, 'because it is the first day in which God changed darkness and matter and made the world. On the same day also Jesus Christ our Saviour rose from the dead.' He makes no mention of abstinence from labour as part of the observance of the day. But whatever may have been the opinion and practice of these early Christians in regard to cessation from labour on the Sunday, unquestionably the first law, either ecclesiastical or civil, by which the sabbatical observance of that day is known to have been ordained, is the edict of Constantine, 321 A.D., of which the following is a translation: 'Let all judges, inhabitants of the cities, and artificers rest on the venerable day of the sun. But in the country husbandmen may freely and lawfully apply to the business of agriculture; since it often happens that the sowing of corn and planting of vines cannot be so advantageously performed on any other day; lest, by neglecting the opportunity, they should lose the benefits which the divine bounty bestows on us.' Before this time, such of the Christian writers as had endeavoured, by a mystical style of interpretation, to turn the Mosaic ceremonies to account as sources of moral and religious instruction had, probably in imitation of Philo, spiritualised the law of the Sabbath to the effect of representing it as a mystical prohibition to the Christian of evil works during all the days of his life, and a prefiguration of the spiritual repose and enjoyment which is his portion both in this world and in the next. But, in addition to this significance, there now began to be discovered in the Old Testament foreshadowings of the new Sunday-Sabbath; and the decrees of synods became more stringent. The Emperor Theodosius forbade business and public spectacles; Leo III. forbade legal processes and all labour. The Frank kings enforced Sunday observance by severe statutes. In England Ina of Essex forbade all servile work, and Alfred all labour, traffic, and legal processes. Canute was a supporter of Sunday observance; and some of the Norman kings were more strenuous, statutes of Edward III., Richard II., and Edward IV. specially dealing with the subject.

In Scotland the first record of effort by the authorities for the sanctification of the Lord's day is in the life of St Margaret. That saintly and most influential promoter of the stricter Roman usages had in Scotland to contend with great regardlessness of the Sunday, the Culdees (whom strangely enough Presbyterians were wont to claim as their spiritual ancestors) championing a lax Sunday keeping. 'It was another custom of theirs to neglect the reverence due to the Lord's day, by devoting themselves to every kind of business upon it just as they do on other days. That this was contrary to the law she proved to them by reason as well as by authority. Let us venerate the Lord's day because of the resurrection of the Lord, which happened that day, and let us no longer do servile works upon it.' She further quoted St Gregory's arguments in favour of keeping holy the day, and proved so unanswerable that thenceforward no one ventured to carry burdens or compel another to do so. How long the influence of St Margaret continued we do not know. Her descendant, James IV., seems to have paid more attention to the fourth commandment than to some of the others; Pedro de Ayala records of him that he 'fears God and observes all the precepts of the church. He does not eat meat on Wednesdays or Fridays. He would not ride on Sundays for any consideration, not even to mass.' But in Scotland, as a rule, the pre-reformation Sunday was in no sense strict; markets and fairs were commonly held on that day. Courts of law sat; archery was practised even in the kirk-yard; and Robin Hood and Little John plays were special Sunday spectacles.

The continental Reformers, while insisting on the value of the Sunday as a day of rest and worship, favoured the 'Dominical' as distinguished from the 'Puritan' view of the Sunday. Luther denied that Sunday should be kept because Moses commanded it; Zwingli is even more explicit; the second Helvetic Confession (1566) denies that keeping one day in seven is a moral duty, or that the observance of Sunday is founded on the fourth commandment, or that the Christian people might not choose any other day than the first; Calvin supports the freer view; and Beza expressly says that 'a Judaical rest from all kinds of work is not to be observed.' Nowhere except in English-speaking countries is the name Sabbath connected with the Sunday; when the word is regularly used for the name of a day of the week, as in Italian (*Sabato*), it simply means Saturday; the word for Sunday being with the Romance-speaking peoples derived from the Latin *dies dominica* ('Lord's day')—*Domenica*, *Dimanche*, &c. Orthodox German pastors take their households to miscellaneous concerts on Sunday evenings, and would consider hesitation to do so as a remnant of mere Jewish prejudice.

The English reformers—Cranmer, Hooper, Frith, Tyndale—it may generally be said, took a view distinctly unlike that of the Puritans. In Scotland also the less strict opinion at first prevailed. Knox's *Confession* and the Geneva Catechism, in use till the Westminster Confession was adopted, do not insist even on Sunday observances, and the word Sabbath is not used. Knox wrote letters and entertained guests to dinner on Sunday; plays (religious subjects) were performed on Sundays with the sanction of kirk-sessions as late as 1574. Church acts were immediately passed against holding markets on Sunday (a custom which obtained, in some places at least, as late as 1581), or producing the play of Robin Hood, and drinking in taverns in time of sermon. The Sunday is called Saboth-day soon after the Reformation; and the national legislation against all working or trading on Sunday dates from the Act of 1579. But it is contended, on good grounds, that the stricter view of Sabbath observance is of Puritan origin, and was introduced into Scotland from England. Some Puritans called the Lord's day 'the Sabbath' long before the end of the 16th century; but the first full statement of the 'high' doctrine of the Christian Sabbath was the *Sabbathum Veteris et Novi Testamenti: or the True Doctrine of the Sabbath*, by Dr Nicolas Bownde or Bound (1st ed. 1593; enlarged ed. 1606). The observance of the Sunday now became a keenly debated point between Puritans and High Churchmen—the first question of doctrine on which they directly differed. The Book of Sports (see SPORTS, BOOK OF) was long an apple of discord between Puritans and the other party; in the Long Parliament the Puritans triumphed, and the Westminster Assembly incorporated the Puritan view. It is certainly after the date of Bownde that the kirk-session records of Scotland are filled with proceedings against Sabbath-breakers for all manner of work, indoor and outdoor (shaving being especially noted), walking or 'vaging' in the streets and fields, being absent from public worship, &c., as well as for drinking or really disorderly and disquieting conduct. Sabbath-breaking was one of the charges on which the bishops were deposed by the Covenanting General Assembly of 1638. Scotland has since then been specially the classical land of Sabbath observance, though the early legislation of Massachusetts and Connecticut (where it was ordained that Sunday should be counted from sunset on Saturday) was even more puritanically rigorous. But in Scotland, as in England and America, the tendency is towards giving greater freedom to the individual conscience. Still, great numbers of devout Christians regret this tendency, and press for greater strictness of observance, and seek legislative support. In Scotland public-houses have been strictly kept closed since 1853; in Ireland, with exception of the great towns, since 1878; and in Wales since 1881; but English Sunday Closing Acts have always been negatived. In Scotland especially there is frequent agitation against Sunday trains, Sunday postal deliveries, the opening of museums, libraries, or botanic gardens, and Sunday cycling: and disasters such as that of the Tay Bridge (1879) have by some been treated publicly as God's judgment on Sabbath-breaking. The Sabbath Alliance was founded in 1847 for promoting the stricter observance of Sunday. On the other hand, the Sunday Society was founded in 1875, under the auspices of Dean Stanley and others, to secure the opening of museums and galleries on Sunday. The Grosvenor Gallery was opened on Sunday in 1878; the same year the Manchester and some others were opened on Sunday for the first time. The question as to Sunday trains, long fiercely debated in America, was compromised by allowing the running of the through mails, while, as in England, local trains do not usually run.

The law of England on Sunday observance begins with acts of Charles I. (1625 and 1627), but is mainly based on the Act 29 Car. II. chap. 7, dating from 1676, which forbids all labour, business, or work done in the course of a man's calling on the Lord's day, works of necessity and mercy being excepted. It does not apply to coach-hirers, or drivers, or farmers. A baker baking bread transgresses the statute, but not one who bakes his customers' Sunday dinners. Contracts entered into on Sunday are not void if they are not within the regular business of the contracting parties; a tradesman may draw or accept a bill of exchange on Sunday, and a professional man may sell his horse. By an act of Geo. III. any house of amusement to which persons are admitted on a Sunday on paying money, or by tickets already paid for, is a disorderly house—the test being whether the thing is done for gain. In some respects English Sunday laws are more explicit than those of Scotland. Special licensing laws regulate hotels and public-houses. There are also laws against killing game, using dogs or nets for sporting purposes, or fishing for salmon otherwise than with rod or line; the Factory Acts and Pawnbroking Acts exclude Sunday labour (Jews being excepted). Local regulations deal with theatres, museums, galleries, &c.

In Scotland a law of 1579 prohibits hand-labouring, working, gaming and playing; there was another act in 1661. And these statutes, often confirmed, have recently been held to be still valid. In some respects the law of Scotland is stricter; all salmon-fishing is forbidden. But in the main the legislation is the same. Diligence cannot be executed on Sunday, save in case of persons *in meditatione fugæ;* contracts signed on that day are not necessarily void.

In America the law generally follows that of England, though some states have special regulations about Sunday travelling. There are rules in force for preserving order and quiet on that day; by municipal regulations or general statute places of amusement and houses for the sale of intoxicants are usually kept shut.

In sharp opposition to the bulk of Puritan testimony is the contention of the devout people formerly known as 'Sabbatarians,' still represented by the Seventh-day Baptists in America, and a section of the Tunkers there. The English Sabbatarians of the 17th century (represented by Theophilus Brabourne) strenuously contended that the Sabbath was divinely instituted at the close of the work of creation, and remains binding on all mankind till the end of the world; the seventh day of the week alone is the Scriptural Sabbath: as there is absolutely no warrant in Scripture for changing from the seventh day of the week to the first, this change is mere will-worship, and a most unjustifiable encroachment of man's imagination on God's law. From the time of the Apostles, they hold, there never wanted down to the Reformation sincere Christians who, in the face of obloquy and persecution, continued to observe the fourth commandment. In the Abyssinian Church the Sabbath has not been supplanted by the Sunday, both days being kept; support is also claimed from the practice of the Armenians and Nestorians. Immediately after the Protestant Reformation were founded small societies testifying to the truth. In the later part of the 16th century and earlier part of the 17th there were at least eleven churches of Seventh-day Baptists in England, now dwindled to one or two. In America there are some flourishing churches of Seventh-day Baptists in sixteen states of the Union, with a membership of 10,000, two colleges, and an extensive literary propaganda.

The literature of the Sabbath controversy is exceedingly voluminous, as may best be seen by consulting Robert Cox, *The Literature of the Sabbath Question* (2 vols. 1865). See also, on the Puritan side, Holden's *Christian Sabbath* (1825); Gilfillan's *Sabbath* (1861); *Four Prize Essays* (Sabbath Alliance, 1886); and on the Dominical side, Hengstenberg's *The Lord's Day* (Eng. trans. 1853); Hessey's *Sunday* (Bampton Lectures for 1860); Zahn, *Geschichte des Sabbaths* (1878); Gairdner and Spedding, *Studies in English History* (1881); Crafts, *The Sabbath for Man* (New York, 1885). For the Seventh-day Baptists, see Lewis, *Sabbath and Sunday* (new ed. 1886); Andrews, *History of the Sabbath* (1873); and Bailey's *History of the Seventh-Day Baptist General Conference.*

Sabbatia (named from Sabbati, an Italian botanist), a genus of plants, of the natural order Gentianaceæ, natives of North America. They are small herbaceous plants, some with simple, and some with branched stems. They all contain, like many others of the same order, a pure bitter principle, useful in fevers and as a tonic.

Sabellianism, a heresy about the distinction of Persons in God, the name of which is due to Sabellius, of whom but little is known, save that he was most probably a native of Libya, came to Rome under Zephyrinus, and was banished by Callistus, whereupon he took refuge in the Libyan Pentapolis. The Adoptianists and Modalists up to this time were the chief divisions of the Monarchians, the former making Christ the chosen of God, His divinity the effect of a complete oneness of will with Him, the latter making Him merely a manifestation of God. Modalism prevailed in Rome under the patronage of Calixtus, but was denounced by Hippolytus, who was himself accused of *ditheism.* Sabellius led the more extreme Modalists, and offered strong opposition to Calixtus, but his influence was far more important in the East than in the West, where the phrase of Athanasius that the Son and the Father are one and the same in substance (ὁμοούσιοι) was at once accepted, though rejected at Antioch in 268.

The earlier form of Sabellianism was almost identical with Patripassianism, the chief teachers of which were Praxeas, Noetus, Epigonus, and Cleomenes. But it developed into a complete resolution of the Trinity into a mere threefold manifestation of God to man. Father, Son, and Holy Spirit are not distinct subsistences (*hypostases*), but merely one and the same person in different aspects, just as the sun is at once a spherical body, a fountain of light, and a source of heat. The single absolute Divine Essence—the *monas* or pure Deity—unfolds itself in creation and the history of man as a Trinity. The *energy* by which God called into being and sustains the universe is the *Logos*, after whose image men were created; but when they had fallen from perfection it became necessary for the Logos, or Divine Energy, to hypostatise itself in a human body, in order to raise and redeem them; hence in the man Christ Jesus dwelt the fullness of the Godhead *bodily*; while the same Divine Energy, operating spiritually and impersonally in the hearts of believers, is the Holy Ghost. Sabellius held further that these Divine manifestations are merely temporary, and that after the Logos and the Holy Ghost had done their work they would be reabsorbed in the absolute Deity—the *trias* would again resolve itself into the *monas*; or, in the language of St Paul, that 'God would be all *in* all.' Epiphanius alleges that Sabellius derived his system from an apocryphal Gospel to the Egyptians; and there are, as Neander points out, so many points of resemblance in Sabellianism to the Alexandrian Jewish theology in general that the statement may be regarded as at least indicating the direction from which proceeded the influences that determined the theosophy of the unknown Pentapolitan. The 4th-century heresy associated with the name of Marcellus of Ancyra was closely allied to Sabellianism, which indeed becomes a term employed somewhat loosely. The followers of Sabellius were formally suppressed by the Catholic Church in the 4th century; but his doctrine, which, divested of its Gnostic and Neoplatonic phraseology about *emanation* and *re-absorption*, &c., is substantially Unitarian, has seldom wanted eminent advocates in any subsequent age of Christianity.

See the Church History of Neander; discussions by Schleiermacher and Lange; Döllinger's *Hippolytus u. Kallistus* (1853; Eng. trans. by Plummer, 1876); and Zahn's *Marcell. v. Ancyra* (1867).

Sabians. See SABÆANS, MANDÆANS, ZABISM.

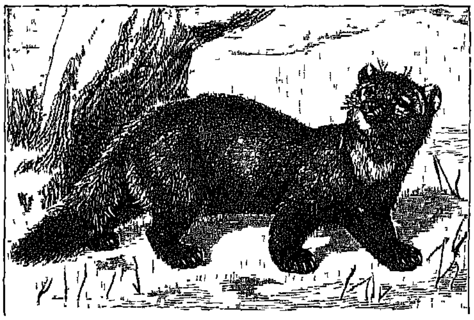
Sabine, a river of Texas, rises near the northern boundary of Texas, and flows south-east to the border of Louisiana, and then south, forming the boundary between the two states. It empties through Sabine Lake (18 miles long by 9 miles wide) into the Gulf of Mexico. The Sabine is 500 miles long, and though shallow is mostly navigable for small steamboats.

Sabine. See SAVINE.

Sabine, SIR EDWARD, physicist, was born in Dublin, on the 14th October 1788. He obtained a commission in the artillery in his sixteenth year, and accompanied Ross and Parry as astronomer in the expeditions of 1819–20 in search of a north-west passage. Between 1821 and 1827 he undertook a series of voyages to places between the equator and the north pole, making at each point pendulum and magnetic experiments of great value. Elected a Fellow of the Royal Society in 1818, he was from 1861 to 1879 its president. He was for many years secretary of the British Association, and filled the office of president in 1853. In 1856 he was raised to the rank of major-general, in 1869 he was created K.C.B., retiring as general in 1874; and in 1875 he was elected a corresponding member of the French Academy. He died at Richmond, June 26, 1883, aged ninety-five. His scientific reputation rests chiefly upon his labours in terrestrial magnetism, his various memoirs in the *Philosophical Transactions* and Reports to the British Association being to this day invaluable collections of magnetic facts. By his personal influence he did more than any other single man in inducing the government to establish magnetic observatories in different parts of the world, and in initiating the valuable magnetic work now carried out by the Admiralty.

Sabines, an ancient Italian people whose original headquarters were amongst the central Apennines, but ultimately occupying an area which extended down into the western plains, even to Rome itself. They had for neighbours Umbrians, Etruscans and Latins, and Samnites (see map of Italia Antiqua). They and their near kinsmen, the Samnites, constituted a group sometimes called *Sabellian*; and the two or more Sabellian peoples, together with the (less nearly) related Umbrians, spoke Aryan Italic dialects, to which the name of Umbro-Sabellian has been given. According to the legend, a colony of Sabines occupied the Quirinal Hill in Rome, but were ultimately incorporated with the Latin followers of Romulus upon the Palatine, and so helped to constitute the Roman people (see ROME). The *Rape of the Sabines* belongs to this period of legendary history. Romulus, having difficulty in finding wives for his followers (credited with a dubious reputation as runaways and malefactors), invited the Sabines to a feast and games; and while the games were going on the garrison of the Palatine seized the unsuspecting and unprotected Sabine women, whom they carried off to be their wives. After several wars the Sabines outside of Rome were ultimately subjected (241 B.C.).

Sable (*Martes zibellina*), a species of Marten (q.v.), so nearly allied to the Common Marten and Pine Marten that it is difficult to state satisfactory specific distinctions. The feet are covered with fur, even on the soles, and the tail is perhaps more bushy than in the British martens. The length, exclusive of the tail, is about 18 inches. The fur is brown, grayish yellow on the throat, and small grayish-yellow spots are scattered on the sides of the neck. The whole fur is extremely lustrous, and hence of the very highest value, an ordinary sable skin being worth £2 to £4, 10s., and one of the finest quality £28. The fur attains its highest perfection in the beginning of winter, and the pursuit of the sable at that season is one of the most difficult and adventurous of enterprises (see FURS). The sable is a native of Siberia, widely distributed over that country, and found in its coldest regions, at least wherever forests extend. The progress of geographical discovery in the



Sable (*Martes zibellina*).

eastern parts of Siberia has been much indebted to the expeditions of the hardy and daring sable-hunters, exploring new regions at the worst seasons of the year, and spending dreary months at a great distance from all human abodes. The sable is taken by traps, which are a kind of pitfall, it being necessary to avoid injury to the fur; or by tracking it through the snow to its hole, and placing a net over the mouth of the hole. It is a very wary animal, and not easily captured. It makes its nest in a hollow tree, or sometimes, it is said, by burrowing in the ground, and lines it with moss, leaves, and grass. From this it issues to prey on hares and smaller animals of almost any kind, its agility enabling it even to catch birds among the branches of trees. It is ready, when food is scarce, to eat the remains of an animal on which a larger beast of prey has feasted, and is said even to satisfy its hunger with berries in winter, when animal food is not to be had. The sable, although it inhabits high northern latitudes, does not, as so many arctic animals do, change to white in the winter. This is accounted for by its habit of hunting among the branches of trees, against the dark colour of which white would be conspicuous, and therefore disadvantageous.

Sable Island, a low-lying island in the Atlantic, in 44° N. lat. and 60° W. long., 110 miles E. of the central part of Nova Scotia (and not near Cape Sable, at the south-east corner of Nova Scotia, where there is also a Sable Island). It consists of two parallel sand ridges, with a lagoon between them. Scrubby grass, cranberries, &c. grow on the island, which is so dangerous to navigation, and has so frequently been the scene of wrecks, as to be called 'the sailor's grave.' The Canadian government has since 1873 built three lighthouses on it, with an establishment of some 30 persons, of which two have been swept away and the third undermined, as the island is gradually sinking. Early in the 19th century it was 40 miles long; in 1890 it was reduced to 20 miles: it is to be hoped it may soon utterly vanish. Near it there are sandbanks.

Sables D'Olonne, Les, a seaport of France (dept. Vendée), on the Atlantic coast, 50 miles S. by W. of Nantes, owes its early importance to Louis XI., who excavated (1472) the port and erected the fortifications. There is a trade in grain, wine, salt, cattle, timber, and tar. Salt-making, ship-building, and fishing (sardines and oysters) are the chief occupations. The town is visited for its sea-bathing. Pop. 10,114.

Sabots, a species of wooden shoes made out of one block, and largely used by the French and Belgian peasantry, especially by those who inhabit moist and marshy districts. They are made of fir, birch, beech, alder, walnut, and other wood, and are manufactured principally in the Cevennes districts of France, the more ornamental varieties especially at Mende, Villefort, and Marvejols, all in the department of Lozère. For greater comfort and convenience, straw is stuffed between the foot and the wooden sides, or, with the most luxurious, a low woollen sock, made to fit the hollow of the shoe. The name is sometimes extended to a kind of Clogs (q.v.), with wooden soles and leather uppers.

Sabre. See Sword.

Sabretache (Fr.), the leather case for carrying letters, &c. which is attached to the sword-belt of hussars and of most mounted officers. In the latter case it is often highly ornamented.

Sabrina Land, a stretch of coast-land discovered in the Antarctic Ocean (1839) by Balleny; it is crossed by 120° E. long. and the Antarctic Circle.—*Sabrina* is the Latin form of Severn.

Saccharic Acid, $H_2C_6H_8O_8$, is a product of the action of nitric acid, under certain conditions, on grape and cane sugar, or on starch, gum, and lignine. It occurs as a colourless, inodorous, deliquescent, gummy, uncrystallisable mass, which is freely soluble in alcohol. It is sufficiently powerful to dissolve iron and zinc, with extrication of hydrogen. It has a tendency to form double salts. It is dibasic, and forms an acid and a normal salt with potassium.

Saccharimeter, or Saccharometer, an instrument for determining the quantity of sugar in liquids, especially brewers' and distillers' worts. In principle it resembles the hydrometer (see Specific Density), used for ascertaining the strength of alcoholic liquids. It consists of a hollow sphere or oval of thin brass, with a graduated stem and a hook so placed opposite each other that when placed in water it floats, and the graduated stem stands upright on the top, and the hook is below, for the purpose of appending weights. The degree to which the stem sinks gives the means of calculating, by tables prepared on purpose, the proportion of saccharine matter present in the liquid.

Saccharin, or Glucide, $C_6H_4COSO_2NH$, is a sweet substance prepared by complex processes from coal-tar. It is a white, semi-crystalline powder, with a faint odour and intensely sweet taste. So sweet is it that it requires to be very much diluted before its sweetness can be appreciated, from ½ to 1 grain sufficing for a cupful of tea. It is not a pure substance as found in commerce, but contains a variable proportion (40 to 60 per cent.) of a less sweet compound. On this account opinions differ as to its sweetening power compared with that of sugar, it being estimated to be from 200 to 300 times stronger than the natural product. It was at first thought likely that it would prove a serious rival to sugar, but its price offers no great inducement, and conflicting opinions as to its safety have rather militated against its use. At present it is employed for sweetening the food of diabetic patients, and for disguising the taste of drugs. Some aerated-water makers also employ it as a substitute for sugar, and it may be used to give an extra sweetness to glucose in the manufacture of artificial jams, &c. Saccharin is but slightly soluble in water, but dissolves readily if mixed with baking-soda, carbonic acid gas being liberated during solution.

Saccharissa. See Waller.

Saccharum. See Sugar-cane.

Sacchetti, Franco (c. 1330-99), an Italian novelist, a follower of Boccaccio, was a native of Florence, who held several diplomatic offices. Of his 258 *Novelle*, first printed in 1724, ten are translated in Thomas Roscoe's *Italian Novelists* (1825).

Saccopharynx. See Pelican-fish.

Sacheverell, Henry, D.D., was born in 1672 at Marlborough, the son of the High Church rector of St Peter's, and from the grammar-school there was sent by charity in 1689 to Magdalen College, Oxford. He shared rooms with Addison, who dedicated to his 'dearest Henry' *An Account of the Greatest English Poets* (1694); and, gaining successively a demyship and a fellowship, he took the degrees of B.A. (1693), M.A. (1696), B.D. (1707), and D.D. (1708). He had held the small Staffordshire vicarage of Cannock, when in 1705 he became preacher of St Saviour's, Southwark, and soon made his mark as a pulpit orator. In 1709 he delivered the two sermons—one at Derby assizes, the other on the 5th of November at St Paul's—which have given him a place in history. The rancour with which he assailed the principles of the Revolution Settlement and the Act of Toleration, whilst glancing at Godolphin as 'Volpone,' and asserting the doctrine of non-resistance, roused the wrath of the Whig government of the hour, and led to his impeachment before the House of Lords of high crimes and misdemeanours (1710). Ardent crowds, shouting 'High Church and Sacheverell!' and now and then wrecking a meeting-house, attended him to Westminster; he defended himself ably (Burnet ascribes the defence to Atterbury), but by a majority of seventeen he was found guilty, and suspended for three years from preaching, his two sermons also being burned by the common hangman. The ministry fell that same summer, and in 1713, on the expiry of his suspension, Sacheverell was selected by the House of Commons to preach the Restoration sermon before them, and specially thanked on the occasion. A more substantial token of favour was his presentation to the rectory of St Andrew's, Holborn, after which little more is heard of him save that he squabbled with his parishioners, and was suspected of complicity in a Jacobite plot. He died at the Grove, Highgate, 5th June 1724, and was buried in St Andrew's, Holborn, whence his lead coffin was stolen in 1747.

See vol. ii. of Hill Burton's *History of the Reign of Queen Anne* (Edin. 1880); and F. Madan's 'Bibliography of Dr Sacheverell' in the *Bibliographer* for 1883-84.

Sachs, HANS, the most prolific and at the same time the most important German poet of his time, was born on 5th November 1494, at Nuremberg, where his father was a tailor. While at school he learned the rudiments of Latin, but was never a scholar in the academic sense of the term, although he was a very well- and widely-informed man. About the age of fifteen he began to learn the craft of shoemaking; his love of verse also led him to learn the art, almost mechanical, of verse-making from Leonhard Nunnenbeck, a weaver and *meistersinger* in his native town. On finishing his apprenticeship, Sachs, as was the custom of craftsmen in those days, made a tour through Germany, practising his calling in various cities, and frequenting assiduously the schools or corporations organised by the *meistersinger*, who, since the disappearance of the older *minnesinger*, or minstrels of chivalry, had become the chief representatives of German poetry. On his return to Nuremberg Sachs commenced business as a shoemaker, and prospered in his calling; and, after a long, cheerful, and happy life, died on 19th (or 25th) January 1576, and was buried in St John's churchyard, Nuremberg.

Sachs's career as an author is divided into two periods. In the first he shows an interest mainly in the occurrences that were then agitating Germany. It was the epoch of the Reformation of Luther, whose praises he celebrated (1523) in an allegorical tale entitled *Die Wittenbergisch Nachtigal*, while his poetical fly-sheets (of which about 200 are known) furthered in no small measure the Protestant cause. In the second period his poetical activity was turned more to the delineation of common life and manners. His poetry is distinguished by its heartiness, good sense, homely morality, and fresh humour. It is, however, deficient in high imagination and brilliant fancy, and contains much prosaic and insipid verse. It was his chief pride to be an honourable citizen of Nuremberg, and his mind and his interest seldom travel beyond the narrow limits of its encircling walls. There is not one of his productions but what was meant to serve some didactic purpose. His best works are *Schwänke*, or Merry Tales, the humour of which is sometimes unsurpassable, serious tales, allegorical and spiritual songs, and Lenten dramas. His *meistergesänge*, the pieces he wrote according to the precepts of the verse-makers' guild, are now of little or no value, though in his own day they raised him to the first place amongst all his contemporaries. By the 52d year of his career (1567) as a poet he had written 34 vols., containing upwards of 6300 pieces, among which were more than 4000 *meistergesänge*, 200 comedies and tragedies, about 1700 merry tales, secular and religious dialogues, proverbs, and fables, 7 prose dialogues, and 70 songs, secular and devotional. The first edition of his works was published at Augsburg in 1558-61, but that of Willer (5 vols. 1570-79) is better. After the middle of the 17th century Hans Sachs fell into neglect and was forgotten; and he remained so until his memory was revived by Goethe in 1776. His *Complete Works* were published by Götze and Von Keller (Stuttg. 15 vols. 1886). The selections of Merry Tales and Proverbs in Verse by Goedeke and Tittmann (3 vols. 1883-85) and by Engelbrecht (1879) can be recommended, as well as Tittmann's edition of the Lenten Dramas.

Besides Drescher's *Studien zu Hans Sachs* (Marburg, 1891), there are biographies by Ranisch (1765), Genée (1887), Stein (Halle, 1889), Kawerau (Halle, 1889), and Schweitzer (in French; Nancy, 1889). English readers may consult MacCallum, *Studies in German Literature* (1884).

Sachs, JULIUS, botanist, born at Breslau 2d October 1832, studied at Prague and began to teach botany there. After lecturing at the agricultural colleges of Tharandt in Saxony and Poppelsdorf near Bonn from 1859 to 1867, he was in the last year appointed professor of Botany at Freiburg, but removed to Würzburg in the following year. There he carried on, in a laboratory built under his own direction, important experiments in plant physiology, especially in determining the influence of light and heat upon plants, and in investigating the movements and other organic activities of vegetable growth. His *Lehrbuch der Botanik* (4th ed. 1874; Eng. trans. 1875) and *Handbuch der Experimentalphysiologie der Pflanzen* (1866) are useful and instructive text-books. Besides these he has written *Geschichte der Botanik vom 16 Jahrhundert bis 1860* (1875; Eng. trans. 1890), *Grundzüge der Pflanzenphysiologie* (1873), and *Vorlesungen über Pflanzenphysiologie* (Eng. trans. 1887).

Sack, a name in common use in the time of Shakespeare, and occurring down to the middle of the 18th century as denoting a kind of wine. The exact nature of this famous wine, the favourite beverage of Falstaff, and the origin of the name have been much discussed. Sack or seck seems to be simply an English disguise of the Spanish *seco* (Fr. *sec*), applied to wines of the sherry genus, as distinguished from the sweet wines; a term which we now translate by 'dry.' Canary was often the wine meant by sack. In old churchwardens' accounts sack is frequently mentioned as a communion-wine. It seems to have been mixed with port; and this mixture of white and red wines survived at Douglas in the Isle of Man till at least 1887 (*Notes and Queries*, 1887-88).

Sackbut (Fr. *saquebute*), a name used for two totally different instruments—the one a kind of trumpet, the predecessor of the Trombone (q.v.); the other, the sackbut of Scripture, a stringed instrument somewhat of the nature of a guitar.

Sacketts Harbor, a village of New York, on a bay of Lake Ontario, at the mouth of Black River, 12 miles by rail W. of Watertown. In the war of 1812 it was an important naval station; but it has now only some 800 inhabitants, although it is becoming a popular summer-resort.

Sackville, THOMAS, Earl of Dorset, poet and statesman, was born about 1536 at Buckhurst in

Sussex, the only son of Sir Richard Sackville, Chancellor of the Exchequer. He is supposed to have studied at Hart Hall, Oxford, and St John's College, Oxford, and then to have entered the Inner Temple; in 1554 he married, and in 1558 was returned to parliament. With Thomas Norton he produced the blank-verse tragedy of *Ferrex and Porrex* (afterwards called *Gorboduc*), which in January 1562 was acted before Queen Elizabeth (who was Sackville's second cousin) at Whitehall by the gentlemen of the Inner Temple. This work, whose plot is founded on a British legend, and which is after the style of Seneca, the incidents being moralised at intervals by a chorus, claims particular notice as the earliest tragedy in the English language. Dramatic energy it has none, but the style is pure and stately, evincing eloquence and power of thought (see DRAMA, Vol. IV. p. 85). Sackville's other chief production was the *Induction to a Myrrorr for Magistrates* (1563), a noble poem, 'uniting,' as Hallam says, 'the school of Chaucer and Lydgate to the *Faery Queen*,' and almost rivalling the latter in the magnificence and dignity of its allegoric personifications. The influence of Dante is very perceptible. His prodigality brought Sackville into disgrace with the queen, and he travelled awhile in France and Italy, but on his father's death in 1566 returned to England, and next year was knighted and created Lord Buckhurst. He was now employed much as a diplomatist in France and the Low Countries; in 1586 announced her death-sentence to Mary Queen of Scots; in 1589 was installed a Knight of the Garter; in 1599 succeeded Burghley as lord high treasurer; and in 1604 was created Earl of Dorset. He died suddenly at Whitehall at the council table, 19th April 1608.

See the Life prefixed to the edition of his Works by the Hon. and Rev. W. Sackville-West (1859), and a long article in vol. ii. of Cooper's *Athenæ Cantab.* (1861).

CHARLES SACKVILLE, sixth Earl of Dorset, was born January 24, 1637, and succeeded to the title in 1677. He travelled in Italy, was returned by East Grimstead to the first parliament of Charles II., and soon became an especial favourite of the king, and notorious, like too many of the courtiers, for his boisterous and indecorous frolics. He served under the Duke of York at sea, was employed on various missions, but could not endure the tyranny of James II., and was one of the most ardent in the cause of the Prince of Orange. His later years were honoured by a generous patronage of men of letters like Prior, Wycherley, and Dryden. He died at Bath, January 19, 1706. He was himself the author of a few occasional lyrical and satirical pieces, but is only remembered for one short poem, the bright and delightful song, 'To all you Ladies now on Land.'

Saco, a city and port of entry of Maine, on the left bank of the Saco River, here crossed by a bridge to Biddeford, and with falls of 50 feet supplying water-power, 16 miles by rail WSW. of Portland. It contains cotton and shoe factories, awmills, machine-shops, &c. Pop. (1880) 6389; '890) 6075.—The *Saco River* rises in the White ountains of New Hampshire, and runs south-t through Maine to the Atlantic. It is 170 es long.

crament (Lat. *sacramentum, mysterium, mystērion*), the name given by theological s to certain religious rites, the number as s effects of which are the subject of much versy between various bodies of Christians. ord *sacramentum*, in primitive classical neant either the oath taken by soldiers on st enrolment, or the sum of money deposited ors on entering upon a cause, and forfeited 'to sacred uses' by the unsuccessful party; and the corresponding classical Greek word *mystērion* meant not merely the secret religious ceremonies practised in the worship of certain gods, but also any revealed secret. It is certain, nevertheless, that at a very early period of the Christian church both the Latin word and its Greek equivalent came to be applied specially to certain rites of the Christian ceremonial, and chiefly (or as is commonly held by Protestants, exclusively) to those of Baptism and the Eucharist. Of the catechetical lectures of St Cyril of Jerusalem the lectures devoted to the subject of Baptism and the Eucharist are called 'mystagogic lectures.' Here it will be enough to state concisely what are the views of the several religious communities on this much controverted subject, which formed one of the main grounds of division between the Roman Church and the Reformers of the 16th century.

In the Roman Church it is held that there are seven sacraments—viz. Baptism, Confirmation, the Eucharist, Penance, Extreme Unction, Holy Orders, and Matrimony. The special teaching of Catholics on each of these rites will be found under the several heads; but there are certain general principles regarding them all on which the Roman Catholic doctrine differs widely from that of the Reformed communities. Catholics define a sacrament to be a visible or sensible sign permanently instituted by God, and conveying real interior grace to the recipient, and they teach that all sacraments contain within themselves, as instruments, and, when they are received with proper dispositions, produce, such grace by the virtue imparted to them by God, and not merely through the faith of the recipient; although they hold that proper dispositions on the part of the recipient, as sorrow for sin, love of God, pious resolves, &c., are conditions indispensable for the efficacy of the sacramental rite (see OPUS OPERATUM). They divide the sacraments into two classes, 'sacraments of the living' and 'sacraments of the dead.' The first class comprises the Eucharist, Confirmation, Holy Orders, and Matrimony—all which sacraments can only be received fruitfully by persons in a state of grace or justification. The second includes Baptism, Penance, and Extreme Unction, the special purpose of which is to remit sin, and which therefore can be received by persons in a state of sin, but penitent for that sin, and resolved to amend their lives. Of three of the sacraments—viz. Baptism, Confirmation, and Holy Orders—it is held that they imprint a 'character,' and therefore that they can only be received once. The others may be repeatedly received, but under conditions which will be learned under each separate head. Two things are held to enter into the constitution of the sacrament—viz. the 'matter' and the 'form.' By the former is meant the material element or the physical action whereby that element is applied to the recipient of the sacrament; as water in baptism, oil in extreme unction, and in both the act of washing or of anointing. By the latter is understood the form of words employed by the minister in communicating to the recipient the external rite in which the sacramental act consists. The minister of a sacrament is the person who is supposed to be divinely authorised to impart it. The Council of Trent anathematises those who teach that there are more or less than seven sacraments. The Greek Church also recognises the seven sacraments.

The Reformed Churches have for the most part rejected these views. By the majority of them the sacraments are held to be merely ceremonial observances, partly designed as a solemn act, by which each individual is admitted to membership, or desires to make solemn profession thereof; partly intended to stimulate the faith and excite the fervour and the pious dispositions of the recipient, to which dispositions alone all the interior effects are to be ascribed. As to the number of rites called by the *name*, almost all Protestants agree in restricting it to two—viz. Baptism and the Lord's Supper; although some of the rites which Catholics regard as sacramental are retained by some of the Protestant communities as religious observances. Calvin defends the ceremony of ordination by imposition of hands, once even calling it a sacrament, though evidently not in the strictest sense of the word. In the English Church, however, there has always been a school in which opinion tending towards the Catholic view has prevailed. Not only have English Churchmen ascribed to the two rites of Baptism and the Eucharist or Lord's Supper (q.v.) the power of producing an interior grace (which in the former is called Regeneration, q.v.), but since the Tractarian movement many of them have been willing to call the other rites, especially Confirmation, Penance, and Holy Orders, by the name of sacrament, although of a secondary character, and not 'generally necessary to salvation.'

See the separate articles on the sacraments, especially BAPTISM, and LORD'S SUPPER, and works there cited; also ROMAN CATHOLIC CHURCH; and for the sacraments as recognised by the Orthodox Eastern Communion, see GREEK CHURCH, Vol. V. p. 396.

Sacramentarians, a term used in more senses than one. (1) Ordinarily in England it means one who holds a 'high' or extreme doctrine of the efficacy of the sacraments, especially of the Eucharist (see LORD'S SUPPER). (2) Technically, however, the word is used in church history in an almost diametrically opposite sense for persons holding a 'low' doctrine on the subject of the sacraments—for the party among the Reformers who separated from Luther on the doctrine of the Eucharist. Luther taught the doctrine of the real presence of the body and blood of Christ along with the bread and wine (see LORD'S SUPPER). Carlstadt, Capito, and Bucer were the leaders of those who called this doctrine in question. This sacramentarian party became so considerable that in the diet of Augsburg they claimed to present a special confession known in history by the name of the Tetrapolitan Confession —so called from the four cities, Strasburg, Constance, Lindau, and Memmingen. The Tetrapolitan Confession rejects the doctrine of a corporeal presence, and although it admits a spiritual presence of Christ which the devout soul can feel and enjoy, it excludes all idea of a physical presence of Christ's body. Simultaneously with this German movement, yet independent of it, was that of the Swiss reformer Zwingli, whose doctrine on the Eucharist was identical with that of Carlstadt, and who himself presented a private confession of faith to the Augsburg diet in which this doctrine is embodied. The four cities named above continued for many years to adhere to this confession presented to the diet of Augsburg in their name; but eventually they accepted the so-called Confession of Augsburg, and were merged in the general body of Lutherans. On the contrary, the article of Zwingli upon the Eucharist was in substance embodied in the confession of the Helvetic Church.

Sacramento, the largest river of California, rises in the north-eastern part of the state, its head-stream, Pitt River, draining Goose Lake, and flows south-west through the Sierra Nevada to Shasta, south to Sacramento, and thence south-south-west into Suisun Bay, through which its waters pass into San Pablo Bay and so to the Pacific Ocean. Its length is about 500 miles, and it is navigable for small vessels to Red Bluff, nearly 250 miles. A few miles above its mouth it receives the San Joaquin; and with this and other tributaries it drains the great central valley of the state.

Sacramento, the capital of California, is on the east bank of the Sacramento River, at the mouth of the American River, 120 miles by water and 90 by rail NE. of San Francisco. The streets are laid down at right angles on a level plain. The business portion is built of brick, the dwellings of wood, with shade-trees and gardens. The principal public buildings are the state capitol (which cost about $2,000,000), the county court-house (formerly the capitol) and hospital, the post-office, a Roman Catholic cathedral, the Crocker Art Gallery, and the Masonic and Oddfellows' halls. The manufactories include a number of flour and planing mills, carriage, box, and broom factories, foundries, potteries, spice-mills, and a cannery; and here are the shops of the Southern Pacific Railroad, covering 25 acres. Sacramento was settled in 1839 by a Swiss named Sutter, who built a fort here in 1841; but it was not till 1848, after the discovery of gold, that the city—at first as a canvas town—was laid out. Inundations led to the building of a levee in 1862. In 1854 Sacramento became the state capital. Pop. (1880) 21,420; (1890) 26,386.

Sacrarium (Lat., 'a place where sacred objects are deposited'), the part of a church where the altar is.

Sacred Heart of Jesus, FEAST OF, a modern festival of the Roman Catholic Church. Its origin is traced to a vision which is recorded of a French Visitation nun named Marguerite Marie Alacoque (1647–90), who lived at Paray-le-Monial (q.v.). This devotion was gradually propagated in France, approved by Clement XIII. in 1765, and extended to the whole church in 1856, Sister Marguerite Marie being beatified in 1864. The festival is held on the Friday (in England on the Sunday) after the octave of Corpus Christi. Of many churches dedicated to the Sacred Heart by far the most splendid is that erected on Montmartre, the highest point of Paris, in 1874-91, at a cost of nearly a million sterling. The faithful worship the heart of Jesus, considered 'not as mere flesh, but as united to the divinity;' and the heart is chosen because it is a symbol of charity and of the inner life. The heart of the Blessed Virgin, on the same principle, is *venerated* by the Roman Church.—There is a cloistered order of nuns of the Sacré Cœur, which was founded at Paris in 1800 by Fr. Varin and Mme. Barat, approved in 1826, and has very numerous houses in Europe, America, and Australasia. The chief of these in England is at Roehampton, in Ireland at Roscrea. Its members teach the higher branches of girls' education.

See Bougaud, *Histoire de la bienheureuse Marguerite Marie* (5th ed. 1880); and Nilles, *De Rationibus Festorum Sacratissimi Cordis* (1875).

Sacred Wars. See AMPHICTYONIC COUNCIL, PHILIP.

Sacrifice has been the fundamental institution of all natural religions. It is found at one time or another with the same general features in nearly all parts of the world. The same human wants have everywhere found the same embodiment. As a general rule its historical development among different peoples keeps pace with the progress of their thoughts regarding the nature of the divinities they worship. Sacrifice is primarily a sacramental meal at which the communicants are a deity and his worshippers, and the elements the flesh and blood of a sacred victim. Primitive tribes everywhere seem to regard themselves as related to their gods by the bond of kinship, and every tribe has certain sacred animals which it regards as related to the tribal god by precisely the same bond. These sacred animals are probably a survival of the totem-stage through which all civilised races seem to have passed. In any case they play a most important part in primitive religion. They are regarded with reverence as sources or media of supernatural influences. Their lives are protected like those of kinsmen. To slaughter one of them for private use is an act of sacrilege or murder. Sacrifice is a rare and solemn public function. The significant part of it is not the slaying of the victim, but the sacrificial meal which follows. During this meal the life of the sacrosanct animal with its mysterious virtues is supposed to pass physically into the communicants, whereby the natural bond of union between the god and his clients is sacramentally confirmed and sealed.

While this sacrificial meal occurs with the same general features in all natural religions, there is infinite diversity in detail. (1) There are differences as to the portions assigned to the divine and human communicants. As a rule one or more parts which are regarded as either peculiarly sacred or peculiarly choice—the blood, the fat, the head, the shoulders, the viscera—are given to the deity, and the rest is eaten by the worshippers. Sometimes a whole victim is given to the deity, while another is eaten by his commensals. Sometimes the portion of the god, sometimes that of the worshippers, is eaten by priests—but that is a late refinement. (2) There are differences as to the minor offerings which usually accompany the great sacrifice and help to furnish forth the feast. Fruit, cakes, honey, wine, milk, butter, and oil are the most common of the secondary oblations. What is prescribed in one country is forbidden in another. Each people naturally offers the choicest produce of its own land. (3) There are differences as to the times and seasons of sacrifice. Among pastoral tribes the great sacrifices occur at the time of yeaning, among agricultural peoples during vintage and harvest. (4) Finally there are important differences as to the way in which the portion of the deity is conveyed to him. At first men believe that he actually eats the flesh of sacrifice. He is supposed to dwell in certain hallowed spots in his dominions—in stones, trees, fountains, caves. At these natural shrines his worshippers meet and sacrifice, and there they lay out his portion and leave it. At this stage sacrifice is literally the food of the gods. After a time men rise above this crude conception. The deity comes to be regarded as an ethereal being whose home is the upper air, and he can no longer be supposed to partake of solid food. The difficulty that now arises is overcome partly by the use of fire, which etherealises the sacrifice and sends it up to the deity in savoury clouds of smoke and vapour, partly by the multiplication of liquid offerings, especially blood and wine, which sink into the ground and may readily be supposed to be drunk up by the god.

These are the details and non-essentials of primitive sacrifice. The essentials are the public assembly, the shrine, the sacred victim, the banquet, and the supposed presence of the god as a guest-friend. The object is always to renew and strengthen the ties of kinship and friendship between the god and his worshippers, and so to secure the continuance of material prosperity. This primitive sacrificial system is not without religious value. If it is not lofty, it is genuine. It is no mere imposing or touching ceremony. The ideas which it embodies are to every worshipper realities. Religion and ritual are still one. The system has also considerable ethical value. It binds the worshippers not merely to their god but to one another. The goods it seeks are material, but they are always public and social, never selfish goods. It gives the individual no place except as a member of the commune or tribe.

A new and radically different conception of sacrifice is formed when the tribal system begins to break up. Primitive ideas of the consanguinity of gods, men, and beasts become obsolete. Sacred animals become private property, their flesh begins to be used as common food, and they lose their sanctity. Before a sacrifice can now take place an animal has first to be surrendered by its owner and consecrated. Dedication takes the place of natural sanctity. It is this new and important element that changes the character of sacrifice. The act of surrender, which is at first a mere preliminary, comes to be regarded as the essential feature. A sacrifice begins to be spoken of as a gift or tribute from the worshipper to the deity, and the original sacramental idea is gradually lost sight of. Is this a forward or a backward movement of thought? It may be the one or the other, according to the meaning attached to the gift. Two interpretations are possible. Gifts have either a symbolical or an intrinsic value. If the sacrificial gift is simply an expression of the truth that all private property is a trust from God and ought to be devoted to His service, the new conception is an advance and can do nothing but good. But if it be supposed that God stands in need of gifts, and that the more numerous and costly the oblations the greater their efficacy, the tribute-idea is a backward movement. Sacrifice then becomes nothing but a method of conjuring. Unfortunately the latter view is the common one. The historical outcome of the gift or tribute theory is holocausts, hecatombs, and human sacrifices. These last are a strange instance of reversion to barbaric practice. Human sacrifice is natural among cannibals: the food that is most grateful to man is always presented to the gods. Its revival among civilised peoples is the result of a very different train of thought. Those who begin to measure the atoning power of a sacrifice by its magnitude, splendour, or cost cannot forget that they have possessions more precious than flocks and herds. Hence in times of great distress they begin to conjure the displeasure of their gods with offerings of their own flesh and blood.

As the breaking up of the tribal system leads to a radically new conception of the nature of sacrifice, so the downfall of a nation may always be expected to produce great changes in the sacrificial system. Adversity always puts a great strain on a nation's faith in the efficacy of sacrificial gifts. Repeated calamity shatters its faith. How can it escape from religious negation? Not by any new sacrificial theory. Sacrifice is either a sacramental rite or a tribute. No other conception is possible. The history of Israel, however, proves that two courses are still open to a people whose minds have been purged of the superstition that mere gifts can secure the divine favour. Some few great minds rise above the sacrificial idea to a purely spiritual religion. The majority return to the sacramental idea. Of the latter some revive the sacramental rite in its most primitive form, using as the sacramental elements the flesh and blood of various animals still tabooed or sacred. A greater number adopt the most complex and refined sacramental ritual. Taking it up at the stage where its historical development has been arrested, elaborating it at certain points and recasting it at others so as to make it more fitly express the religious wants of the new time, they begin to practise the whole with a fresh zeal.

In primitive Israel the central feature of sacrifice (*shelem, zebah*) is always the common meal, provided for by the slaughter of the sacred animal and by various kinds of cereal oblation (*minha*). Time gradually robs the meal of its sacred character, and then the holocaust (*'ōla*) becomes common. After the Exile the great sacrifice is the sin-offering (*asham*), which culminates in the solemn ritual of the day of atonement. It is generally supposed that the central idea of the sin-offering is that of substitution—Jehovah accepting the life of the victim for that of the sinner. That is probably a mistake. Just as in the earlier sacrificial meal, so here, the significant part of the rite is not the shedding, but the application of the life-blood, followed by the burning of certain portions of the flesh and eating of others. Some of the details may readily lend themselves to a new interpretation, but the origin and primary significance of the ritual can be understood only when its distinctive features are compared with those of the sacrificial feast.

The thinkers of Greece and the prophets of Israel wage a constant polemic against the popular superstitions connected with the sacrificial system. Some of the latter seem to break away entirely from ritual, others do much to give it an ethical and spiritual meaning. Christianity embraces whatever is true both in the sacramental and in the dedicatory idea of sacrifice. The former idea receives its perfect expression in the first Christian rite, the latter in the first rule of Christian ethics, which transfigures sacrifice into self-sacrifice. But the followers of Christ are slow to rise to the height of His teaching. Material sacrifice is always easier than spiritual. Many of the errors connected with the old sacrificial systems survive as well in crude unethical conceptions of the Christian atonement as in the mass of the Church of Rome.

See A. Lang's *Myth, Ritual, and Religion* (2 vols. 1887); Tylor's *Primitive Culture* (2 vols. 1871); J. G. Frazer's *Totemism* (1887); Wellhausen's *Reste arabischen Heidenthumes* (1887); and especially Robertson Smith's *Religion of the Semites* (1889).

Sacrilege is not now a legal, but is a popular term used to denote the breaking into a place of worship and stealing therefrom. In England whoever breaks and enters any church, chapel, meeting-house, or other place of divine worship and commits any felony therein, or whoever, being in such places, shall commit any felony therein, and break out of the same, is guilty of felony and liable to penal servitude for life, or for not less than three years, or to imprisonment for a term not exceeding two years, with hard labour. The legal offence of breaking and entering a place of worship with intent to steal comes under the head of burglary or housebreaking. In Scotland there is no increase of severity in the punishment by reason of the sacred character of the things stolen.

Sacristan, an official attached to a church who is charged with the care of it, and in particular of the sacred vestments and utensils. These are kept in the *sacristy*, or vestry, which in continental churches is often a spacious building.—The English name *sexton* is an early corruption of this word.

Sacrobosco, JOANNES DE (or JOHN HOLYWOOD), an English mathematician of whom little is known, except that he seems to have been a native of Halifax, to have studied at Oxford, and taught at Paris as professor of Mathematics, where he died in 1244 or 1250. He was one of the first doctors of the middle ages who made use of the astronomical writings of the Arabians. His treatise, *De Sphæra Mundi*, a paraphrase of a portion of Ptolemy's *Almagest*, enjoyed great renown as a manual among the scholastics. First published in 1472, it passed by 1647 through forty editions, besides translations and commentaries. See an article by C. L. Kingsford in vol. xxvii. of the *Dict. Nat. Biog.* (1891).

Sacrum, or OS SACRUM, is a triangular bone situated at the lower part of the vertebral column (of which it is a natural continuation), and wedged between the two innominate bones so as to form the keystone to the pelvic arch. It is readily seen to consist of five vertebræ with their bodies and processes, all consolidated into a single bone. Its anterior surface (see illustrations at PELVIS) is concave, not only from above downwards, but also from side to side. The posterior surface is convex, and presents in the middle vertical line a crest, formed by the fusion of the spines of the vertebræ, of which the bone is composed. The last sacral vertebra has, however, no spine, and the termination of the vertebral canal is here very slightly protected. The sacrum of man differs from that of the lower animals by its greater breadth in comparison with its length. This proportion is expressed in the following way: $\frac{100 \times \text{breadth}}{\text{length}}$ = *sacral index*. In the male European the average sacral index is 112, in the negro 106, in the Australian aboriginal 99, in the orang 87, in the gorilla 72. In the female the sacrum is broader than in the male, the sacral index of the European female being about 116 (Turner, *Challenger* Reports, Zoology, xvi.). The sacrum and its connections are illustrated at PELVIS.

Various reasons have been assigned for the name given from of old to this bone; Littré accepts the view that it was because it was a part that had special significance with the ancients in sacrifices. Another reason is based on the view maintained by the Jewish rabbins, who held that this part of the skeleton, which they called 'luz,' resisted decay, and became the germ from which the body would be raised.

Sacy, ANTOINE ISAAC, BARON SILVESTRE DE, the founder of the modern school of scientific Arabists, was born at Paris on 21st September 1758. He was trained for the civil service, and whilst labouring in the Mint he made himself master of the chief Semitic languages, as well as Persian, and to some extent of Turkish. He had already gained the reputation of a sound Oriental scholar through papers contributed to Eichhorn's *Repertorium* and other learned journals, when the excesses of the republicans caused him to retire from government service, and devote himself wholly to his favourite pursuits. He published in 1793 his first ambitious work, a translation of the Persian *Annales de Mirkhond* along with *Mémoires sur Diverses Antiquités de la Perse*. Two years later he was called to fill the chair of Arabic in the newly-founded Institute of Oriental Languages; and to this he added in 1806 the duties appertaining to the professorship of Persian. He held besides several public appointments, nearly all simultaneously with his professorships, such as that of a member of the Corps Législatif (1808), rector of the university of Paris (1815), perpetual secretary of the Academy of Inscriptions, founder and member of the Asiatic Society, and member of the Chamber of Peers. As a teacher he was held in the very highest esteem; he wrote valuable text-books—*Grammaire Arabe* (2 vols. 1810), the fruits of fifteen years' labour; *Chrestomathie Arabe* (3 vols. 1806), and its supplement, *Anthologie Grammaticale* (1829)—which helped to train many of the best Arabic scholars of the 19th century; and he himself had for his pupils several of the best teachers of that language who laboured in both France and Germany in succeeding years. He died in Paris on 21st February 1838. Besides the works quoted and alluded to he also published Abd-Allatif's *Relation de l'Égypte* (1810), an edition of the tales of Bidpai (*Calila et Dimna*, 1816), Farid ed-Din Attar's *Pendnameh* (1819), Hariri's *Makamat* (1822), *Exposé de la Religion des Druses* (1838), &c. See Reinaud, *Notice . . . de Baron Silvestre de Sacy* (1838).

His son, SAMUEL USTAZADE SILVESTRE DE SACY (1801–79), a journalist, was long one of the leading writers on the staff of the *Journal des Débats*, and in 1864 was appointed a member of the Council of Public Instruction. In 1855 he was elected a member of the Academy, and in 1867 of the senate. In 1858 he published a collection of his literary articles as *Variétés Littéraires, Morales, et Historiques* (2 vols.); and he edited in 1861-64 the *Letters of Madame de Sévigné* in 11 volumes.

Saddleback, or BLENCATHARA, a Cumberland mountain (2847 feet) of the Skiddaw group, 4½ miles NE. of Keswick.

Sadducees, a Jewish school or party in New Testament times, the name most probably derived from one Zadok, founder of an aristocratic party, or from the race of the Zadokites, a family of priests at Jerusalem since the time of Solomon. The chief characteristics of the Sadducees were that they were an aristocratic party, and further that they acknowledged only the written *Torah* as binding, rejecting the entire traditionary interpretation and further development of the law during the course of centuries by the scribes. They thus rejected the whole body of Pharisaic tradition, representing at once an older *legal*, and an older *religious*, standpoint. Accordingly they refused to believe in a resurrection of the body, or any personal continuity of the individual, or retribution in a future life—a survival of original Old Testament theology; they denied angels and spirits; and they held that man enjoys freedom of will to do good or evil, and that his happiness or unhappiness is the work of his own hands alone. They obviously lacked the religious energy of the Pharisees, whose interests were centred in another world, and, partly also from their superior social position, became marked by superior culture, by worldliness, and by merely political aims. Thus Sadduceeism is denounced by Jesus as 'the leaven of Herod,' while he only inveighs, as does the Talmud, against the hypocrites amongst the Pharisees. The Sadducees disappear with the fall of the Jewish state. We still find mention of them in the Mishna, but the notices in the Talmud are far from being clear.

See Schürer's *History of the Jewish People in the Time of Jesus Christ* (Eng. trans. div. ii. vol. ii. 1890); Wellhausen, *Die Pharisäer und die Sadducäer* (1874); Montet, *Essai sur les origines des partis Saducéen et Pharisien* (1884); and the articles JEWS and PHARISEES.

Sade, DONATIEN ALPHONSE FRANÇOIS, MARQUIS DE, a notorious French romancer, was born at Paris, June 2, 1740, fought in the Seven Years' War, and was in 1772 condemned to death at Aix for his nameless vices. He made his escape, but was afterwards imprisoned at Vincennes and in the Bastille, where he wrote his fantastically scandalous romances, *Justine* (1791), *La Philosophie dans le Boudoir* (1793), *Juliette* (1798), and *Les Crimes de l'Amour* (1800). Afterwards he went mad, and died at Charenton, 2d December 1814. His name has supplied to his language the useful term *Sadisme*. See the study by Janin.

Sádi (also spelt *Sa'di*, *Saadi*, and *Sa'adi*), the assumed name of the SHEIKH MUSLIH ADDIN, one of the most celebrated of Persian poets, who was born at Shiraz about the year 1184. Little is known of the circumstances of his life. His father's name was Abdallah, and he was a descendant of Ali, Mohammed's son-in-law; notwithstanding his noble lineage, however, he held but an insignificant position. Sádi was early left fatherless. He received his education in science and theology at Bagdad, and from here he undertook, together with his master, his first pilgrimage to Mecca, a pilgrimage which he subsequently repeated no less than fourteen times. He travelled for a great number of years, and is said to have visited parts of Europe, Barbary, Abyssinia, Egypt, Syria, Palestine, Armenia, Asia Minor, Arabia, Persia, Tartary, Afghanistan, and India. Near Jerusalem he was taken prisoner by the Crusaders, not while fighting against them, but while practising religious austerities in the desert. He was ransomed for ten dinars by a merchant of Aleppo, who recognised him, and gave him his daughter in marriage; this union, however, did not prove happy. He married a second time, but lost his only son. The later part of his life Sádi spent in retirement near his native town, and he died at a very old age in 690 A.H., or 1263 A.D.; according to others, however, he did not die until 1291 or 1292 A.D. In person he is described as having been of rather insignificant appearance, short, slim, and spare. His was a contemplative, pious, and philosophical disposition. The years of his retirement he occupied in composing those numerous works which have made him justly famous through East and West. Although European critics would hardly be inclined to endorse to the full the judgment passed upon him by his countrymen, that he was 'the most eloquent of writers, the wittiest author of either modern or ancient times, and one of the four monarchs of eloquence and style,' yet there is no doubt that this 'nightingale of thousand songs' fully merited the honours showered upon him by princes and nobles, both during his lifetime and after his death. A mausoleum, with a mosque and college attached to it, was erected in his honour at the foot of the hills about 2 miles to the north-east of Shiraz, and the people, who soon wound a halo of legend around his life, flocked thither in pilgrimage.

The catalogue of his works comprises twenty-two different kinds of writings in prose and verse, in Arabic and in Persian, of which *ghazels* and *kassidas* ('odes,' 'dirges') form the predominant part. The most celebrated and finished of his works, however, is the *Gulistan*, or Flower-garden, a kind of moral work in prose and verse, consisting of eight chapters on Kings, Dervishes, Contentment, Taciturnity, Love and Youth, Decrepitude and Old Age, Education, and the Duties of Society, the whole intermixed with a number of stories, maxims, philosophical sentences, puns, and the like. Next to this stands the *Bostan*, or Tree-garden, a work somewhat similar to the *Gulistan*, but in verse, and of a more religious nature. Third in rank stands the *Pend-Nameh*, or Book of Instructions. Elegance and simplicity of style and diction form the chief charm of Sádi's writings. For wit he has been likened to Horace, with whose writings he may not have been unacquainted, since he is said to have known Latin.

The first complete printed edition of his works, called the *Salt-cellar of Poets*, by Harrington, was published in Calcutta (1791-95), and has been reprinted since by native presses in India. The *Gulistan*, first edited with a Latin translation by Gentius (Amsterdam, 1651), has been reprinted very frequently, and has been translated into a number of European tongues, into English by Gladwin, Ross, Eastwick, and Platts; and see Robinson's *Persian Poetry for English Readers* (1883). The *Bostan* was first published complete in Calcutta in 1828 (Vienna, 1858), and has likewise been translated into other languages; *With Sa'di in the Garden*, by Sir Edwin Arnold (1889), is a translation of part of the *Bostan.* Many manuscript copies of Sádi's works exist. A carefully collated MS. of the *Bústán of Shaikh Muslihu-d-Din Sa'adi*, prepared by Platts, was photographed and published in London, with annotations by Rogers, in 1891.

Sadler, Sir Ralph, was born in 1507, and was employed by Cromwell, Henry, and Elizabeth in diplomacy with Scotland. He was left one of the twelve councillors of Edward VI.'s minority, fought at Pinkie, sat in the commission on Queen Mary at York, and was her gaolor at Tutbury. He was sent to carry the news of her execution to her son, and died himself soon after in 1587.

His *Papers*, of great value for Border and Scottish history generally, were edited by Sir Walter Scott, with a *Memoir* (1809).

Sadoleto, Jacopo, was born at Modena in 1577. His father, a distinguished jurist in Ferrara, was in a position to give his son every advantage of a liberal education. Sent by his father to Rome in 1502, he there found a patron in Olivero Caraffa (under whose roof he lived for some years), and eventually entered the church. On the accession of Leo X. the polished Latin style of Sadoleto gained him the position of apostolical secretary, an appointment he held under two other popes, Clement VII. and Paul III. By Leo he was also made bishop of Carpentras in 1517, though he did not leave Rome till four years later. Settled in his charge, he performed its duties with a devotion that commanded the respect even of those who had broken with the Church of Rome. Both by Clement VII. and Paul III. he was successively summoned to Rome to give his aid in the councils of the church. By the latter of these popes he was in 1536 made cardinal, greatly, he affirms, against his own will, as his chief desire was the pursuit of his favourite studies and the faithful performance of the duties of his charge. In 1544 he acted as legate to Francis I. on a fruitless mission to effect peace with Charles V. He died at Rome in 1547.

By his high character and his literary gifts and accomplishments Sadoleto ranks as one of the most distinguished churchmen of his age. While he cultivated classical studies with all the enthusiasm of the dissolute Bembo, he still preserved his Christian feeling and the sense of the responsibilities of his profession. He had sincerely at heart the reform at least of the discipline of the church, and had his counsels and example been followed Rome would have played a worthier part in the religious revolution of the 16th century. He corresponded with many of the Protestant leaders, and did his utmost to find a common basis on which reunion might be possible. His works mainly consist of his personal and official letters, and of commentaries on the Psalms and on the Epistles of St Paul. On these last Erasmus passes the curious criticism 'that their very polish of expression will with some take off the edge of their pious suggestion.' Sadoleto's complete works were published at Rome in 1759, with an annotated life prefixed. See Joly's *Étude sur Sadoleto* (Caen, 1856).

Sadowa. See Koniggrätz.

Safe-conduct. See Passport.

Safed, one of the four holy cities of the modern Jews in Palestine, spreads in horseshoe shape round a hill 2700 feet above the Mediterranean, 6 miles NW. of the Sea of Galilee. Here dwell some 12,000 Jews, 5000 Moslems, and 200 Christians. The town was overthrown by earthquakes in 1759 and 1837. A castle of the Christians, built during the Crusades, was destroyed by the sultan of Damascus in 1220, and, having been rebuilt by the Templars, was again taken and destroyed by Beybars of Egypt in 1266. The Jewish colony has been settled here since the 16th century, and embraces many immigrants from Poland.

Safes. The manufacture of iron safes for the preservation of money and valuable papers has become one of great importance. The foundation of the plan on which fireproof safes are still constructed was laid by a Mr Richard Scott in 1801. Mr Thomas Milner in 1840 patented a fireproof safe embodying the same principle, but with some improvements. In 1843 letters-patent were granted to Messrs Tann for the use of a mixture of pounded alum and gypsum, previously heated and cooled, as a fire-resisting medium placed between two plates of iron, from 3 to 6 inches apart, which together form the wall of the safe. Milner's plan was to fill the jacket formed by the double-plated sides with sawdust, in which were packed a number of small tubes filled with an alkaline salt. These tubes burst when exposed to heat, and the sawdust becomes pervaded with moisture. When alum or sulphate of alumina is used there can be no charring till the large quantity of water these salts contain is expelled; and this is a slow process, as the heat causes a protecting crust of the anhydrous salt to form on the inside of the outer plate. Fireproof safes are still made on the same principle.

Safes are made to resist the efforts of burglars by making the outer wall of three plates, the centre one being of very hard and the other two of mild steel. All three are screwed together from the inside. By this arrangement the wall is made very difficult to drill. To prevent the door being wrenched off by wedges or other means, Messrs Chubb make the bolts of the lock, which emerge from the four edges of the rectangular door, to shoot diagonally, and so dovetail the door at the top, bottom, and sides to the frame of the safe (see Lock).

Public safe-deposits for the safe-keeping of important documents, cash, gold and silver plate, and other valuables, have been constructed in recent years in many American cities, as well as in London and other large towns in Great Britain. Some of these contain a large number of safes, the building of the National Safe Deposit Company, Queen Victoria Street, London, having room for as many as 20,000. The brick walls of this company's great safe-vault are 3 feet thick, faced externally with firebrick and lined internally with cast-iron plates, 4½ inches thick, strengthened by imbedded wrought-iron bars. The separate compartments of the vault have doors, 12 inches thick, formed of metal plates of different degrees of hardness. These weigh 4 tons each, and are raised and lowered, portcullis-like, by hydraulic power. Chancery Lane Safe Deposit was opened in 1885. Its chief portion consists of four strong rooms 'armour-plated' and built on iron columns in vaults, but completely isolated from the external walls, so that armed patrols (armed watchmen guard the above safe-vault also) can, during the night, walk round, over, and under them. These rooms contain about 5000 separate safes and have doors weighing 2 tons each, which by a clockwork arrangement can only be opened at certain hours. The lock of a single safe cannot be opened unless both renter and custodian are present as each has a different key for the same safe. In the case of the Safe Deposit, opened in 1891, in St James Street, London, the walls, roof, and floor are formed of a triple thickness of Siemens-Martin steel together having a minimum thickness of 1½ inch. The middle plate is of hard and the two outer plates are of soft steel, and these three plates were riveted together by hydraulic pressure in such a way that the rivets swell out into the wider holes of the centre plate and therefore cannot be punched. As the rivets are made with a strand of hard steel, neither can they be drilled. See *Protection from Fire and Thieves*, by G. H. Chubb (1875). Various kinds of fireproof chambers are built with vaulted roofs and sides of strong masonry.

Safety-fuze. See BLASTING, and FUZE.

Safety-lamp. It has been long known that when methane, marsh-gas, or light carburetted hydrogen, which is frequently disengaged in large quantities from coal-seams, is mixed with ten times its volume of atmospheric air, it becomes highly explosive. Moreover, this gas—the *fire-damp* of miners—in exploding renders ten times its bulk of atmospheric air unfit for respiration, and the *choke-damp* thus produced is often as fatal to miners as the primary explosion. With the view of discovering some means of preventing these dangerous results, Davy instituted those important observations on flame which led him to the invention of the safety-lamp. He found that when two vessels filled with a gaseous explosive mixture are connected by a narrow tube, and the contents of one fired, the flame is not communicated to the other, provided the diameter of the tube, its length, and the conducting power for heat of its material bear certain proportions to each other; the flame being extinguished by cooling, and its transmission rendered impossible. In this experiment high conducting power and diminished diameter compensate for diminution in length; and to such an extent may this shortening of length be carried that metallic gauze, which may be looked upon as a series of very short square tubes arranged side by side, completely arrests the passage of flame in explosive mixtures. The following are Davy's directions regarding the structure of his lamp: 'The apertures in the gauze should not be more than $\frac{1}{22}$d of an inch square. As the fire-damp is not influenced by ignited wire, the thickness of the wire is not of importance; but wire from $\frac{1}{40}$th to $\frac{1}{60}$th of an inch in diameter is the most convenient. Iron-wire and brass-wire gauze of the required degree of fineness are made for sieves by all wire-workers, but iron-wire gauze is to be preferred: when of the proper degree of thickness, it can neither melt nor burn; and the coat of black rust which soon forms upon it superficially defends the interior from the action of the air. The cage or cylinder should be made of double joinings, the gauze being folded over so as to leave no apertures. When it is cylindrical, it should not be more than two inches in diameter; for in larger cylinders the combustion of the fire-damp renders the top inconveniently hot, and a double top is always a proper precaution, fixed at the distance of half or three-quarters of an inch above the first top. The gauze cylinder should be fastened to the lamp by a screw of four or five turns, and fitted to the screw by a tight ring. All joinings should be made with hard solder; and the security depends upon the circumstance that no aperture exists in the apparatus larger than in the wire gauze.' The oil is supplied to the interior by the pipe projecting from the right side of the figure, and the wick is trimmed by a wire bent at the upper end, and passed through the bottom of the lamp, so that the gauze need not be removed for this process. (The wire is here shown in the figure.) When a lighted lamp of this kind is introduced into an explosive mixture of air and fire-damp the flame is seen gradually to enlarge as the proportion of fire damp increases, until at length it fills the entire gauze cylinder. Whenever this pale enlarged flame is seen the miners should depart to a place of safety, for although no explosion can occur while the gauze is sound, yet at that high temperature the metal becomes rapidly oxidised, and might easily break; and a single aperture of sufficient size would then occasion a destructive explosion. In a strong current of air the heated gas may be blown through the apertures of the gauze before its temperature is sufficiently reduced to prevent an explosion; but such a contingency may be guarded against by placing a screen between the draught and the lamp.

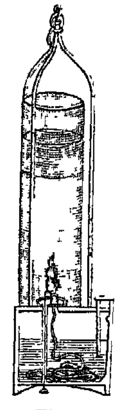

Fig. 1.
Davy Lamp.

The first lamp which would safely burn in an explosive mixture of gas and air was contrived in 1813 by Dr W. Reid Clanny of Sunderland. Into this lamp fresh air was blown through water, and heated air escaped through water by means of a recurved tube. Such a lamp was unfit for ordinary use. George Stephenson invented a safety-lamp which was tried at the Killingworth pits in 1815, and the reader will find its merits discussed in Smiles's *Life of George Stephenson*. Both Clanny and Stephenson applied wire gauze cylinders to their lamps after Davy's came into use, or at least after a communication about it had been made to the Royal Society in 1815. Stephenson's lamp, or as it is called the 'Geordie,' has a glass cylinder inside the wire gauze, the former having a cap of perforated copper. Small orifices below the glass admit the necessary air, and when the air becomes highly explosive the light goes out, so that the lamp does not get overheated. To enable it to burn well this lamp requires to be either held or suspended. What has long been known as Clanny's lamp (not his original lamp) consists of a cylinder of thick glass round the light, and on the top of it resting on a metal ring is a narrower cylinder of wire gauze through which the feed air enters. In the first or earlier form of this lamp there is imperfect combustion and it is not very safe, but when the gauze is protected by a metal jacket or *bonnet* it appears to be secure in currents having a velocity of 25 feet per second. The Mueseler lamp resembles the Clanny in having a glass cylinder below and wire gauze above, but within the gauze top there is a central chimney opening just above the flame. The peculiar construction of this presents an obstruction of two gauzes to the inlet air, while the heated outgoing air only passes through one. Consequently the strong upward draught tends to draw the fresh air briskly through the gauze to the wick, thus keeping the two currents separate and ensuring a good combustion.

For many years after the Davy, the Stephenson, and the Clanny lamp were introduced, the air-currents in coal-mines seldom reached a speed of 5 feet per second. Nowadays, owing to improved ventilation, this speed sometimes exceeds 20 feet per second in the main airways, while in some mines it is not greatly less at the faces where the men are hewing the coal. The old forms of these lamps, though safe under former conditions, are consequently no longer secure. But the Davy lamp can be rendered safe by enclosing it in a lantern, and when so protected against strong currents it is called the 'tin-can Davy.' Nevertheless, this lamp is falling out of use on account of the miserable light which it gives. In the Final Report of the Commissioners on Accidents in Mines, published in 1886, the subject of safety-lamps is very carefully gone into. After describing a considerable number of these which had been experimented with, they say: 'Many of the more secure lamps are, however, rendered unsuitable for regular use by one or more of the following circumstances; either they yield a very poor light, or they require most careful handling to prevent the light from being extinguished, or they are exceedingly sensitive to oblique currents, or they are so complicated as to present great difficulties in putting them together and lighting them.' The Commissioners add: 'But there are four lamps in which the quality of safety, in a pre-eminent degree, is combined with simplicity of construction and with illuminating power at least fully equal to that of any of the lamps hitherto in general use. These are Gray's lamp, Marsaut's lamp, the lamp of the latest pattern proposed by Evan Thomas (No. 7), and the bonneted Mueseler lamp. With the last care must be taken to avoid a considerable inclination to the vertical direction.'

Of these four lamps the one by M. Marsaut, of the Bessèges Collieries, Gard, France, seems to have become the favourite; at least it is now very largely used. Like some other forms it is in principle a bonneted Clanny, but it is made with either two or three wire-gauze covers, *c*, *c*, *c*, fig. 2. In common with the other three lamps mentioned above as exceptionally safe, the lower portion *g* consists of a glass cylinder surrounding the light on the top of which the gauzes are fixed. The curved arrows show how the air enters to support combustion, and the straight arrows how the products of combustion escape at the top; *w* is the wire for trimming the wick. This lamp made with three gauzes will not cause an explosion in so strong a current as 50 feet per second, or even when the inner gauze is at a bright red heat, unless it is kept in the fire-damp till the glass cracks; it may be said to be safe for three or four minutes. With two gauzes the light is two-thirds and with three gauzes it is one-half that of a standard candle, the light of the two-gauze kind being three and a half times greater than that of a Davy lamp.

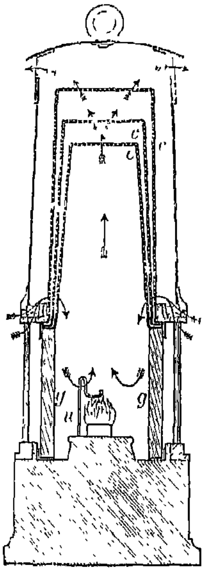

Fig. 2.—Marsaut Lamp.

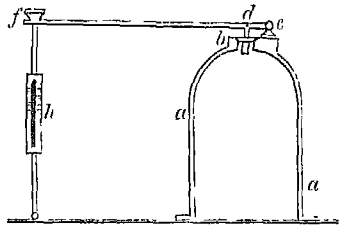
To prevent safety-lamps being surreptitiously opened in a mine it is necessary that they should be locked. One of the best ways of doing this is to fasten the oil-vessel to the other part of the lamp by a riveted lead-plug, and impress it at each end with a mark which should be varied from day to day. Lamps have also been constructed which go out when opened, and one kind can be opened only by help of a powerful magnet.

As respects the illuminants for a safety-lamp seal-oil and refined rape-oil are the two staples, but the former is superior to the latter in burning qualities. Both are improved in this respect by the admixture of two parts of either with one part of petroleum or paraffin-oil of a flashing-point not lower than 80° F. This is considered a safe mixture. A patent was granted on February 16, 1889 (No. 2779) to J. Thorne for what is called the Thorneburry miners' safety-lamp. The peculiarity of this lamp is that it is adapted to burn a heavy petroleum-oil with a high flashing-point, and gives a light from one to one and a half candle-power, which is much greater than that of other modern safety-lamps. It has been tested by Sir F. Abel and Professor Dewar, who report that the lamp fulfils the conditions essential to safety as laid down by the recent Commission on Accidents in Mines.

Electric glow-lamps are used for lighting up pit-bottoms and roadways, though hardly as yet for illuminating the working faces of mines. But portable, self-contained electric lamps that are perfectly safe have been devised which will furnish for several hours a considerably better light than that of the best safety-lamp in use. As air is completely excluded from these lamps they give no indication of the condition of the atmosphere of a mine, so that their employment would require the use of fire-damp detectors, and also of some ordinary safety-lamps.

Safety-valve, an apparatus the duty of which is to allow the steam to escape from a boiler when it reaches a certain pressure, and thus to prevent undue strain on the boiler-plates. The figure shows in outline the principle of this valve: *a*, *a* is a dome on the top of the boiler-shell; *b* is a conical brass valve resting on a seat, which has been smoothly bored for its reception; *c* is the fulcrum of a long lever *c*, *f*, from which at *d* there is a projection resting on the top of the valve. The end, *f*, of the lever is held down against the steam-pressure by the spring *h*. The pull exerted by this spring can be adjusted by a nut at *f*, and it is fitted with a brass case, and an index so arranged as always to point to a figure which indicates at what pressure per square inch the steam in the boiler will be able to lift the valve. For most stationary boilers a weight which can be moved along the lever to any desired position is used instead of the spring. In marine boilers the lever is frequently dispensed with altogether, and weights act directly on the valve. It is also usual, and in steamers compulsory by law, to put two safety-valves on each boiler, one adjustable at will by the engineer, and the other (called the 'government valve') enclosed in a case to which access can only be obtained by means of a key in the possession of the captain. The danger of explosion through overloading the valves is thus obviated. See also STEAM-ENGINE.



Saffi, or ASFI, a seaport of Morocco, stands on a little bay on the Mediterranean coast, 120 miles WNW. of the city of Morocco. It is a compactly built place, dominated by a fine ruined castle of the sultans of Morocco dating from the 16th century. The place was held by the Portuguese for several years; they abandoned it in 1648. The fortifications they built still stand in part. The shrine of the Seven Sleepers here is visited by both Moslems and Jews. Saffi was at one time the chief seat of the trade of Morocco with Europe, and, though it has declined since the rise of Mogador, it still exports beans, maize, pease, wool, olive-oil, &c. to the annual value of £151,600 (84 per cent. to Great Britain), and imports cottons, sugar, &c. to the average annual value of £65,900, more than one-half from Great Britain. Pop. 9000.

Safflower (*Carthamus tinctorius*), an annual herbaceous plant with large orange-red flowerheads, belonging to the natural order Compositæ. It is believed to be indigenous to India and adjoining countries, but it may have had a wide distribution in the wild state, as safflower seeds have been found in ancient tombs in Egypt. Safflower is cultivated all over India, and to some extent also in Persia and Egypt, for the dye obtained from its flowers. It has likewise been cultivated in southern France and other countries. Formerly it was largely exported from India, but its importance in western Europe as a dyestuff has greatly diminished since the introduction of the coal-tar colours. Only 190 cwt. (value £830) was imported into Great Britain in 1889. The flowers yield both a red and a yellow dye, but the latter is of little value. A peculiar treatment of the flowers with an alkaline solution is required to obtain the red dye, which is called Carthamine. This substance dyes silk and also cotton of a beautiful red colour, but it is not permanent. It is used as a colouring matter of toilet Rouge (q.v.). The seeds of the safflower plant yield a useful lamp-oil, and they are given to fatten poultry. See DYEING, Vol. IV. p. 138.

Saffron consists of the dried stigmas of the flowers of the Saffron Crocus (*Crocus sativus*). It is used as a colouring material for some articles of food and medicinal tinctures. Formerly it was employed for dyeing fabrics yellow, and, to a slight extent, is so still in some countries. In Persia it is much consumed as a condiment, and for this purpose it is also used in Spain; whilst, according to Giraldus Cambrensis, it forms with milk the diet of the fairies. Saffron is cultivated in various districts in the south of Europe; and in England, where it is said to have been introduced from the East in 1339, it was much grown till about 1768 in Essex (round Saffron-Walden) and Cambridgeshire. It is also cultivated in Persia, Afghanistan, and Cashmere. The gathered stigmas of the plant are pressed under a weight, and heat applied till the cake-shaped mass is quite dry. From so small a portion of the plant being useful, a vast number of flowers are required to make a small quantity of saffron. There is accordingly a strong temptation to adulterate it, the flowers of Carthamus (safflower) being much used for this purpose, for which reason they are sometimes called bastard saffron. The strong tinctorial power of saffron is owing to the presence of a body called *polychroite* or *safranin*.

Crocus sativus.

Saffron was of much greater importance centuries ago than it is now. It was in favour with the ancient Greeks as a dye, and with both them and the Romans as a perfume. In the middle ages it was employed in cookery and as a drug. It is on record that as late as the 15th century persons were burned alive in Nuremberg for adulterating saffron. The yellow colour of this dyeing substance seems to have been applied to the dress of royal persons at an early time in Greece and in Ireland, and to the shirts of persons of rank in the Western Islands of Scotland down to a comparatively late period.

Saffron-Walden, a municipal borough of Essex, 15 miles S. of Cambridge, 27 NNW. of Chelmsford, and 45 by a branch-line (1865) NNE. of London. The Saffron Crocus (see SAFFRON) was formerly cultivated here, and the name of the town is said to be derived from 'Saffron Woods.' The parish church, crowning a hill, is a stately Perpendicular structure, with a spire 108 feet high, and brasses and monuments—one to Lord Chancellor Audley (1488-1544). There are also remains of a Norman castle, a corn exchange (1848), a town-hall (1879), a cattle-market (1834), and a grammar-school, founded in 1423. Audley End, 1½ mile SW., the seat of Lord Braybrooke, was built in 1603 by Thomas Howard, Earl of Suffolk, and is still a magnificent mansion, though partly demolished since 1701. Pop. (1851) 5911; (1891) 6104. See works by Lord Braybrooke (1836) and John Player (1845).

Saga. See ICELAND, where the more important are enumerated, also the books of *The Saga Library*, by W. Morris and E. Magnusson (Lond. 1891 *et seq.*).

Sagaing, a decayed town of Burma, extends for a mile and a half along the right bank of the Irawadi, opposite to Ava. Its houses, mean and few, are embosomed in orchards and gardens, and embrace amongst them a great number of ruined temples. Sagaing preceded Ava as the capital, for a time, of Burma.

Sagan, a town of Prussian Silesia, the chief place (since 1397) in the principality of Sagan, on the Bober, 33 miles by rail W. by S. of Glogau. It has manufactures of cotton and woollen cloths, beer, &c. At the castle Wallenstein was visited (1629-30) by Kepler. Pop. 12,010.

Sagar, or SAUGOR, a well-built town in the Central Provinces of India, is situated in a hilly tract, on a feeder of the Jumna. There are here a Mahratta fort, now converted into British stores, barracks, and a magazine, as well as a gaol (1846) and a park (1862); and there were formerly a college (removed to Jabalpur) and a mint (removed to Calcutta). Sagar has a trade in salt, sugar, and cloth. Pop. (1881) 44,416.—The *district* has an area of 4005 sq. m. and a pop. of 564,950.

Sagar, a low, swampy island at the mouth of the Hugli, the holiest branch of the Ganges; it is particularly sacred in the estimation of the Hindus. Multitudes of pilgrims annually resort to it in January, and after the three days' festival of purification is over a great fair is held. The island has an area of 225 sq. m., but is very thinly inhabited, the greater part being jungle, the haunt of tigers and other wild animals. A lighthouse (1808), a meteorological observatory, and a telegraph station are the chief buildings.

Sagasta, PRAXEDES MATEO, statesman, born at Torrecilla, 21st July 1827, became an engineer, but taking part in insurrections in 1856 and 1866 had twice to flee for a time to France. He had a place in Prim's cabinet (1868), supported Amadeus, held office under Serrano, and under the new monarchy became leader of the Liberals, being minister in 1881-83, and again 1885-90.

Sage (*Salvia*), a genus of plants of the natural order Labiatæ, and containing many species, herbaceous and half-shrubby. There are only two perfect stamens (although apparently four), the filaments of which bear at their summit a cross thread—the much elongated *connective*—fastened by a joint, and having one cell of the anther at the upper end, and the other but imperfect cell at the other end. Common Sage, or Garden Sage (*S. officinalis*), so much grown in gardens as an aromatic herb for flavouring purposes in cookery, is a native of the south of Europe. It is possessed of active properties, as its powerfully aromatic odour and bitter taste indicate. The leaves and flowering parts of the plant, infused as tea, are considered tonic and astringent. The tea, along with vinegar or alum and honey, is a valuable gargle in cases of inflammation of the throat and relaxation of the uvula. The plant contains an essential oil (*Oil of Sage*), which has been used in liniments against rheumatism; but its reputation for this purpose is not now so high as formerly. The oil contains much stearoptine. Sage grows best in a dry soil, and is easily propagated by slips or cuttings. Clary (q.v.) is a species of sage. Meadow Clary, or Meadow Sage (*S. pratensis*), is a common ornament of meadows and borders of fields in most parts of the continent of Europe and in the south of England. It has bluish-purple flowers. The Apple-bearing Sage (*S. pomifera*) is a native of the south of Europe and of the East, remarkable for its very large reddish or purple bracts, and for the large gall-nuts which grow on its branches, as on the leaves of the oak. The peasantry of Crete collect these nuts and sell them in the towns for the purpose of making sweetmeats; they have an aromatic sweet taste. Some of the species of Salvia have very beautiful flowers, and are prized ornaments of gardens and greenhouses.

Sage (*Salvia officinalis*):
a, a flower.

Sage Cock. See GROUSE.

Saghalien, or SAKHALIN (though the proper name is Karaftu), is a long (670 miles) and narrow (20 to 150 miles) island, running north and south, and lying close off the east coast of the Maritime Province of Siberia. The Strait (or Gulf) of Mamia Rinso (or Tartary) separates it from the mainland; the Strait of La Pérouse parts its southern extremity from the Japanese island of Yezo; and the misty, chilly sea of Okhotsk washes its eastern and northern shores. Owing to the vicinity of this sea, to the presence of ice-floes off the east coast, and to the dense forests, chiefly of coniferous trees, which clothe the mountains (5000 feet) that run from end to end of the island, the rainfall is heavy and mists very prevalent, so that the climate is on the whole extremely raw and cold. The rivers are navigable only for very short distances; but they, as well as the adjoining seas, teem with fish, the rivers especially with salmon. Petroleum and naphtha exist in the island, and coal is mined by Russian convicts. Soon after the Russians became masters of the whole island (1875) they made an attempt to colonise it by means of convicts; but the scheme proved a failure, as neither the climate nor the soil are adapted for agriculture. Some 4000 to 5000 convicts are, however, employed to work the coal-mines. Area of island, 24,550 sq. m.; pop. 12,000, of whom one-half are Russians; the remainder belong to the Ainos (q.v.) and a couple of Mongolic races, with some Japanese. Bears, sables, wild reindeer, tigers, and other wild animals occur. The vegetation is chiefly Siberian in character. Saghalien has been inhabited since the stone age, of which, as well as of the bronze age, many relics, such as dwellings, bones, implements, &c., have been discovered. It belonged to China until the beginning of the 19th century. The Japanese then considered themselves masters of the southern part down to 1875, when they ceded it to Russia, certain of the Kurile islands being granted in return. The Russians had begun to settle in the northern part about 1857, and now are masters of the whole island.

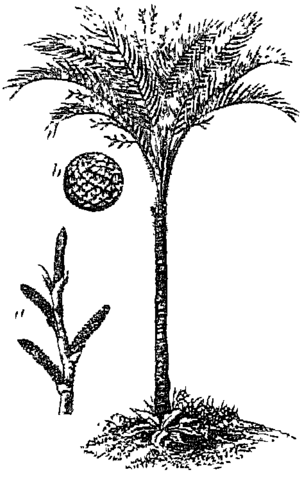
Saginaw, the third city of Michigan, and capital of Saginaw county, is built on an elevated plateau on the left bank of the navigable Saginaw River, opposite East Saginaw (q.v.), and 108 miles by rail NNW. of Detroit. It has some handsome public buildings, and is a flourishing city. It contains extensive manufactories of flour, salt, lumber, barrels, sashes, doors, and blinds, &c., and exports large quantities of lumber and salt. Pop. (1880) 10,525; of East Saginaw, 19,016; together, 29,541; (1890) 46,322.—SAGINAW BAY, an arm of Lake Huron, the largest indentation of the southern peninsula of Michigan, is 60 miles long by 30 wide, and has several fine harbours. The river Saginaw (30 miles) falls into it.

Sagitta, or ARROW-WORM, a genus of small pelagic worms, included along with one other genus—Spadella—in the class Chætognatha. The arrow-worms occur in all seas; they often measure about an inch in length, and are quite translucent. The animal is divided by two partitions into three regions, head, body, and tail. In the mouth there are sickle-shaped bristles or 'jaws,' to which the term Chætognatha refers. There are two pairs of thin lateral 'fins,' and the tail is similarly fringed. The animals are hermaphrodite, the paired ovaries and testes developing from two cells which appear at a very early stage in the history of the embryo. Each cell divides into two—an ovarian and a testicular rudiment. The development is very regular; the anatomy of the adult is in many ways unique and of much zoological interest.

See *I Chætognathi* (1883), by Grassi, in the monographs on the Fauna of the Gulf of Naples; 'Die Chætognathen' by P. Hertwig, in *Jenaische Zeitschft. f. Naturwiss.* xiv. (1880).

Sago, a nutritive, farinaceous substance obtained from the pith of several species of palms, principally, however, from *Sagus* (*Metroxylon*) *Rumphii*, the spiny, and *S. lævis*, which is spineless. For the natives of the Eastern Archipelago this palm is a source of vegetable food naturally more abundant and less variable in its yield than rice. The stem consists of a thin hard wall, about 2 inches thick, and of an enormous volume of a spongy medullary substance, which is edible. Each tree yields about 600 lb. of pith. There are three well-marked varieties of this palm. The tree grows in Java, Sumatra, Celebes, Borneo, Malacca, and Siam. The only countries, however, where it is found growing in large forests are New Guinea, the Moluccas, Celebes, Mindanao, Borneo, and Sumatra, being widely spread over the Moluccas, but confined to particular parts of the others. There is no regular fixed season for extracting the farinaceous pith, which is taken as occasion requires, and as the individual tree becomes mature, which is at about fifteen years.

These palms propagate themselves by lateral shoots as well as by seed, and they die after producing fruit, so that a sago-plantation once formed is perpetual. Sago-meal is eaten by the natives in the form of pottage, and also partially baked in earthenware moulds into small square biscuits. Large quantities of the meal in its pure state are sent to Singapore from the eastern islands, where it is granulated or pearled, and bleached by the Chinese for shipment to Europe. It comes into commerce in three forms, the common brown sago, pearl-sago, and sago-flour. It is made by two processes, the starch grains being burst in some samples and not in others. The chief uses of sago in Europe are for feeding stock, making starch, and by cocoa-manufacturers for grinding up and giving thickness or consistence to the dietetic beverage made with it. Of sago about 15,000 tons are used in Britain, and of sago-flour 10,000 tons yearly. The imports of sago and sago-flour in 1890 were 537,018 cwt., valued at £273,000.



Sago Palm (*Metroxylon Rumphii*): *a*, inflorescence; *b*, fruit.

The stem, about 15 to 20 feet, is cut into lengths, split open, and the pith dug out and placed in a vessel with a sieve bottom. Water is applied to separate the flour and carry it into a second vessel, where it is soon deposited. The water is then run off, and the flour dried and put into little baskets made of sago-leaves. The produce of a tree ranges from 600 to 750 lb. Pearl-sago (which the Chinese of Malacca prepare and send to Singapore) is in small white spherical grains, varying in size from that of a poppy-seed to a grain of millet. There are several varieties which differ much in colour, some being white and others reddish brown like radish-seed. One kind of granulated sago from India has been introduced under the name of tapioca—the real Tapioca (q.v.) being a totally different substance. Sago is not entirely soluble in hot water like ordinary starch, and can therefore be employed in making puddings, &c., and in this way forms a valuable article of food, being cheap, light, nutritious, and easy of digestion.

Saguenay, a large river of Canada, falling into the estuary of the St Lawrence on the north side, about 115 miles below Quebec. It drains Lake St John, and flows in an almost straight line about 100 miles east-south-east. In its upper part, amid a wilderness of hills, it has numerous cataracts; but in the lower course, from the village of Chicoutimi down, it flows between precipitous cliffs, often from 500 to 1500 feet high, and is in many places 2 or 3 miles broad, while the depth varies from 17 to 170, and even, near the mouth, to 500 fathoms. The largest vessels can ascend to Ha Ha Bay, 10 miles S. of Chicoutimi; and during the summer great numbers of tourists visit the river, attracted by its magnificent scenery.

Saguntum, a wealthy and warlike town of ancient Spain, in Hispania Tarraconensis, stood on an eminence near the mouth of the Pallantias, its site occupied by the modern town of Murviedro. Founded, according to Strabo, by Greeks from Zacynthus, it became at an early period celebrated for its commerce, and attained to great wealth. But the one event in its history was its siege and destruction by the Carthaginians, under Hannibal, in 219 B.C. Having held out the greater part of a year against an army of 150,000 and a consummate general, the famished Saguntines concluded their resistance with an act of heroic self-sacrifice. Heaping their valuables into one vast pile, and placing their women and children around it, the men made their last sally against the enemy, and the women fired the pile they had prepared, cast themselves upon it with their children, and so found in the flames the fate their husbands met in battle. The destruction of Saguntum directly led to the second Punic war.

Sahara (Arab. *Sáh'ra*), the vast desert region of North Africa, stretching from the Atlantic to the Nile, and from the southern confines of Morocco, Algeria, Tunis, and Tripoli southwards to the vicinity of the Niger and Lake Tsad. It is usual to regard the Libyan Desert, lying between Egypt, the central Soudan, and Tripoli, as a separate division. Both are, however, links in the chain of great deserts that girdle the Old World from the Atlantic coast across Africa, Arabia, Persia, Turkestan, and Mongolia to the Pacific. It was long customary to assert that the Sahara was the bed of an ancient inland sea, and that it consisted of a vast, uniform expanse of sand, swept up here and there into ridges by the wind. But this idea is utterly erroneous. Since the French became masters of Algeria, and more especially in recent years, they have completely revolutionised our knowledge of the Sahara, at all events of the country immediately to the south of Algeria and Tunis. The surface, instead of being uniform and depressed below sea-level, is highly diversified, and attains in one place an altitude of fully 8000 feet. But, in spite of our knowledge of this part of the world having been so greatly increased of late, there are several extensive tracts as to which we have next to no information. The present article will therefore only touch upon the more outstanding features.

From the neighbourhood of Cape Blanco in the west a vast bow or semicircle of sand-dunes stretches right round the northern side of the Sahara to Fezzan, skirting the Atlas Mountains and the mountains of Algeria. This long belt of sand-hills varies in width from 50 to 300 miles, and is known by the names Igidi and Erg, both meaning 'sand-hills.' The hills rise to 300 feet (in one place, it is said, to more than 1000 feet), though the average elevation is about 70 feet. They are composed of pure quartz sand, reddish brown in colour; are stationary in character, though constantly changing their outward form and configuration; and lie as a rule in parallel chains, whose outward slopes are fairly gentle, but their inward slopes steep. Water is nearly always to be found below the surface in the hollows between the different chains of these sand-hills, and there a few dry plants struggle to maintain a miserable existence. South of Algeria, on the other side of the Erg, the country rises into the lofty plateau of Ahaggar (4000 feet), which fills all the middle parts of the Sahara. Its surface runs up into veritable mountains 6500 feet high, which, incredible as it may seem, are covered with snow for three months in the year. On the south it apparently falls again towards the basins of the Niger and Lake Tsad; nevertheless there are mountain-ranges along the eastern side reaching 8000 feet in Mount Tusidde in the Tibbu country, and a mountain-knot in the oasis of Air (or Asben) which reaches up to 6500 feet. Mountainous tracts occur also in the west, between Morocco and Timbuctoo, but of inferior elevation (2000 feet). These mountainous parts embrace many deep valleys, most of them seamed with the dry beds of ancient rivers, as the Igharghar and the Mya, both going some hundreds of miles northwards towards the 'shotts' (see below) of Algeria and Tunis. These valleys always yield an abundance of water, if not on the surface in the watercourses, then a short distance below it, and are mostly inhabited, and grazed by the cattle and sheep and camels of the natives. Another characteristic type of Saharan landscape is a low plateau strewn with rough blocks of granite and other rocks, and perfectly barren. These elevated stone-fields, called 'hammada'—the best known is the Hammada el-Homra, south-east of Ghadames and on the border of Tripoli—alternate with tracts of bare flat sand, with broad marshes, where water has stood and evaporated, leaving salt behind it, and with extensive tracts of small, polished, smoothly-rounded stones. In very many parts of the Sahara, especially in the valleys of the mountainous parts, in the recesses or bays at the foot of the hills, alongside the watercourses, and in the hollows of the sand-dunes, in all which localities water is wont to exist, there are oases—habitable, cultivable spots, islands of verdure in the midst of the ocean of desert. These oases occur in greatest number along the southern face of the Atlas and the Algerian mountains, on the northern side of the Ahaggar plateau, and along certain definite lines, the chief of which extend between Murzuk in Tripoli and Lake Tsad, the Igharghar and Sokoto by way of Air, the Igharghar and the bend of the Niger by way of Timissao, Morocco and Cairo by way of Tafilet, Tuat (Ain-salah), and Ghadames, and Morocco and Timbuctoo by way of Tenduf and Taudeni. These lines of oases mark the great caravan-routes between the central Soudan states and the Mediterranean.

A large portion of the Sahara, though not the whole, was undoubtedly under water at one time, probably in the Cretaceous period and earlier. Then the surface seems to have been in great part elevated, so that the water remained only in some lakes and in gulfs near the Mediterranean coast. The physical features that at present characterise the Sahara are undoubtedly due in their broad essentials to atmospheric, chemical, and even mechanical causes, and only in a very small degree to the action of water. Water has exercised scarcely any influence on a large scale here since the Tertiary period; and there can be no doubt that a process of desiccation, similar to that which is now going on in the Turkestan deserts, has been in operation throughout the whole of this region from the earliest historic time. The Romans had colonies or military posts a long way southwards, in what are now desert regions; and both Herodotus and Pliny tell us that the elephant, the rhinoceros, and the crocodile, all animals that only live near abundant supplies of water, were common throughout North Africa in their day. None of the Egyptian inscriptions or animal-sculptures represent the camel, nor do the Greek and Roman historians mention it either as being a denizen of North Africa. The camel is now the principal carrier across the Sahara, and must have been introduced since the beginning of the Christian era. The inference from these and other facts is that the process of desiccation has gone on more rapidly during the last 2000 years. The *position* of the sand-dunes is determined by the unchangeable configuration of the surface; the wind and chemical action do all the rest. The sand itself is simply the Saharan rocks (granite, gneiss, mica-schists, and cretaceous rocks) ground to dust. The great heat by day causes the rocks to expand; the great fall of the temperature at night, combined with the enormous evaporation that then takes place, makes them split and crack, and break into pieces; and the strong, often violent, winds use these fragments like files, or even sand-blasts, with which to grind to pieces other rocky fragments. The terrors of the desert sand-storm have been often described (see DESERT). Thick deposits of Saharan quartz sand-dust were discovered by the *Challenger* on the floor of the Atlantic a long way west of the African coast. The sand in the dunes is so dry that in several places the tread of a camel or a man will make the hill hum, or even thunder, as a vast quantity of it slips down to a lower level. The range of *temperature* is exceedingly great: often the thermometer falls from considerably more than 100° F. during the day to just below freezing-point at night. In the west of the Sahara the daily average is 85° in the shade in the month of May. Rain does fall in certain parts of the Sahara with more or less frequency; but in most districts on the average after intervals of two to five years. After a fall of rain it is not unusual to see the river-beds in the mountainous regions filled with foaming torrents. But the atmosphere is so dry and clear that objects can be seen and sounds heard at a vast distance. The Mirage (q.v.) is no uncommon feature. Owing to this extreme dryness of the air, the Sahara, especially where it is reached by the prevailing west and north-west winds, is very healthy.

The plant-life is very rich in the oases, the date-palm, which has its home in these regions, being the principal ornament as well as the most valuable possession of these fertile spots. But fruit trees, as oranges, lemons, peaches, figs, pomegranates, &c., are also grown, with cereals, rice, durrha, millet, and such-like food crops. In the desert regions the plant-life is confined principally to tamarisks, prickly acacias and similar thorny shrubs and trees, salsolaceæ, and coarse grasses. The animals most commonly met with include the giraffe, two or three kinds of antelope, wild cattle, the wild ass, desert fox, jackal, hare, lion (only on the borders of the desert), ostrich, desert lark, crow, viper, python, locusts, flies. The people keep as domestic animals the camel, horse, ox, sheep, and goat.

The human inhabitants, who are estimated altogether at between 1,400,000 and 2,500,000, consist of Moors, Tuareg, Tibbu, Negroes, Arabs, and Jews. The Moors and Tuareg are both Berbers (q.v.); the former live between Morocco and Senegal, the latter in the middle, south of Algeria and Tunis. The Tuareg are great traders, and control the principal caravan-routes. The Tibbu, who number about 200,000, and are regarded as being ethnically intermediate between the Berbers and the Negroes, occupy the oases between Fezzan and Lake Tsad. The Arabs of pure stock are very few; they have become mixed with the Berbers and the Negroes. The most valuable products of the Sahara are dates and salt, the latter collected on the salt pans, and made from the rock-salt of Taudeni in the west, and of Kawar (Bilma) in the east; the remaining products are horses, soda, and a little saltpetre. But for many long years there has been a very active trade carried on by caravans, between the central Soudan and Niger countries and the Mediterranean states, the ivory, ostrich-feathers, gums, spices, musk, hides, gold dust, indigo, cotton, palm-oil, shea-butter, kola-nuts, ground-nuts, silver, dates, salt, and alum of the interior lands being exchanged for the manufactured wares (textiles, weapons, gunpowder, &c.) of European countries. The French desire to get this trade into their own hands, and are proposing to construct a trans-Saharan railway, light and of narrow gauge, from the coast to the shores of Lake Tsad and the Niger.

They also entertain the grandly ambitious idea of uniting their possessions on the Senegal and on the Niger with Algeria and Tunis. This union has, indeed, been theoretically accomplished already by the agreement of 1890 between Great Britain and France, by which the whole of the Sahara, except the west coast (which is claimed by Morocco and Spain and Great Britain) and the extreme east (beyond a line drawn from Murzuk in Fezzan to Lake Tsad), was acknowledged 'to be within the French sphere of influence.' The proposed trans-Saharan railway would make this union more practical, especially if the railway line were taken from Algeria to near Timbuctoo, a distance of 1750 miles, as one scheme proposes. Alternative routes are to connect the Algerian system with Kuka on Lake Tsad (2250 miles), to build a line from near Cape Nun on the Atlantic to Timbuctoo (1100 miles), and to connect the Senegambian coast by a line over Futa Jallon with the upper Niger.

Within recent years scientific men have eagerly discussed the possibility of reclaiming the Sahara from the arid desolation to which such a vast proportion of its surface is now abandoned. That no amelioration can be effected in the great bulk of its area is pretty well agreed; and if the desiccation is principally due, as has been maintained, to continental changes of elevation, it is pretty certain that nothing can be done. But the destruction of forests on the northern mountain-slopes is believed to be a co-operating cause. If so—for the fact is doubtful—this could be remedied. Two other schemes have, however, been proposed, and one of them has been carried out with admirable success. Westward from the Gulf of Cabes stretches for 250 miles a chain of salt lakes (*shotts*) right along the south of Tunis and Algeria, to the meridian of Biskra. Into these Captain Roudaire proposed (1874) to let the waters of the Gulf of Cabes by cutting through a ridge, 13 miles wide and 150 feet high, and so making an inland sea of some 3100 sq. m. in area with an average depth of close upon 80 feet. The scheme is, in point of engineering, practicable; but it is questionable whether it would accomplish the desired effect of modifying the climate and soil of the surrounding regions any more than the Sea of Aral or the Caspian does. At all events the proposal has been allowed to drop. In 1877 Mr Donald Mackenzie propounded the idea of flooding the western Sahara, the district called El Juf, by letting in the waters of the Atlantic; but the German traveller Lenz ascertained that El Juf was not a vast depression, but only a small valley. The other measure is the boring of Artesian Wells (q.v.), and with the water so obtained irrigating the soil in the vicinity. This method of reclaiming the desert, which was apparently known to the ancients, has been prosecuted by the French with great energy since 1856. By 1890 they had made a string of these wells from the cultivated districts of Algeria as far as Tugurt, on the edge of the desert, south of Biskra. Water is generally found at depths varying from 10 to 300 feet, and in great abundance. Wherever these wells have been bored the date-palm groves and the orchards have increased greatly in extent, and the population has become much denser.

In 1890 Cardinal Lavigerie, Archbishop of Carthage (Tunis), founded at Biskra a lay order called the Armed Brothers of the Sahara; their duties are to convert the native inhabitants, to protect and assist escaped slaves, and to tend the sick and wounded.

There is no single work treating of the Sahara as a whole. The best sources are the reports of French explorers, to be found in the *Proceedings of the Paris Geographical Society*, and Zittel, *Die Sahara, ihre physische und geologische Beschaffenheit* (Kassel, 1884); Nachtigal, *Sahara und Sudan* (3 vols. 1879-89); Barth, *Travels in North and Central Africa* (5 vols. 1857-58); Lenz, *Timbuktu* (1884); Rohlfs, *Quer durch Afrika* (1874), &c.; Duveyrier, *Les Touaregs du Nord* (1864); Tchihatchef, *The Deserts of Africa and Asia* (Brit. Assoc. Reports, 1882); Rolland, *Géologie du Sahara* (1891); French books of travel by Soleillet (1876), Choisy (1881), Largeau (1882), and Douls (1888). For the railway schemes, see *Comptes Rendus* of Paris Geog. Soc. (1890); and Donald Mackenzie, *Flooding of the Sahara* (1877).

Saharanpur, a town of British India, North-west Provinces, is situated 125 miles by rail N. of Delhi, and is the station for the hill sanatorium of Masuri (Mussoorie). It has an old Rohilla fort, a handsome new mosque, St Thomas' Church (1858), numerous administrative offices, and government botanical gardens (1817). It was formerly notorious for its malaria, but has vastly improved in this respect since a marsh to the east of the town has been drained. Pop. (1872) 43,844; (1881) 59,194.—The *district* has an area of 2221 sq. m. and a pop. of 979,544.

Sahib (Arab., 'master,' 'lord'), the usual title in India and Persia of a respectable European, equivalent to Mr, Sir, &c. Hence *Sahibah* is the term for Lady, Madam.

Saida. See SIDON.

Sa'id Pasha. See EGYPT, Vol. IV. p. 242.

Saiga. See ANTELOPE.

Saigon, capital of French Cochin-China, stands on the river Saigon, a branch of the delta of the Mekhong, about 60 miles from the sea by river. The present town has grown up under French influences since 1861, and with its fine streets and squares, and boulevards, is one of the handsomest cities of the East. It has a magnificent governor's palace, a cathedral (1877), two higher colleges, an arsenal, a floating dock and a dry-dock, administrative offices, and a botanical and zoological garden. Its population, consisting principally of Chinese, Annamese, and French, amounted to (1881) 13,481, and (1890) 16,213. But the business suburb of Cholon, 4 miles to the south-west, had (1885) 27,589, and (1890) 39,925 inhabitants, more than half Chinese. Saigon (properly *Gia-dinh*) is the most important port between Singapore and Hong-kong. It exports every year rice, chiefly to China, the Philippines, Japan, and the Straits Settlements, to the value of £1,440,000 to £1,720,000. The remaining exports include fish, salt, cotton, wood, beans, and hides. The port is entered by 400 to 500 vessels of 460,000 to 560,000 tons annually, of which nearly one fourth are British; then come German and French. Previous to the French occupation (1861) Saigon, although only a collection of common Siamese huts, was the capital of the province of Lower Cochin-China.

Sail, a sheet of canvas or other suitable material which is spread to the wind to cause a boat or ship to move through the water. In Britain flax and hemp are the materials of which sail-cloth is usually made; jute, cotton, and linen, and mixtures of these are also used by civilised peoples. Amongst savages matting and tissues of various vegetable fibres are used. Sails are extended by means of masts, yards, booms (at lower edge of fore-and-aft sails), gaffs (at upper edge), ropes, and combinations of these. Sails may be of various shapes, and of any size, according to the carrying power of the vessel. A vessel of shallow draught or of narrow beam can bear comparatively little sail; while a vessel of proportionately deep draught, and heavily ballasted—as a yacht—or a vessel of great breadth of beam, can carry sail of great area. A sail acts with the greatest power when the wind is directly astern, as in fig. 1; but it can be applied, though with less strength, when on either beam. The action of the wind on an oblique sail is a good example of what is known in mechanics as 'the composition and resolution of forces.' Let TD, fig. 2, be a ship, PAS its sail, WA the direction of the wind, and let the length of WA represent the pressure of the wind on the sail. WA can be resolved into AB perpendicular to the sail, and BW parallel to it, the latter of which has no effect in pressing on the sail; therefore AB is the effective pressure on the sail. Were the vessel round, it would move in the direction BA. Let BA be resolved into CA and BC, the former, CA, acting in the direction of the keel or length of the vessel, or in the direction CAD, and the latter perpendicular to it, or in the direction of the breadth. The former pressure, CA, is the only pressure that moves the vessel forward, the other, BC, makes it move sideways. From the form of the vessel, however, this latter force, BC, produces comparatively little lateral motion; any that it does occasion is called *leeway*. It results, therefore, that with the wind exerting an oblique pressure, the actual progress will be to the power of the wind only as CA is to WA.

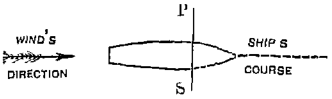


Fig. 1.

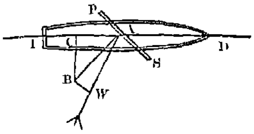

Fig 2.

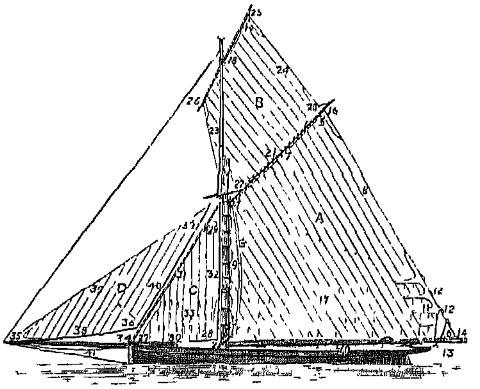

Fig. 3.—Sails of a Cutter Yacht, with the names of the different parts:

Mainsail, A.—1, main-tack; 2, main-tack tackle; 3, main-tack tricing-line; 4, neck or throat; 5, peak; 6, clew; 7, head; 8, leach; 9, luff; 10, foot; 11, strengthening pieces; 12, cringles; 13, reef pennants rove; 14, main clew lashing; 15, mast hoops and seizings; 16, peak earing; 17, reef knittles or points.

Gaff-topsail, B.—18, head; 19, peak; 20, clew; 21, foot; 22, tack; 23, luff; 24, leach; 25, peak earing; 26, head earing.

Foresail, C.—27, fore-tack; 28, clew; 29, head; 30, foot; 31, luff; 32, leach; 33, reef knittles or points; 34, fore-tack tackle rove through a sheave in stem-head.

Jib, D.—35, tack, hooked on to the traveller; 36, clew; 37, head; 38, foot; 39, luff; 40, leach; 41, inhaul of the traveller.

Sails may practically be divided by their shape into the approximately triangular and approximately square; and according as they are set parallel to the keel of the ship or across the ship, they are *fore-and-aft* sails or *square* sails. The sails which are set square across the ship are not exactly, but nearly, square in shape. But many fore-and-aft sails are also nearly square, or at least four-sided; the chief exception to this being *stay-sails*, which are purely triangular, and are suspended on the ropes which stay the masts upon the foresides—from the jib-boom, bowsprit, and deck in the case of the foremast, and from the deck in the case of the mainmast. Two of these staysails, the fore staysail and the jib, are common to most types of boats referred to in this article.

The larger sailing-vessels are usually propelled by a combination of fore and aft and square sails in varying number; the name and position of these will be illustrated at the article Ships (q.v.). The Schooner (q.v.) has mainly fore-and-aft sails on both masts, though the square-topsail schooner carries square topsails. The two-masted Brig (q.v.) is mainly square-rigged; and the brigantine is a cross between brig and schooner. The Cutter (q.v.) is the typical fore and-aft one master. The names of the several sails, and the technical terms for the parts of the sails, will be gathered from the accompanying illustration (fig. 3). A *sloop* is supposed to have a fixed bowsprit, whereas that of the cutter is a running one. A *yawl* has a foremast rigged exactly like a cutter, but has a small mizzen-mast carrying a *spanker* or *driver*. See Yacht.

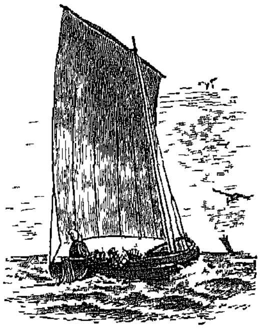

Fig. 4.—Lug-sail.

Some other types of sail not shown in the figures in the articles referred to may be noted here. The *lug-sail*, a four-sided sail hung from a yard fastened obliquely to the mast, about one-third of its length from the one end. Luggers may be one, two, or three masted, and may accordingly vary much in size. The typical *shoulder-of-mutton sail* is a triangular sail set on a boat's mast; the tip is sometimes made into a separate gaff-topsail. The *sprit-sail* is a quadrangular sail stretched from the mast by help, not of a gaff along its top, but by a sprit extending from the foot of the mast diagonally to the upper aftmost corner of the sail. The London barge has its heavy mainsail partly supported by a sprit, and there is a spanker on a small mast behind (see Vol. VI. p. 702). The spinnaker is a jib-like racing sail carried by yachts, and extended to catch the wind on the side opposite the mainsail. Many American centre-board boats carry one large quadrangular fore-and-aft sail only, the mast rising out of the bow of the boat.

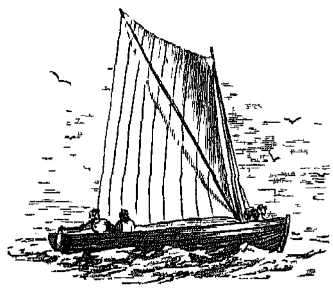

Fig. 5.—Sprit-sail.

The *lateen* sail, much used in the Mediterranean, is a triangular sail stretched from a long yard attached to a short mast, as shown in fig. 6. The felucca is a two-masted lateen-sailed boat; the sails of the Egyptian *dahabeeah* and of the Arab *dhow* are of the same type. A *xebec* carries a combination of lateen and square sails.

The South Sea *proa*, the Chinese *junk*, and other local rigs have many peculiarities in their sails. Naval rigs are illustrated at NAVY. See also SHIPS AND SHIPBUILDING, YACHT; and for Sailing or Navigation, see GREAT CIRCLE SAILING, LATITUDE AND LONGITUDE, MERIDIAN, SEXTANT, STEERING, &c.

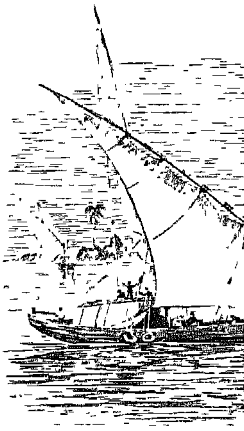

Fig. 6.—Felucca.

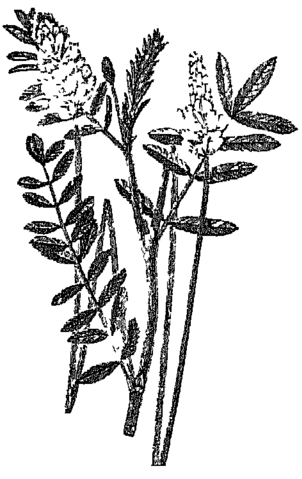
Saima, LAKE. See FINLAND.

Sainfoin, or SAINTFOIN (*Onobrychis sativa*), a plant of the natural order Leguminosæ, sub-order Papilionaceæ, of a genus nearly allied to Hedysarum (see FRENCH HONEYSUCKLE), but having one-seeded pods, which are marked with wrinkles or pits, and are more or less prickly toothed at the margin. It is a spreading perennial, about two or three feet high, with leaves of nine to fifteen smooth acute leaflets, and spikes of beautiful flesh-coloured flowers, striated with rose-red, on long stalks. It is a native of the continent of Europe and of the south of England, and is much cultivated as a fodder-plant in dry, and particularly in calcareous soils, to which it is admirably adapted. Its cultivation was introduced into England in 1651; and before the introduction of turnip-husbandry the sheep-farmers of the chalk districts depended almost entirely upon it, as they still do to a large degree. It is, however, a very local crop, being scarcely cultivated on any but the most calcareous soils, where scarcely anything else is equal to it, although it has been found to succeed well on any soil sufficiently dry. There is no more nutritious fodder than sainfoin, whether for sheep, oxen, or horses. Even the dry stems of a crop which has produced seed are readily consumed by cattle, if cut into small pieces. Sainfoin is a deep-rooted plant and sometimes endures for ten, or even fifteen years on the same land—more generally only for four to seven years; and in the eastern counties of England it is often sown instead of clover on light and somewhat calcareous sands and sandy loams, and the ground is ploughed again in two or three years.—The name *sain-foin* probably means ‘wholesome hay’ (from Lat. *sanus*), and not, as is often assumed, a shortened form for *saint foin* (‘holy hay’).



Sainfoin (*Onobrychis sativa*).
(Stebler and Schroter, *Best Forage Plants*.)

Saint, a name applied in the New Testament to the members of the Christian community generally, but restricted by ecclesiastical usage from very early times to those who have been specially remarkable for their personal virtues and their eminent services to the cause of religion. In the ages of persecution the quality which most of all challenged the admiration and reverence of the faithful was naturally constancy in the profession and the defence of the Christian faith; and the honours of the martyrs, even before the age of persecution had passed, were extended to confessors, and eventually to all who died in the odour of sanctity, and especially to those who also obtained the reputation of performing miracles. In general, however, the saints of the Catholic Church are distributed into several classes, chiefly in relation to the special character of the ecclesiastical offices appropriated to their honour. Thus we find enumerated (1) Apostles and Evangelists; (2) Martyrs; (3) Confessors, a name applied primitively to those who had courageously undergone imprisonment or pains for the faith without gaining the final crown of martyrdom, but in later times understood of all who, not being martyrs, were eminent for sanctity of life; (4) Doctors or saints eminent for sacred learning; (5) Virgins; (6) Matrons and Widows. Anciently the title of Saint was bestowed upon an individual by the members of the particular Christian community to which he belonged, or to which his merits were most familiar. In the earliest times, however, the letters of St Cyprian show that caution was observed by the bishops to guard against the recognition of undeserving persons. It was not, however, till the 12th century that the pope reserved to himself the exclusive right to add to the roll of saints, or that a regular form of procedure was established in the Roman courts for the purpose of testing and of solemnly pronouncing upon the title of persons, who had died with a reputation for sanctity, to the public *cultus* of the church. A saint, according to the received interpretation, is one who has exercised the three theological virtues of faith, hope, and charity, and the cardinal virtues, prudence, justice, fortitude, *in a heroic degree*, and has persevered in this exercise until death. Sanctity may exist without miracles, as, according to the commonly alleged instance, there is no record of John the Baptist having wrought miracles; and, on the other hand, miracles may be performed by heretics or sinners. Nevertheless, by the existing discipline of the Roman Church, before a decree of Canonisation (q.v.) can be obtained, the rule requires evidence of such miracles as an expected fruit of heroic faith and as a confirmatory sign of sanctity after proof has been given of the heroic virtues.

It is difficult to estimate with anything approaching to exactness the number of saints who have received *cultus* as such in the various churches of Christendom from the earliest times. Of many almost all record has perished, except their names commemorated in some ancient calendar or preserved in the dedication of some church or sacred locality. The fullest list is that to be found in the index or general table in the sixty-first volume of the colossal work of the Bollandists (see ACTA SANCTORUM). From these tables it appears that biographies or notices have been given of about 17,000 saints in the preceding sixty volumes—that is, up to the end of October; and further, there are added the names of some 3500 for whom biographies were being prepared for the concluding volumes of the work not yet finished. But the authority, however great, which is due to these researches is no more than the authority of learned men. The catalogue which possesses the highest ecclesiastical authority, and which has the character of a liturgical or church service-book, is that of the *Martyrologium Romanum*, revised by order of Gregory XIII. in 1586 by Baronius (q.v.), and frequently supplemented since. The breviary prescribes that the 'Martyrology' be read as part of the office of Prime wherever the office is solemnly sung in choir; and it is the custom, moreover, in religious communities to read the 'Martyrology' for the day publicly in the refectory. The 'Martyrology' is not, as its name might suggest, confined to the commemoration of martyrs only. It comprises the saints of every class to whom the Roman Church gives authentic recognition, and names some 2700 in all, including about twenty saints of the Old Testament, arranged as in a calendar according to the days of their celebration; while the recital for each day terminates with the clause, 'And in other places of very many other holy martyrs, confessors, and holy virgins.' It is plain that of this multitude only a select few can have festivals assigned to them in the ecclesiastical year, or proper offices in the breviary or missal.

About two-thirds of every month in the Roman calendar is occupied with special saints' days, though, on some of these, minor saints are commemorated by a collect or prayer. But the Roman calendar is modified or supplemented in a greater or less measure in every national church, every diocese, and every religious order or community. Thus to the Roman breviary in England is added a supplement containing the offices of the English saints who sometimes displace or transfer to another day the saints of the Roman calendar. The fixed calendar of saints' days in use in various Catholic countries or communities thus varies considerably. At the end of the useful handbook by Canon Husenbeth, entitled *The Emblems of Saints*, will be found printed in parallel columns for purposes of convenient comparison eight such calendars—the Roman calendar, two old English calendars, the Scottish, the French, the Spanish, the German, and the Greek. It should further be noted that the actual calendar of saints' days in use in any given year can never quite correspond with the fixed calendar of this or that diocese or community. The great movable feasts determined by the annually varying date of Easter constantly disturb the order of the calendar, and lead to transferring the observance of a saint's day to some proximate *feria* or vacant day, and in some cases to extinguishing it altogether. The complicated rules which regulate these changes are based upon the different ranks accorded to the feasts—doubles of the first class, doubles of the second class, greater doubles, doubles, semi-doubles, and simples—in their relations to one another and to the Sundays and movable feasts which also have their various ranks.

Thus, to take an example of these variations at random, the 26th of May is the festival of St Philip Neri in the Roman calendar, but in England his place is taken by St Augustine of Canterbury, while St Philip is regularly transferred to the following day. On the other hand, in the churches of the Congregation of the Oratory the feast of their founder keeps his own day even in England, and St Augustine is postponed to 6th September. Again, the 26th of May is specially liable to be invaded by the occurrence of movable festivals. Thus, in 1877 the English churches had to transfer St Augustine to the 30th of the month, and St Philip Neri to the 23d of June. The result is that a special local 'ordo' is annually printed for the use of the clergy, and the annual *Catholic Directory* for England gives separately the fixed calendar and the ecclesiastical calendar corresponding to the clerical 'ordo' for the year.

In Christian art representations of the saints are often marked by the nimbus, aureole, or glory (see NIMBUS), and many of the saints are pictured as accompanied by emblems, by which they could readily be recognised. Apart from symbols which only typified the person indicated (as a shepherd for Christ, a gourd or a whale for Jonah), the figure of the saint is given with an added emblem. Thus the four evangelists were symbolised by four rivers, the four rivers of paradise. The adoption of the four living creatures (Rev. iv. 6) for the same purpose does not appear to have taken place till the 5th century; but soon it became a constant practice to represent St Matthew by or with the man, Mark with the lion, Luke with the ox, John with the eagle. The twelve apostles are depicted as twelve men, twelve sheep, or twelve doves. St Peter, for obvious reasons, is represented with the keys or with a fish; many of the saints with the instruments by which they were martyred—St Paul with a sword; St Andrew with a Cross (q.v.); St Simon with a saw; St James the Less with a club; St Matthew with a lance; St Catharine with a wheel; St Lawrence with a gridiron; others with objects connected with their history or in some other way—St George with a dragon; St Matthew with a purse. St James the Elder is figured as a pilgrim. Many hundreds of such emblems are given in Canon Husenbeth's work already mentioned, together with a list of patron saints of trades, professions, countries, and cities. A martyr who had a special interest in a place was called its patron (see PATRON) as early as the 4th century; the possession of a relic was enough to constitute the saint a patron of its possessors. His being born in a place or having died there was a good reason for choosing the patron saint. The angels Michael, Gabriel, and Raphael were chosen patrons of churches as early as the 6th century. Trades and professions had their patrons, and every disease a saint gifted for its cure. The patron saint defended his votary, heard his prayer, helped him in difficulty, and even protected him at the day of judgment from the consequences of his sin. Among well-known patron saints were St George of England, St Andrew of Scotland, St Patrick of Ireland, St David of Wales, St Denis of France, St James of Spain, St Nicholas of Russia, St Stephen of Hungary, St Mark of Venice. There are curious instances, especially in the 15th century, of armorial bearings assigned to certain English and other saints. The Catholic doctrine of invocation of the saints is treated at PRAYER; at RELICS the honour paid to relics of saints and martyrs is dealt with. See also ROMAN CATHOLIC CHURCH, and SYMBOL.

Besides the *Acta Sanctorum* of the Bollandists, see Mrs Jameson's *Sacred and Legendary Art;* Alban-Butler, *Lives of the Fathers, Martyrs, and other Saints* (12 vols., new ed. 1866); Baring-Gould, *Lives of the Saints* (17 vols. 1872-92), the last volume of which treats of the emblems of saints; *Lives of the English Saints* (1844-45), edited by Cardinal Newman; C. A. Jones, *Saints of the Prayer-book* (1885); R. Owen, *Sanctorale Catholicum* (1880); R. M. Stanton, *A Menology of England and Wales* (1888), which includes the English martyrs of the 16th and 17th centuries recently beatified by Pope Leo X.; for Irish saints, O'Hanlan (1877) and Whitley Stokes (1888); for Scottish, Forbes (1872) and Pinkerton (new ed. 1892); for Welsh, Rees (1853).

St Affrique, a town of the French dept. of Aveyron, 56 miles NW. of Montpellier, stands in a beautiful valley in the midst of meadows, orchards, and vineyards. There is a considerable trade in wool and in the celebrated Roquefort cheese (see ROQUEFORT). Pop. 5081.

St Albans, a city of Hertfordshire, 20 miles NNW. of London, on the top and northern slope of an eminence washed by the Ver, one of the chief feeders of the Colne, across which stood Verulamium. That important Roman station is perhaps identical with the fortress of Cassivellaunus, destroyed in 54 B.C. by Cæsar, and was taken by Boadicea in 61 A.D. In honour of the protomartyr Alban, said to have been beheaded here about 303 for sheltering the Christian priest Amphibalus, Offa, king of Mercia, in 793 founded a great Benedictine abbey, which from Pope Adrian IV. (q.v., born at Bedmond, 3 miles SW.) obtained precedence over all other abbeys in England. Rebuilt after 1077 with flat Roman tiles from Verulam by Abbot Paul of Caen, and dedicated in 1115 in the presence of Henry I., the abbey church, in spite of successive alterations (Early English, Decorated, Perpendicular), is still 'the vastest and sternest' of early Norman structures, its exterior length (548 feet) being second only to Winchester's, whilst the transepts measure 189 feet across, and the massive central tower is 144 feet high. It was made the cathedral of a new diocese in 1877, and since 1871 has been very thoroughly restored by Sir G. G. Scott and Sir Edmund Beckett, the nave being reopened on 21st October 1885. Special features of interest are the substructure of the shrine of St Alban (its 2000 shattered fragments pieced together), the tombs of Duke Humphrey of Gloucester and 'Sir John Mandeville,' the superb presbytery reredos, and Abbot Ramryge's chantry. Of the forty abbots down to the Dissolution in 1539 the greatest was Cardinal Wolsey; and among the monks were Matthew Paris, Roger Wendover, Rishanger, and the other compilers of the *Chronica Monasterii S. Albani*, which, like the *Treatise* of Dame Juliana Berners (q.v.), was printed here at Abbot Wallingford's press, and which has been edited for the Rolls series (25 vols. 1863-91). The abbey gatehouse was in 1869 converted from a gaol to the purposes of King Edward VI.'s grammar-school, which till then had occupied the Lady Chapel; else, nothing remains of the monastic buildings. In St Michael's Church is Lord Bacon's monument; the 15th-century clock-tower was restored in 1864; and a drinking-fountain marks the site of an Eleanor's cross, demolished in 1702. There are almshouses founded by the famous Duchess of Marlborough, a town-hall (1832), a corn exchange (1857), and a free library (1880). The industries include straw-plaiting, brewing, boot and brush making, and silk-manufacture. St Albans, which was disfranchised for bribery in 1852, was incorporated by Edward VI. in 1553, and had its municipal boundary extended in 1879. It was the scene of two battles in the Wars of the Roses (q.v.)—the first, on 22d May 1455, a victory for the Yorkists; the second, on 17th February 1461, for the Lancastrians. Pop. (1851) 7000; (1881) 10,931; (1891) 12,895.

See F. L. Williams' *History of Verulam* (1822), and works on the cathedral by Peter Newcome (1793), J. W. Comyns Carr (1877), and James Neale (1878).

St Amand, a town of France, dept. Cher, on the river Cher, 25 miles SSE. of Bourges, with ironworks and porcelain-factories. Pop. 7722.

St Amand-les-Eaux, a town of France, dept. Nord, 8 miles NW. of Valenciennes, with hot sulphur-springs and a ruined abbey. Pop. 8722.

St Andrews, one of the smaller towns of Scotland, but no mean city in age, importance, or historical interest, stands on a rocky plateau at the edge of St Andrews Bay, and is 42 miles NNE. of Edinburgh. From the number and nature of the remains of ancient burial found in and around the city there can be little doubt that there was a settlement here in early prehistoric times. The monkish legend, long discredited, assigned its ecclesiastical origin to St Regulus (q.v.) or Rule, who, warned in a dream, brought certain bones of St Andrew from Patras in the 4th century, and, like too many foreigners in the present day, was wrecked at Muckross, afterwards called Kilrimont, now St Andrews. There is, however, reason for believing not only that those relics were brought in the 8th century, but that, before the end of the 6th, Cainnech or Kenneth, the patron saint of Kilkenny, had founded a monastery at Rig-Monadh, the Royal Mount, and that thus arose the name of Kilrimont. Early in the 10th century it seemingly became the seat of the 'Ardepscop Albain,' the high bishop of the Scots; and in Queen Margaret's time he began to be called the Bishop of St Andrews. The Augustinian Priory, founded in 1144, was the richest and greatest of all the religious houses of Scotland. The Cathedral, founded in or about 1160 in presence of Malcolm IV., and consecrated in 1318 in presence of Robert the Bruce, was stripped of its images and ornaments in 1559, and afterwards fell into ruin. The extreme length inside is 355 feet, but at one time it had been several bays longer. The Bishop's Palace or Castle, first built in 1200, was frequently demolished and rebuilt, and is now a ruin. George Wishart and other martyrs were confined in its 'bottle-dungeon,' and Cardinal Beaton was slain within its massive walls. None of the ruins is less imposing or more interesting than the foundations on the Kirkhill—the site of the Celtic church. St Rule's Tower has probably occasioned more discussion and perplexed more archæologists than any other building in Scotland. Its arches, as well as that of its roofless chapel, approach the horseshoe in form. The parish church, which was almost entirely rebuilt in 1798, was founded in 1412. Its predecessor, which stood near the cathedral, was built three centuries earlier. Of the Black Friars Monastery a portion of the chapel remains; but of the Grey Friars almost nothing. The schools of St Andrews were noted in 1120; but the University, the first in Scotland, only dates from 1411. St Salvator's College was founded in 1455, St Leonard's in 1512, and St Mary's in 1537. St Salvator's and St Leonard's were united in 1747. The average attendance of students is about 200; but much is also being done for the higher education of women. The library contains over 100,000 volumes, and there is a good museum. The parish church of St Leonard's is roofless, and the congregation worships in the beautiful chapel of St Salvator's. The Madras College, founded and endowed by Dr Bell, has been recently remodelled and placed under a new governing body. The town was erected into a free burgh between 1144 and 1153. In those days the inhabitants were described as Scotch, French, Flemish, and English. In 1526 it was reckoned one of the six 'principale townis of merchandice of this realm;' but it has now almost no trade. The small harbour suffices for the few coasting vessels which frequent it. For a number of years the fishers were increasing rapidly, but the steam-trawlers are proving too much for them. There is a small brewery, and a smaller foundry. The manufacture of golf-clubs and balls is naturally a thriving industry, St Andrews being known all over the world as the headquarters of golf. It is a popular watering-place and summer resort. Since 1860 several new streets and many handsome villas have been erected. Pop. (1801) 3263; (1891) 6853

Saint Arnaud, Jacques Leroy de, a French marshal, was born at Bordeaux, 20th August 1796, entered the army in 1815, but left it in 1822 to take part in the Greek struggle for independence. Returning to the French army in 1831, he six years later proceeded to join the foreign legion in North Africa, and laid the foundation of his reputation in the wars against the native tribes during the next ten years. In 1847 he was made a general of brigade; and in the early part of 1851 he carried on a bloody but successful warfare with the Kabyles. Louis Napoleon, plotting the overthrow of the republic, was at this time on the lookout for resolute and unscrupulous accomplices; and he recalled General Saint Arnaud and appointed him to the command of the second division of the city forces. On 26th October Saint Arnaud became war minister, and took an active part in the arrangements for the *coup d'état* of 2d December, and in the subsequent massacres at the barricades. For these services he was rewarded with the marshal's baton. On the breaking out of the Crimean war in 1854 he was entrusted with the command of the French forces, and co-operated with Lord Raglan in the battle of the Alma, 20th September. But nine days afterwards he died on board ship, on his way home to France. See his *Lettres* (ed. by his brother, 2 vols. 1864).

St Asaph, a little cathedral city of Flintshire, North Wales, on an eminence between the rivers Elwy and Clwyd, 6 miles SSE. of Rhyl. The cathedral, 182 feet long, is the smallest in the kingdom, and, rebuilt after 1284, is a plain, cruciform, red sandstone structure, mainly Decorated in style, with a massive central tower 93 feet high, fine oak stalls, and a tablet to Mrs Hemans, who lived here 1809–28. It was restored by Scott in 1867–75. St Kentigern (q.v.) is said to have founded about 560 a bishopric at Llanelwy, renamed St Asaph after his favourite disciple. Among sixty-five bishops since 1143 have been Reginald Pecock; W. Morgan, the first translator of the Bible into Welsh; Isaac Barrow the elder, on whose monument is a request for prayers for his soul; W. Lloyd, one of the Seven Bishops; Thomas Tanner; and S. Horsley. St Asaph has a grammar-school, founded about 1600, and rebuilt in 1882. It is one of the eight Flint parliamentary boroughs. Pop. 1901.

See works by Browne Willis (1710), E. A. Freeman (1850), R. J. King (Murray's *Welsh Cathedrals*, 1873), and D. R. Thomas ('Diocesan Histories' series, 1888).

St Augustine, an ancient Spanish town on the east coast of Florida, now the capital of St John's county, stands on Matanzas Sound, 2 miles from the Atlantic and 37 miles by rail SSE. of Jacksonville. It was founded in 1565, and is the oldest town in the United States. Its mild and equable climate renders it a favourite winter-resort for invalids. It is a Roman Catholic bishop's see, and contains a cathedral and convent; and it has also a Peabody Institute. Pop. 2300.

St Austell, a town of Cornwall, 14 miles NE. of Truro and 1½ NW. of the head of St Austell Bay. It has some woollen and iron manufactures, but owes its importance to the china-clay, tin, and copper that are worked in the vicinity (see Pottery, Vol. VIII. p. 360). The interesting church (13th to 16th century) was restored in 1870. Pop. (1861) 3825; (1891) 3477.

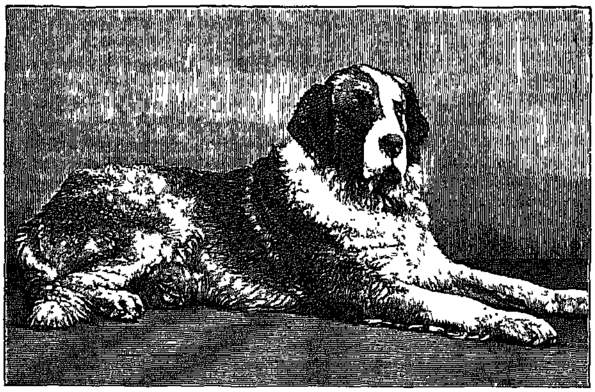
St Bartholomew, or St Barthélemy, a French West Indian island, 190 miles E. of Porto Rico. Area, 8 sq. m.; pop. 2835. The treeless surface rises to 1003 feet; the climate is very dry. French from 1648 till 1784, the island then was Swedish till 1877, when it was bought back by France for £16,000.

St Bees, a coast village of Cumberland, 4½ miles S. of Whitehaven by rail and 3 SE. of St Bees Head (300 feet). A nunnery founded here about 650 A.D. by an Irish princess, St Begha, appears to have been destroyed by the Danes, and to have been reconstituted as a Benedictine priory in the reign of Henry I. St Bees College was established in 1816 by Dr Law, then Bishop of Chester, to supply a systematic training in divinity to candidates for ordination whose means were inadequate to defray the expenses of a university. The bishops of the province of York had previously been compelled to ordain a number of such men as literates, the poverty of many of the northern benefices not securing a sufficient supply of graduates. A portion of the ruined priory church of St Bees was fitted up by the Earl of Lonsdale as lecture-rooms, library, &c. On the recommendation of the bishop, an incumbent was selected for the perpetual curacy of St Bees by the patron, the Earl of Lonsdale, with a view to his holding the position of principal of the college. The principal selects his own staff of lecturers. The expenses are defrayed from the fees paid by the students—£10 each term. The college course extends over two years, each divided into two terms—January 14—April 21, and August 14—November 21. During this period the standard English divinity works, with the Greek Testament, are chiefly studied, and the composition of sermons, &c. practised. The students reside in lodgings in the village, and attend the service daily in the parish church. Students are admitted at the age of twenty-one; and graduates are admitted to the second year's course on producing their diploma The average number of students is about 60. Near the church is a grammar-school founded by Archbishop Grindall in 1587, and reconstituted in 1881. St Bees is in some repute as a sea-bathing place.

St Bernard, the name of two mountain-passes in the Alps. (1) Great St Bernard is on the road between Aosta in Piedmont and Martigny in the Swiss canton of Valais, and is 8120 feet above sea-level. Almost on its crest stands the celebrated hospice founded in 962 by Bernard de Menthon, a neighbouring nobleman, for the benefit of pilgrims journeying to Rome. It now affords sleeping-accommodation for eighty travellers, and can give shelter to about 300 in all. The hospice is connected with a station in the valley below, from which the monks above are warned by telephone when travellers are on their way up the mountain. The keepers of the hospice are a dozen or so of Augustinian monks, all young and strong; their work is, with the aid of large dogs, to rescue travellers who are in danger of perishing from the snow and cold. But the dogs they use are no longer the famous St Bernard breed, but Newfoundlands. The rigorous cold and the difficulty of breathing the rarefied air frequently do permanent injury to the health of the monks in charge. In 1889 a botanical garden, chiefly for Alpine plants, was laid out in the Entremontthal, on the northern slope of the pass. Diggings in 1890 revealed the foundation of a small Roman temple of imperial times near the summit of the pass, with a few bronzes and other antiques. (2) Little St Bernard, SW. of the above in the Graian Alps, connects the valley of Aosta with that of Tarantaise in Savoy. By this pass Hannibal is believed to have led his forces into Italy. It too has a hospice, 7143 feet above the sea.

St Bernard, a breed of dogs which derives its name from the hospice of St Bernard, where it was first introduced for the purpose of finding the pass across the mountain in snow. Every morning during the winter two dogs, one old and one young, accompanied by one or more of the monks or attendants, started from the monastery for the shelter at the foot of the mountain on the Italian side; a similar party of men and dogs also descended to the shelter at the Swiss end of the pass. If any travellers were found there they were helped on their way to the hospice, the dogs going on before to show the road. Possibly, on rare occasions, the dogs were allowed to go down to the valley by themselves, but as a rule they only acted as guides to the monks. Pictures and stories of the dogs laden with food and clothes, and sometimes actually carrying a benumbed traveller, are plainly due to the exaggeration of their admirers.

The St Bernard, according to the traditions of the monastery, is the result of a cross between a Danish bull-bitch and a mastiff, a native hill dog, though at what time effected it is impossible to say. After the breed was once established it was kept pure until 1812, when owing to the severity of the winter the monks were obliged, contrary to their usual custom, to send out the brood bitches as well as the dogs, with the result that all the females succumbed to the cold, and the monks found themselves without the means of continuing the true breed. In this extremity a cross with the Newfoundland was tried, but at first failed, owing to the excessive coat of the Newfoundland, which hampered the dogs in snow; however, by breeding back to their own short-coated dogs, the monks obtained the desired shortness of coat, though occasional specimens were born with the rough coats. These rough-coated specimens were sold or given away to the inhabitants of the surrounding valleys, who continued to breed them, so that St Bernard dogs soon became general in Switzerland. About 1860 these dogs first attracted the attention of English travellers, who imported them to Britain, where they were exhibited and at once excited much notice on account of their size and beauty. Others were introduced, and the St Bernard was soon established as the most popular big dog, a popularity which has gone on increasing. The St Bernard, as bred to modern English ideas, is an immense red or orange coloured dog, marked with white on muzzle, neck, chest, feet, and tip of tail. The head should be massive and imposing, with a strong square muzzle, a point of great importance. Legs should be straight, with large feet, and double or, at least, single dew claws. Hind-feet should turn out, though not sufficiently to hinder the dog's movements. The coat of the rough variety is of medium length; it should not be too curly. In the smooth variety the coat should be short and wiry. Many of the finest St Bernards measure over 30 inches high at the shoulder, and weigh over 150 lb. On account of his great size and weight the St Bernard often moves in an awkward manner, a defect which should be avoided. St Bernards, though occupying a great deal of space, are so handsome that they are kept as companions in great numbers; as a rule they are good tempered, though many are not to be trusted.



St Bernard Dog, 'Scottish Prince.'

See Hugh Dalziel's *The St Bernard* (1888), and his *St Bernard Stud-book* (1891).

St Brieuc, a town of Brittany, the capital of the department of Côtes du Nord, on the Gouet, 2 miles from its mouth in the English Channel, and 93 E. of Brest. It has a port, Le Légué, at the river's mouth; a cathedral, dating from the 13th century; the ruined Tour de Cesson (1395, blown up 1598); and a lyceum, with a library of 27,000 volumes. Pop. (1886) 16,289.

St Catherine's, a city of Ontario, chief town of Lincoln county, on the Welland Canal, by rail 32 miles E. by S. of Hamilton and 5 S. of Port Dalhousie on Lake Ontario. It has large manufactures of machinery and agricultural implements, and some shipbuilding. Its mineral springs are noted. Pop. (1881) 9631; (1891) 9170.

St Chamond, a town of France, dept. Loire, 7 miles NE. of St Étienne by rail, has manufactures of ribbons, stay-laces, silk, and iron, with large coal-mines in the vicinity. Pop. (1872) 12,585; (1886) 14,383.

St Charles, capital of St Charles county, Missouri, on the high north bank of the Missouri River, 23 miles by rail (44 by river) NW. of St Louis. It has flour-mills, a railroad-car factory, and large bridge-building works. Pop. 6500.

St Christopher, popularly St Kitts, one of the Leeward group of the West India Islands, belonging to Great Britain, lies 45 miles NW. of Guadeloupe. It is long (23 miles) and narrow (5 miles), and is traversed by a chain of rugged mountains (Mount Misery, 4100 feet); area, 68 sq. m. The capital is Basse-terre (q.v.), with a population of about 7000. Principal products are sugar, molasses, rum, and salt, with some coffee, cocoa, tobacco, and cattle. Administratively St Kitts is united with Nevis (q.v.) and the little island of Anguilla; the government rests with a governor, an executive council appointed by the crown, and a legislative council of ten official and ten unofficial nominated members, three of the latter from Nevis. The imports for the three islands together average about £175,500 annually, not quite one-half from Great Britain; the exports vary between £159,970 (1886) and £345,170 (1889). Pop. of all three islands (1889) 44,101; of St Kitts (1881) 29,137. This island, whose native Carib name meant the 'fertile island,' was discovered in 1493 by Christopher Columbus, who named it from a fanciful resemblance of its outline to statues of his patron saint, St Christopher. Colonised by French and British settlers simultaneously in 1625, it passed wholly into the possession of England in 1713, though the French both before and after that date seized it and held it for short periods.

St Clair, a navigable river of North America, in the line of the Great Lakes, and carrying (225,000 cubic feet per second) into Lake St Clair the waters of Lake Huron. It is over 40 miles long, and half a mile broad. In 1891 a railway tunnel under its bed was completed between Port Huron, Michigan, and Sarnia, Ontario, 20 feet in diameter, and 6026 (including excavated approaches, 11,553) feet long. Lake St Clair is 26 miles long and 25 wide, has an area of 410 sq. m., and from its south-west end passes the volume of water it has received into Lake Erie by means of the Detroit.

St Clair, a borough of Pennsylvania, 5 miles by a branch-line N. of Pottsville, with rich mines of anthracite coal, and a pop. (1890) of 6950.

St Claude, a town in a valley surrounded by hills, in the French department of Jura, with a pop. of 8116, largely occupied with turner's work, cabinet-making, and a trade in cheese. The monastery here dates from 430 A.D.

St Cloud, a town of France, dept. Seine-et-Oise, situated on an eminence near the Seine, 10 miles by rail W. of Paris. Henry III. was assassinated here in 1589 by the fanatical monk Jacques Clément. St Cloud was long famous on account of its magnificent château, built by Louis XIV.'s brother, the Duke of Orleans. Napoleon planned and carried out here the *coup* of 18th Brumaire, and after he became emperor made this château his favourite place of residence. It was destroyed, and its magnificent park (in which stands the Sèvres porcelain-factory) greatly injured, during the siege of Paris in 1870. Pop. 5316.

St Croix, an American river, called also the Passamaquoddy and the Schoodic, which, flowing out of Grand Lake, on the eastern border of Maine, runs south-east 75 miles to Passamaquoddy Bay, and forms a portion of the boundary between the United States and New Brunswick. See also SANTA CRUZ.

St Cyr, a village of France, dept. Seine-et-Oise, about 2 miles by rail W. of Versailles. It owes its origin to an educational institution for poor girls of good birth, founded by Louis XIV., at the suggestion of Madame de Maintenon. It was for its 250 pupils that Racine wrote his tragedies of *Esther* and *Athalie*. Madame de Maintenon died here, and was buried in the choir of the church. The institution was suppressed at the Revolution; and in 1806 the buildings were converted by Napoleon into a military school, which still exists. Pop. 3296.

St Davids, a 'city' of Pembrokeshire, South Wales, in the westernmost corner of the Principality, on the rivulet Alan, within 1½ mile of St Brides Bay and 16 miles WNW. of Haverfordwest station. The ancient *Menevia*, it is now a mere village; but in the middle ages its cathedral, with the shrine of its founder, St David (q.v.), the patron saint of Wales, attracted many pilgrims, among them the Conqueror, Henry II., and Edward I. and Queen Eleanor. Rebuilt between 1180 and 1522, that cathedral still is mainly Transition Norman in character, a cruciform pile, measuring 298 feet by 120 across the transepts, with a central tower 116 feet high. Special features are the reddish-hued stone, the richly ornamented nave with fretted timber roof, the rood screen (c. 1338), the base of St David's shrine, the tomb of Edmund Tudor, Henry VII.'s father, and the mosaics by Salviati. The west front was rebuilt by Nash in 1793; and the whole was restored by Scott in 1862–78. Little is known of the British bishops after St David's death in 601; of the seventy-two since 1115 may be mentioned Archbishops Thoresby and Chichely, Barlow, Ferrar the Marian martyr, Middleton the forger, Archbishop Laud, Mainwaring, Bull, Lowth, Horsley, and Thirlwall. North of the cathedral is the ruined college of St Mary (1377), with a slender tower 70 feet high; and across the Alan are the stately remains of Bishop Gower's palace (1342), which Bishop Jones and Mr Freeman considered to be 'altogether unsurpassed by any existing edifice of the kind.' A restored cross, the shattered Close wall, and the imposing Tower Gate deserve notice, and also St Davids Head, rising 100 feet above the sea. Pop. of the parish, 2053.

See works by Browne Willis (1717), Manby (1801), Bishop Jones and E. A. Freeman (1856), Sir G. G. Scott (1869), and the Rev. W. L. Bevan (1888).

St Denis, a town in the French department of Seine, 4 miles N. of Paris, is situated within the line of forts forming the outer defences of the city, and was itself formerly fortified. It has manufactures of printed calicoes, flour, chemicals, machinery, white-lead, and other commodities. A famous sheep and parchment fair has been held here since 1552. The town is supposed to date from the foundation of a chapel raised above the tomb of St Denis (q.v.). This chapel was replaced in the 7th century by an abbey, built by Dagobert I., who was buried in its church, which thereafter became the mausoleum of the kings of France. The existing abbey church was begun by Abbot Suger in 1137, and skilfully restored by Viollet-le-Duc from 1848 onwards, though it suffered again in the bombardment of the town by the Germans in 1871. Monuments were erected above each of the royal tombs by St Louis, and the series was continued in after ages. The most magnificent of these memorials are the tombs of Louis XII. and his queen, Anne of Brittany, of Francis I. and Claude, and of Henry II. and Catharine de' Medici. The abbey was plundered by the English in 1430. Napoleon converted it into a school for the daughters of officers of the legion of honour. During the Revolution, in 1793, the royal tombs were sacrilegiously rifled and demolished, and the bodies cast indiscriminately into ditches prepared for them. Pop. (1872) 31,850; (1886) 47,980. See D'Ayzac *Histoire de l'Abbaye de Saint-Denis* (1861).

St Denis, the capital of Réunion (q.v.).

St-Dié, a town of the French department of Vosges, stands on the Meurthe, 50 miles by rail SE. of Nancy, possesses a Romanesque-Gothic cathedral, a large seminary, and a museum, and carries on energetically the weaving of cotton, the making of hosiery, paper, machinery, and iron goods. It is a convenient point from which to make excursions into the Vosges Mountains. Pop. (1872) 9748; (1886) 14,047.

St Dizier, a town of France (dept. Haute-Marne), 38 miles by rail SE. of Châlons, is situated on the Marne, which here begins to be navigable. In 1544 it resisted for some weeks the army of Charles V., and in 1814 the French twice defeated here the invading army of the allies. There are iron forges and foundries, boat-building yards, and cotton-factories. Pop. 9863.

St Domingo. See HAYTI, SAN DOMINGO.—St Domingo Bark is one of the names for Caribbee Bark (q.v.).

Sainte-Beuve, CHARLES-AUGUSTIN, the greatest literary critic of modern times, was born at Boulogne-sur-Mer in 1804. His father was commissioner of taxes in the town, and was a man of literary tastes. He died three months before the birth of his son, but it was from him that Sainte-Beuve deduced the leading bent of his own character and talent. His mother, *née* Augustine

Coilliot, was the daughter of an Englishwoman who had married a Boulogne sailor. This connection of his mother with England partly explains that interest in English literature, and especially in English poetry, which Sainte-Beuve showed from first to last of his literary career. She was a woman of character and practical sense, but with so little regard for any ideal interests of life that she was never reconciled to her son's choice of a literary career till his election as a member of the Academy in his forty-first year. Her husband had left her in straitened circumstances, and it was only by considerable sacrifice on her part that her son received the advantage of a liberal education. Incessant toil and a modest return was to be Sainte-Beuve's own fortune throughout life, and this early acquaintance with a simple economy schooled him to a subsequent scale of living in which many would have forfeited their independence and self-respect.

Till his fourteenth year Sainte-Beuve attended the school of a M. Blériot in Boulogne, where he received a thorough grounding in Latin, and where he gave unmistakable proofs of unusual gifts. By his own desire he was then sent to Paris, where, boarding with a freethinking professor, M. Landry, he attended the Collége Charlemagne. At this school also he gave further promise of future distinction. Though he had thus shown such special aptitudes in the direction of literature, for the next three years (1824-27) he followed a course of medical study, and for another year even walked the hospitals—apparently out of deference to his mother's wishes.

It was in 1824, when Sainte-Beuve was in his twentieth year, and while he was still a medical student, that he began that career as a man of letters which he was to follow with such assiduity and devotion to the end. In that year M. Dubois, who had been one of his teachers at the Collége Charlemagne, founded a literary and political paper called the *Globe*. Supported by such writers as Jouffroy, Rémusat, Ampère, and Mérimée, the *Globe* became one of the leading organs of the day, and was hailed by Goethe as heralding a new departure in the intellectual life of France. On the invitation of Dubois, who had recognised the promise of his pupil, Sainte-Beuve took his place on the regular staff of contributors. For three years he wrote short articles on various subjects, which were collected after his death, and published under the title of *Premiers Lundis*. With the doctrinaire attitude of the chief contributors of the *Globe* Sainte-Beuve was never in complete sympathy, and in 1827 he came under a new influence, which forms one of the turning-points in his life. In that year he wrote a eulogistic review of the *Odes et Ballades* of Victor Hugo, which led to the closest relations between the poet and his critic. Supreme as he is in his own department, Sainte-Beuve was not of those who dominate other minds by the fervour of their own convictions, or the fury of their own creative impulse. Before he attained his full powers, therefore, and while his susceptibility was stronger than his judgment, he came under a succession of influences of the most diverse character and tendency. Under the influence of Hugo Sainte-Beuve became for a time the zealous advocate of that romantic movement of which Hugo was the acknowledged leader, and of which Sainte-Beuve himself was eventually the most judicious critic. As a member of the romantic *cénacle* which counted in its number Hugo, Lamartine, De Musset, and Alfred de Vigny, Sainte-Beuve embodied his new ideals and his new experiences both in poetry and prose. In 1828 he published his *Tableau de la Poésie Française au Seizième Siècle*, with the double object of justifying the romantic movement and of directing attention to what was of real value in the French poetry of the 16th century. In 1829 and 1830 successively appeared *Vie et Poésies de Joseph Delorme* and *Les Consolations*, poems which, while they show intellectual subtlety and ingenious fancy, are fraught with morbid feeling strangely dissonant from the buoyancy and serenity of the writer's later years. In 1829, also, in the pages of the *Revue de Paris*, the predecessor of the *Revue des Deux Mondes*, he began the first of those longer critical articles on French literature which, under the name of *Causeries*, he was afterwards to carry to such perfection.

The revolution of July 1830 brought Sainte-Beuve under a new set of influences. The *Globe* now passed into the hands of the Saint-Simoniens, and for a year he became one of its contributors under the new direction. All his life Sainte-Beuve had a keen interest in questions relating to the well-being of the people; but his new colleagues soon passed the limits of his sympathy, and we find him for the next three years on the staff of the *National*, then edited by Armand Carrel. An article by Sainte-Beuve in that journal, which was the organ of extreme republicanism, led to a rupture with the editor, and he discontinued his contributions. It was during this period (1830-36), also, that Sainte-Beuve became a sympathetic listener of one of the most interesting men of the century, the famous Lamennais. In his later years Sainte-Beuve insisted that the foundation of his intellectual life was the French materialism of the 18th century; yet both his relations with Lamennais and his private correspondence prove that at this period of his life, at least, religious questions seriously engaged his attention. With the extreme democratic opinions of Lamennais after his breach with Rome Sainte-Beuve could have no sympathy, and by 1836 their intimate relations ceased. Later in life he expressed himself very frankly regarding Lamennais' career, but his final judgment is virtually that of all judicious critics. His solitary novel, *Volupté* (1834), also belongs to this period of his life, a period apparently of mental and spiritual unrest, of which this novel is the somewhat morbid expression. In 1837 he proceeded to Lausanne, where he delivered a series of lectures on the history of Port-Royal. Subsequently, as the result of the intermittent labour of twenty years, these lectures took the shape of a book of five volumes, which contain some of Sainte-Beuve's finest work. Whereas in the first two volumes, however, he is to a certain extent in sympathy with Jansenism, in the last three his point of view is that of the purely disinterested critic. At Lausanne Sainte-Beuve was deeply impressed by the character and views of Alexandre Vinet, and, though he eventually diverged far from Vinet's teaching, he treasured his memory as one of the noblest hearts and minds it had been his fortune to know. During his stay at Lausanne Sainte-Beuve produced his last volume of poetry, *Pensées d'Août*, in which with but moderate success he attempted, as a departure from the usual rhetorical character of French verse, a simpler form of expression and more familiar turns of thought. From Lausanne he made a journey into Italy, visiting Rome, Naples, and other cities; and with this journey closes the first period of his life, during which he was still groping his way to his true function.

From 1840, according to Sainte-Beuve himself, dates a new departure in his criticism. Thenceforward he claims to have been master of himself, and in his own words to be the disinterested 'naturalist of minds.' In that year he was again in Paris, where an appointment as keeper of the Mazarin Library brought him a modest competence, which saved him from the necessity of hasty production. During the next eight years he wrote mainly for the *Revue des Deux Mondes*, to which he had been an intermittent contributor since its foundation in 1831. As one of the most distinguished literary workers of the day, he was in 1845 elected member of the French Academy, his eulogium being pronounced by Victor Hugo. The political confusions of 1848 led Sainte-Beuve to accept the professorship of French literature at Liége, where he delivered a course of lectures afterwards published under the title of *Chateaubriand et son Groupe Littéraire sous l'Empire*. In 1849 he returned to Paris, when he entered on an engagement which was to afford him the precise sphere he needed for the adequate display of his powers and attainments as a literary critic. This was to write for the *Constitutionnel* an article on some literary subject to appear on the Monday of every week. For the next twenty years Sainte-Beuve, with little intermission, carried on this task. On Monday he settled down to his task, and on five successive days worked for twelve hours at the preparation of his materials and the composition of his article. Saturday he devoted to a careful revision of proofs, and on Sunday he allowed himself a holiday. In 1861 these *Causeries du Lundi*, as they were called, were transferred to the *Moniteur*, an official organ of Napoleon III.; in 1867 back to the *Constitutionnel*, and finally in 1869 to the *Temps*. The papers thus written make up in all twenty-eight volumes, of which the first fifteen are entitled *Causeries du Lundi*, and the succeeding volumes *Nouveaux Lundis*.

By his acceptance of the government of Napoleon III. Sainte-Beuve gave offence to many of his former friends; but his justification was that forms of government were indifferent to him provided he might pursue his own objects in peace. In 1854, on the occasion of his appointment as professor of Latin Poetry at the Collége de France, the students refused to listen to his lectures, and he was forced to demit both the office and its emoluments. The lectures he intended to deliver, a critical estimate of Virgil, were subsequently published as a separate volume. Nominated a senator in 1865, he regained popularity by his spirited speeches in favour of that liberty of thought which the government was doing its utmost to suppress. In his last years Sainte-Beuve lived the life of a hermit in his modest house in the Rue Mont-Parnasse, though he counted among his friends and admirers the first men of letters in France. He died on 13th October 1869 of a malady from which he had long suffered. It was his special instruction that he should be buried without religious ceremony and without the customary eulogium. His funeral, however, was attended by a multitude estimated at ten thousand, but the only words pronounced at his grave were—'Adieu, Sainte-Beuve; adieu, our friend.'

It is by the amount and variety of his work, and the range of qualities it displays, that Sainte-Beuve holds the first place among literary critics. Others have equalled or surpassed him in individual effects; where he is unapproachable is in his faculty of educing the interest and significance of the most various types of human character, and the most various forms of creative effort. To his marvellous insight, range of sympathy, and knowledge of detail he added an experience of men and things exceptionally rich and varied for one whose main function was literary criticism. But, besides their value as criticism, the works of Sainte-Beuve are an inexhaustible mine of facts and reflections bearing on every interest of human life. Regarded in its totality, his work is in its essential tendency identical with that of Montaigne. In both we have the point of view of the uncommitted observer, the same many-sided presentment of life, the same inconclusive philosophy; and in both a personal character equally void of every heroic element. Supreme as he is in his own department, however, Sainte-Beuve is not a European man of letters like Erasmus, or Voltaire, or Renan. The subjects he treated were not of universal interest, and his literary methods are as far as possible from the simplicity and directness which are the crowning qualities of these three writers. Nevertheless, the work of Sainte-Beuve marks an epoch in the intellectual history of Europe. By its delicacy, subtlety, and precision it extended the limits of the study of human character and of the products of human intelligence.

The chief authority for the life of Sainte-Beuve is the strongly prejudiced book of the Vicomte d'Haussonville, *C. A. Sainte-Beuve, sa Vie et ses Œuvres* (1875). See also Sainte-Beuve's own 'Ma Biographie' in *Nouveaux Lundis*, vol. xiii. Amongst numerous works, one of the most read is *Souvenirs* by his last secretary, M. Troubat (1890). The works of Sainte-Beuve are as follow: *Tableau Historique et Critique de la Poésie Française et du Théâtre Français au XVI^{e} Siècle*; *Poésies Complètes* (2 vols.); *Volupté*; *Port-Royal* (7 vols. 1860); *Chateaubriand et son Groupe Littéraire sous l'Empire* (2 vols. 1860); *Critiques et Portraits Littéraires* (5 vols.); *Portraits Contemporains* (5 vols.); *Portraits de Femmes*; *Causeries du Lundi* (15 vols.); *Nouveaux Lundis* (13 vols.); *Souvenirs et Indiscrétions*; *Premiers Lundis* (3 vols.); *Les Cahiers de M. Sainte-Beuve*; *Chroniques Parisiennes*; *Lettres à la Princesse*; *Étude sur Virgile*; *Le Général Jomini*; *Monsieur de Talleyrand*; *P. J. Proudhon, sa Vie et sa Correspondance*; *Correspondance de C. A. Sainte-Beuve* (2 vols.).

Sainte-Claire Deville, HENRI ÉTIENNE, French chemist, was born on 11th March 1818, in St Thomas, West Indies, and was educated in Paris. In 1844 he was commissioned to organise the Faculty of Sciences at Besançon, and in 1851 obtained the chair of Chemistry in the Normal School at Paris, and shortly afterwards the similar chair to the Sorbonne. He died in Paris on 1st July 1881. He began his work as a chemical investigator by inquiring into the composition of certain resins, but soon transferred his energies to the investigation of metallurgic substances. It was Sainte-Claire Deville who first produced aluminium (1855) and platinum in commercial quantities, and demonstrated the general theory of the dissociation of chemical compounds at a high temperature. Amongst other results that were due to his skill and ingenuity, he discovered (1849) anhydrous nitric acid; examined the forms of boron and silicon; devised methods for fusing platinum, iridium, cobalt, &c.; determined the density of metallic vapours at exceedingly high temperatures; produced artificially sapphire, aluminium, and similar substances; and invented a way of getting crystallised oxides. His labours for producing globules of aluminium, which he exhibited at the Paris Exhibition of 1855, were in continuation of Wöhler's, dating from 1827. The platinum metals he studied along with Debray. His papers were published in *Comptes Rendus* of the Academy of Sciences, and in *Annales de Chimie*. He also published *De l'Aluminium* (Paris, 1859), and *Métallurgie du Platine* (2 vols. 1863).

Sainte Croix. See SANTA CRUZ.

St Elias, MOUNT, a great volcanic mountain on the borders of Canada and Alaska, long believed to be the highest mountain on the American continent, and to reach a height of 18,000 or 19,000 feet. It is now thought not to exceed 13,500 feet; but it has proved extremely difficult of approach, standing in a wild, inaccessible region, and clothed almost from base to summit with eternal snow.

There are huge glaciers and utterly impassable precipices and yawning chasms; but in 1886 a party comprising Schwatka, Wood, and Seton Carr reached a height of 7200 feet on the mount, nearly all above the snow-level.

Sainte Marie-Aux-Mines. See MARKIRCH.

Saintes, an old town of France, dept. Charente-Inférieure, on the left bank of the Charente, 28 miles by rail SE. of Rochefort, has manufactures of iron and copper goods, machinery, and leather. In ancient times this town, under the name of *Mediolanum*, was the capital of the Santones, from whom the subsequent province derived the name of Saintonge (see ROLAND, Vol. VIII. p. 766). Its interesting Roman remains include a triumphal arch and the ruins of an amphitheatre. It was a bishop's seat down to 1790; the cathedral still stands. Palissy's home was at Saintes during the first fifty years or so of his life. Pop. 14,558.

St Étienne, one of the most important industrial towns in France, stands (dept. Loire) on a tributary of the Loire, 36 miles by rail SW. of Lyons and 312 SSE. of Paris. It is built in the midst of the second largest coalfield of France (the largest is that of Valenciennes in the north), in which some 17,000 men are employed, and from which 3,000,000 tons of coal are extracted annually. The town, which looks thoroughly grimy, has few buildings of interest; but a school of mines (1816), a national small-arms factory (1764), a gallery of art, an artillery and a commercial museum may be mentioned. The chief industries are in iron and steel and in ribbons. Its hardware workshops employ more than 20,000 workpeople, and turn out steel and iron plates, gun-armour, iron masts, large castings for machinery, firearms, locks, cutlery, files, nails, tools, &c. The government small-arms factory (4000 men) has since the period of the Revolution supplied nearly all the muskets and rifles and revolvers for the army. Some 40,000 persons, mostly hand-workers in their own homes, are engaged in the town and its vicinity in making ribbons, laces, fringes, and similar ornamental work. The production of ribbons is valued at £3,760,000 for a single year, and of this some £2,740,000 worth is exported. Besides these branches of industry, hats, pottery, and hemp cables are made. Pop. (1800) 16,000; (1851) 53,741; (1876) 126,019; (1891) 133,443. The coal-mines began to be worked in the 14th century, but only on an extensive scale in the end of the 18th. The town was twice captured by the Huguenots, in 1563 and 1570, and between this last date and 1629 it suffered terribly on three occasions from the plague. The first railways in France were built from St Étienne, one in 1828 to Andrezieu, the other in 1831 to Lyons.

St Eustatius, a Dutch West Indian island, 10 miles NW. of St Christopher. Area, 8 sq. m.; pop. 2286.

Saint-Évremond, CHARLES MARGUETEL DE SAINT-DENIS, SEIGNEUR DE, a famous French writer and wit, was born at St Denis near Coutances in Normandy, 1st April 1613. He was educated by the Jesuits at Clermont, at Caen, and at the Collége d'Harcourt in Paris, next entered the service, and fought with distinction at Rocroi, Freiburg, and Nördlingen. He gave steady support to the throne throughout the Fronde, but in 1661 had to flee first to Holland, finally to England, on the discovery of his witty and sarcastic Letter to Créqui on the Peace of the Pyrenees. He was warmly received by Charles II., and here he spent the rest of his days, delighting the world with his wit, a fast friend of the beautiful Hortense, Duchesse de Mazarin, whose strange death sorely troubled his old age. Here he died, 29th September 1703, and was buried in Westminster. His writings were famous long before they were made public, and in his own day he enjoyed an equal reputation on either side of the Channel for polished satire, Attic irony, and brilliant style. Distinctively a man of fashion, a complete Epicurean in philosophy and life, a brilliant conversationalist in an age when conversation ranked among the fine arts, he has written his name high amongst the masters of French prose, although he lacked enthusiasm, ambition, motive, illusions, to produce anything adequate to his gifts. Still, it is a sovereign distinction to have created a style so delicate, yet so effective and so individual. His one mannerism is antithesis, yet the art is so exquisite as never to offend. His influence was great—it is praise enough to say that he helped to form the Chevalier de Grammont. His satire, *La Comédie des Académistes* (1644), is a masterpiece in its kind, and his dissertation on Racine's *Alexandre* reveals the true critic's insight. But so little was his curiosity that though he lived nearly forty years in England he never learned English and never knew Shakespeare. The letters betwixt him and his dear friend Ninon de Lenclos are charming beyond most. His writings, including essays, comedies, &c., were first collected by Des Maizeaux with a Life (Lond. 1705). There are good volumes of selections by C. Giraud (1865) and Lescure (1881).

See the studies by Gilbert and Gidel (1866), Merlet (1870), Pastorello (Trieste, 1875); also Sainte-Beuve's *Nouveaux Lundis*, vol. xiii., and *Causeries du Lundi*, vol. iv.

St Flour, a town in the French department of Cantal, finely situated on a steep basaltic plateau (3000 feet) 50 miles S. of Clermont-Ferrand, has a cathedral (Gothic; 1375-1466), and manufactures pottery, cloth, &c. Pop. 4998.

St Gall, a Swiss canton lying between the Lake of Constance on the N. and the Grisons on the S., with Zurich on the W. The country is for the most part mountainous, rising to 10,660 feet in Ringelspitz, and to 8216 in Säntis, and consists of a series of valleys radiating outwards from the high canton of Appenzell, which St Gall entirely surrounds. The Rhine flows along the eastern border. Portions of the lakes of Constance, Zurich, and Wallen lie within its boundaries. Sandstone and slates are quarried. The mineral springs of Pfäffers and Ragatz are well known. But the chief source of wealth is the embroidery of cottons, muslins, and jaconets, carried on principally at St Gall and Wattwyl. Rorschach, on Lake Constance, is a port of some trade. Area of canton, 779 sq. m.; pop. (1888) 229,441, of whom three-fifths are Roman Catholics, the rest Protestants of the Reformed Church. They speak German. The canton is governed by a Great Council, chosen by the communes for three years (see SWITZERLAND).

ST GALL, the capital of the above canton, stands on the Steinach, 2196 feet above sea-level (the highest *town* in Europe), 53 miles by rail E. of Zurich, and 9 from Rorschach on the Lake of Constance. The buildings of its famous Benedictine monastery are now used as government offices and schools, and for housing the monastic library, founded in 830, of 41,700 volumes and 1800 MSS., several of these last of great antiquity and value. Other buildings are the old abbey church, thoroughly restored in 1756-66, and made a cathedral in 1846; the Protestant church of St Lawrence (restored 1851-53); the town library, founded in 1536, and containing 60,400 volumes and 500 MSS.; and the museum with collections of natural history, works of art, and antiquities. The city carries on a large trade in its staple commodity, embroidered textiles (cotton, muslin, &c.), and in agricultural products. Pop. (1888) 27,910. The original nucleus of the place was the cell of St Gall (*c.* 550-645), an Irish follower of St Columban, who settled here in 614. Around this soon grew up a monastery of the Benedictine order, which was promoted by Charles Martel to the dignity of an abbey. The abbey gradually became one of the masterpieces of mediæval architecture; whilst the monks were indefatigable in the collection and transcription of MSS.—biblical, patristic, historical (sacred and profane), classical, liturgical, and legendary. Several of the classics, especially Quintilian, Silius Italicus, and Ammianus Marcellinus, have been preserved solely through the MSS. of St Gall. Its monastic schools enjoyed the greatest reputation for learning from the 9th to the 12th century. Amongst its more distinguished pupils were Notker and Ekkehard. They were noted also for the cultivation of music (Notker Labeo being the chief ornament), and its MSS., preserved in the library, have been extensively made use of by the restorers of ancient ecclesiastical music. By the 10th century a walled town had grown up around the monastery. After long struggles the townsmen succeeded, in the 13th century, in throwing off the supremacy of the abbey, though shortly before this the abbots were elevated to the rank of princes of the empire. In 1454 the town was admitted to the Swiss confederation, and in 1528, through the influence of the reformer Vadianus, it embraced the new doctrines. At the close, however, of the religious war in 1531 the Catholic religion was re-established, and the abbot reinstated. At the French Revolution the abbey was secularised (1798), and its revenues were soon afterwards sequestrated (1805). By a later arrangement (1836) St Gall was erected into a bishopric. The French republicans created the canton of Säntis out of the town and abbey lands, with others, in 1799; and in 1803 the existing canton of St Gall was formed.

See *historical works* by Von Arx (4 vols. St Gall, 1830), Baumgartner (3 vols. Zurich and Einsiedeln, 1868-90), Henne-Am Rhyn (1863), and Näf (1867).

St George's. See BERMUDAS.

St-Germain-en-Laye, a town of France, dept. Seine-et-Oise, stands on an eminence above the Seine, with a royal forest (10,000 acres) behind it and the river before it, Paris in the distance, 13 miles to the E. by rail. Above the river runs the famous terrace (2625 yards long by 115 feet wide), made by Lenôtre in 1672. The historic associations cluster round the old royal castle, which, until Louis XIV. removed the court to Versailles, was the favourite residence of the kings of France. Here were born Henry II., Charles IX., Louis XIII., and Louis XIV., and here died Louis XIII. King James II. of England lived in this castle from 1689 to his death in 1701. After that it was turned into barracks, then into a military prison, and finally by Napoleon III. into a museum of Gallo-Roman antiquities. Peace was signed within its walls between Charles IX. and the Huguenots in 1570, and the peace between France and Brandenburg in 1679. The Fête des Loges, one of the most popular of popular festivals, is held annually at a chapel in the forest. The people (15,997 in 1886) manufacture woollens and cottons. See Lacombe, *Le Château de St-Germain* (4th ed. 1874).—*St Germain-des-Prés*, named like the other from Germanus (q.v.), was a famous Benedictine monastery near Paris (see MAURISTS). Its church (1001-1163) ranks as the oldest in Paris.

St Germans, formerly the seat of the ancient diocese of Cornwall, now a small village, stands on the slope of a hill, on a branch of the river Lynher, 9½ miles W. by N. of Plymouth. It is notable only for its fine parish church, which has an excellent Norman west front. Pop. of parish (1881) 2869; (1891) 2877.

St Gilles, a town of France, dept. Gard, is situated on the Canal de Beaucaire, 12 miles SSE. of Nîmes. Its abbey church, the west front of which is a masterpiece of Romanesque architecture, and is covered with the richest decoration, dates from 1116. Pope Clement IV. was born here. Pop. 4876.

St Gotthard, a mountain-knot of the Alps, that has its feet planted in the Swiss cantons of Uri, Grisons, Ticino, and Valais, and lifts its head, 9850 feet high, to the eternal snows. In its arms it holds the sources of the rivers Rhine and Rhone, Ticino and Reuss, and so sends the water from its melted snows to the German Ocean, the Mediterranean, and the Adriatic. On its shoulder it bears one of the most celebrated of the Alpine passes from Switzerland to Italy. The road that crosses this pass (6936 feet) leads from the shores of Lake Lucerne to the shores of Lago Maggiore. This route was first used by the Longobardi in the 6th century. In the days of Charlemagne the path was made practicable for pack-animals; but down to 1820 it was not wider than 13 feet. In 1820-24 it was widened to 18 feet and smoothed for carriages. Near the summit of the pass stand two hotels and a hospice, the latter for poor wayfarers, of whom some 12,000 used to travel this way every year. Since 1882, however, a railway has climbed up the lower slopes of the St Gotthard, and then burrowed through it in a tunnel. The making of this tunnel was begun in 1872 and finished in 1880; it extends from Göschenen (at a height of 3639 feet) in Uri to Airolo (3757 feet) in Ticino, measures 9¼ miles in length, is 26 feet wide and 21 high, rises with a gradient that reaches on an average 26 in 100 feet, and cost £2,270,000 to make. The total cost of the St Gotthard railway was £9,080,000, of which Switzerland contributed £1,120,000 as a subvention, Italy £2,200,000, and Germany £1,200,000; whilst £1,840,000 was raised by shares, and £2,720,000 by mortgage. The line has proved very successful financially, the shareholders' dividends rising annually. See *Nature*, vol. xxi.

St Helena (generally called St Helēna, not St Helĕna), a lonely island in the Atlantic, 1200 miles from the west coast of Africa, 1695 from Capetown, and 4477 from Southampton, measures 10 miles by 8, and has an area of 47 sq. m. It is part of an old volcano, and reaches 2823 feet in High Hill. Its shores face the ocean as perpendicular cliffs 600 to 2000 feet high, and are in many places cleft by deep, narrow valleys. The climate is pretty constant and generally healthy. Whale-fishing and the growing of potatoes are the principal occupations of the inhabitants, 6444 in 1871, 5059 in 1881, 5000 in 1889. Previous to the cutting of the Suez Canal St Helena was a favourite port of call for vessels bound to and from India by the Cape of Good Hope, and the inhabitants did a large trade in furnishing these vessels with provisions and other supplies. But the shorter route afforded by the Canal and the Red Sea has entirely destroyed this trade, and the island is speedily going from bad to worse. Vessels call in rapidly diminishing numbers (853 in 1869, but only 288 in 1889). Since 1890, too, the British government has been withdrawing the garrison, though, on the other hand, Jamestown, the capital (pop. 2500), on the north-west coast, has been made a second-class imperial coaling station, and carefully fortified.

The customs revenue has fallen from £16,000 in 1869 to £4891 in 1889. The imports have decreased rapidly in value from £64,585 in 1879 to £28,963 in 1889, and the exports of the island's produce from £3485 in 1880 to £393 in 1889. Some £20,000 worth of produce from the whale-fisheries in the adjacent seas is exported, chiefly to the United States. St Helena was discovered by the Portuguese in 1502, and taken possession of by the British East India Company in 1651. They remained masters of the island down to 1834; since that time it has been administered by a governor and an executive council of four members. The island is chiefly celebrated as the place of Napoleon Bonaparte's imprisonment from 1815 to his death in 1821. His home was the farmhouse of Longwood, 3 miles inland from Jamestown; and the spot where he was first buried lies about 1 mile to the south-west. There is an Anglican bishop of St Helena. See Melliss, *St Helena* (Lond. 1875); Brooke, *History of St Helena* (1808-24); and books quoted under NAPOLEON.

St Helens, (1) a town of Lancashire, on the Sankey brook, flowing to the Mersey, 12 miles ENE. of Liverpool and 21 W. by S. of Manchester. Thanks to its railway and canal facilities, and to the immediate neighbourhood of coal, it has grown within recent years from quite a small village to an important industrial centre, and now is the great seat of the manufacture of crown, plate, and sheet glass, and also possesses extensive alkali, copper-smelting, and iron works. It was constituted a municipal borough in 1868; a parliamentary borough, returning one member, in 1885; and a county borough by the Local Government Act, 1888. The handsome town-hall, with a public library, was opened in 1876. Pop. (1871) 45,134; (1881) 57,403; (1891) 71,288.—(2) A small town in the Isle of Wight, 4 miles SE. of Ryde. Pop. of parish (1851) 1948; (1891) 4469.

St Helier, the capital of Jersey, is situated on the south shore of the island, and the east side of St Aubin Bay. It is defended by Elizabeth Castle (1551-86), on a rocky island off the shore, approached by a causeway at low-water; and by Fort Regent, on the south-east side of the town, built in 1806-15 on a scarped granite rock, at a cost of £1,000,000. Victoria College (1852) is a handsome edifice; and one may also notice the courthouse (1647), the public library (1736), a gilt statue of George II. (1751), and the harbour, forming an outer and inner basin. An active trade is carried on with England, France, and India. Pop. (1851) 29,153; (1871) 30,756; (1891) 29,100. See JERSEY, and CHANNEL ISLANDS.

St-Hilaire. See BARTHELEMY, GEOFFROY.

St Ignatius' Bean. See IGNATIUS' BEANS.

Saintine, or BONIFACE, JOSEPH XAVIER (1798-1865), a Frenchman, the author of plays, poems, and tales without number, of which one only is famous now—*Picciola, the Story of a Prison Flower* (1863).

St Ives, (1) a fishing-town of Cornwall, beautifully situated on the west shore of St Ives Bay, 8 miles NNE. of Penzance. It has a branch-line (1865); a harbour, with a pier by Smeaton (1770) and a breakwater (1864); a 15th-century granite church, with an ancient cross; and a town-hall (1832); whilst on a hill, 545 feet high, is a pyramid (1782). St Ives is the chief seat of the Pilchard (q.v.) fishery, and from its mild climate and good bathing is a favourite resort. It is said to take name from St Ia, an Irish princess, martyred here in 450 A.D. Incorporated by Charles I. in 1639, it returned two members till 1832, and then one till 1885. Pop. (1861) 7027; (1891) 6094. See Lach-Szyrma's *History of Penzance, St Ives, &c.* (1878), and J. H. Matthews' *History of St Ives* (1892).—(2) A picturesque old monastic town of Huntingdonshire, on the left bank of the Ouse, 5 miles E. of Huntingdon. It has a curious likeness to Stratford-on-Avon; and, surrounded on one side by low clay hills, it stands on the border of the fen country, but not in the fens, having a gravel subsoil, with an unusually rich alluvial soil above. Almost destroyed by fire (1689), and inundated by the river (1823), it has a 15th-century parish church, a corn exchange (1864), and a six-arch stone bridge of singular beauty, built by the abbots of Ramsey, with an old chapel or lighthouse in the middle. Cromwell lived at Slepe Hall, now built over, in 1631-36, and Theodore Watts was born here. This place is said to be named after Ivo, a Persian bishop, who died here about 590, and it became in 1017 the seat of a Benedictine priory. A large weekly cattle-market was chartered in 1290, and the town was incorporated in 1874. Pop. (1851) 3522; (1891) 3037.

St James's Palace, a large inelegant brick structure, fronting towards Pall Mall. Originally a hospital dedicated to St James, it was reconstructed and made a manor by Henry VIII., who also annexed to it a park, which he enclosed with a brick wall, to connect St James's with Whitehall. The gateway and clock-tower are from designs by Holbein. Here Queen Mary died (1558); Charles I. slept here the night before his execution; and here Charles II., the Old Pretender, and George IV. were born. When Whitehall was burned in 1697, St James's became the regular London residence of the British sovereigns, and it continued to be so till Queen Victoria's time. Additions and improvements, gradually made, totally changed the original palace, so that at the present time little, if any, of the old structure remains. In 1837 the royal household was transferred to Buckingham Palace, whither the drawing-rooms were also removed at the death of the Prince Consort, and St James's is now used only for levees.—*The Court of St James's* is a frequent designation of the British Court.—St James's Park lies southward from the Palace, and extends over 58 acres.

St-Jean-D'Angély, a small town of France, dept. of Charente-Inférieure, 15 miles NNE. of Saintes. Pop. 6494.

St John, the largest river of New Brunswick, rises in the highlands in the north of Maine, flows north-east and then south-east 450 miles (the last 225 within British territory), and falls into the Bay of Fundy by an estuary 5 miles in width. Near the sea it is navigable for large vessels; while for craft of 120 tons it is practicable as far as Fredericton (80 miles), and for small steamers to Woodstock, 75 farther up. Through most of its upper course the stream separates Maine from Canada.

St John, the commercial capital and largest city, and the railway centre, of New Brunswick, stands on the north or left bank of the estuary of the St John River, by rail 277 miles NW. of Halifax and 481 from Montreal. Steamers connect it with Boston. The harbour is good, and accessible to the largest vessels at all seasons of the year. Shipbuilding and the timber-trade are the chief industries, together with fishing and the West India trade; but the manufactures also are important and numerous, and include engines and locomotives, machinery and farming implements, nails, axes, leather, boots and shoes, paper, cotton and woollen goods, clothing, furniture, carriages, soap, wrought stone, &c. On June 21, 1877, a fire destroyed the greater part of the town; but a new St John speedily arose, with wide, clean streets and handsome buildings. These include a custom-house, post-office, city building, provincial lunatic asylum, hospital, and a Roman Catholic cathedral. St John returns three members to the House of Commons (two of them for the city and county together), and six to the Provincial Legislature (four for city and county). Adjoining St John, and practically forming with it one city, is the town of Portland. Pop. (1881) 26,127 (with Portland, 41,353); (1891) 39,179.

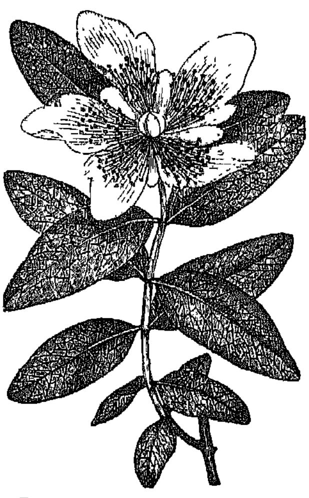
St John, KNIGHTS OF. See HOSPITALLERS.

St John's, (1) the capital of Newfoundland, stands on the extreme east coast of the island, on Avalon Peninsula, 1076 miles ENE. of Montreal and 1730 W. by S. of Cork in Ireland. It is thus the nearest port in America to Europe; and it possesses a small but excellent harbour, which is well fortified. Railways run to Harbour Grace (84 miles) and Placentia (25 miles). The city has a number of oil-refineries (fish and seal), and also tanneries, shoe-factories, cabinet-works, &c. Pop. 28,610.—(2) Chief town of St John county, Quebec, on the left bank of the river Richelieu, opposite the town of St Athanase, with which it is connected by a bridge, and 27 miles by rail SE. of Montreal. It contains a lunatic asylum, barracks, potteries, foundries, sawmills, &c., and carries on a considerable trade in lumber and grain. Pop. 4314.—(3) St John's, or San Juan, capital of Porto Rico, stands on a small island connected by bridges with a peninsula on the north coast. The town is handsome; its excellent harbour is being silted up. Pop. 24,000.

St John's Bread. See CAROB.

St Johnstoun. See PERTH.



Large-flowered St John's Wort (*Hypericum calycinum*).

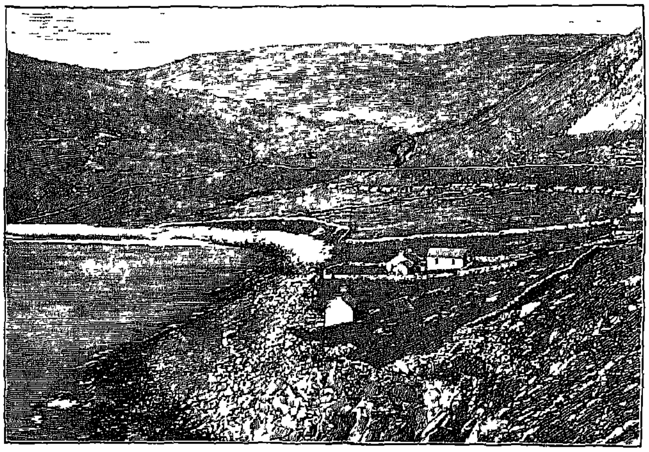
St John's Wort (*Hypericum*), the typical genus of plants of the natural order Hypericineæ. It is a numerous genus of herbs and shrubs widely distributed, both in the New and the Old World, particularly abundant in western Asia, southern Europe, and in North America; it occurs also within the tropics. The leaves are opposite entire, without stipules, often marked with glandular dots of two kinds, pellucid ones which are very apparent when the leaves are held against the light, and black ones which are usually on the under side of the leaves round the edge, or sometimes on the flowers. The flowers are regular, with five sepals, and five petals, usually yellow. They abound in a yellow resinous juice which is more or less purgative and anthelmintic. The common St John's Wort, an abundant native of Britain, even when slightly bruised yields copiously a yellow resinous juice, which, when rubbed between the fingers, emits a scent like lemons, and stains the skin dark purple. The plant has long been credited with powerful medicinal properties, but finds no place in the pharmacopœias, nor is it recognised by regular practitioners. It has been used as a vulnerary, both externally and internally, in chest complaints, dysentery, hæmorrhages, and jaundice. In France and Germany the plant is ceremoniously gathered on St John's Day by the common people as a charm for evil spirits, storms, and thunder; in North Wales a similar custom still exists, and in Scotland it was formerly worn as a charm on the person against all malignant influences. The leaves of *H. androsæmum* are called by the French *toute saine*, hence the English name *Tutsan*; in both countries they were formerly used to dress fresh wounds. Other species of Hypericum have similar properties. There are several species, such as *H. calycinum* (also called Aaron's Beard), frequently cultivated in British gardens.

St Joseph, a city of Missouri, capital of Buchanan county, is on the left bank of the Missouri River, 110 miles (68 by rail) above Kansas City. Eight lines of railway centre here, and the river is crossed by an iron railway and foot bridge (1873), which has five spans, one a pivot-draw span of 365 feet, and cost $1,500,000. Here are the state asylum for the insane and St Joseph College and other Roman Catholic institutions; the city was formerly a bishop's see. St Joseph has large pork-packing establishments and manufactories of stoves, ornamental and other ironwork, guns, carriages and wagons, clothing, furniture, brooms, beer, syrups, &c. Its wholesale trade considerably exceeds $100,000,000 annually. The first settler, an Indian trader, laid out the town in 1843, and by 1851, when it was incorporated as a city, it was already famous as the starting-point for the long journey in wagons across the plains. Pop. (1870) 19,565; (1880) 32,431; (1890) 52,324.

Saint-Just, LOUIS ANTOINE LÉON FLORELLE DE, French Revolutionist, was born at Decize near Nevers, 25th August 1767, and was educated by the Oratorians at Soissons. He began the study of law at Rheims, but early gave himself to letters, and found his gospel in the writings of Rousseau. At nineteen he set off for Paris, perhaps to avoid taking orders, with some of his mother's plate and other valuables, and was, at her request, imprisoned for six months for selling these. Like most young men of his age he was fired by the revolutionary fever, which, added to the native enthusiasm of his temperament, was yet to carry him far. He published in 1789 a poor poem, *L'Organt*, a mere boyish imitation of Voltaire's *Pucelle*, and in 1791 an essay of a different promise, *L'Esprit de la Révolution.* Next year he was returned fifth deputy for Aisne to the Convention. He first attracted notice by his fierce tirades against the king, and he opened the memorable debate on the verdict in his trial. 'Royalty,' said he, 'is in itself a crime. Every king is a rebel and a usurper. We must judge Louis, not as a citizen, but as an enemy; that is to say, put him to death without forms of process.' He soon became a devoted follower of Robespierre, and by his influence was sent on missions to the armies of the Rhine and the Moselle, which his energy and enthusiasm, as well as administrative ability, urged on to victory. He made bombastic rhetorical speeches before the Convention, but his slight youthful figure, mild voice, large blue eyes, long black hair, and singular beauty gave no promise of the intensity and relentlessness of the fire that burned within him. 'He carries his head like a Saint Sacrament,' said Camille Desmoulins. 'And I,' retorted Saint-Just, 'will make *him* carry his like a Saint Denis'—a ferocious prophecy soon to be fulfilled. Saint-Just began the attacks on Hébert which sent him to his doom, quickly followed by the fall of Danton and his friends. Early in 1794 he laid before the Convention a comprehensive report on the police, and soon after proposed Robespierre's famous civil institutions—a ludicrous scheme for a new organisation of society. Boys were to be taken from their parents at seven and brought up for the state, not the family; marriages were not to be proclaimed till after the birth of the first child; friendship was to be no longer a domestic tie, but a public obligation, every citizen being required on reaching twenty-one to declare in the temple who were his friends, he that had none to be banished. Until the citizens were sufficiently educated for this splendid programme a strong dictatorship was necessary, and the faithful follower and his chief alike saw the one man in Robespierre. Saint-Just fell with Robespierre, but unlike him carried his head high on the tumbril, and died without a word, 28th July 1794.

See S. Fleury, *Saint-Just et la Terreur* (1851), and the Life by Ernest Hamel (1850), the latter as eulogistic as the former is the opposite; also vol. ii. of Aulard's work, *Les Orateurs de la Législative et de la Convention.*

St Kilda, a lonely island in the Atlantic, belonging to Harris in Inverness-shire, and 40 miles W. of North Uist. With an extreme length and breadth of 3¼ and 1¼ miles, it is only 1·9 sq. m. in area; has lofty precipitous cliffs almost everywhere, except at the south-eastern landing-place; and attains a maximum altitude of 1220 feet. The rocks are igneous, incumbent on sandstone; the climate is mild; and the soil is black loam, with very fine pasture, but only some 40 arable acres. The live-stock includes nearly a thousand sheep (which graze also on four neighbouring islets), about forty West Highland cattle, and as many mongrel collies; but a principal source of wealth is the sea-birds—fulmar petrels, solan geese, puffins, &c.—which supply feathers, oil, and meat. The fisheries, though productive, are neglected; coarse tweed and blanketing are the only manufactures. The crofter inhabitants, all Gaelic-speaking, and all Free Churchmen since 1844, enjoy Home Rule and are practical Communists; but these advantages are well-nigh counterbalanced by the destructive tempests and consequent famines, by poverty, and by an absolute lack of amusements—eight hours' worship on Sunday the only break in the week. Crime is unknown; but the percentage of illegitimate births during 1851-86 was 6·25. The 'boat-cold' is still communicated by strange boats that touch at the island; but the 'eight days' sickness' seems dying out—that terrible infantile lockjaw which carried off fifty-two children during 1856-86. The island was the property of the MacLeods from time immemorial, was sold in 1779 by General Normand MacLeod XX., chief of MacLeod, and was repurchased in 1871 for £3000 by his grandson, Normand XXII., chief of MacLeod of MacLeod. Its native name is Hirta (Gael. *h-Iar-tir*, 'the western land'); and the name St Kilda is probably of Columban origin. Events in its 'history' have been the reduction of the population by smallpox to four adults and twenty-six children (1724); the imprisonment of Lady Grange here by her husband (1734-42); the emigration of thirty-six islanders to Australia (1856); the drowning of six (1864); and the establishment of a regular school (1884). Pop. (1851, the maximum) 110; (1886) 80.



The Town and Bay, St Kilda.

See works by Dean Munro of the Isles (1585), Martin (1698-1703), Kenneth Macaulay (1764), L. MacLean (1838), J. Sands (1877), G. Seton (1878), and R. Connell (1887).

St Kilda, a coast suburb of Melbourne (q.v.), on the east side of Hobson's Bay.

St Kitts. See St Christopher.

St Lawrence, a great river of North America, which, issuing from Lake Ontario, flows north-east for some 750 miles—part of the way forming the boundary between Canada and the United States—and falls into the Gulf of St Lawrence by a broad estuary. But in its widest acceptation the name includes the whole system of the Great Lakes and their connecting streams, with a total length from source to mouth of 2200 miles, and a drainage basin of 297,600 sq. m. (These lakes, which are of comparatively modern date, are nothing more than a great system of river-valleys, whose old outlets have been blocked, but many of whose former channels have been traced within late years: see Wright, *The Ice Age in North America.*) The area of water-surface in the five lakes alone is 94,650 sq. m., and their aggregate basin 259,950 sq. m. The St Lawrence system, or that of which the great river is the outlet, thus constitutes by far the largest body of fresh water in the world. This mighty artery of North-east America rises, under the name of the St Louis, on the spacious plateau which sends forth also the Mississippi towards the Gulf of Mexico, and the Red River of the North towards Hudson Bay. Lake Superior (602 feet above sea-level), the next link in the chain, finds its way to Lake Huron through St Mary's River, whose rapids have a fall of 20½ feet. Below Lake Huron, which receives Lake Michigan from the south, St Clair River, Lake St Clair, Detroit River, and Lake Erie maintain pretty nearly the same level (there is a fall of some 8 feet, however, in Detroit River) till the river Niagara descends 326 feet to Lake Ontario, which is itself still 247 feet above the sea-level. The St Lawrence proper, with a number of lake-like expansions (such as the Lake of the Thousand Isles, of St Francis, St Peter, &c.), presents the character first of a river, and then of an estuary, down to the gulf. Prior to 1858 only vessels drawing not more than 11 feet of water could pass up the river above Quebec; but since then a channel has been made in the shallow parts of the river, 300 feet wide and 27¼ deep, which permits the passage up to Montreal of vessels of 4000 tons burden. Between Lake Ontario and Montreal there are several rapids, which, however, may be all avoided by means of canals that have been constructed at a very great expense. At about two-thirds of the distance from Lake Ontario to the city of Montreal the intersection of the parallel of 45° determines the point where the St Lawrence, after having been an international boundary from the head, or nearly so, of Lake Superior, becomes exclusively Canadian. Immediately above the island of Montreal the St Lawrence is joined by its principal auxiliary, the Ottawa (800 miles), from the north-west; and a little more than half-way between this confluence and Three Rivers, the highest point of tidal influence, the Richelieu from the south brings in the tribute of Lake Champlain. Other principal tributaries are the St Maurice (400 miles), the Saguenay (100), and the Batiscan (50). The width of the St Lawrence varies from less than 1 to 4 miles; the estuary at its mouth is above 100 miles across. During winter the river is frozen over and navigation closed. For map, see CANADA.

The GULF OF ST LAWRENCE, a western inlet of the North Atlantic, washes Newfoundland, Quebec, New Brunswick, and Nova Scotia. It has three communications with the ocean—the Strait of Belleisle, between Newfoundland and Labrador; the Gut of Canso, between the island of Cape Breton and the peninsula of Nova Scotia; and a far wider passage than either, with the island of St Paul in the middle, between Cape Breton and Newfoundland: while in the opposite direction it narrows, at the west end of Anticosti, into the estuary of the St Lawrence River. Besides Anticosti, St Paul's, and Prince Edward's, already mentioned, this arm of the sea contains very many clusters of islands, which are rendered more dangerous to shipping by the thickness of the fogs and the uncertainty of the currents. Both the Gulf and River of St Lawrence are celebrated for the productiveness of their fisheries. See QUEBEC.

St Leonards. See HASTINGS.

St Lô, a town of Normandy, dept. Manche, is built on a rocky elevation on the right bank of the Vire, 60 miles by rail SE. of Cherbourg. A St Lô, Bishop of Coutances, built a church here in the 6th century; but the place was destroyed by the Normans in 888, and, having been rebuilt, taken by the English in 1346 and 1417. Noteworthy are the beautiful churches of Sainte-Croix, founded in 805, and Notre Dame (15th century). Cloth, ribbons, and laces are manufactured, and wool is spun. The astronomer Leverrier was born here in 1811. Pop. 10,327.

St Louis, fifth city of the United States in population, the commercial metropolis of the Mississippi valley, and principal city of the state of Missouri, is situated on the west bank of the Mississippi River, 21 miles S. of the mouth of the Missouri, and by rail 1108 WSW. of New York, 2434 E. of San Francisco, and 696 N. of New Orleans. On February 15, 1764, Pierre Ligneste Laclède, head of the Louisiana Fur Company, established a trading post on the present site of St Louis, giving it the name which it still bears in honour of Louis IX. of France. In 1768 the Spaniards took formal possession of Upper Louisiana, but the settlement was governed by a French captain, St Auge de Bellerive, until 1770, when Don Pedro Piernas was made lieutenant-governor and military commandant, with headquarters at St Louis. In 1800 the village again became a part of the French possessions, and in 1803 passed into the hands of the United States. The population of the settlement in 1799 was 795; in 1810, one year after the town was incorporated, it had increased to 1400, in 1820 to 4928, and in 1840 to 16,469. Then began the great growth of the city. In 1844 the population was 34,140; in 1850, 74,439; in 1870, 310,864; and in 1890, 451,770.

Copyright 1892 in U.S. by J. B. Lippincott Company.

St Louis is built upon three gently sloping terraces, the summit of the third being 200 feet above and 4 miles W. of the river. Beyond this point for miles the country is almost perfectly level. The city has a river frontage of 19 miles; its greatest width is 6·62 miles, and its area 62½ sq. m. The streets in the old part of the city are narrow, but all those west of Third Street, three blocks from the river, are broad and straight. St Louis has 371·75 miles of paved streets and 80·22 miles of paved alleys. The sewerage system is excellent. There is no surface drainage, and the length of public and private sewers is 320·86 miles. The streets are sprinkled three times daily by the city government, and 10,000,000 gallons of water are used each day for this purpose. The water-supply is taken from the Mississippi River at Bissel's Point, north of the city. The water-works cost $8,000,000, and have a capacity of 50,000,000 gallons daily. In 1891 an extension was in course of construction at an estimated cost of $4,000,000, to double the capacity. There are 214·36 miles of street railway in St Louis, of which the motive-power on 116·61 is electricity, on 61·50 cable, and 36·70 horse. The city is lighted entirely by electricity.

The seventeen parks of St Louis contain 2268·30 acres. The largest is Forest Park, in the western part of the city, containing 1371·94 acres. Tower Grove Park, which, with the botanical garden, was given to the city by the philanthropist Henry Shaw, contains 266·76 acres, and is one of the most beautiful in the world.

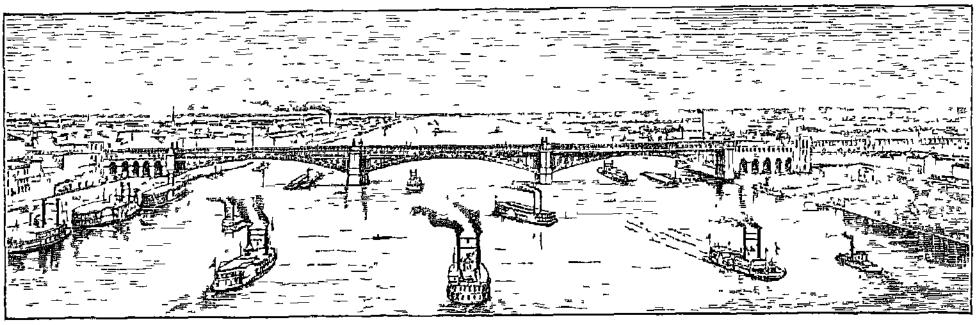
The principal public buildings are the Four Courts, court-house, city hospital, insane asylum, and women's hospital, the custom-house and post-office, which cost over $5,000,000, the Merchants' Exchange, Exposition Building, and the Crow Museum of Fine Arts. A new city hall was building in 1891 at Washington Park at a cost of over $1,500,000. The Exposition is one of the features of St Louis. It is open for forty days every autumn. The building covers two blocks and cost $900,000. The Mercantile Library Building (68,000 vols.) is a handsome structure, and so too is the new Public School Library Building (75,000).

The city owns 109 school buildings and 69 kindergarten structures, and the school property is valued at $3,734,672. The number of pupils in 1890 was 58,316, and teachers 1154. The schools are governed by a president and board of directors elected by the people. The expenditures for the public schools average $1,000,000 annually. There are 90 parochial schools, 64 of them Roman Catholic, 23 Lutheran, and 3 Hebrew. The Washington and St Louis universities, and the Christian Brothers and Concordia colleges are the leading advanced educational institutions; but there are numerous academies and colleges of lower grade, besides two law schools, nine medical colleges, a school for nurses, a school of midwifery, and a college of pharmacy. St Louis contains 284 churches, representing almost every Christian denomination, and the value of church property is appraised at $6,700,000. There are five English and four German daily newspapers.

Eighteen railroads enter St Louis, the terminus of all being the new Union Depôt (1874–92). The Mississippi at St Louis is spanned by two bridges. The older of these, the Eads, was opened for traffic 4th July 1874, and cost $6,536,730. It consists of three spans, the central being 520 feet in the clear, and the two side spans 502 feet each. It is a railroad, foot, and wagon bridge, and connects with the Union Depot by a tunnel one mile long under the city. The Merchants' Bridge, a railroad bridge, was commenced January 24, 1889, and was completed May 3, 1890. It is constructed of steel, and is 2420 feet long, including approaches.

During 1890, 10,633,021 tons of freight were received in St Louis by rail and river, and 5,872,712 tons shipped. The total bank clearings of the same year were $1,118,573,210. The receipts of grain aggregated 77,795,232 bushels, and of cotton 587,187 bales. St Louis is an important manufacturing city. In tobacco it leads the world, the product in 1890 amounting to 52,000,000 pounds. The beer production was 58,491,814 gallons, and the value of boots and shoes manufactured was $7,000,000. Its dry goods trade in 1890 amounted to $35,000,000, hardware $14,000,000, groceries $75,000,000, and boots and shoes $21,000,000.

In 1875 St Louis was separated from the county of St Louis and given an independent government of its own. The mayor and municipal assembly constitute the governing power. The bonded debt of the city at the close of the fiscal year ending April 13, 1891, was $21,673,100. The payment of this debt is provided for by a sinking fund. The receipts for the same fiscal year were $10,834,962; expenditures $8,555,240. The total assessed value of real estate in 1891 was $252,031,820. See Billon, *Annals of St Louis in its Early Days* (1887).



The Eads Bridge across the Mississippi, St Louis.

St Louis, the capital of the French colony of Senegal in West Africa, is situated on a small low island near the mouth of the Senegal River. Bridges connect it with N'dar Toute, a summer watering-place, on the right bank, and with the suburb of Bouetville, the terminus of the railway, on the left bank. The mouth of the river is rendered dangerous by a shifting bar of sand. The great ocean steamers land goods and passengers at Dakar, on Cape Verde, 100 miles to the south-west, and thence they are conveyed by rail. Nevertheless, the place has a trade worth £1,000,000 a year, gums and earthnuts being exported in considerable quantities. The climate is not healthy; drinking-water is supplied by an aqueduct 7½ miles long. There are a cathedral, governor's palace, &c., and a public garden. Pop. (1885) 16,682.

St Lucia, the largest of the Windward Islands, in the West Indies, 42 miles long and 15 to 20 wide, with an area of 245 sq. m. The pop. is 4500, of whom 1200 are whites; the exports (sugar, cocoa, logwood, &c.) vary in value from £115,000 to £160,000; the imports vary between about the same limits. Much of the island is high and rocky land, covered with well-nigh impenetrable forest, and it contains extensive deposits of sulphur, the successful working of which was checked by the export duty. The climate is in the main healthy, a fresh trade-wind blowing almost continually. The island, discovered in 1502, was colonised by the French in 1563; but between that date and 1803, when it definitively became an English possession, it five or six times changed hands between France and England, by capture or treaty. The capital is Castries (pop. 8000). Caribbee Bark (q.v.) is sometimes called St Lucia Bark.

St Lucia Bay, a lagoon at the mouth of the Umfulosi River in Zululand, surrounded by uninhabitable swamps. Cape St Lucia is a promontory to the south of the channel which connects the lagoon with the sea.

St Malo, a fortified seaport of Brittany, dept. Ille-et-Vilaine, stands 51 miles NNW. of Rennes by rail, on the estuary of the Rance. The old town clusters all over a rocky islet that is surrounded with walls and connected with the mainland by a single narrow causeway (*Sillon*). Forts and batteries crown several rocks lying off the town, and the defences are completed by an old castle next the causeway. The harbour is safe, but difficult of approach; the tides sometimes rise 50 feet, and storms dash over the top of the battlements. About the end of the 17th century the people of this town reaped large fortunes by piracy in the English Channel, and the port was the headquarters of the French East India Company. Although its trade has fallen off somewhat of late, its harbour, which lies between St Malo and St Servan, and is common to both places, is still entered by 1286 vessels of 222,700 tons (average for four years ending 1890), of which 650 of 180,800 tons are British and 600 of 36,300 tons French. St Malo exports potatoes, buckwheat, barley, butter, eggs, and fruit, and imports coal (173,200 tons annually), timber, pitch, and iron. The people, 10,225 in 1886, are principally engaged in shipping pursuits. The most noteworthy features of the town are the cathedral (which has had no bishop since 1790) and the museum. This town has been the birthplace of several distinguished sons, including Chateaubriand, Maupertuis, Lamennais, Lamettrie, and the sailors Duguay-Trouin, Cartier, and Labourdonnais. The English bombarded the town in 1693 and 1695, and in 1758 an expedition led by the second Duke of Marlborough burned several vessels lying in the harbour.

Saint-Marc Girardin. See GIRARDIN.

St Martin, one of the Lesser Antilles, West India Islands, has since 1648 been divided between France and the Netherlands. It exports sugar, cotton, tobacco, maize, &c., and large quantities of salt. The French portion, a dependency of Guadeloupe, has an area of 20 sq. m. and a pop. of 3500. The Dutch portion, a dependency of Curaçao, has an area of 18 sq. m. and a pop. of 4500.

Saint-Martin, Louis Claude, a French philosopher, born at Amboise, 18th January 1743, and died at Aunai near Chatillon, 14th October 1803. Influenced by Bohme and Mystrasin, he was a vigorous opponent of sensationalism and materialism. Of his numerous works amongst the best known are *Des Erreurs et de la Vérité* (1775); *De l'Esprit des Choses* (1800); and *L'Homme de Désir* (1790). See the *Essai* on him by Caro (1852).

St Mary Church, a town of South Devon, overlooking Babbicombe Bay, 1½ mile N. by E. of Torquay, of which it is practically a suburb. Pop. (1851) 2293; (1891) 6653.

St Mary's Loch. See Yarrow.

St Mary's River, the strait connecting Lakes Huron and Superior, with a 'sault' or rapids falling 20½ feet.

St Maur. See Maurists.

St Mawes, a village of Cornwall, on an offshoot of Falmouth Harbour, 3 miles E. of Falmouth. It has a castle (1542), and from 1562 to 1832 returned two members.

St Michael's, or Sao Miguel, the largest and most important of the Azores (q.v.).

St Michael's Mount, a conical and isolated granite rock in Mount's Bay, Cornwall, 3 miles E. of Penzance. It communicates with the shore by a causeway 560 yards long, which, however, is covered with water eight hours out of the twelve, and sometimes is impassable for two or three days together. The Mount is 195 feet high, is 5 furlongs in circumference, and is crowned by an old and picturesque castle—now used as a manorial residence—surmounted by a tower, on one angle of which there is a projecting stone lantern, popularly called 'St Michael's Chair.' At the base of the north or landward side of the Mount is a fishing-village. The 'guarded mount' is said to have received its name from an apparition of St Michael to some hermits; and Edward the Confessor founded upon it a Benedictine priory, which in 1088 was annexed to the abbey of Mont St Michel in Normandy. After the Dissolution it became the residence of five families in turn, until it was sold in 1660 to its present proprietors, the St Aubyns. For a demolition of the notion that the mount within Cornish-speaking times has been converted from a wooded promontory to an island, see vol. iii. of Max-Muller's *Chips* (1870).

St Michel, Mont, an extraordinary rocky islet of the Norman department of Manche, in the bay of St Michel, 18 miles WSW. of Avranches. It is a solitary cone of granite, a thousand yards in circumference and 242 feet high. It rises sheer out of a level expanse of sand, and, though its elevation is not great, the perfectly flat environment and its pointed crest render it a most striking feature in the landscape. Till 1880-81 it was only accessible by crossing the sands at low-water, there being a firm track across them, with quicksands to right and left; but a good road was then formed along a causeway a mile in length. A Druid stronghold once, the islet, as the scene of an apparition of St Michael in 708, became the seat of a great Benedictine monastery, which, 'half church of God, half fortress,' has memories of Henry I., II., and V. of England, resisting the last successfully in two sieges. The Revolution transformed this celebrated place of pilgrimage into a prison, and such it remained until 1863; in 1874 it was declared a 'monument historique,' and large sums have been spent on its restoration by Viollet-le-Duc and his successor. The buildings include the church (*c.* 1140-1521), with Norman nave and Flamboyant choir; the exquisite cloisters (1228); the Halle des Chevaliers, where Louis XI in 1469 founded the order of St Michael; and 'La Merveille,' the monastery proper, so called from its huge north wall of the 13th century, 246 feet long and 108 high. Beneath is a little fortified town with 200 inhabitants. See Luce, *Chronique de Mont St Michel* (2 vols. 1879-86).

St Moritz, a favourite watering-place in the upper Engadine (q.v.), with chalybeate, sulphurous, and other mineral waters, and a pop. of 500.

St Nazaire, a seaport of France, dept. Loire-Inférieure, is situated on the north side of the estuary of the Loire, 40 miles by rail W. by N. of Nantes. Between 1831 and 1887 £1,450,000 was spent on harbour improvements, extensive docks (82 acres) having been built in 1845-57 and 1864-81 to accommodate the larger vessels that were unable to get up the Loire to Nantes (q.v.). Since these began to be used the shipping of the place has increased at a very rapid rate. In 1887 there entered 755 vessels, with a total tonnage of 504,286 tons; in 1890, 1621 vessels of 860,625 tons (637 of 443,714 tons being British and 911 of 381,746 French). The most important of the imports are wine (½ to 1¾ million gals.), coal (533,000 to 780,500 tons), tar, iron and lead, wheat and flour, timber, and manure; the exports embrace chiefly brandy (11,600 to 109,600 gals.), wine, coal, wheat and flour—these four in transit—eggs and poultry, sardines, butter, bone-dust, vegetables, dyes, glass, and toys. The respective values are not returned; but in 1886 the total trade was valued at £5,124,000. Pop. (1851) 2400; (1881) 16,314; (1891) 41,000.

St Neots, a market-town of Huntingdonshire, on the Ouse, 8 miles SSW. of Huntingdon. It takes name from Alfred the Great's eldest brother, whose relics were translated from St Neot in Cornwall to a Benedictine monastery founded at Eynesbury, close by, in 974; and it has a fine parish church, with a tower 156 feet high, a corn exchange (1863), and manufactures of iron, paper, &c. Pop. (1851) 2949; (1891) 4077. See Gorham's *History of Eynesbury and St Neots* (2 vols. 1824).

St Nicolas, a town of Belgium, in East Flanders, 12 miles by rail W. by S. of Antwerp, stands in the midst of the district of Waes, a densely-peopled and productive agricultural region. It has a large flax-market, and manufactures cotton and woollen stuffs, lace, needles, bricks, and pottery. A flourishing trade is carried on in linens, flax, corn, &c. Pop. (1888) 27,572.

St Omer, a town of France, and second-class fortress, dept. Pas-de-Calais, stands in a marshy site, on the Aa, 26 miles SE. of Calais by rail. The chief objects of interest are the Gothic cathedral (13th-15th century), with remarkable sculptures, the ruined tower and arches of the Benedictine abbey church of St Bertin, an arsenal, a museum, and a library. A college for the education of English and Irish Catholics was opened at St Omer in 1592. It was closed, however, during the Revolution, but still exists as a seminary. Alban Butler was a president, and O'Connell a student. The people carry on active manufactures of tobacco-pipes, tulle, cambric, cloth, and muslin, and a brisk trade in provisions (eggs, vegetables, &c.), sugar, and spirits. Pop. (1872) 21,007; (1886) 20,198.

Saintonge, a former French maritime province, now forming mainly the department of Charente-Inférieure. The capital was Saintes (q.v.).

St Paul, the capital of the state of Minnesota, occupies a commanding and elevated situation on both banks of the Mississippi, near the mouth of the Minnesota River, one of its principal tributaries. It is the outgrowth of a small hamlet of voyageurs, chiefly Canadian, employed in the fur trade, and

Copyright 1892 in U.S by J B Lippincott Company.

in selling whisky to the soldiers at Fort Snelling in the vicinity. The first log-huts were erected on the site of the city in 1840, and in 1841, at the suggestion of a Roman Catholic priest who made occasional visits, a small log-chapel was erected and dedicated to St Paul, which has given the name to the city. In 1842 the first family of American ancestry arrived, and in 1846 the hamlet had become of sufficient importance to have a post-office. In the act of the United States congress passed in 1849 authorising the organisation of Minnesota Territory, St Paul was designated as the capital, and from that time has occupied an important position. At that period the town did not contain a brick or stone building, and the number of inhabitants was about 500, which in 1891 had become nearly 150,000. Upon the lower plateau of limestone rock are the capitol, post-office, court-house, and large stores; the best private residences are on the upper plateau, overlooking the Mississippi. The Summit Avenue is noted for its width and the beauty and costliness of the houses. The sanitation of the city is excellent. Ample provision is made for education. In 1851 there were two small wooden schoolhouses; in 1891 there were 45 school buildings, 468 teachers, 18,000 pupils, all under the supervision of a board of education and superintendent. Besides these schools supported by the public are numerous private schools. There are several colleges, not under the control of the city or state: Macalester College, the oldest of these, was chartered in 1853, and that year opened its preparatory department, known as the Baldwin School; Hamline University, chartered in 1854, is under the control of the Methodist Church; and St Thomas College is a Roman Catholic institution. The water-works furnish a daily supply of eight million gallons. All parts of the city are reached by electric street-railways. The free City Library contains 30,000 volumes. There are 138 churches, of which 19 are Baptist, 10 Congregational, 22 Lutheran, 23 Methodist, 14 Presbyterian, 12 Protestant Episcopal, and 19 Roman Catholic. In a central depôt ten railways receive and deliver passengers. St Paul is the centre of the wholesale grocery and dry-goods business in Minnesota. Pop. (1860) 10,701; (1870) 20,030; (1880) 41,473; (1890) 133,156.

St Paul, a volcanic islet 2 miles long and 860 feet high, in the Indian Ocean, midway between Africa and Australia, in 38° 42′ S. lat. and 77° 32′ E. long. It is comparatively bare, in contrast to the smaller but densely vegetated island of New Amsterdam, 50 miles to the north. For the beaching here of H.M.S. *Megæra* (June 1871), and the eleven weeks' detention of her crew, see *Blackwood's Magazine* for January 1872.—St Paul's Rocks is a group of small islets 1° N. of the equator and 540 miles from the South American coast.

St Paul de Loanda. See LOANDA.

St Paul's School was founded in 1509–12 by John Colet (q.v.), dean of St Paul's, for 153 children 'of every nation, country, and class.' He endowed it with lands, whose yearly value has risen from £122, 4s. 7½d. to £10,000; and he dedicated it to the Child Jesus, but 'the saint,' in Strype's words, 'has robbed his Master of the title.' The original schoolhouse in St Paul's Churchyard was burned in the Great Fire of 1666; the second by Wren (1674) gave place in 1824 to a third; and a fourth, on a site of sixteen acres at West Kensington, near Addison Road station, was opened by Lord Selborne on 23d April 1884. This removal was effected under a scheme of the Charity Commissioners (1879), which provided for a classical school for 500 boys, a modern school for a like number, and a high school for 400 girls. The boys either are day-scholars or live in one of eight boarding-houses. The governing board consists of thirteen members chosen by the Mercers' Company (to whose oversight Colet committed his foundation) and nine nominated by the universities. There are seven Oxford and Cambridge exhibitions of from £80 to £40 tenable for four years, and a Woolwich one of £50 for two years, besides six other exhibitions and thirteen prizes. The first high-master, from 1512 to 1523, was William Lilye; and among his successors have been Richard Mulcaster (1596–1608), Alexander Gill (1608–35), his son and namesake (1635–40), Thomas Gale (1672–97), and Herbert Kynaston (1838–76). Famous Paulines have been Major André, the Hon. C. Boyle, Camden, Roger Cotes, Sir P. Francis, Halley, Leland, the Duke of Marlborough, Milton, Robert Nelson, Pepys, and Strype; and one has been infamous—Judge Jeffreys. See R. B. Gardiner's *Admission Registers of St Paul's School* (1884).

St Peter Port, the town of Guernsey (q.v.).

St Petersburg, the capital of the Russian empire, stands at the head of the Gulf of Finland, in 59° 56′ N. lat. and 39° 19′ E. long., at the mouth of the Neva. The flat and low marshy ground upon which the city is built only recently emerged from the sea, and even in historical times the hills of Pulkova and Duderhof, which are now at a distance of 9 miles from the shore, stood close by the sea. Before entering the sea the mighty Neva, which flows 36 miles from Lake Ladoga, subdivides into many branches, thus giving origin to no less than 100 islands of various sizes, the surfaces of which rapidly increase. Nearly 600 acres of land have thus been added to the area of St Petersburg during the last 150 years. When a strong wind is blowing from the sea its level rises by several feet, and the poorer parts of St Petersburg are inundated every year; but when the overflow exceeds 10 feet nearly the whole of the city is inundated too. Such was the case in 1777 and 1824, when the Neva rose 13·8 feet above its average level. In August 1891 it rose again for a few hours full 10 feet above the average. The country round St Petersburg being covered with morainic deposits, peat bog, and marshes, is of a poor aspect and so thinly peopled that the government of St Petersburg has only thirty-three inhabitants per square mile. The almost uninhabited wildernesses of Karelia, Olonetz, and Vologda, beginning at the very gates of the capital, stretch towards the north and east, while the lake-depression (see RUSSIA) and the very thinly peopled tracts of the Valdai plateau separate St Petersburg from the Russian cities of Tver, Yaroslav, and Moscow (400 miles). Within a radius of 120 miles there is not one single town worth naming, the towns nearest to the Russian capital being the now decaying Novgorod, the Finnish cities of Viborg and Helsingfors (263 miles), and the Baltic cities of Reval and Riga (449 miles). Nevertheless the mouth of the Neva was from an early period coveted by the Novgorod merchants. In the 15th century they already had their factories at the head of the delta of the Neva; so that Peter I. only followed the tradition of the Novgorodians when he took possession of the Swedish forts at the head and at the mouth of the Neva, laid the first foundations of his capital (in 1702) on one of the islands of the delta, and dreamed to make of it a new Amsterdam. His dream was realised to some extent, but St Petersburg still remains isolated from the rest of the empire. One single line of railway connects it with the head of the Volga and Moscow; another with Poland and western Europe; a third with the Baltic provinces; and a fourth with Finland. The real connection between Russia and its capital was established through the Neva, which since it was connected by canals with the upper Volga, became the real mouth of the immense basin of the chief river of Russia and its numberless tributaries. Owing to this connection St Petersburg became, and has remained for more than 150 years, the chief port of Russia for the export of raw produce and the import of manufactured goods. Foreign trade and the centralisation of all administration in the residence of the emperor have made of St Petersburg a populous city with more than a million inhabitants and covering 42 sq. m., on the banks of the Neva and the islands formed by its branches—the Great Neva, the Little Neva, the Great Nevka, the Little Nevka, and scores of others.

The Great Neva, the chief branch, which has within the city itself a width of from 400 to 700 yards, and carries every second 1,750,000 cubic feet of very pure water, is a most beautiful river. It is so deep that large ships can lie alongside its granite embankments. But it is rather shallow at the mouth, with a narrow and sinuous channel across the bar, so that Cronstadt, built on an island 16 miles to the west of St Petersburg, remains both the fortress and the port of the capital. Since 1885 a ship-canal, 22 feet deep, admits ships to the Galernaya Harbour in the south-west corner of St Petersburg, and two-thirds of the foreign vessels unload within the city itself. The main body of the city, containing more than one-half of its inhabitants as well as all the chief streets, stands on the mainland, on the left bank of the Neva; and a beautiful granite quay, with a long series of palaces and mansions, stretches for 2¼ miles from the timber-yards in the east to the New Admiralty in the west. Only two permanent bridges cross the Neva; the other two, built on boats, are removed in autumn and spring, as well as when the ice of Lake Ladoga comes down the Neva in the beginning of May. The island Vasilievsky, between the Great and Little Nevas, has at its head the Stock Exchange, surrounded by spacious storehouses, and a row of scientific institutions, all facing the Neva—the Academy of Sciences, the University, the Philological Institute, the Academy of Arts, and various schools and colleges. On the Peterburgskiy Island, between the Little Neva and the Great Nevka, stands the old fortress of St Peter and St Paul, facing the Winter Palace, and containing the Mint and the cathedral wherein the members of the imperial family are buried; its old-fashioned casemates are used as political prisons. It has behind it the arsenal, and a series of wide streets bordered by small, mostly wooden houses, chiefly occupied by the poorer civil service functionaries. Farther up the mainland on the right bank of the Neva is covered by the poorer parts of the city, but contains some public buildings and a great number of factories. Numerous islands, separated from each other by the small branches into which both Nevkas subdivide, and connected together by a great number of wooden bridges, are covered with beautiful parks and summer-houses, to which most of the wealthier and middle-class population repair in the summer. The main part of St Petersburg has for its centre the Old Admiralty; its lofty gilded spire and the gilded dome of St Isaac's Cathedral are among the first sights caught on approaching St Petersburg by sea. Three streets radiate from it, east-south-east, south-east, and south; the first of them the famous Nevskiy Prospect; while four canals describe irregular half-circles which intersect these three streets at right angles. The street architecture, with its huge brick houses covered with stucco and mostly painted gray, is rigid and military in aspect. But the canals and the bridges which span them, the width of the chief streets, and an occasional glimpse of the Neva or of some broad square break the monotony.

A spacious square, planted with trees, encloses the Old Admiralty on three sides. To the east of it rise the huge and magnificent mass of the Winter Palace, the Hermitage Gallery of Art, and the semicircular buildings of the general staff, which surround a square facing the palace, and adorned by the Alexandra column, a shaft of red granite 84 feet high. To the west of the Admiralty is the Petrovskiy Square, where prances the well-known statue of Peter I.—the work of Falconet—on an immense block of granite brought from Finland. The cathedral of St Isaac of Dalmatia, in the south of it, is an almost cubic building (330 feet long, 290 broad, and 310 high), surmounted by one large and lofty and four small gilded domes. This church, erected by Nicholas I., is devoid of architectural beauty, but its peristyles of immense red granite monoliths give it a character of rude majesty. Its interior decorations are very rich, and it contains pictures painted by the best representatives of Russian art during the last half century. A somewhat stiff monument to Nicholas I. by Baron Clodt stands on a large square to the south of the cathedral.

The Nevskiy Prospect is one of the finest streets of the world, not so much for its houses—they are of a very mixed and mostly vulgar architecture—as for its immense width and length, the crowds which overflow its broad *trottoirs*, and the vehicles which glide over its wooden pavement. It runs for 3200 yards, with a width of 130 feet, from the Admiralty to the Moscow railway station, and thence with a slow bend towards the south for another 1650 yards, to reach again the Neva near the Smolnyi convent. About midway in its first part it passes by the Kazan cathedral, the Gostinoi Dvor—a two-storied building containing numerous shops—the public library, the square of Catharine II. adorned with a gorgeous but tasteless statue of the empress, and the Anitchkoff Palace. It crosses the Fontanka on a broad bridge adorned by four groups in bronze of wild horses with their tamers.

The climate is less severe than might be expected, but it is unhealthy and very changeable on the whole. The average temperatures are 15·4° F. in January, 64° in July, and 38·6° for the year. Still, the Neva remains frozen for an average of 147 days every year. A short but hot summer is followed by a damp autumn and very changeable winter, severe frosts being followed by rainy days in the midst of winter, and returning in April and May after the first warm days of the spring.

The population has rapidly increased during the 19th century, and attained, with the suburbs, 1,036,324 in December 1890, as against 918,016 in 1881. But it decreases very much during the summer (849,315 in July 1889), chiefly because masses of peasants who come to work in the factories in winter time return to their villages in summer. Thus in July 1889 the population of the city proper was 724,102; in December, 924,466; in July 1890, 731,336; in December 1890, 956,226. The sanitary arrangements being very imperfect, typhoid fever and European cholera are endemic, and their attacks are especially severe upon newcomers. The mortality is high: from 31 to 39 per thousand before 1885, but since only 28. The birth-rate has for many years been 31·2 to 31·6 per thousand. Before 1885 the deaths exceeded the births. In 1881 there were in St Petersburg no less than 22,189 Finnish citizens, and 26,567 foreigners, chiefly Germans (16,112). The total German population both from the Baltic provinces and Germany attains about 50,000.

As a manufacturing centre St Petersburg has not the importance of Moscow, the total yearly production of its factories (cottons, various textiles, metals, leather, sugar, guns, porcelain goods, &c.) not exceeding £20,000,000. There are many large factories in the surrounding country, but the industrial establishments of the capital itself are chiefly small, with an average of ten workers each. In 1881, out of the 588,235 persons of both sexes who themselves earned or otherwise were in possession of their own means of existence, 308,332 found their living in industry and trade, 94,295 in liberal professions and the public service, 106,631 as servants, and 33,406 belonged to the army. The trade of St Petersburg is very considerable. Every year no less than 12,000 to 13,000 boats and nearly as many rafts, loaded with corn, hemp, flax, linseed, leather, fuel-wood, and building materials, representing a total of nearly 3,000,000 tons, reach St Petersburg *viâ* the Neva. At the same time about 1,260,000 tons of various goods, including 500,000 tons of corn, come in by rail, chiefly from the upper Volga. The exports of corn alone from St Petersburg attained 862,000 tons in 1888, that is, one-third of the total export of corn from the Baltic ports, and one-fifth of the total export from Russia. Large quantities of hemp, flax, linseed, leather, crude petroleum, &c. must be added to the above—the total value of the exports being from £8,000,000 to £10,000,000; the imports, chiefly of coal, machinery, groceries, and manufactured goods, reach about the same value. The port is visited every year by about 1800 ships.

The great number and variety of scientific, literary, artistic, and technical institutions, and of institutions for higher education, which are concentrated in the capital, as well as the development of the press, render life at St Petersburg especially attractive, the more so as the provincial towns of Russia decidedly suffer from a lack of such. Even Moscow, which down to 1848 was the intellectual centre of Russia, has largely fallen from that position. The St Petersburg University, and the numerous academies, medical, technological, engineering, naval, military, &c., as well as the Ladies' University, number several thousands of students, both male and female. The scientific societies are very numerous: the Academy of Sciences and its branches are well known to European scientists. Great facilities for work in all branches of art are afforded by the Academy of Arts; and St Petersburg is on the whole a very musical city, with an excellent conservatoire. The public libraries are numerous. Besides the Imperial Public Library (1,200,000 volumes and 40,000 MSS.), there are the libraries of the Academy of Sciences, the University, the Council of State, as well as those of the scientific societies, some of which are very rich in their special branches. There are besides rich museums of art in the Hermitage (Flemish, Russian, and early Italian schools well represented, and priceless collections of Greek and Scythian antiquities), in the Academy of Arts, and in several private collections; while the scientific museums of the Academy of Sciences, the Mining Institute, the Asiatic Museum, &c. enjoy a high repute in the scientific world. The press is represented by nearly 120 periodicals, and the greatest part of the Russian publishing trade is concentrated at St Petersburg.

St Pierre, the largest town, though not the capital, of the island of Martinique (q.v.), in the West Indies, has a good harbour (defended by a fort), a cathedral, a college, a botanical garden, and 28,000 inhabitants. It was founded in 1665, and was the birthplace of Josephine, consort of Napoleon I.

St Pierre. See RÉUNION, and MIQUELON.

Saint-Pierre, JACQUES-HENRI BERNARDIN DE, the author of *Paul and Virginia*, was born at Havre, 19th January 1737. His parents were amiable but foolish people with absurd pretensions to family, and the education of the abnormally imaginative boy was ill regulated from the beginning. He found his ideals in the Lives of the Saints and *Robinson Crusoe*, made a voyage to Martinique in one of his uncle's ships, and returned to pursue irregular studies at Caen and Rouen. He dreamed of a missionary's life, but was sent to Paris to become an engineer, and found himself at twenty-three on his father's second marriage compelled to shift for himself. He served some time in the Engineers, but quarrelled with his chiefs and was dismissed, and next year was sent to Malta only to suffer the same experience. His head was turned by the writings of Rousseau, and he made public employment impossible for him by the innumerable utopian memoirs and criticisms on matters of administration with which he deluged the bureaus of the ministers. Buoyed up by dreams of a new state to be founded on the shores of the Sea of Aral, he travelled on nothing to Russia, and returned in dejection to Warsaw, where in his three months' stay occurred the romance which grew into that legend of the love of a princess which he ended by believing in himself. Next followed further wanderings to Vienna, Dresden, and Berlin, and a government expedition to Madagascar, which he abandoned at the Île de France, to spend there almost three years of melancholy and observation. In June 1771 he returned to Paris, his head full of ideas, yet he hesitated awhile before he recognised his true vocation. His *Voyage à l'Ile de France* appeared early in 1773, and at first attracted little attention. Yet it gave a distinctly new element to literature in that close portraiture of nature—that apprehension of the mysterious correspondence between the spectacle and the spectator, which nowadays adds the personal accent to descriptions of landscape. As he himself said of the contemporary descriptions, 'la physionomie n'y est pas,' and indeed even Rousseau's *Confessions* and *Rêveries* (both later) give us sensations rather than images.

A close friend of Rousseau in his last years, Saint-Pierre became misanthropic and half-crazy through poverty and lack of sympathy, and wearied out his few friends with his importunities. His *Études de la Nature* (3 vols. 1784) showed the strong influence of Rousseau in its sentimentalism, its inspired folly, and the ridiculous length to which it carries the use of final causes. He proves the existence of God from poetic reasons; everything in nature points to Him, for God made nature for man, and man for Himself. Nature makes men good; society corrupts them—'plus la société est policée, plus les maux y sont multipliés et cruels.' Hence the value of ignorance—the mother of all mystery—especially to women. In his Elysium are no capitalists nor nobles, but monuments to the inventors of useful arts, and such especial benefactors of the race as Nicot, who introduced tobacco into Europe. Not to speak of more essential faults, the book contains much wild physical science, as his theories of the tides and elongation of the poles. The new work was received with immense applause, and a fourth volume followed in 1788, containing the immortal *Paul et Virginie*, its author's one work of genius. Humboldt owns the wonderful truth with which it realises the splendours of tropical vegetation, but it is as an exquisite idyll of love growing up unconsciously in two natural hearts that the book possesses a perennial charm even for such critics as Sainte-Beuve and Gautier. *Daphnis and Chloe* suggested the idea of the change from friendship into love, but individual genius alone wrought the peculiar spell which carried *Paul and Virginia* quickly across Europe in English, Italian, Dutch, Russian, Polish, and Spanish translations, and which made Napoleon take it with him in his Italian campaign, and re-read it at St Helena. Yet the story has many faults besides its overstrained sentimentality—it is sadly marred by its didactic passages, and indeed the whole is but an object-lesson to the *Études*. His next works were *Vœux d'un Solitaire* (1789) and the weaker novel, *La Chaumière Indienne* (1791).

At fifty-five Saint-Pierre married the daughter of his printer, a girl of twenty, and at sixty-three he married another young girl, who after his death became the wife of Aimé Martin, his enthusiastic biographer and editor. A member of the Institute from its foundation in 1795, he was admitted to the Academy on its revival in 1803, but he made himself ridiculous by childish quarrels with his fellow-members. Napoleon heaped favours upon him, and he lived comfortably amid his flowers till his death in his country-house at Eragny, near Pontoise, 21st January 1814.

Saint-Pierre wrote down to the last, yet did not succeed in destroying his reputation. His *Harmonies de la Nature* (3 vols. 1796) was but a pale repetition of the *Études*. Besides these the *Le Café de Surate* and the *Essai sur J.-J. Rousseau* alone deserve to be named. His name survives only in his one masterpiece, but his influence remains entire in the greater Chateaubriand and Lamartine.

His *Œuvres Complètes* by Aimé Martin fill 12 volumes (1813-20); the *Correspondance*, 4 volumes (1826). His great Biography by the same editor appeared in 1820; its extravagances may be corrected by Arvède Barine's clever study (1891) in *Les Grands Écrivains Français*. There are also books by Fleury (1844) and Prévost-Paradol (1852).

St Pol de Léon, a decayed town in the Breton department of Finistère, near the English Channel, 13 miles NNW. of Morlaix. It has a 13th-century cathedral, dedicated to St Pol, who came hither from Cornwall in the 6th century, and also the Kreizker church, with a beautiful spire 263 feet high. Pop. 3914.

St Quentin, a town in the French dept. of Aisne, stands on the Somme, by rail 95 miles NE. of Paris and 33 S. of Cambrai. The church of St Quentin is a remarkably fine Gothic structure, dating from the 12th to the 15th century, and containing a much more ancient crypt. The town-hall (15th and 16th centuries) is also a fine specimen of Gothic. The town is a centre of the cotton industries, which give employment to 130,000 hands in the making of calicoes, tulle, cretonnes, jaconets, muslin, merino, cambric, gauze, and so forth. Further, vast quantities of embroidery are prepared, and machinery, hats, paper, sugar, soap, and beer are manufactured. The French historian Martin was born here in 1810. Pop. (1856) 26,887; (1886) 47,200. St Quentin and its vicinity have been the scene of two memorable battles. The Spaniards under the Duke of Savoy and Ferdinand Gonzaga, assisted by an English contingent under the Earl of Pembroke and Egmont in command of the Flemings, inflicted a crushing defeat upon the French under Constable Montmorency, on 10th August 1557 (St Lawrence's Day), a victory which Philip II. commemorated in the Escorial (q.v.). Shortly afterwards the town, after a brilliant defence by Coligny, capitulated to the Spanish army. On 19th January 1871 the Germans under Von Goeben defeated and put to rout the army of Faidherbe, capturing nearly 10,000 prisoners, with the loss to themselves of about 3000 men.

Saint-Réal, César Vichard, Abbé de, who has been, and not undeservedly, styled the French Sallust, was born in 1631 at Chambéry, and died there also in 1692. He went early to Paris, visited London and there lived awhile under the shelter of St Évremond and the Duchesse de Mazarin, but in 1679 settled at Chambéry as historiographer to the Duke of Savoy. He had been long a student of history when in 1674 he covered himself with distinction by his brilliant *Histoire de la Conjuration que les Espagnols formèrent en 1618 contre la République de Venice*, which to this day is counted among French classics. His style is vivid and vigorous, simple and pure, yet picturesque; and the story is unfolded with a skilful mastery of dramatic sense. It has been objected that the facts are not always reliable, the conclusions frequently unsound, but it should be remembered that Saint-Réal wrote history before the modern conception of history awoke, and that his aim was to produce a good literary narrative, not a chronicle. A work of art should be estimated according as it corresponds to the ideal of the writer, rather than to the prepossessions of the individual reader, and, this test applied, the *Conjuration contre Venice* remains an exquisite masterpiece of historical painting in miniature.

Saints. See Saint.

Saint Saëns, Charles Camille, an eminent French musician, was born in Paris, October 9, 1835. At the age, it is said, of two and a half years he was taught the pianoforte by his great-aunt, and at seven he had further instruction from Stamaty, and subsequently learned harmony under Maleden. In 1847 he studied the organ under Benoist. At the age of sixteen he wrote his first symphony, which was performed with success, and was followed by numerous other instrumental works. He became organist, first of the church of St Méry, and in 1858 of the Madeleine, where he continued till 1877. His first opera, *La Princesse Jaune*, was given in 1872, and *Le Timbre d'Argent* in 1877; but neither was successful. *Samson et Dalila*, a sacred drama, was produced at Weimar, also in 1877, and was subsequently successfully revived at Rouen. More important operas are *Henri VIII.*, brought out in 1883 at the Grand Opéra with success, not however extending to its subsequent revivals; *Proserpine*, given in 1887, but received with disapprobation; and *Ascanio*, produced at the Grand Opéra, March 21, 1890, and well received, though not with unmixed praise. He is one of the greatest living executants on the pianoforte and organ, and has remarkable powers of improvisation. He has appeared as a performer in various countries, and several times in England. His reputation as a composer is high, but he holds a somewhat peculiar position in his own country, where the great criterion of ability is the opera, in which he has not attained the highest rank; while many of his instrumental works, which include three symphonies, four symphonic poems (in which he follows the lead of Liszt), two orchestral suites, several concertos for piano and orchestra, and violin and orchestra, and, above all, a considerable quantity of chamber music, show the most consummate mastery, if not genius. The faults laid at his door are inequality, incongruity, and occasional eccentricity. He is a distinguished musical critic; and his selected papers, *Harmonie et Mélodie* (1885), show a lucid style and temperate judgment.

Saintsbury, George Edward Bateman, was born at Southampton, October 23, 1845, and was educated at King's College School, London, and Merton College, Oxford. From 1868 till 1876 he filled scholastic appointments at Manchester, Guernsey, and Elgin, but soon after established himself firmly in the literary world of London as one of the most active and influential critics of the day. All his work is characterised by clearness of thought, fullness of knowledge, and force, if not always grace of style; and he has been invaluable to his generation as a guide to French literature old and new. He has been an active contributor to the greater magazines (of *Macmillan's* he was for some time editor) and to encyclopædias, including the present work. Among his books are a *Primer* (1880) and a *Short History* (1882) of French literature; *Dryden* in 'English Men of Letters' (1881), and *Marlborough* in 'English Worthies' (1885); a *History of Elizabethan Literature* (1887); a short history of *Manchester* (1887); *Essays in English Literature, 1780–1860* (1891); and *Essays on French Novelists* (1891). Besides these he has edited Scott's *Dryden*; *Specimens of French Literature, from Villon to Hugo* (1883); *Specimens of English Prose Style, from Malory to Macaulay* (1885); Corneille's *Horace*, and other French classics for schools; and a translation of Scherer's *Critical Essays on English Subjects* (1891).

St Servan, a seaport of France, dept. Ille-et-Vilaine, stands on the east side of the estuary of the Rance, just above St Malo (q.v.), from which it is separated by a creek a mile wide. It has a floating-dock, is much frequented as a watering-place, and carries on shipbuilding and its cognate branches, and has a little commerce in fruit, potatoes, barley (exports), coal, and timber (imports). Close by are the ruins of the cathedral of Aleth (6th to 12th century). Pop. 9877.

Saint-Simon, CLAUDE HENRI, COMTE DE, the founder of French socialism, was born at Paris, October 17, 1760. He belonged to a branch of the same ancient and noble family as the duke whose memoirs are so celebrated. The young count had D'Alembert for tutor, and from his earliest years was inspired by an ambition which was not unmixed with vanity. He ordered his valet to rouse him every morning with the words, 'Rise, *Monsieur le Comte*, you have great things to do.' Like other French nobles, he showed his youthful enthusiasm for liberty by serving as a volunteer in the American war of independence against England. He did not, however, take any prominent part in the Revolution in his own country; his birth as an aristocrat brought him into suspicion with the extreme party, and he was imprisoned for a time. But he made a little fortune by speculating in confiscated lands; not from love of money, as we are assured, but that he might have leisure to promote the grand projects which he was now contemplating.

His ancestor Charlemagne had appeared to him in a dream, and encouraged him to devote his life to philosophy, by promising that his successes as philosopher would equal those of the emperor as warrior and statesman. Accordingly Saint-Simon now went through a long course of study and experiment to fit himself for his new career. Pleasure and science were alike welcome to him, provided they enlarged the circle of his knowledge and experience. One of his experiments was matrimony (1801); it proved a failure, and was soon terminated by a divorce. The lavish expenditure incurred during his experiments also reduced him to utter poverty, in which he passed the rest of his life. It was at this time that he made his characteristic proposal of marriage to Madame de Staël: 'Madame, vous êtes la femme la plus extraordinaire du monde, comme j'en suis l'homme le plus extraordinaire; à nous deux nous aurions, sans doute, un enfant plus extraordinaire encore.' Madame de Stael, however, declined to humour the philosopher, and Saint-Simon, now beginning to be in straits, published his first work, *Lettres d'un Habitant de Genève a ses Contemporains* (1803). His early writings were scientific and speculative. The first distinct approach to an enunciation of socialism occurred in a work *L'Industrie*, which appeared in 1817, and similar views were set forth in *L'Organisateur* (1819), *Du Système Industriel* (1821), *Catéchisme des Industriels* (1823). The last, and by far the most important, work of Saint-Simon was the *Nouveau Christianisme*, published in 1825. While writing these works the philosopher lived in utter penury, being often destitute of decent food and clothing, and hardly able to scrape together the means of publishing them. But for the kindness of friends and a small pension allowed him by his family in 1812 he would have died of starvation. In 1823 he had so exhausted his funds that he tried to shoot himself with a pistol, and lost an eye in the attempt. He died May 19, 1825.

It will be seen that the most prominent feature of Saint-Simon's life was the originality with which he ordered it for himself. The heroic fortitude which he showed in enduring extreme poverty and neglect cannot be too highly commended. That his originality degenerated into eccentricity and vanity is evident enough. The like qualities and defects are found in his works. They are wanting in sober-mindedness, judgment, and system; they are loose, diffuse, and full of repetitions. Yet there must have been a great charm both in the personality and in the theories that attracted so many of the brightest and ablest young men of France, including Comte and Augustine Thierry. Notwithstanding all his vagaries and eccentricities, the man who originated Comtism and French socialism must be regarded as a seminal thinker of high rank. He sowed the seed which afterwards grew into important systems. In opposition to the destructive spirit of the Revolution, he sought after a positive reorganisation of society. He desired that the feudal and military system should be superseded by an industrial order controlled by industrial chiefs, and that the spiritual direction of society should pass from the church to the men of science. In the *Nouveau Christianisme* the cause of the poor is laid down as the groundwork of religion. Proceeding from the grand precept, 'Love one another,' Saint-Simon thus enunciated the fundamental principle of the new Christianity: 'The whole of society ought to strive towards the amelioration of the moral and physical existence of the poorest class; society ought to organise itself in the way best adapted for attaining this end.' According to Saint-Simon, the essence of religion and the transforming principle of the new society are alike contained in these words.

After his death the vague ideas of Saint-Simon were developed by his disciples into an elaborate system of socialism. During the excitement produced by the revolution of 1830 the school attracted great attention both in France and Europe. The *Globe* became its organ, and many of the most promising youth of France joined it. An association living out of a common purse was established. But dissensions connected with the marriage question arose between the two leaders, Bazard and Enfantin. Bazard, with many important members, seceded, and Enfantin, who had advocated lax ideas on the relations of the sexes, led the association into the lower depths of extravagance and absurdity till the courts of law interfered, and the society was broken up in 1832. Many members of the school afterwards played a leading part in various departments of French life. The first systematic presentation of socialism may be regarded as due to the Saint-Simon school, and it will be most convenient to give an account of their views under the article SOCIALISM.

An admirable edition of the works of Saint-Simon and Enfantin was issued by survivors of the school (36 vols. Paris, 1865–74). See also Reybaud, *Études sur les Réformateurs Modernes;* Paul Janet, *Saint-Simon et le Saint-Simonisme;* A. J. Booth, *Saint-Simon and Simonism.*

Saint-Simon, LOUIS DE ROUVROY, DUC DE, a great French writer, was born at Paris, January 16, 1675. His father, who was sixty-eight at his birth, had been a page and favourite of Louis XIII., and had risen rapidly at court, becoming First Equerry in 1627, and finally duke and peer in 1636, but soon after fell into disgrace, and passed much of his time thereafter at the castle of Blaye on the Gironde, which as governor he kept for the crown throughout the Fronde. The boy was given the title of Vidame of Chartres, as those of marquis and count had become too common. He received a careful education at home and at the academy of Rochefort, entered the service in the king's household troops in 1691, and behaved with spirit at Neerwinden (1693) under the eye of Luxembourg. He succeeded his father in the title, as well as in all his appointments, in 1693, married in 1695, and served in the army of the Rhine under his father-in-law, the Marshal de Lorges, from 1694 till the peace of Ryswick, having offended Luxembourg by championing the action of the dukes in Parlement against his claim in a question of privilege. Dissatisfied with his promotion, he left the service in 1702, and repaired to Versailles, where he studied the 'insects of the court,' and conformed to all the tedious etiquette of Louis XIV., without for some years enjoying any measure of the royal favour. He embroiled himself in an endless series of disputes with members of the peerage about points of precedence and privilege, such as the carrying round the alms-plate in the chapel, which the ladies of the ducal family of Lorraine had refused to do. He made bitter enemies of the powerful Marquis d'Antin, as well as the Duc de Maine, the eldest of the king's bastards by Madame de Montespan, who had been, to his great displeasure, given in 1694 a special rank below the princes but above the other peers; and he was disliked by the Dauphin and the whole 'cabal of Meudon' which surrounded him. Indeed he left Versailles for a time, and passed most of the year 1709 in the country at La Ferté. But he recovered the king's favour by his efforts to bring his friend Orleans to a more reputable life, and by his successful intriguing in the project to marry the Dauphin's favourite son, the Duc de Berry, to the daughter of Orleans. The marriage took place in July 1710, and the Duchess de Saint-Simon was, to his great regret, made lady-in-waiting to the young Duchess de Berry, and passed nine uncomfortable years of attendance upon her half-maniac mistress. The death of the Dauphin (April 1711) relieved him of all anxiety for the future, for his son, the Duke of Burgundy, Fénelon's pupil, was his warm friend. But his joy was short-lived, for the virtuous young Dauphin and Dauphiness were both carried off by fever in February 1712. Another mortification was the elevation of the two bastards in 1714 to be princes of the blood. The king's death on 1st September 1714 opened up a bitter struggle between Orleans and Maine, in which Saint-Simon supported his friend with equal warmth and boldness. It ended in the complete triumph of Orleans; but, though Saint-Simon had a seat on the council of the regency, he found Orleans indifferent to his schemes of financial reform, and the restoration to the peers of a paramount position in the work of government; and he failed to prevail upon him even to decide the momentous 'Affaire du Bonnet,' as to whether the president should keep his cap on his head or before him on the table when addressing the peers in Parlement. But he had at least the gratification of seeing 'the bastards' degraded from the princely rank, and the proudest day of his life was that of the Bed of Justice (August 26, 1718), in which his hated enemies, the members of the Parlement, were called in to hear the decree and witness the fall of their patron Maine—to this day alone he devotes seventy-seven pages of his *Mémoires.* His influence decreased as that of Dubois rose; but he was sent to Spain in 1721 on a splendid special embassy to demand the hand of the Infanta for the young king, Louis XV. The death of Orleans in December 1723 closed his public career, and he spent the next thirty years in calm retirement at his château of La Ferté Vidame near Chartres, 77 miles distant from Paris. He lost his much-loved wife in 1743; three years later, his eldest son, who left only a daughter behind him. His second son died childless in 1754; his only remaining child, a daughter, was ugly and deformed, yet married the Prince of Chimay in 1722, although she never left her father's house. Saint-Simon died in his house at Paris, 2d March 1755. He had struggled all his days with colossal debts, and he sank at last into sheer insolvency.

Saint-Simon amused himself, between the years 1734 and 1738, in making notes in an interleaved copy of Dangeau's dry and servile *Journal* (written 1684–1720); but he seems to have began his own journal before 1699. Finally, about 1739, he began to prepare the *Mémoires* in their final form, and this task he completed about 1752. This precious MS. was claimed by his cousin, the Bishop of Metz, but it was finally impounded in 1761 by the Duc de Choiseul for the Foreign Office. It was read to furnish amusement for Madame de Pompadour; Madame du Deffand speaks of it in a letter to Horace Walpole; and it had undoubtedly been seen by Duclos, Marmontel, and Voltaire. A volume of garbled extracts appeared at Brussels in 1780, but it was not till 1830 that the first authentic edition appeared, the MS. having been given to General de Saint-Simon by Louis XVIII. The first adequate edition was that in 20 volumes, edited by Chéruel in 1856, which at once attained an extraordinary popularity. But the final edition of the inimitable *Mémoires* is that in *Les Grands Écrivains*, by M. de Boislisle (30 vols —vol. i. 1871; vol. viii. 1891). There is an abridged English translation by Bayle St John (4 vols. 1857). The additions to Dangeau had been published along with the *Journal* in 19 volumes, 1854. The rest of Saint-Simon's voluminous MSS. were locked up till 1880, when M. de Freycinet opened them up. M. Prosper Faugère published the *Écrits Inédits* (7 vols. 1880–83). The *Lettres et Depêches* of the Spanish embassy were edited by M. E. Drumont (1880); the *Projets de Gouvernement du Duc de Bourgogne* in 1860.

Saint-Simon's Memorials on Precedent and Privilege are not interesting, nor yet his Letters, but his *Mémoires* remains a consummate masterpiece of literary art, in its kind absolutely alone. His knowledge of military affairs was inadequate; his fondness for a striking story was a standing snare to him; and other inaccuracies are plentiful enough; while his narrative is constantly marred by defective information and by prejudice, never by deliberate falsehood. In the introduction he claims himself, and with justice, as 'straightforward, truthful, candid, and inspired with honour and integrity.' He was an honest hater—'all my life,' he says, 'I have known only too well how to love and how to hate'—but if he heaps his hatred upon Vendôme, Villars, Madame de Maintenon, Maine, Noailles, and Dubois, he has no less intense a love for Beauvilliers, for his spiritual adviser the Abbot Rancé of La Trappe, and for his young hero the Duke of Burgundy. His life was pure in an impure age; he had an un-French dislike to all such frivolities as cards and frequenting play-houses; there is but one instance even of his taking part in a hunt. He describes with pity the horrors of hunger among the peasantry during the winter of 1709; and his heart was hot within him at the inhuman persecutions of the Jansenists and the Huguenots, which he ascribes directly to Madame de Maintenon, herself 'the dupe of her own hypocrisy'—a mere tool in the hands of the Jesuits. He loved the old Gallicanism of the French Church, and abhorred the infamy of the Revocation, and he describes the military disasters and humiliation of the king's later years with a remorseless truth that does not impair his patriotism, although it has cost him the favour of Chauvinist editors, and even of M. Chéruel. 'A reign of blood and brigandage and perpetual wars against all Europe continually allied against him and armed by the necessity of defending itself'—so he described the epoch of the Grand Monarque. He does ample justice to the dignity and kingly deportment of Louis, who 'never considered that any one but himself had been king of France.' He was an admirable observer, and he has left us an inimitable gallery of the portraits of a whole court, all distinct and individual, vivid and real, snatched securely from forgetfulness and the night of time. He usually sketches the physical aspect first, with a few firm graphic strokes, and he gives colour, fire, life, to everything he touches, for he possesses that magical power of vision which enables the reader to divine and resuscitate a vanished past. His aim was to make his reader think 'not that he is reading a history or memoirs, but rather that he is himself in the secret of all that is represented to him, and spectator of all that is related,' and in his aim he succeeded as no other has done before or since. Yet his style is unstudied, slap-dash, full of confusions of construction—'il écrit à la diable pour l'immortalité,' said Chateaubriand. Villemain and Marmontel placed him above all contemporary writers; Taine ranks him with Pascal and La Fontaine, Sainte-Beuve with Molière and Bossuet. The last and greatest critic with these words sums up his judgment: 'Thanks to him—un Tacite au naturel et à bride abattue—we have nothing to envy in the earlier writer. And what is more, the vein of comedy, which he has so boldly scattered through his Memoirs, has given us in him truly a Tacitus à la Shakespeare.'

See Sainte-Beuve, *Causeries du Lundi* (vols. iii. and xv.), and *Nouveaux Lundis* (vol. x.); Taine, in *Essais de Critique et d'Histoire*; Chéruel, *Saint-Simon considéré comme Historien de Louis XIV.* (1865); Clifton W. Collins, in 'Foreign Classics' (1880); Henry Reeve, *Royal and Republican France* (vol. i. 1872); and the admirable study by Edwin Cannan—the Lothian prize essay for 1885.

St Stephen's. See Westminster.

St Sulpice, the famous diocesan seminary for priests in Paris, close by the large and wealthy church of St Sulpice, on the south side of the Seine, near the Luxembourg.

St Thomas, a volcanic island of Africa belonging to Portugal, lies in the Gulf of Guinea 170 miles W. of the mouth of the river Gaboon. Its southern extremity almost touches the equator. Measuring 32 miles by 21, it has an area of 360 sq. m.; pop. nearly 20,000, including 1000 whites. Although it rises to the altitude of 6000 feet, it has the reputation of being very unhealthy. Coffee and cocoa, with some pepper, cinnamon, maize, indigo, &c., are the principal products. Chief town, St Thomas (pop. 3000), on the north-east coast, the seat of a bishop. The island was discovered in 1470, and colonised in 1493 by the Portuguese, to whom it reverted after a Dutch occupation from 1641 to 1844. See Crouch, *Glimpses of Feverland* (1889).

St Thomas, one of the Virgin Islands in the West Indies, belongs to Denmark, and lies 36 miles E. of Puerto Rico. Area, 33 sq. m.; pop. 14,389, 8632 of them women, and nearly 600 Jews. English is the language of the educated classes. The surface is hilly (1555 feet) and the soil poor. The cultivation of vegetables, guinea grass, and a small quantity of cotton employs the scanty rural population. The port, Charlotte Amalie or St Thomas (pop. 12,000), was formerly a busy emporium for the European trade with the West Indies, the harbour in which the merchant fleets assembled to wait for their convoys, and later the principal port of call in the West Indies. All these advantages have now passed from it. Before the abolition of slavery it was covered with prosperous sugar-plantations. The island is often visited by earthquakes, but they are not, as a rule, so destructive as the cyclones. It was first colonised by the Dutch in 1657. The British held it in 1667–71, 1801, 1807-15.

St Thomas, a town of Ontario, 15 miles S. of London by rail, 112 ENE. of Detroit, and 9 miles N. of Port Stanley on Lake Erie, with sawmills, foundries, and railway works. The town, which has a ladies' college, is an important railway centre, and has grown rapidly. Pop. (1881) 8367.

St Thomas's, one of the great London hospitals, dates from 1553, and is now housed in seven four-storied red-brick pavilions, a spacious but ugly building standing opposite the Houses of Parliament, on the south side of the Thames. The present edifice cost £500,000. The revenue of the hospital is about £40,000. It treats annually 6000 in-patients and over 60,000 out-patients.

St Victor, Hugo of, a mediæval theologian, a Fleming, born near Ypres in 1097, died in 1141 as prior of the Augustinian monastery of St Victor at Paris, was a man of the school of Bernard of Clairvaux, and a mystic, his favourite teaching being that the intellect or its exercise, reasoning, will never enable man to discover the 'uncorrupted truth of things.' His writings were very popular in the monastic schools and in pietistic circles during the middle ages. His pupil, Richard of St Victor, prior of his monastery from 1162 to 1173, and a Scot by birth, went even further than Hugo in that he proclaimed mystic contemplation to be above reason.

Saint-Victor, Paul de, a superfine French writer, was born at Paris in 1827, the son of a poet who translated Anacreon and became a fine connoisseur in painting. He had his education at Freiburg in Switzerland and at the Collegio Romano at Rome, and made his début in 1851 as a dramatic critic in the *Pays*, under the protection of Lamartine, whom he had already served as secretary. In 1855 he carried his pen to the *Presse*, later to *La Liberté*, and last to the *Moniteur Universel*. He quickly made himself famous by his knowledge and insight, and by a brilliant style, marred only by its affectedness and over-elaboration. Sense of colour, imagination, a quick eye for the picturesque in everything, and the sovereign gift of the artist—the intuition of individuality—made him a word-painter of the first rank, while his severity of taste and his sense of form saved him from extravagance. Yet his style is splendid, Oriental or at least Italian rather than French—even in his appearance he was a Venetian who had stepped out of his canvas. 'When I read Saint-Victor, I put on blue spectacles,' said Lamartine, and Victor Hugo wrote to him, after reading his review of the *Travailleurs de la Mer*, 'One would write a book merely to make you write a page.' His first book was *Hommes et Dieux* (1867), a series of historico-æsthetic studies on the Venus of Milo, Diana, Ceres, Helen, Nero, Marcus Aurelius, Cæsar Borgia, and Henry III. Later books were *Les Deux Masques, tragédie-comédie* (3 vols. 1879-83); *Anciens et Modernes* (1886); *Les Femmes de Goethe* (1869); *Victor Hugo* (1885); and *Barbares et Bandits.* Saint-Victor was reserved in temperament, and indeed, to speak truly, was something of a coxcomb. He lived an uneventful life, was for some years General Inspector of Fine Arts, and died at Paris, 9th July 1881. See the study by Alidor Delzant (1887), which reveals to us the strangely mechanical method in which he wrote. He first selected certain words, spread them about his page like colours on a palette, next grouped round them other euphonious terms, and lastly strung the whole together in a proposition.

St Vincent, one of the British islands in the West Indies, Windward Group, 105 miles W. of Barbadoes. Area, 132 sq. m.; pop. (1881) 40,548; (1889) 47,640, of whom over 5000 were whites and Hindu coolies, the rest being Negroes and people of mixed blood. The island is traversed from north to south by a chain of volcanic mountains, which rise in the volcano called the Souffrière (a violent eruption in 1812) to 3000 feet. Many of the valleys are fertile, and the shores are rich and productive. Only one-seventh of the entire area is under cultivation. The climate is healthy. Sugar, rum, cocoa, spices, and arrowroot are the principal products, sugar and other commodities being exported to the value of £124,587 in 1889, though the exports had fallen constantly from £166,753 in 1883 to £81,837 in 1888. The imports fell from £152,333 in 1882 to £79,777 in 1888, but went up again in 1889 to £98,212. Great Britain sends one-half of the imports and takes one-sixth of the exports. The chief town is Kingstown (pop. 6000), at the head of a bay on the south-west coast. The island is ruled by a governor and a nominated legislative council of eight members; previous to 1877 it had a representative government. St Vincent was discovered by Columbus in 1498, and was then inhabited by Caribs. These people were left in possession down to 1783, although Charles I. gave the island to the Earl of Carlisle in 1627. In 1797 the Caribs, rebelling with French aid, were transferred to the island of Rattan in the Bay of Honduras.

St Vincent, Cape, a promontory forming the south-western corner of Portugal, off which several important naval battles have taken place. On June 16, 1693, Admiral Rooke was here attacked by a superior French fleet, and defeated with the loss of twelve men-of-war and eighty merchantmen which were sailing under his convoy; on January 16, 1780, Admiral Rodney destroyed here several Spanish ships of Langara's fleet; on February 14, 1797, the great battle of Cape St Vincent (see following article) resulted in the total defeat of the Spaniards and capture of some of their largest ships. This victory frustrated the formidable Spanish-French scheme of invading England. The fourth naval fight off Cape St Vincent took place between the fleet of Queen Maria of Portugal, commanded by Sir Charles Napier (q.v.), and that of Dom Miguel, in which a portion of the latter was destroyed and the rest captured, 5th July 1833.

St Vincent, Earl, Admiral, John Jervis was born at Meaford Hall, Staffordshire, January 9, 1734. Running away to sea as a boy, he rose to be a naval lieutenant in 1754, and so distinguished himself in the Quebec expedition in 1759 as to receive the rank of commander. As captain of the *Foudroyant* in 1778 he fought in the action off Brest, and in 1782 captured the *Pégase* of 74 guns, whereupon he was made K.C.B. In 1793 he commanded the naval part of the successful expedition against the French West India Islands. In 1795, now a full admiral, he received the command of the Mediterranean fleet. On the 14th February 1797, with only fifteen sail of the line and seven frigates, he fell in, off Cape St Vincent, with the Spanish fleet of twenty-seven sail. Jervis determined to engage the enemy, and the battle of St Vincent was fought; but it should be remembered that the genius of Nelson contributed greatly to the success of the day (see Nelson, Vol. VII. p. 432). For this victory the king created Jervis Earl St Vincent, and parliament settled upon him a pension of £3000 a year. After having, by great firmness, repressed a mutiny off Cadiz, which threatened the loss of the whole fleet, he was compelled by ill-health to return home. He was soon applied to by government to subdue the spirit of sedition which had openly manifested itself in the Channel fleet; and his endeavours were eminently successful. He held the appointment of First Lord of the Admiralty for the three years 1801-4, and reformed innumerable crying abuses; and having for a second time commanded the Channel fleet, he retired into private life, and died 13th March 1823. He was buried in St Paul's Cathedral.

See his *Life and Correspondence*, by Captain E. P. Brenton (2 vols. 1838); the *Memoirs of the Earl of St Vincent*, by J. S. Tucker (2 vols. 1844); James's *Naval History* (new ed. 1878).

St Vitus' Dance. See Chorea.

Sais, an ancient Egyptian city, called in the hieroglyphs *Sa*, was situated on the right bank of the Canopic branch of the Nile. It gave its name to two Egyptian dynasties, the 24th and 26th, founded by natives of the city. Sais was important as a religious capital, and had a famous temple of the goddess Neith and the tomb of Osiris. Towards the decline of the monarchy it rose to great splendour. The 26th dynasty transferred hither the capital of the kingdom. It was also a renowned seat of learning, and was frequently visited by the sages of Greece. The legend of the mysterious veiled statue in the temple at Sais (which formed the subject of Schiller's ballad and of Novalis' romance) is the issue of Greek invention.

Saith. See Coal-fish.

Saivas is the name of one of the three great divisions of Hindu sects. See India, Vol. VI. p. 106. The word designates the votaries of Siva, and comprises different special sects, which varied in number at different periods of mediæval Hinduism. See Siva.

Sakai, a town of Japan, situated on the south-west of the island of Nippon, 7 miles S. of Osaka. Before the rise of this town Sakai was the chief commercial port of Japan; its trade is now absorbed in that of Osaka. Pop. (1888) 45,005.

Sakhalin. See Saghalien.

Saki (*Pithecia*), a genus of long-tailed American monkeys of the family Cebidæ. Some species (e.g. *P. hirsuta*) are covered with long hair, and are sometimes called Fur-tailed Monkeys. The Black Saki (*P. satanas*), from the Amazons, is the best-known species.

Saki, a kind of beer which the Japanese make from rice. It is the common alcoholic liquor of Japan. It is clear, and has a peculiar taste, which Europeans generally reckon unpleasant. The Japanese usually heat it before drinking, and pour it into flat cups or saucers of lacquered wood. It produces a very speedy and transient intoxication.

Sakkara, a village 10 miles S. of Cairo, near the ruins of Memphis (q.v.), and famous for its eleven Pyramids (q.v.).

Sáktas is the name of one of the great divisions of Hindu sects. See INDIA, Vol. VI. p. 106.

Sakuntala is one of the most pleasing female characters of Hindu mythology. She is mentioned as a water-nymph in the *Yajurveda* (see VEDA); she is the subject of a beautiful episode of the *Mahabharata* (q.v.), and is spoken of in the *Puranas*; but her name has become especially familiar in Europe through the celebrated drama of Kálidása (q.v.), which, introduced to us by Sir William Jones in 1789, became the starting-point of Sanskrit philology in Europe.

Sákyamuni, or the 'Saint Sákya,' is a name of the founder of the Buddhist religion; see BUDDHISM, Vol. II. p. 516.

Sál (*Shorea robusta*), a tree of Northern India, of which the wood—hard, dark brown, rather coarse grained, but very durable—is next in value to teak. It is carefully cherished by government.

Sala, GEORGE AUGUSTUS HENRY, journalist and novelist, and a man of much out-of-the-way learning, was born in London, the son of an Italian and an Englishwoman, in 1828, and, forsaking art for literature, became a contributor to *Household Words*, the *Welcome Guest*, *Temple Bar* (which he founded and edited), the *Illustrated London News* (to which he for many years contributed the 'Echoes of the Week'), and *Cornhill*. As special correspondent of the *Daily Telegraph* he was in the United States during the civil war, in France during the war of 1870–71, in Russia in 1876, and in Australia in 1885. *Twice Round the Clock* was published in 1859. Among his best-known novels are *The Baddington Peerage* (1860), *Captain Dangerous* (1863), *Quite Alone* (1864). *Wat Tyler, M.P.* is a burlesque; and among the popular books of travel are *A Journey due North* (1859), *Dutch Pictures* (1861), *A Trip to Barbary* (1865), *From Waterloo to the Peninsula* (1866), *Rome and Venice* (1869), *Under the Sun* (1872), *Paris Herself Again* (1881), *America Revisited* (1882), and *A Journey due South* (1885).

Salaam (*Selám*, Arab. = Heb. *Shalom*, 'peace'), the general term of salutation among the Mohammedans. Several of their social usages in this respect are founded upon religious precepts; among these is the custom of greeting each other with the words 'Es-selámu aleikum' ('Peace be with you'), which is answered by 'With you be peace, and the mercy of God, and His blessings!' This salutation is neither to be addressed to nor to be received from any non-Mohammedan.

Salad, the term given to a preparation of raw herbs for food. It derives its name from the fact that salt is one of the chief ingredients used in dressing a salad. The principal salad herbs are lettuce, endive, chicory, celery, mustard and cress, water-cress, onions, radishes, tomatoes, chervil, and a few savoury herbs used to give flavour. They are usually cut up, and mixed with salt, vinegar, oil, and other condiments, according to taste. Sugar is also frequently added. Cresses, seed-leaves of mustard, &c. are often eaten without any addition. Salad has always been a favourite food with civilised nations, and has varied very little in its composition. The great value of salads is in the fact that they are uncooked, and consequently contain a larger quantity of mineral matter, such as potash, soda, &c., than if boiled. Potato salad is made in Germany with potatoes that have been boiled. Salads are sometimes prepared with animal food, such as boiled lobsters, crabs, eggs, &c. For some kinds of salad tarragon vinegar is best. See MAYONNAISE.

Sal'adin, the name given by western writers to SALAH-ED-DIN YUSSUF IBN AYUB, the sultan of Egypt and Syria, and the founder of the Ayubite dynasty in those countries. He lives in the works of historians as the Moslem hero of the third crusade and the beau-ideal of Moslem chivalry. He was born in 1137 at the castle of Tekrit, on the Tigris, of which his father Ayub, a Kurd, was governor under the Seljuks. Following the example of his father and uncle, he entered the service of Nureddin (q.v.), emir of Syria, and accompanied his uncle Shirkoh in his expeditions to Egypt (1167–68) in command of Nureddin's army. On the death of Shirkoh Saladin was made grand-vizier of the Fatimite calif, and in 1171 he overthrew that monarch and constituted himself sole sovereign of Egypt. The growing power of the young prince not only aroused the alarm of the Christians, but provoked the more dangerous jealousy of Nureddin. But on Nureddin's death (1174) Saladin proclaimed himself sultan of Egypt and Syria, and the title was confirmed to him by the calif of Bagdad. He next reduced Mesopotamia to his rule, and received the homage of the Seljuk princes of Asia Minor. The remaining years of his life were occupied in wars with the Christians and in the consolidation of his extensive dominions. On 4th July 1187 the Christian army suffered a terrible defeat near Tiberias, the king of Jerusalem, the two grand-masters, and many other warriors of high rank being taken captive; then Jerusalem was stormed (3d October), and almost every other fortified place on the Syrian coast (Acre, Saida, Beyrout, &c., though not Tyre) was taken by the victorious Saladin. The news of this great success being brought to western Europe aroused the religious enthusiasm of the Christians to its highest pitch, and a powerful army of crusaders, headed by the kings of France and England, speedily made their appearance on the scene of strife. They captured Acre in 1191, and Richard Cœur-de-Lion defeated Saladin, took Cæsarea and Jaffa, and finally obtained a treaty for three years (August 1192), by which the coast from Jaffa to Tyre was yielded to the Christians. In the following year Saladin died at Damascus on 3d March. Saladin was not a mere soldier; his wise administration left traces which endured for centuries, in the citadel of Cairo, and in sundry canals, dikes, and roads. His opponents frankly attribute to him the noble qualities of chivalry, invincible courage, inviolable fidelity to treaties, greatness of soul, piety, justice, and moderation. The chivalrous side of his character has been well caught by Scott in *The Talisman*. The Ayubite dynasty ruled over Syria till 1259, when it was dispossessed by the Perso-Mongols, and over Egypt till the rise of the first Mameluke kingdom in 1250. See Reinaud's *Notice sur la Vie de Saladin* (1874).

Salamanca, a city of Spain, stands on and between four low hills beside the river Tormes, 110 miles NW. of Madrid. From the middle of the 13th to the close of the 17th century it was the seat of one of the most celebrated universities in Europe. Founded in 1243, this great school won renown at first for the teaching of civil and canon law; later theology became an important faculty. In the 16th century there were here from 6000 to 8000 students, amongst them the members of an Irish College; at the present day there are not more than 400. The university buildings date chiefly from the 15th century, and are Gothic in style. In Salamanca's palmy days her population reached 50,000, and the university counted more than a score of colleges. The library, founded in 1254, contains 70,500 vols. and 870 MSS. The city is still surrounded with walls, pierced by ten gates, and preserves very much of its mediæval appearance, its houses, convents, and churches, its streets and squares having altered but little since the university began to decline. The river is crossed by a bridge of twenty-seven arches, in part of Roman construction. The great square is the largest perhaps in Spain; it is surrounded by an arcade, and has on one side the municipal buildings. It was used for bull-fights, and can hold 20,000 spectators. The city possesses two cathedrals; the old cathedral, cruciform in shape, late Romanesque in style, and dating from the 12th century, is richly decorated with paintings and monuments; the new cathedral (1513-1734) is a florid Gothic pile, also richly decorated. Amongst the remaining noteworthy buildings are the Jesuit College (1614), Renaissance in style; the Old College, now the governor's palace; the convents of the Dominicans and the Augustinians, the churches of which are both elaborately ornamented. In the middle ages Salamanca was famous for its leather-work; at the present day it has not much industry, save a little manufacture of cloth, linen, leather, and pottery. Pop. (1886) 17,155. The town was captured by Hannibal in 222 B.C. The Moors were expelled from its walls in 1055. During the Peninsular war it was taken by the French (1812), who committed great destruction in one of its quarters, and in the vicinity Wellington defeated Marmont on 22d July 1812.—The *province*, which produces a good deal of wool, has an area of 4940 sq. m. and a pop (1887) of 314,424.

Salamander (*Salamandra*), a genus of tailed Amphibians, nearly related to the newts (Molge, &c.). The salamanders are born in the water, but in adult life mostly live on land. In early life they breathe by gills, but these disappear, the adults breathing entirely by lungs. They feed on worms, slugs, snails, insects, and other small animals. In habit they are somewhat sluggish, shy, and stupid. The Spotted Land Salamander (*S. maculosa*) is very common in Europe and in North Africa. It is six to eight inches in length, and is conspicuous with bright yellow patches on a blackish background. Its skin is very glandular, and is usually covered with a moist secretion. The Black Salamander (*S. atra*) lives on the Alps, and is viviparous. There are no British species. The four genera included in the family Salamandridæ—of which the salamander is type—are confined to the Old World. Though the salamanders are quite harmless, they have long had, and still retain, a popular reputation of extreme venomousness, and are therefore much dreaded. Strange fables have been current concerning them from remote ages, particularly concerning the icy cold (a reference perhaps to the moist secretion) which envelops their body, and enables them not only to endure fire without burning, but to extinguish fire. Pliny refers to this belief, but very dubiously (*Nat. Hist.* x. 86 and xxix. 23); and so recently as 1716 the *Philosophical Transactions* recorded how a salamander, being cast 'into the fire, thereupon swelled presently, and then vomited store of thick slimy matter, which did put out the neighbouring coals.' Cellini, it will be remembered, was beaten as a boy by his father to make him remember he had seen a salamander in the fire.

The Spotted Salamander (*Salamandra maculosa*).

Sal'amis (now *Koluri*), an irregularly-shaped, mountainous island of Greece, off the coast of Attica, and forming with it the Bay of Eleusis. Close to the southern promontory lies the long narrow island of Psyttalia. Its area is about 35 sq. m., and it has a population of over 4500, the chief town being the port of Koluri, on the west coast, itself with more than 3500 inhabitants. In ancient times its two principal towns, Old and New Salamis, lay, the former on the south, the latter on the north-east coast. Salamis was an independent state till about 620 B.C., when it fell, first to Megar, next to Athens through the policy of Solon. Its name is ever memorable from the great naval battle between the Greeks and Persians, fought (480 B.C.) a few days after the battle of Thermopylæ, in the narrow strait between the east coast of Salamis and the west coast of Attica. The Greek fleet of 366 triremes was drawn up at the entrance of the bay forming the harbour of New Salamis, the Athenian contingent under Themistocles, the Corinthian under Adimantus, while the Spartan Eurybiades commanded the whole. Great dissensions prevailed among the Greek leaders, which would probably have led to a general break-up had not Themistocles by a stratagem induced Xerxes, king of the Persians, to bring up his fleet, and give immediate battle to the Greeks. Xerxes drew up his ships, numbering 1200 triremes and 3000 smaller vessels, during the night previous to the battle, opposite the Greek fleet, along the coast of Attica, almost completely blocking up both entrances to the straits; and confident of victory he took his seat on a throne erected on a lofty height on the Attic coast, almost opposite New Salamis. Both Greeks and Persians fought with great bravery, but the latter were entirely defeated, their unwieldy fleet losing all advantage of numbers in the narrow space. Both the order and incidents of the battle are obscure, but the issue is clear enough. The loss of the Greeks is said to have been 40, and that of the Persians 200 ships, exclusive of those which were captured.

Sal Ammoniac, known also as Chloride of Ammonium, and sometimes as Hydrochlorate of Ammonia, is used in medicine and in chemistry to a considerable extent. It is obtained from the ammoniacal liquor of the gas-works by adding hydrochloric acid and then subliming it in iron pots, or by adding sulphuric acid and then subliming the ammonium sulphate with sodium chloride in the same way; on a small scale it may be made by adding hydrochloric acid to solution of ammonia. It occurs in colourless, odourless, translucent fibrous masses, with an acrid saline taste, and soluble in water. It is used as an expectorant in chronic bronchitis and pneumonia, as a diuretic, diaphoretic, and alterative in rheumatism, and as an alterative in neuralgia; it is also given in catarrhal conditions of the gastro-intestinal tract and in various hepatic diseases. While being dissolved in water it greatly lowers the temperature, and hence in solution can be used as a refrigerant. The dose is 5 to 20 grains given in solution. In chemistry it is largely used as a test. See AMMONIA.

Salangane. See EDIBLE BIRDS'-NEST.

Salar Jung. See JUNG.

Salband, name given by miners to the band of altered rock or other material which often separates the contents of a mineral vein or lode from the rock-mass which the vein traverses. *Selvage* and *Flucan* are terms used in the same sense.

Saldanha Bay. See CAPE COLONY.

Saldanha Oliviera e Daun, JOÃO CARLOS, DUKE OF, Portuguese statesman and marshal, was born on 17th November 1790, a grandson of the 'Great Marquis,' Pombal, and great-grandson of the Austrian Marshal Daun. He was educated at Lisbon and entered the army. When the French invaded Portugal he took the patriotic side, and fought with distinction at Busaco, San Sebastian, Nive, &c. From 1817 to 1822 he was in South America, and took a leading part in the struggle between Brazil and Montevideo, after the capture of which last town he was nominated viceroy of the province. When, however, Brazil declared herself independent of Portugal, Saldanha returned to Lisbon, and in 1825 was appointed governor of Oporto. A moderate constitutionalist, he took the part of Dom Pedro against Dom Miguel (see Portugal), helping to defend Oporto in 1833, beating off repeated attacks upon Lisbon (for which he was created marshal), gaining the victories of Pernes and Almoster, taking Leiria and Santarem, and finally forcing Miguel to sign the convention of Evora Monte (26th May 1834) and leave Portugal. During 1836-46 the extreme democratic party were in power and Saldanha lived partly in exile, partly in retirement, partly employed on diplomatic and other public business abroad. Meanwhile Portugal was in a most unsettled and disorderly state. Saldanha returned home in 1846; and from that time down to 1856 was alternately at the head of the government (1847-49, 1851-56), being supported chiefly by England, and in armed opposition to his political opponents. During the reign of Pedro II. he held no great office of state, and under King Louis was kept abroad as ambassador at Rome and London, except that he was prime-minister for some months in 1870. He died in London, 28th November 1876. He had been created a duke in 1846. The highly eulogistic *Memoirs*, by Count da Carnota (Lond. 1880), must be read with caution.

Sale is an exchange of land or goods for money. *Sale of Land.*—The 3d section of the Statute of Frauds (29 Car. II. chap. 2) requires contracts for the sale of land to be in writing, signed by the party to be charged therewith. Such a contract, even when those conditions are not complied with, will be specifically enforced, when it has been part performed by the party seeking relief. Such part performance, according to the phrase, takes the case out of the statute. Certain conditions of sale are usually put forth on the part of the vendor, and under them the sale is conducted. The purchaser is supplied with an abstract of title going back for forty years. Then the deeds conveying the estate are prepared and signed, the money is handed over, and the purchase completed. Before this, however, the purchaser is entitled to the estate and the vendor to the purchase-money, but the vendor has a lien for the unpaid price. The Real Property Limitation Act, 1874, gives, in the absence of fraud, a person who has held real property undisturbed for twelve years an indefeasible title thereto. The method of sale is somewhat different according as the land is freehold, leasehold, or copyhold—i.e. forming part of a manor. In the last case the copyholder surrenders the land into the hands of his lord, who thereupon admits the alienee. If the property is in Middlesex, or Yorkshire, or Kingston-upon-Hull, the conveyance is registered, and instruments dealing with the same subjects rank according to date of registration. Recent acts give power to limited owners (as tenants for life, &c.) to sell the land they occupy; but they must act under the sanction of the court, and apply the purchase-money as directed. In Scotland no contract for the sale of land is binding without writing. There is no copyhold, and leasehold is rare. There is a very perfect system of registration.

Sale of Goods.—By the 17th section of the Statute of Frauds no contract for sale of goods of the price of £10 or upward is valid unless the buyer receive and accept part of the goods sold, or pay part of the price, or the agreement be reduced to writing and signed by the parties. The title of buyer is no better than that of a seller, so that, e.g., if you purchase a watch from a man not its owner, the true owner can make you deliver it up without compensation. But there are some exceptions: thus, an agent under the Factors Acts, who may sometimes give a buyer a better title than he has himself; also goods bought in market overt become the absolute property of the purchaser, with the undernoted exception. In London every shop on a week-day is a market overt; elsewhere, only a market held at a regular time and place. The sale of horses is regulated by certain special provisions, chiefly contained in a statute of Philip and Mary. Even if goods be sold in market overt, on the subsequent conviction of the thief the property will revert to the true owner. On sale the duty of the seller is to deliver the goods, but not to send or convey them. The buyer is bound to accept and pay for what he has ordered. *Caveat emptor*, by which words is meant that the buyer takes an article at his own risk, is the rule, but a good many exceptions are admitted. The seller has a lien on the goods as long as the purchase-money is unpaid, and in case of the buyer's insolvency he may stop them in transit. In Scotland the chief theoretical point of difference is that, whilst in England the completion of the contract of sale vests the property of the goods in the buyer, in Scotland he has only a right to demand their delivery; but owing to various statutory provisions the difference is not of much practical importance. Also, the contract may be entirely verbal, and the doctrine of sales in market overt is not recognised. Among many books on the subject of sale that of Benjamin (4th ed. 1888) is the most complete. See also Bill of Sale, Contract, Warranty.

In the United States the sale of land is simplified by registration, but the law is based on that of England. So also with the sale of goods; only the law as to market overt is not recognised in the States, nor is warranty of title carried so far as in England.

Sale, George, an eminent oriental scholar, was born in Kent about 1690, educated at the King's School, Canterbury, and bred to the law. He assisted in getting up the *Universal History*—together with Swinton, Shelvocke, Campbell, George Psalmanazar, and A. Bower—for which he wrote the cosmogony and several portions of oriental history. He was also one of the authors of the *General Dictionary*; but he is best known by his unrivalled translation of the Koran, 'with explanatory notes taken from the most approved commentators, to which is prefixed a preliminary discourse' (1734). This translation, with its learned preliminary discourse, formed a new epoch in the study of Islam and its literature (see Koran; and Wherry's *Comprehensive Commentary on the Qurán, comprising Sale's Translation*, 1882-86). That his contemporaries fastened the charge of heresy upon one who spoke philosophically and humanely of other creeds is not to be wondered at. He died 14th November 1736. After his death a catalogue of his oriental MSS. was published, and they are now in the Bodleian Library, Oxford.

Sale, Sir Robert Henry, British soldier, was born in 1782, the son of an officer in the army of the East India Company, and himself in 1795 joined the colours as ensign. He saw a great deal of fighting; he was present at the storming of Seringapatam (1799) and of Travancore (1809), assisted at the capture of Mauritius (1810), and fought throughout the Burmese war of 1824-25. In this war he took part in the capture of Rangoon and in the storming of Bassein, and distinguished himself in the assault on the lines of Prome, where he was wounded. When war was declared against Afghanistan in 1838 'Fighting Bob,' as Sale was called, was given the command of the first brigade in the Bengal division of the invading army. He greatly distinguished himself at the assault and capture of Ghazni, being again wounded. In the autumn of 1840 he was despatched to punish certain hostile chiefs in Kohistan and to keep a close watch upon the restless movements of the usurper Dost Mohammed, who was looking for an opportunity to strike a blow at Kabul. When the evacuation of Afghanistan was decided upon Sale's was the first brigade to set off back to India; but it had to fight its way through all the passes—the Coord Kabul, Tezen, Jagdalak—that lie between Kabul and Jellalabad. In this last fortress he was closely invested from 12th November 1841 to 7th April 1842; but in numerous sorties, and even in a general engagement (Tezen), he defeated the forces of Akhbar Khan (son of Dost Mohammed). He was at length relieved by General Pollock, who commanded the army sent to punish the Afghans for their treacherous slaughter of General Elphinstone's force in the defiles, and with him took part in the recapture of Kabul and the events that followed it. Sale was killed, his thigh being shattered by grape-shot, at the battle of Mudki, fighting against the Sikhs, on 18th December 1845. See Gleig, *Sale's Brigade in Afghanistan* (1846). His wife, Lady Sale, who was captured by the Afghans during Elphinstone's retreat, and kept prisoner by them until the arrival of Pollock's army, wrote a *Journal of the Disasters in Afghanistan* (1843).

Salem, a town in the south of India, 120 miles by rail SW. of Madras, stands in a pretty position in a valley backed by hills, and is a clean though straggling place, with extensive cotton manufactures and much general trade. Pop. (1881) 50,667; (1891) 67,750.

Salem, (1) a city and port of entry of Massachusetts, on a peninsula in Massachusetts Bay, 16 miles by rail N. by E. of Boston. It has a good harbour, from which was formerly carried on a large trade with China, the East Indies, Africa, and South America; but now only a coast trade in ice and coal remains. Principal institutions of Salem are the East India Marine Society, its collections now united with those of the Peabody Academy of Science (which possesses a noble collection of Japanese pottery), the Essex Institute, and the Salem Athenæum, the last two housed in Plummer Hall. The manufactures include cottons, jute, leather, shoes, iron castings, lead pipes, &c. Salem was settled in 1626. In 1692 the great witchcraft delusion broke out, during which nineteen persons were hanged (including one clergyman) and one pressed to death. Nathaniel Hawthorne and Prescott the historian were born here. Pop. (1880) 27,563; (1890) 30,801.—(2) Capital of Salem county, New Jersey, on Salem Creek, 3½ miles from its entrance into the Delaware and 36 miles by rail SSW. of Camden. It has manufactories of glass, flour, oil-cloth, carriages, besides a foundry, planing-mills, and a number of fruit-canneries. It was founded in 1675. Pop. (1890) 5512.—(3) Capital of Oregon, on the east bank of the Willamette River (here crossed by a wagon-bridge), 52 miles by rail S. by W. of Portland and 720 N. of San Francisco. Settled in 1834 and incorporated in 1853, it became state capital in 1860. The streets are wide and regular. Here are the state capitol, prison, and insane asylum, and schools for the blind and deaf and dumb, besides the Willamette University (Methodist Episcopal, 1851), and several manufactories. Pop. (1880) 2538; (1890) 4515.

Salemi, a town in the west of Sicily, 39 miles SW. of Palermo. Pop. 11,512.

Salep. See ORCHIDS, Vol. VII. p. 627.

Salerno (anc. *Salernum*), a city of Southern Italy, on the gulf of the same name, 33 miles by rail SE. of Naples, with a pop. of 22,328. A hill behind the town is crowned by an old Norman castle. The beautiful Gothic cathedral of St Matthew (whose bones were brought from Pæstum in 954) was erected by the Normans (1076-84), and has in front of it a quadrangle of porphyry and granite pillars and inside it monuments of Gregory VII. and Margaret of Durazzo. One of its doors is of bronze, Byzantine work. The city was celebrated in the middle ages for its university (founded in 1150, closed in 1817), but especially for its school of medicine (*Schola Salernitana*), which was long the first in Europe (see Vol. VII. p. 117). In the neighbourhood are the ruins of Pæstum (q.v.). There are a couple of small harbours. Cotton is spun. Originally a Roman colony (194 B.C.), Salerno figures little in history until after it was taken by Robert Guiscard, who made it his capital. But the removal of the Norman court to Palermo and the sack of the city by the Emperor Henry VI. struck serious blows at its prosperity, and a third came from the decay of the medical school in the 14th century.

The *Gulf of Salerno* is a nearly semicircular indentation, separated from the Bay of Naples by the promontory ending in Point Campanella. On its shores stand Amalfi and Salerno.

Sales, FRANCIS DE. See FRANCIS OF SALES.

Salette, LA, an Alpine village of France, dept. Isère, 28 miles SSE. of Grenoble. Here on 19th September 1846 the Virgin is alleged to have appeared to two peasant children; from that time the spot was visited annually by thousands of pilgrims. In 1852-61 a pilgrimage church was built, in the Romanesque style, at an elevation of 5920 feet. The alleged appearance of the Virgin was, however, discredited by Pope Leo XIII. in 1879. Pop. 607.

Saleyer, a group of islands lying off the south-west extremity of Celebes, in the East Indies, consists of the principal island (area, 170 sq. m.; pop. 20,000) and several small ones (their united area 130 sq. m. and pop. 10,000), and is governed by native chiefs who pay tribute to the Netherlands East India government. Principal exports, cotton, trepang, cocoa-nuts, tortoiseshell, salt, and tobacco. The people, of mixed Malay race, are professedly Mohammedans.

Salford. See MANCHESTER.

Salicin, $C_{13}H_{18}O_7$, is a crystalline glucoside obtained from the bark of the *Salix alba* and other species of Salix (Willows), and also from the bark of several species of Populus (Poplars). It occurs in small white crystals, without smell, but having a very bitter taste; is soluble in 28 parts of cold water, in 1 part of boiling water, and in 60 parts of rectified spirit. When treated with strong sulphuric acid it dissolves with a bright red colour; being a glucoside it is readily decomposed by suitable chemical agencies into glucose (grape-sugar) and saligenin. Saligenin can be easily oxidised to form salicylic acid. It is used to a considerable extent in medicine. Its action and uses when given internally are much the same as those of Salicylic Acid (q.v.), but it is less powerful, is not so depressant, and does not disturb digestion so much.

Being a bitter, it promotes appetite and digestion, and therefore has a certain amount of tonic effect. Its dose is 5 to 30 grains.

Salic Law, a collection of the popular laws of the Salic or Salian Franks (see FRANKS), purporting to have been committed to writing in the 5th century, while the people were yet heathens. There exists several Latin texts of this code, and considerable obscurity rests over its history. It relates principally to the compensation and punishment of crimes, and there is a chapter containing provisions regarding the succession to what are called Salic Lands, which seems to have been inserted at a later date. Although the Frankish law did not in general exclude females, the succession to these salic lands, whatever they were, was confined to males, probably from the importance of securing the military service of the chief proprietors. It was but a doubtful analogy that led the rule of succession to Salic lands to be extended to the succession to the French crown, and it seems to have been only in the 14th century that the exclusion of females from the throne became an established principle. The accession of Philip the Long was probably the first occasion on which it received public sanction, and the fact that Edward III. rested his claim on female succession doubtless led to that instance being regarded as an unquestionable precedent. See *Lex Salica, the Ten Texts with the Glosses*, edited by Hessels (1880).

Salicylic Acid, $C_7H_6O_3$, was originally obtained from Salicin (q.v.), but is now made on a large scale from carbolic acid, to which it is very closely allied chemically. It may also be obtained from oil of wintergreen or oil of sweet birch, which consist mainly of salicylate of methyl. It occurs in small white crystals, slightly soluble in cold water; it has no smell, but is very irritating to the nostrils, and causes sneezing; its taste is sweetish and acid. Salicylic acid is used externally as an antiseptic, and as an application in some skin diseases.

For internal use the SALICYLATE OF SODIUM is preferred, as it is much less irritating to the stomach. It occurs in small white crystals, has a sweetish taste, and is very soluble in water. It is used very largely in acute rheumatism, and controls this disease much more speedily and thoroughly than any other drug. It is of less value in chronic rheumatism. It is also employed as an antipyretic, and has been given with some advantage in gout and in diabetes. It is depressant to the heart, and if given in too large doses may induce marked disturbance of the central nervous system, characterised by buzzing in the ears, deafness, and disturbances of vision. More severe results have been noted, but they are very rare. The dose is 10 to 30 grains.

Salina, capital of Saline county, Kansas, on the Smoky Hill River, 186 miles by rail W. by S. of Kansas City. Salt and gypsum are obtained near by, and the city has flour-mills and grain-elevators. Pop. (1870) 918; (1890) 6031.

Salina Formation, name given in North America to one of the subdivisions of the Silurian system, which appears to be equivalent to the lower portion of the Ludlow rocks of the British series. See SILURIAN SYSTEM.

Saline is a term applied to a very popular effervescent powder used as a gentle aperient. It is sold under all kinds of fancy titles, but essentially consists of a mixture of bicarbonate of soda, sugar, and tartaric acid, with a minute trace of Epsom salts or chlorate of potash.

Saline Plants. Those plants which grow on or near the seashore, in the water of the sea or of salt lakes, or on the beds of dried-up lakes, and which are therefore used to a supply of salt which is above the average in amount, and which therefore become to a certain extent modified in form and function, may if we choose be called saline plants, but the term is of no particular value. Few of them are strictly aquatic plants, except the marine Algæ, or Seaweeds, which grow immersed in salt water, either always or in certain states of the tide, and derive their nourishment from it through their fronds, and not by roots from the rock to which they are attached. Grasswrack (q.v.), however, is an instance of a phanerogamous plant living entirely and always immersed in salt water. Other phanerogamous plants grow chiefly or only on the seashore and in salt marshes. Some of these, however, as the sea-kale, may be cultivated in gardens remote from the sea, but they succeed best when liberally supplied with salt. Asparagus is another well-known garden-plant which derives much benefit from similar treatment. Some of the Saltworts (q.v.) and other saline plants yield much soda when collected and burned, and the produce was at one time largely imported into Britain from Spain and other countries under the name of Barilla (q.v.). The dry steppes of Russia and Tartary, having in many places a strongly saline soil, are covered with a very peculiar vegetation. Among the ornaments of these steppes is *Halimodendron argenteum*, a shrub of the natural order Leguminosæ, often cultivated in gardens for its beautiful rose-coloured flowers and silvery gray leaves. Saline plants have their whole tissues impregnated with salt.

Salins (anc. *Salinæ*), a town of the French dept. of Jura, 22 miles S. by W. of Besançon, has valuable salt-springs, which supply baths for visitors and yield salt. Pop. 5252.

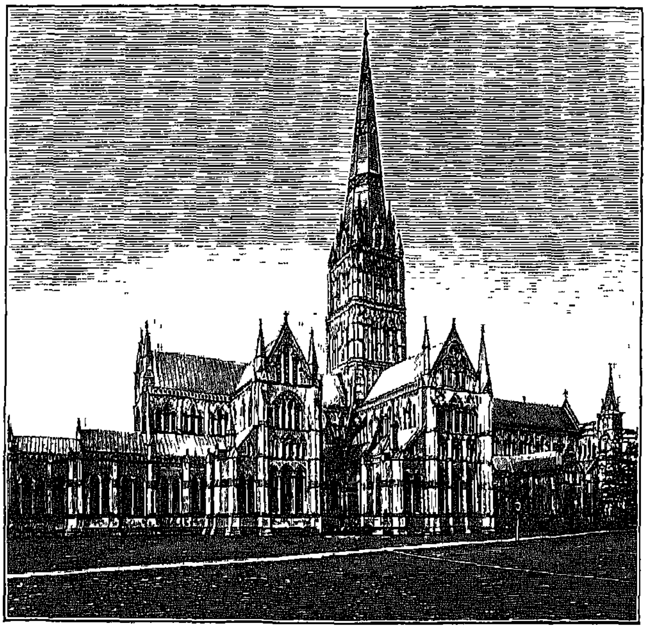
Salisbury (New Sarum) and **Old Sarum.** Old Sarum (*Sorbiodunum*) stood about a mile north of the present city of Salisbury. It now consists of a bare conical hill encircled with entrenchments, with a central mound—from Roman times a castle and a place of much importance. Here Canute died, and here William the Conqueror assembled the barons to renew their oath of fealty. In 1075 Bishop Herman removed the bishopric of the united sees of Ramsbury and Sherborne to Old Sarum, and began a cathedral, which was finished by his successor St Osmund, who established a chapter of secular canons and compiled the *Use of Sarum*, which was adopted throughout the greater part of England. The foundations of Old Sarum Cathedral are still to be traced in very dry seasons. It was in the form of a cross, 270 feet long by 70 feet wide, with a transept of 150 feet. Old Sarum returned two members to parliament until the passing of the Reform Bill, although at that time there had for many years been no inhabitants. Service was daily performed in a chapel until the Reformation, after which the place was entirely deserted. The desertion of Old Sarum and the foundation of Salisbury or New Sarum were due to the removal of the cathedral from the former place to the latter. The reasons for the change were the frequent disputes and collisions between the authorities of the castle and the cathedral, the exposed position of Old Sarum (the noise of the winds often drowning the voices of the officiating priests), and the want of water.

Salisbury or New Sarum is a cathedral city, the capital of Wiltshire, and a parliamentary and municipal borough. It stands in a valley near the confluence of the rivers Avon, Bourne, Wily, and Nadder, 84 miles WSW. of London. The plan of the city is very regular, it having been laid out as a whole at its foundation in rectangular plots. Water originally ran through most of the streets, but the streams were covered over after the visitation of the cholera in 1849. The removal from Old Sarum took place in 1220, when the foundations of the new cathedral (B.V.M.) were laid. The Lady Chapel was consecrated in 1225, and the whole building, after being rehallowed in 1258, finally dedicated in 1260. The cathedral consists of a nave of ten bays, choir, and Lady Chapel, with two aisles, and two transepts, each having a single aisle towards the east, the ground-plan being in the form of a double cross. The whole building is a perfect example of pure Early English style. The cloisters and the chapter-house were built about 1270, and the tower (Decorated) and the spire added about 1330. The spire is the highest in England (400 feet). It formed no part of the original design, and the effect of the addition became apparent in a dangerous settlement which took place within 100 years of its erection. Owing to this the spire leans 27½ inches towards the south. The cathedral suffered from a disastrous 'restoration' at the hands of James Wyatt (1782–91), when two 15th-century chapels, built by Bishop Beauchamp and Lord Hungerford, and two porches were destroyed, much painted glass removed, the tombs rearranged, and a lofty campanile standing apart from the cathedral pulled down. Much of the damage then done has been repaired in the restoration begun in 1863 under Sir Gilbert Scott, and continued under Mr Street and Sir Arthur Blomfield. There is a curious muniment-room over the vestry containing a copy of the Magna Charta of King John, said to be that handed to Longespée, Earl of Salisbury, who was one of his witnesses. The library, built about 1450, is over the east side of the cloisters, and contains about 5000 volumes and many valuable MSS. The outside measurements of the cathedral are: length 473 feet, width 111 feet; the height of the nave and choir inside is 81 feet. The cathedral stands apart from any other building in the midst of a beautiful Close of about half a square mile in extent, encircled by a wall, within which stand the Bishop's Palace, an irregular building begun by Bishop Richard Poore (*circa* 1220) and added to by many of his successors, the deanery and canons' houses, and many other picturesque buildings.

The parish churches are St Martin's, St Thomas of Canterbury, a handsome Perpendicular building of the 15th century, and St Edmund of Canterbury, formerly a collegiate church of secular canons.

The other most notable buildings are the council-house, where the assizes are held; the county hall; the infirmary; the 'Hall of John Hall' and Audley House, now the church-house of the diocese, two fine examples of 15th-century domestic architecture; the old George Inn (now a shop), where Pepys stayed; St Nicholas' Hospital; the market-house; the poultry-cross; and the Blackmore Museum, which contains one of the finest collections of prehistoric antiquities in England, the collection from America being probably unrivalled anywhere.

The market-place is spacious and planted with trees, and contains statues of the late Lord Herbert of Lea (Sidney Herbert) and Professor Fawcett, who was a native of the city. Here the Duke of Buckingham was beheaded in 1483 when Salisbury was the headquarters of Richard III. There are many charities and almshouses, and an endowed school for the choristers of the cathedral. The city chiefly depends upon its agricultural trade, the former manufactures of cutlery and woollens being extinct. Salisbury returns one member to parliament. Pop. (1851) 11,657; (1881) 14,792; (1891) 17,362.



Salisbury Cathedral, from the north-east.

John of Salisbury was the confidential adviser of Becket, and, sharing his exile, became (1176) bishop of Chartres. He wrote a Life of Becket, and a work, *Polycraticus*, in which he lashes the vices of the court. He died 1180.—Margaret, Countess of Salisbury, was the mother of Cardinal Pole (q.v.).—The most notable bishops of Old Sarum were St Osmund and Bishop Roger; of New Sarum, Hallam (whose death at the Council of Constance, 1417, is regarded by Dean Milman as fatal to many really effective reforms in the church), Cardinal Campeggio, Jewell, Seth Ward (a founder of the Royal Society), Burnet, Hoadley, Sherlock, Douglas, Burgess, Denison, Hamilton, and Moberly. Fox the martyrologist, Hooker, Fuller, Pearson, Isaac Barrow, Joseph Butler, and Liddon have been canons of the cathedral, where George Herbert was a frequent worshipper. Among distinguished natives and residents have been Massinger, William and Henry Lawes, Chiffinch (the chief agent in the intrigues of Charles II.), Harris the philologist, Chubb 'the Deist,' and Henry Fawcett. Fielding resided at one time in the Close, and Joseph Addison was educated at the grammar-school.

See Hatcher's *History of Old and New Sarum*, Britton's *Salisbury Cathedral*, Price's *Salisbury Cathedral*, Dodsworth's *Salisbury Cathedral*, Jones's *Fasti Ecclesiæ Sarisberiensis*.

Salisbury Plain, in south Wiltshire, an undulating tract of chalky down affording splendid pasture for sheep. There are rich valleys well timbered, but the high-lying land is too poor to repay cultivation. There are many ancient mounds and barrows, and in the midst of the plain stands Stonehenge (q.v.). Salisbury Plain is one of the few places in England where the ancient sport of hawking is still pursued.

Salisbury, Marquis of. Robert Arthur Talbot Gascoyne-Cecil, third Marquis of Salisbury, was born at Hatfield House on the 13th of February 1830. The famous name Cecil is said to have been Sitsilt originally: a certain Robert Sitsilt, who served in the Welsh wars of Rufus' time, is believed by the family to have been its founder. It is more distinctly traceable to David Cyssell, of Stamford, who was sheriff of Northamptonshire in the reign of Henry VII. David's eldest son found a place at court as one of Henry VIII.'s pages, and after returning to private life became sheriff of Rutland. His dwelling was at Burghley, near Stamford (q.v.); and here his son was born (his eldest son) who served England and Elizabeth so wisely for forty years. This statesman, Lord Burghley (q.v.), had two sons, one by his first wife, a daughter of Sir John Cheke, the other by his marriage with a daughter of Sir Anthony Cooke. The eldest was made Earl of Exeter, and from him the present Marquis of Exeter descends. The younger son was the famous Robert Cecil, whose great services to James I., and to the state, were rewarded within two years by three steps in the peerage. In 1603 he became Lord Cecil of Essendine, in 1604 Viscount Cranborne, and in 1605 Earl of Salisbury. The marquis is directly descended from the first Earl of Salisbury, and inherits Hatfield (q.v.) from him. As Lord Robert Cecil he proceeded from Eton to Christ Church, Oxford, in 1847. Two years afterwards he took the B.A. degree with an honorary fourth-class in mathematics. He shared in the Union Society's debates, always as distinctly Conservative, and yet more distinctly as a churchman. He was treasurer of the Union Society in his time, and gave great satisfaction in that office. His Oxford life over, Lord Robert Cecil went forth on a round of travel, extending to Australasia. On his return he was elected a Fellow of All Souls College, Oxford, and very soon afterwards entered the House of Commons, at the age of twenty-three being returned for Stamford. His address to the electors declared him a Conservative, warmly attached to the Church of England, eager to associate religion with education, and anxious for social and sanitary improvements—for the good of the poor particularly. He took his seat in the House of Commons when that assembly met in February 1854; and his first speech therein (on university reform) was delivered in the April following. A year afterwards he made his first foreign-affairs speech—on the terms of peace that should be imposed on Russia (Crimean war). He came further into notice when, on a motion condemning the conduct of the Aberdeen administration as 'the first and chief cause of the calamities that befell' our soldiery in the Crimea, he seconded General Peel in moving 'the previous question.' He took a busy part in the domestic reforms of 1856.

In 1857 Lord Robert Cecil launched his first legislative proposal, which was that parliamentary electors should be enabled to record their votes by means of voting papers, filled in before a justice of the peace; a proposal of particular service at county and university elections. In 1858 he opposed the abolition of church-rates in a speech which further advanced him in the estimation of his party; and he again distinguished himself in supporting a motion of Mr Gladstone's backing up the plan of uniting Moldavia and Wallachia. The Conservatives were now in office, and their leaders resolved to take up the question of Parliamentary Reform. In 1859 Mr Disraeli introduced his Reform Bill of 'fancy franchises,' Lord Robert Cecil supporting it by arguments which he had set forth in the 'Oxford Essays' for 1858. The bill upset the government. When, in the time of its successors, the paper-duties question threw the two Houses into conflict, and when Mr Gladstone paralysed the opposition of the House of Lords by including the abolition of the duties in one single Budget Bill, Lord Robert Cecil opposed the novel device with extraordinary vigour and acerbity. It was now seen that he had all the gifts that carry a man from the back seats of the House of Commons to the most honourable positions on 'the front bench.' From this time forth Lord Robert Cecil became a frequent speaker; facile on many subjects, studious of all that he dealt with, pugnacious, vigorous, often brilliant, and remarkable for a rather unfortunate kind of sarcasm. In debates on pauperism, on army organisation, on civil service reform, on finance he was heard to considerable effect in those years; but he never spoke more warmly, or with more obvious personal interest, than in defence of the church or when popular education was discussed. Foreign affairs engaged his attention hardly less, as was seen, for example, when the German attack on Denmark, and the conduct of Lord Palmerston's government in relation thereto, was brought before the House of Commons by Mr Disraeli.

The years 1865 and 1866 were important in the history of Lord Salisbury. On the 14th of June in the first-named year he became Viscount Cranborne and heir to the marquisate by the death of his elder brother; in July of the following year he was admitted to the cabinet under Lord Derby's administration as Secretary of State for India. In 1865 parliament had been dissolved, and Lord Palmerston had been confirmed in office by the constituencies; but within three months afterwards (October 18) Palmerston was dead. Thereupon Mr Gladstone took the leadership of the House of Commons and virtually of the cabinet; the Reform question was revived, and a bill brought in of which Lord Cranborne was one of the most effective opponents. One of his speeches (on an amendment by Earl Grosvenor) is an epitome of some of the strongest objections of Conservatism to such an extension of the franchise as was soon afterwards carried by Mr Disraeli. Mr Gladstone's Reform Bill was defeated; and when on the resignation of the government Lord Derby took office, Lord Cranborne was made Secretary for India. It is asserted by many and denied by none that to this office Lord Cranborne brought good business habits and a remarkably prompt apprehension of detail. But he was not to hold it long. The Reform agitation continued, and Lord Derby and Mr Disraeli resolved upon one of those measures called 'dishing.' The first business of the new Tory government was to concoct a Reform Bill. Discontent with its provisions compelled Lord Cranborne, Lord Carnarvon, and General Peel to resign their offices. The bill was proceeded with when, quitting his place on the Treasury bench for a seat below the gangway, Lord Cranborne fought against the measure with extreme pertinacity and vigour; we should add, with honourable consistency. His unsparing invective on this occasion did not improve his relations with Mr Disraeli, which were never rooted in personal friendship at any time.

When, in the spring of 1868, Mr Gladstone moved for the disestablishment and disendowment of the Irish Church his strongest opponent was Lord Cranborne. The last speech he ever made in the House of Commons was addressed to this subject. On the 12th of April 1868 he became Marquis of Salisbury, and his first work in the House of Lords was still to defend the church. After speaking against anti-ritual legislation, he had again to deal with the disestablishment question.

This he did with his accustomed vigour, prophesying that the disestablishment of the Irish Church would have no such effect in dispelling Fenianism as Mr Gladstone anticipated. In 1868, the first year of Mr Gladstone's first administration, Lord Salisbury proposed to abolish the rule whereby bills are dropped when both Houses have not time to pass them in the same session; this proposal fell through. He supported Earl Russell's Life Peerages Bill (1868), which was rejected. Next year he was elected Chancellor of the University of Oxford. Meanwhile disaffection and outrage in Ireland went on, and when in 1870 the government framed a strong Peace Preservation Bill, Lord Salisbury (who was now recognised as the leading Conservative in the House of Lords) supported it in a sub-sarcastic speech, the graver argument of which was conveyed in the following sentence: 'In this country you have long been content only to guide; in Ireland it is essential that you should govern.' The Irish Land Act of 1870 was less to his taste, but it passed without violent opposition. In the following year Mr Gladstone's action in abolishing the army purchase-system by royal warrant, when legislation for that purpose appeared difficult and tedious, called Lord Salisbury to the front. The bill for abolishing religious tests in the universities gave him more arduous employment in criticism and amendment, chiefly addressed to the maintenance of religious instruction.

An important speech made at the time of the Franco-German war, recalling the obligations of Great Britain to maintain the independence of (exactly) half-a-dozen states, enhanced Lord Salisbury's reputation as a student of foreign affairs. As to home affairs this period of his career may be epitomised in the remark that he took an active part in expounding the errors of the government, which were gradually preparing for the defeat inflicted on it with the rejection of the Irish University Bill. Resignation ensued (March 1873); the Conservatives declined office; in January 1874 parliament was dissolved, and the Conservatives came in with a great majority.

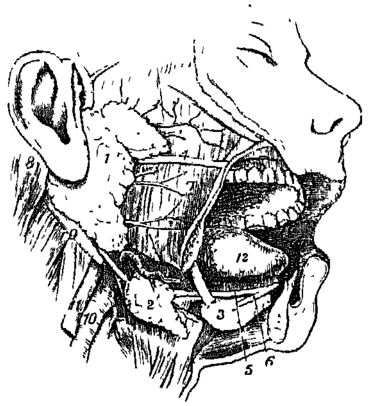
Whether Lord Salisbury would consent to serve with Mr Disraeli, whether Mr Disraeli would invite Lord Salisbury to join him, now became a question of the day. There was no love between them; but the one wished for a footing in the cabinet, and the other felt that his omission would be a danger; and so Lord Salisbury became Secretary for India a second time. It must suffice to say that in this post he gave unfailing proof of great administrative ability. Before the end of the year Lord Salisbury had again come into collision with his chief. He hotly opposed the Public Worship Regulation Act (a government measure); and Mr Disraeli replied to him very tartly in a speech remembered by the words, 'He is not a man who measures his phrases; he is a great master of gibes, and flouts, and jeers.' But the rupture which neither man could afford was avoided. Lord Salisbury now took a very active interest in university reform, but he was soon called to more bustling employments. The Eastern Question was reopened; Turkey was at war with Servia and Montenegro; the Bulgarian atrocities were made known; and to stay the mischief a conference of the European Powers was held at Constantinople. Lord Salisbury was chosen as envoy from Great Britain, and the choice was presently repented of in Downing Street. His conduct at Constantinople surprised not only the uninformed public, but his colleagues. Indeed he did not scruple to act against the whole spirit of his instructions, nor did he heed the remonstrances sent out to him from the Foreign Office. Thus did he come into direct collision with Lord Derby (then Foreign Secretary). But once placed in the position of envoy Lord Salisbury was practically beyond control: to recall him was of course impossible. Later, when the Turks were beaten down, and the treaty of San Stefano became known, there was so much disagreement in Lord Beaconsfield's cabinet that his own policies (wise or unwise) were paralysed. When Lord Derby's secession followed Lord Carnarvon's, Lord Salisbury became Foreign Secretary. Without the loss of a day he signalised the change by publishing a circular despatch so powerfully assertive of the British objections to the San Stefano Treaty that it electrified the public mind; but its glory was sadly dimmed when a famous secret agreement with Russia crept into the newspapers a little while afterwards. Russia being compelled (mainly by the resistance of the British government) to submit her peace treaty with Turkey to a congress of European Powers (held at Berlin), Lord Beaconsfield resolved to act for Great Britain himself, Lord Salisbury accompanying him to the German capital. This arrangement is not improbably explained by Lord Salisbury's too wilful conduct as envoy at Constantinople. The government had a troublous time in Afghanistan and South Africa after these events, Lord Salisbury taking an energetic part in repelling the opposition attacks that arose therefrom.

The 'Midlothian campaign,' in the winter of 1879, was followed by a dissolution of parliament in March of the following year, and that by a heavy defeat for the Conservatives. The worsening state of Ireland and the action and inaction of the Gladstone government in relation thereto, the abandonment of Kandahar, and the peace after Majuba Hill kept Lord Salisbury busy enough even before he succeeded to the leadership of the Conservative party on the death of Lord Beaconsfield. The Irish Land Act and its complete failure as a pacifying measure, the troubles with the Boers, the disturbances in Egypt, a new Reform Bill, the Redistribution of Seats Bill, the Soudan, Gordon's mission and his abandonment gave Lord Salisbury a busy time as opposition leader till the resignation of the government in June 1885. Lord Salisbury now became prime-minister and Secretary of State for Foreign Affairs, to the great advantage of the country in settling the 'Penjdeh incident,' which at one time brought us nearer to war than was publicly known. This was but a short-lived administration. Mr Gladstone returned to power, was wrecked in 1886 by his Home Rule Bill, and after a general election in that year Lord Salisbury again took office. He then desired to bring Lord Hartington into his government, and even offered to serve under Lord Hartington. The Liberal-Unionist leader declined official association, but the whole course of domestic legislation under a government which was no longer called Conservative, but Unionist, took a Radical turn immediately. Lord Salisbury has the credit of conducting the foreign affairs of the country with great success. What is best known about Lord Salisbury's foreign policy is the studied secrecy in which it is shrouded. In domestic affairs he seems to be persuaded that Radical measures are safest; partly because they serve to confirm the loyalty of the Liberal-Unionists, and partly because he thinks the times commend the policy of 'dishing'—so detestable to him in 1867. From the Government of London Bill to the Education Bill, all the legislation of the Salisbury government was of this character down to the close of the session of 1891; while the Irish legislation of that government (Land Purchase Bill) was undoubtedly founded on Mr Gladstone's Home Rule scheme.

Lord Salisbury is essentially a student; a man of robust thought, of high and scornful intellect; a recluse, to be relieved of the torment of association with inferior minds. A masterly and most impressive orator, he yet neglects the art of persuasion; and in speeches of which every word seems to have been well weighed and carefully chosen some startlingly injudicious sentence almost invariably breaks loose. His will is commonly believed to be as firm and well-knit as his speech. It must always be remembered that the difficulties of his task as Foreign Secretary are enormous, though they would probably be much lighter had he gained what no minister of his known intellectual capacity ever lacked so much in this country—popular liking. Lord Salisbury was married in 1857 to Georgiana, daughter of Sir Edward Alderson (a Baron of the Exchequer), and has had issue five sons and three daughters.

See F. S. Pulling, *Life and Speeches of the Marquis of Salisbury* (2 vols. 1885); and the Life by H. D. Traill in the 'Queen's Prime Ministers' series (1891).

Saliva, one of the digestive fluids, mainly the product of the SALIVARY GLANDS, of which there are three pairs—the parotid, the submaxillary, and the sublingual, with efferent ducts which convey the glandular secretions into the mouth. These, when mixed with the mucus secreted by the follicles of the mucous membrane lining the mouth, constitute the ordinary or mixed saliva. The *Parotid Gland*, so called from the Greek words *para*, 'near,' and *ous*, 'the ear,' is the largest of the three glands occurring on each side. It lies upon the side of the face immediately in front of the external ear, and weighs from half an ounce to an ounce. Its duct is about two inches and a half in length, and opens into the mouth by a small orifice opposite the second molar tooth of the upper jaw. The walls of the duct are dense and somewhat thick, and the calibre is about that of a crow-quill.



The Salivary Glands:
1, the parotid gland; 2, the submaxillary gland; 3, the sublingual gland; 4, Steno's duct; 5, Wharton's duct; 6, Bartholin's duct; 7, masseter muscle; 8, mastoid process; 9, digastric muscle; 10, internal jugular vein; 11, external carotid artery; 12, the tongue.

The *Submaxillary Gland* is situated, as its name implies, below the jawbone (part of which is cut away in the figure), and is placed at nearly equal distances from the parotid and sublingual glands. Its duct is about two inches in length, and opens by a narrow orifice on the top of a papilla, at the side of the *frænum* of the tongue. The *Sublingual Gland* is situated, as its name implies, under the tongue, each gland forming a ridge on the floor of the mouth, between the tongue and the lower gums. It has a number of excretory ducts, which open separately into the mouth. The salivary glands are racemose, or of the compound acinous type (see GLANDS). The recesses which open into the fine terminal branches of the ducts are 'lined and almost filled' by the epithelial cells which secrete the saliva. True salivary glands exist in all mammals, except the cetacea, in birds, and reptiles (including amphibians), but not in fishes; and glands discharging a similar function occur in insects, many molluscs, &c. Saliva contains about one-half per cent. of solids, chiefly salts and mucin. The proportion of its active constituent, ptyalin, is extremely small; and it has never been satisfactorily isolated (see DIGESTION).

The most common disease of the parotid gland is a specific inflammation, which has been already described in the article MUMPS. Tumours of various kinds sometimes occur in front of the ear and over the parotid gland. Their removal is often difficult. Calculi are occasionally formed in connection with the ducts of the salivary glands. *Deficient Secretion* is indicated by clamminess or dryness of the mouth, and is common in low forms of fever. It is important as indicating the condition of the system, and seldom requires treatment. If it should occur as an original affection it must be treated by local Sialogogues (q.v.), such as liquorice, horse-radish, pellitory, &c. *Alteration of the Saliva* is not unfrequent in disease. For example, it sometimes loses its alkaline character, and becomes acid, as in acute rheumatism, diabetes, &c.; whilst in other cases it becomes so fœtid as to be a source of annoyance both to the patient and his friends, as, for example, in scurvy, various forms of dyspepsia, salivation, &c. The undue acidity may be corrected by the administration of carbonate or bicarbonate of soda, while the fœtor may be relieved by attention to diet, by antiseptic mouth-washes, and by the use, both local and general, of creasote, nitromuriatic acid, charcoal, chlorate of potash, &c. *Ordinary Inflammation* of these glands (distinct from mumps) may proceed from cold or local injury, but it is often produced by decayed teeth.

SALIVATION, or PTYALISM (from the Gr. *ptyalon*, 'the saliva'), is the term employed to designate an abnormally abundant flow of saliva. It most commonly arises from a specific form of inflammation of the parotid glands, induced by the action of mercury, in which case it is termed mercurial salivation; but it occasionally appears under the action of other drugs, especially iodide of potassium; and sometimes it occurs without any apparent cause, in which case it is said to be *idiopathic* or spontaneous. When mercury is given in such a way as to excite salivation a metallic taste in the mouth is soon recognised by the patient, and a remarkable but indescribable smell, known as the mercurial fœtor, may be detected in his breath; the gums become swollen and spongy at their edges, and usually present a few slight ulcers; and an increased flow of saliva takes place, accompanied by pain in the teeth on pressure. If these symptoms be not checked (and *a fortiori* if more mercury be given) the tongue, cheeks, and throat swell and ulcerate, and the saliva that flows away amounts to several pints in the course of the day. Until a comparatively recent period profuse salivation was deemed the only certain indication that the system was duly under the influence of mercury (and, indeed, it was believed that the cause of the disease was carried out of the body with the saliva); but it is now recognised that salivation is harmful, and in administering mercury the object aimed at is not to allow its effect at farthest to go beyond the production of slight tenderness of the gums, and slight mercurial fœtor. Mercurial salivation is therefore very rarely to be seen at the present day. It is worthy of notice that in the confluent form of smallpox there is almost always more or less abundant salivation, which lasts for several days; and if it cease abruptly the peril is usually great. Moreover, there is a more or less marked tendency to salivation in scurvy, hysteria, hydrophobia, some forms of mania, and not unfrequently in pregnancy.

Salle, DE LA. See SCHOOLS (BROTHERS OF CHRISTIAN).

Sallee, SALÉ, or SLA, a seaport of Morocco, stands on the Atlantic, at the mouth of the Bu-Ragrag, on the northern side of the river, opposite to Rabat (q.v.). It was for centuries notorious as a haunt of pirates, and gave its name to the Sallee Rovers, who carried the terror of their name into the English Channel, and who are known to every reader of *Robinson Crusoe.* It is only within the 19th century that Britain ceased to pay an annual subsidy to the sultan of Morocco to secure safety from their attacks. The people, 10,000 in number, are still fanatical, and suffer no European to dwell within their walls. The streets are mean and poor, and the houses small. A wall surrounds the town, the chief features of which are forts and the prison. Excellent carpets are made, as well as shoes.

Sallow (*Salix*). See WILLOW.

Sallow-thorn. See SEA-BUCKTHORN.

Sallust. CAIUS SALLUSTIUS CRISPUS, a Roman historian, was born of plebeian family at Amiternum in the Sabine country, 86 B.C. He had risen to be tribune of the people in 52, when he helped to avenge the murder of Clodius upon Milo and his party. His own intrigue with Milo's wife may have given a spur to his love of justice, for his morality was far from high; indeed such was the scandal of his licentious life that he was expelled in 50 from the senate. It is true, however, that his attachment to Cæsar's party may well suggest a plausible reason for his expulsion. In 47, when Cæsar's fortune was in the ascendant, he was made prætor, and was consequently restored to his forfeited senatorial rank. Soon after this he nearly lost his life in Campania, in a mutiny of some of Cæsar's troops about to be shipped to Africa. Next year he carried off the enemy's stores from the island of Cercina, and at the close of the African campaign he was left as governor of the annexed kingdom of Numidia, formed into the province of Nova Africa. His administration was sullied by oppression and extortion, but the charges brought against him by the provincials failed before the partial tribunal of Cæsar. With the fruit of his extortion he laid out those famous gardens on the Quirinal which bore his name for centuries, and the splendid mansion in which became an imperial residence of Nerva, Vespasian, and Aurelian. Here he lived apart from public cares, devoted to literary labours, and here he died, 34 B.C. In this retirement he wrote his famous histories, the *Catilina*, or *Bellum Catilinarium*, a brief account of Catiline's conspiracy in 63, during the consulship of Cicero; the *Jugurtha*, or *Bellum Jugurthinum*, a history just twice as long of the five years' war between the Romans and Jugurtha, the king of Numidia; and the *Historiarum Libri Quinque*, commencing with the year of Sulla's death (78 B.C.) and coming down to 67 B.C., of which, unhappily, but a few fragments have come down to us. The two letters *Ad Cæsarem senem de Republica* and the *Invectiva Sallusti in Ciceronem* are not authentic.

As a historian Sallust is not accurate in details of fact and chronological sequence—a defect caused, no doubt, by his love for broad effects and unity of treatment. He was one of the first Roman writers to treat a subject rather than a period of time, and to look directly for a model to Greek literature. He brought to his task strong prepossessions and a fatal readiness to sacrifice anything to his antithesis or epigram; but we need not suppose with Mommsen that his main object was to discredit the old regime and vindicate the memory of Cæsar. He loves to explore in philosophic fashion into the tone of the age and the hidden motives of men, and he falls a victim to his own subtlety and confidently presents his inferences as facts. The high morality which he inculcates harmonises but ill with the facts of his past life, although it may be it was a legitimate enough fruit of after reflection and repentance which supplied its characteristic tinge of pessimism to his tone. In his labour to be brief and concise like his great model Thucydides he is not seldom merely obscure and involved, and his historical style is overlaid too thickly with rhetorical ornament, the narrative overloaded with general reflections that are often little better than pretentious commonplaces. The speeches are dramatically effective though not authentic, the structure of the sentences simple, the repetition of favourite words and rapid changes of construction to secure vivacity being characteristic marks. The Græcisms are mostly close echoes of Thucydides, and even his favourite arrangement of short contrasted phrases is imitated from the same master. Moreover, he makes use of many words and phrases in an archaic sense, and is supposed especially to have drawn much from the elder Cato; while in other ancient critics, again, we read of the innovations of his style. The influence of Sallust is plainly marked on the greater Tacitus, who styles him (*Ann.* iii. 30) 'rerum Romanarum florentissimus auctor.' Martial also places him first in Roman history, and Quintilian does not fear to match him with Thucydides and sets him above Livy, although admitting that the latter is a safer model for boys. His diction and rhetorical colour found him many imitators from the time of Fronto down to the Christian writers of the 5th century.

Editions are by Gerlach (Basel, 1832), Kritz (3 vols. 1828, 1856), R. Dietsch (2 vols. 1859, 1864), and H. Jordan (new ed. 1887). Excellent annotated editions of the two complete works are those by C. Merivale (1852), G. Long (1860; new ed. by J. G. Frazer, 1890), and W. W. Capes (1884); *and there is a good translation by* A. W. Pollard (1882). See L. Constans, *De Sermone Sallustiano* (Paris, 1880), the special Wörterbuch by O. Eichert (Han. 1864; 3d ed. 1885), and Mollweide, *Glossæ Sall.* (Strasb. 1887); also the studies by Th. Vogel (Mayence, 1857), M. Jaeger (Salzb. 1879, 1884), and Th. Rambeau (Burg, 1879).

Sally-port, a gate or passage by which the garrison of a fortress may make a sally or sudden attack on the besiegers.

Salmagundi, a word of uncertain origin, unless it be derived from the Countess Salmagondi, lady of honour to Marie de' Medici and the inventor of the dish; for salmagundi is a dish of minced meat, seasoned with pickled cabbage, eggs, anchovies, olive-oil, vinegar, pepper, and similar ingredients. In an applied sense the word means a pot-pourri, a medley, a miscellany.

Salmasius, CLAUDIUS, the Latinised name of a celebrated French scholar, CLAUDE DE SAUMAISE, who was born at Semur in Burgundy, 15th April 1588. His father, Benigne de Saumaise, a man of superior erudition, was his first teacher. At the age of ten young Salmasius translated Pindar and composed Greek and Latin verses. He studied philosophy at Paris, under the superintendence of Casaubon. From Paris he proceeded to Heidelberg (1606), where he devoted himself to the science of jurisprudence, and publicly professed Protestantism, to which form of the Christian religion he had been secretly attached. So insatiable at this time was his thirst for knowledge—book-knowledge, at least—that he was wont to devote two whole nights out of three to hard reading, in consequence of which he brought himself to within an inch of the grave. In 1608 he published from MSS. two treatises of the sectary, Nilus, Archbishop of Thessalonica, and a work of the monk Barlaam on the primacy of the pope. In 1629 appeared his chief work, *Plinianæ Exercitationes in Caii Julii Solini Polyhistora* (2 vols. Paris, 1629); after the publication of which he set himself vigorously, and without the help of a master, to acquire a knowledge of Hebrew, Arabic, Coptic, and other oriental tongues. In 1631 he was called to Leyden, to occupy the chair that Joseph Scaliger had held there, and it is from this period that his European reputation as a scholar and critic dates. Various efforts were made (1635–40) to induce Salmasius to return to France, but he declined them on the ground that his spirit was too 'liberal' for his native land. Queen Christina of Sweden, however, managed to bring him to Stockholm, and fix him there for a year (1650–51), after which he returned to Holland. He died of a fever caught by imprudently drinking the waters at Spa, 6th September 1658

In the scholastic world Salmasius was probably the most famous personage of his day in Europe. 'A man not in my opinion only, but by the common consent of scholars, the most learned of all who are now living;' 'the miracle of the world, the most learned of mortals.' Such were the expressions of his contemporaries regarding him. The most exalted personages courted his friendship. Christina of Sweden declared that 'she could not live without him.' When Mazarin failed to induce him to return to France he nevertheless sent him the order of knighthood, as a proof of Louis XIV.'s desire to honour him as a Frenchman. Though his attainments were prodigious, Salmasius does not rank with scholars like Casaubon or the younger Scaliger. He had neither Casaubon's balanced judgment nor Scaliger's grasp or insight. Hence, though his industry and learning could not have been inferior to theirs, his work has no distinctive value in the history of scholarship. In England Salmasius is best known in connection with his controversy with Milton regarding the execution of Charles I. At the request of Charles II., Salmasius, as the highest scholastic authority in Europe, published (1649) his *Defensio Regia pro Carolo I.*, which was answered in 1651 by Milton in his *Pro Populo Anglicano Defensio*. The preparation of his pamphlet cost Milton his eyesight, but, as Salmasius died shortly after writing a rejoinder, the English poet boasted that his adversary had the worst of the encounter. The brutal coarseness of both disputants alone gives a certain significance to their controversy at the present day. Yet it must be remembered that the standard of taste in public controversy in the 16th and 17th centuries only corresponded to the license of everyday talk in the most refined society.

For the life of Salmasius, see *De Laudibus et Vita Cl. Salmasii*, prefixed to the collection of his letters published at Leyden in 1656. For his controversy with Milton, see Masson, *Life of Milton*, vol. iv.

Salmon (*Salmo*), a genus of fishes of the family Salmonidæ (q.v.), which, as characterised by Cuvier, has teeth on the vomer, both palatine bones, and all the maxillary bones; and includes numerous species more recently divided by Valenciennes into three genera, Salmo, Fario, and Salar: the first characterised by a few teeth at the end of the vomer; the second by a single line of teeth running down the vomer; the third by two rows of teeth on the vomer, without any remarkable group at its upper end. To many naturalists, however, this division seems too artificial; and the characters, although excellent for distinguishing species, not such as ought to divide genera; an opinion confirmed by the fact that the teeth are numerous along the vomer in the young of the species (as the Common Salmon) which finally retain only a group of them at the end. The division made by Valenciennes separates the Salmon, the Salmon-trout, and the Gray or Bull Trout, the only British species which ascend rivers from the sea, into the two genera Salmo and Fario. A much more natural division, having regard to characters really conspicuous and important, and to the habits of the species, is the simple one of Pennell, which is really nothing more than a formal recognition of groups practically recognised by every one acquainted with the fishes that compose them: '(1) The Silver, or Migratory species (i.e. those migrating to and from the sea); (2) the Yellow, or Non-migratory species; (3) the Charrs, or Orange and Red-coloured species.' The present article is devoted to the first of these groups. The second is noticed in the article TROUT; the third, in the article CHARR.

By far the most important of the Salmonidæ which ascend the rivers of Britain from the sea is the Salmon (*Salmo salar*), in commercial importance far superior to any other fresh-water fish, both on account of the abundance in which it is procured in the northern parts of the world and of its rich and delicious flavour. From ancient times it has furnished important supplies of food; and the salmon-fisheries of Britain have long been a subject of anxious attention to the legislature. Even the rivers of Iceland now yield a rent, and are regularly netted for the supply of the British market, to which the salmon are brought, as from other northern regions, fresh, in ice. Many rivers and streams, also, are rendered valuable by the salmon which periodically visit them, as affording sport to anglers; and those of Norway, as well as those of Britain itself, are now frequented by British anglers.

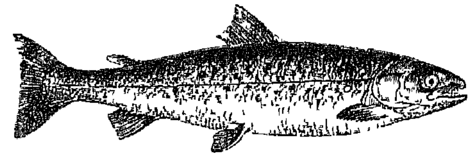


Fig. 1.—Salmon (*Salmo salar*).

The salmon is one of the largest species of the genus, having been known to attain the weight of 80 lb., whilst salmon of 40 or 50 lb., and even upwards, are occasionally brought to market. Very large salmon, however, are not common, owing to the eagerness with which the fishery is prosecuted. No fish is more symmetrical or beautiful than the salmon; and its form is admirably adapted to rapid motion even against powerful currents. The head is about one-fifth of the whole length of the fish. The under jaw of the male becomes hooked during the breeding season with a kind of cartilaginous excrescence, which is used as a weapon in the combats

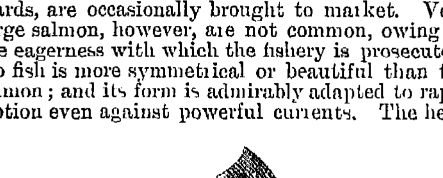

Fig. 2.—Salmon-trout (*Salmo trutta*).

their frequent, wounds so severe being inflicted with it that death sometimes ensues. The lateral line is nearly straight. The scales are small, and the colour a rich bluish or greenish gray above, changing to silvery-white beneath, sprinkled above the lateral line with rather large black spots. The opercular bones show a rounded outline at the hinder edge of the gill-covers, which at once distinguishes this species from the only other British species that can be confounded with it, the Salmon-trout and the Gray or Bull Trout, in both of which the posterior edge of the gill-cover is angular. The tail is forked in the young salmon, but becomes nearly square in the adult. The mouth of the salmon is well furnished with teeth—a line of teeth on each side of the upper jaw, an inner line on the palatine bone, two or three in the adult state at the end of the vomer, two rows on the tongue, and one row along the outer edge of each lower jawbone. This array of teeth indicates voracity, and the salmon seems to prey readily on almost any animal which it is capable of capturing, though it is a somewhat singular fact that the stomach when opened is rarely found to contain the remains of food of any kind. Two or three herrings of full size have, however, been found in its stomach; the sand launce and other small fishes seem to constitute part of its food, and when in fresh water the minnow, trout-fry, or the fry of its own species, worms, flies, &c., though there can be little doubt that the salmon feeds chiefly in the sea. Some hold that it does not feed in the fresh water. The angler catches salmon with the artificial fly, or with the minnow or the worm or the prawn; and no bait is more deadly than the roe of the salmon itself, the use of which is indeed prohibited in British acts of parliament intended for the protection of the salmon-fisheries. The eggs of crustaceans have also been found in the stomach of the salmon in such quantities as to show that they form a very considerable part of its food.

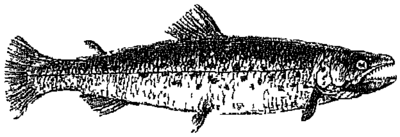

Fig 3.—Gray or Bull Trout (*Salmo eriox*).

The salmon is found on the coasts of all the northern parts of the Atlantic, and in the rivers which fall into that ocean, as far south, at least, as the Loire on the European side and the Hudson on the American. Slight differences can be noted between the salmon on the Atlantic coasts of America and the European salmon, but they are not generally thought sufficient to distinguish them as species. The salmon frequenting one river are, indeed, often characteristically different from those of another river of the same vicinity. The Pacific Salmon (see p. 116) differs in several respects from the *Salmo salar*, particularly in its power of standing a higher temperature; so that the French government have recently made the experiment of introducing it into some of the rivers falling into the Mediterranean. Salmon is in perfection for the table only when recently taken from the water; whilst the fatty 'curd' remains between the flakes of its flesh, which, however, begins to disappear within twelve hours, although otherwise the fish is quite fresh.

The salmon, after its first migration to the sea, passes a great part of its life in it, although under the necessity of periodically ascending rivers, in which the salmon that ascend to spawn or for other causes in autumn often remain during most of the winter. Salmon return, in preference, to the same rivers in which they have passed the earliest part of their existence; as appears both from records of marked salmon, and from the characteristic differences already alluded to. Salmon ascend rivers to a great distance from the sea, as the Rhine to the Falls of Schaffhausen, the Elbe to Bohemia, and the Yukon, the great Alaskan river, which they ascend for more than 1500 miles. Salmon move chiefly during the night. As a rule they do not run when rivers are low, but when they are beginning to fall and clear after a flood. In autumn, however, the sexual instinct urges them to ascend to the heads of rivers where there is good spawning-ground and to the smallest tributaries. The perpendicular height which the salmon can pass over by leaping, when there is abundance of water in the river and sufficient depth in the pool below the fall, seems to be not more than 6 or, at the utmost, 8 feet; they attempt higher leaps, but often fall back exhausted, or fall on adjacent rocks, where they die or are captured. They do, however, rush up steep and broken rapids of much greater height. The ascent of many rivers by salmon has been stopped by high weirs and other obstructions; but means have been devised for preventing this by ***fish-stairs*** or ***fish-ladders***, which are often very conveniently formed by partitioning off a portion of the fall, and intersecting it from alternate sides, two-thirds of its width, by transverse steps of wood or stone, so as partially to divide it into a succession of falls. The salmon soon find out the ladder, and leap up from one step to another. There are, however, very few good salmon-ladders on the numerous obstructions connected with mills and manufactories which have been erected on salmon-rivers. The best of these are the ladder at Deanston dam on the Teith, at Morphie dam on the North Esk, and at Bridgemill dam on the Girvan.

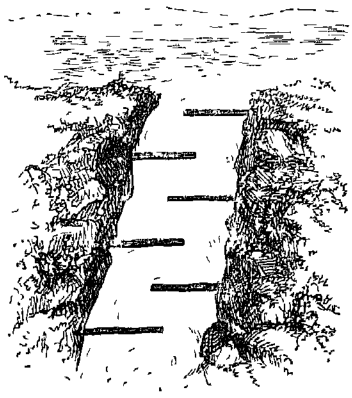

Fig. 4.—Salmon-ladder.

But mill-dams without fish-passes, or with inefficient passes, are not the only causes which prevent the full utilisation of salmon-rivers. There are, besides, natural obstructions, in the shape of waterfalls, which at present bar 500 miles of rivers in Scotland and many thousand acres of lochs against the ascent of salmon. The principal of these waterfalls are the Falls of Tummel, which shut out salmon from 50 miles of rivers and 20,000 acres of lochs. They might easily be made passable at a moderate cost; but the proprietors of the falls refuse their consent to have them touched; and, as the law at present stands, nothing can be done without the consent of the proprietors of the obstruction, even if they are offered most ample pecuniary compensation for loss of amenity or injury to a fine fishing pool below the falls. A pretty exhaustive account of all the natural obstructions, in the shape of waterfalls, on the salmon-rivers of Scotland will be found in the 6th Annual Report by the Inspector of Salmon-fisheries, pp. 30–58.

As the time of spawning approaches salmon undergo considerable changes of colour, besides the change of form already noticed in the snout of the male. The former brilliancy of the hues gives place to a general duskiness, approaching to blackness in the females, much tinged with red in the males; and the cheeks of the males become marked with orange stripes. Salmon in this state are 'foul fish,' being considered unfit for the table, and the killing of them is prohibited by British laws, notwithstanding which, however, multitudes are killed by poachers in some of the rivers, nor do those who eat them either fresh or 'kippered' (i.e. dried) seem to suffer from any unwholesomeness. Salmon which have completed their spawning continue for some time, at least if in fresh water, very unfit for the table. Their capture is prohibited by British laws. They are called '*foul fish*,' or more distinctively, '*spent fish*,' or *Kelts;* the males are also called *Kippers*, *kip* being a name for the cartilaginous hook of the under jaw, whilst the females are known as *Shedders* or *Baggits.* When they remain for a considerable time in fresh water after spawning kelts recover very much, and increase in weight.

The time of spawning is from the end of autumn to the beginning of spring, or even the beginning of summer; differing considerably in different rivers, whilst in each river it is prolonged throughout months, the elder and stronger fish of the former year probably ascending to spawn first. The difference of season in different rivers is probably to be accounted for by the temperature of the water, as affected by latitude, and by the relations of the river to lakes, to low warm plains, and to snow-covered mountains.

Salmon spawn on beds of fine gravel, in shallow parts of rivers, such as are used for the same purpose by trout. Some beds of this kind, in salmon-frequented rivers, have been notable from time immemorial as favourite spawning-places; and large numbers of fish, both the salmon and its congeners, deposit their spawn in them every year. The spawning female approaches the bed, attended by at least one male fish, sometimes by more than one, in which case fierce combats ensue; she makes a furrow in the gravel with her tail, and deposits her spawn in it, on which the male afterwards pours the vivifying milt. It was formerly believed, but erroneously, that the furrow was in part made by the snout of the fish. The eggs, when deposited and vivified, are covered by the action of the tail of the female; the male doing nothing but depositing his milt, and fighting with any other of his sex that may attempt to dispute his place. The time occupied by a female salmon in spawning is from three to twelve days. After spawning the salmon generally soon descends to the sea.

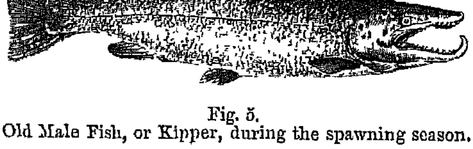

Fig. 5.
Old Male Fish, or Kipper, during the spawning season.

The descending *kelts* are very ravenous, and therefore a great annoyance to anglers who desire to take none but *clean* fish, and must return the kelts to the water.

The eggs deposited in the spawning beds are liable to be devoured by trouts and other fishes, and by insect larvæ of many kinds; ducks and other waterfowl also search in the gravel for their food; and sometimes a flood changes the bed so much as either to sweep away the eggs or to overlay them with gravel to a depth where they are never hatched, or from which the young can never emerge. The number of eggs hatched in ordinary circumstances must be small in proportion to the number deposited, and by far the greater part of the fry perish before the time of descent to the sea.

In from thirty to sixty days after the deposition of the eggs in the spawning bed they begin to show signs of life, and the eyes appear as small specks. The time which elapses before the egg is hatched varies according to the temperature of the water, and therefore is generally shorter in England than in Scotland, 140 days being sometimes requisite in cold climates and late springs; but from 90 to 120 days is the usual term. A temperature above 70° F. is, however, fatal to the *Salmo salar*, though the Pacific salmon can stand a higher temperature. Salmon eggs are easily hatched in an aquarium in which proper care is taken to prevent stagnation of the water. Frank Buckland describes the methods in his *Fish-hatching* (1863).

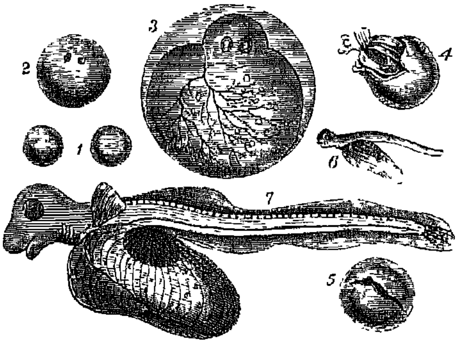

Fig. 6.—Salmon Ova, and newly-hatched Fish:
1, egg of salmon, natural size, just taken from the parent fish; 2, same with eyes of young fish just becoming apparent (30th–35th day); 3, young fish just ready to be hatched, 4, young fish emerging from the shell; 5, empty egg-shell; 6, young salmon about two days old, natural size; 7, same magnified, showing the umbilical vesicle

The young fish lies coiled up in the egg, which it finally bursts in its struggles to be free, and it issues with a conical bag (umbilical vesicle) suspended under the belly, containing the red yolk of the egg and oil globules, which afford it nourishment during the first five or six weeks. The mouth is at first very imperfectly developed, as are the fins, and the whole body has a shape very different from what it is soon to assume, and is very delicate and almost transparent. The slightest injury is fatal. The length, at first, is about five-eighths of an inch. About the seventh or eighth week the young salmon has changed into a well-formed little fish about an inch long, with forked tail, the colour light brown, with nine or ten transverse dusky bars, which are also more or less distinctly visible in the young of other species of this genus, just as the young of many feline animals exhibit stripes or spots which disappear in their mature state. The fry, previously inactive, now begin to swim about, and to seek food with great activity. They are known as *Parr*, or as *Samlet*, and also in some places by the names *Pink*, *Brandling*, and *Fingerling*. The Parr was formerly supposed to be a distinct species (*S. salmulus*), an opinion to which many anglers have clung tenaciously, even after it has been shown to the satisfaction of all naturalists—by Mr Shaw of Drumlanrig in 1834–36, confirmed by experiments at the salmon-breeding ponds at Stormontfield, near Perth, on the Tay—that the parr in reality is nothing else than the young salmon.

It was long urged that the male parr is very often found with the milt perfect; to which, however, it was replied that the female parr is almost never found with perfect roe. But it is now abundantly proved that the male parr is capable of impregnating the roe of the female salmon; and, indeed, ridiculous little parrs seem to be always ready at hand to perform this service during the combats of the great fish, or in their absence. Another remarkable fact has been discovered, that some parrs become smolts and descend to the sea in their first year, whilst others remain in the fresh water, and in the parr state, without much increase of size for another year, and a few even to the third year. A parr will die in the salt water. But when he assumes the silver mail of the smolt, his instinct imperatively urges him to seek the sea, where he thrives and grows apace—the smolt which has taken one, two, or three years to become six inches in length returning to the river, at the end of two months in the sea, as a grilse of several pounds weight. It has been proved in the United States that, though a considerable number of the smolts which descend to the sea return the same season to the river as grilse, a proportion of them do not return that season, but spend their grilsehood in the sea, returning the next season to the river as young spring salmon. This has not been proved with regard to the salmon of the United Kingdom. But many of the best authorities believe it to be the case. At Stormontfield it has been found that about one-half of the parrs migrate when a year old. No reason can be assigned for these things; the facts alone are known to us, and have but recently been established.

Grilse are captured in great numbers in the later part of summer and in autumn, but very few are seen in the earlier part of the fishing season. The grilse usually spawns on its first return to the fresh water—often remaining there for the winter, and on again descending to the sea assumes the perfect character of the mature salmon. Little increase of size ever takes place in fresh water; but the growth of the salmon in the sea is marvellously rapid, not only on its first migration, but afterwards. A kelt caught by the Duke of Athole on 31st March weighed exactly ten pounds. It was marked, and returned to the Tay, in the lower part of which it was again caught, after five weeks and two days, when it was found to weigh twenty pounds and a quarter.

The statistics of salmon-fisheries are very imperfect. It is impossible accurately to ascertain the total annual value of the salmon-fisheries even of Great Britain and Ireland. But if we take the most recent estimates of the English, Irish, and Scottish inspectors, we find the annual value of the English salmon-fisheries to be about £140,000 annually; of the Scotch, £300,000; and of the Irish, £500,000—or together £940,000 annually. That the salmon-fishery is very fluctuating and uncertain the following table of the boxes of Scotch salmon sent to Billingsgate Market from 1834–89, both years inclusive, will conclusively show:

Year.	Boxes of Scotch Salmon	Year.	Boxes of Scotch Salmon
1834	30,650	1862	22,706
1835	42,330	1863	24,297
1836	24,570	1864	22,003
1837	32,300	1865	19,009
1838	21,400	1866	21,725
1839	16,340	1867	23,006
1840	15,160	1868	28,020
1841	28,500	1869	20,474
1842	39,417	1870	20,048
1843	30,300	1871	23,390
1844	28,178	1872	24,404
1845	31,062	1873	30,181
1846	25,510	1874	32,180
1847	20,112	1875	20,375
1848	22,525	1876	31,655
1849	23,690	1877	28,189
1850	13,910	1878	26,405
1851	11,593	1879	13,029
1852	13,044	1880	17,457
1853	10,485	1881	23,905
1854	23,194	1882	22,068
1855	18,197	1883	35,506
1856	16,438	1884	27,219
1857	18,654	1885	30,362
1858	21,564	1886	23,407
1859	16,823	1887	26,907
1860	15,870	1888	22,857
1861	12,337	1889	21,101

During the first seven years in the above table the average number of boxes of Scotch salmon sent from Scotland to Billingsgate was 26,107; during the second septennial period, 29,011; during the third period, ending in 1854, 18,210; in 1855–61, 16,840; in 1862–68, 23,065; in 1869–75, 24,521; in 1876–82, 23,938; and during the last septennial period, 1883–89, 26,765 boxes. The best year in the table was 1835, when 42,330 boxes were sent to Billingsgate; and the worst was 1851, when only 11,593 boxes were sent; thus showing a difference of no less than 30,737 boxes between the best year and the worst.

The salmon-fisheries of the British rivers have in general much decreased in productiveness since the beginning of the 19th century. This is ascribed by many to the introduction of fixed or standing nets along the coast, by which salmon are taken in great numbers before they reach the mouths of the rivers to which they are proceeding, and in which alone they were formerly caught; it having been discovered that salmon feel their way, as it were, close along the shore for many miles towards the mouth of a river, feeding, meanwhile, on sand-launces, sand-hoppers, and other such prey. It is also partly owing to the destruction of spawning fish by poachers, and in no small measure to the pollution of rivers consequent on the increase of population and industry, and to the more thorough drainage of land, the result of which has been that rivers are for a comparatively small number of days in the year in that half-flooded condition in which salmon are most ready to ascend them. The last of these causes is the most irremediable; but the abatement of the others would of itself be sufficient to secure a productiveness of the rivers much greater than at present. The efforts which have begun to be made by breeding-ponds (see PISCICULTURE) to preserve eggs and fry from destruction, and so to multiply far beyond the natural amount the young salmon ready to descend to the sea, promise also such results as may yet probably make the supply of salmon *far* more abundant than it has ever been. There is reason to think that the productiveness of the waters may be increased as much as that of the land.

The stake-net is the most deadly of all means employed for taking salmon; and its use is prohibited in rivers and estuaries. It consists of two rows of net-covered stakes so placed between high and low water marks that salmon coming up to them, and proceeding along them, are conducted through narrow openings into what is called the *court* of the net, from which they cannot find the way of escape. In deep water, where stake-nets cannot fish, another species of fixed engine termed a bag-net is employed, which is equally deadly in its operations; and sometimes stake and bag nets are combined in the same fixed engine, the stake-net occupying the foreshore, or space between high and low water mark, and the bag-net extending into the deep water beyond.

Cruives are the only fixed engines which can be legally used in rivers by those who have special titles to cruive-fishings. There is what is termed the cruive-box in the cruive dam or dike into which salmon are guided by a peculiar sort of grating called the *inscales*, and from which they cannot escape. In Scotland cruives are regulated by a bylaw forming part of the Salmon-fishery Acts of 1862 and 1868. In Ireland there must be what is termed a 'free gap' in every cruive-dike extending down to the bed of the river, the width of the gap being regulated by the width of the river.

In rivers only movable nets can be used for the capture of salmon. Of these, the most common and universal is that form of fishing known as *net and coble*. In this a small boat, or *salmon coble*, is used to carry out a seine-net from the shore, setting (*shooting*) it with a circular sweep, the concavity of which is towards the stream or tide, and men stationed on shore pull ropes so as to bring it in by both ends at once with whatever it may have enclosed. Coracles (q.v.) are used in salmon-fishing in the Severn and other Welsh rivers. Nets which a single man can carry and work are also used in many rivers and estuaries, as those called *halve-nets* on the Solway, which may be described as a bag attached to a pole.

Those rivers of Britain where the fishing is strictly preserved still afford good sport, the Aberdeenshire Dee having yielded 5000 salmon and grilse to the rod in a single year; but many anglers betake themselves to Norway or even Canada for their favourite sport. Recently the salmon and other fish of the rivers of Britain have suffered terribly from the so-called *Salmon Disease* (see below). Much labour has been spent on the successful acclimatisation of salmon in New Zealand and Tasmania.

The SALMON-TROUT (*S. trutta*, or *Fario argenteus*), also commonly called the Sea-trout, is rather thicker in proportion to its length than a salmon of the same size, and has the hinder free margin of the gill-cover less rounded. The jaws are nearly equal; the teeth strong, sharp, and curved, a single row running down the vomer, and pointing alternately in opposite directions. The colours are very similar to those of the salmon; the sides, chiefly above the lateral line, are marked with numerous X-shaped dusky spots, and there are several round dusky spots on the gill-covers. The salmon-trout does not attain so large a size as the salmon, but has been known to reach 24½ lb. The flesh is pink, richly flavoured, and much esteemed, although not equal to that of the salmon. Great quantities of salmon-trout are brought to market in London and other British towns; this fish being found from the south of England to the north of Scotland, in Orkney and Shetland, and in the Outer and Inner Hebrides. Its habits are generally similar to those of the salmon. Large shoals sometimes congregate near the mouth of a river which they are about to enter, and sometimes afford excellent sport to the angler in a bay or estuary, rising readily to the fly. The young are not easily to be distinguished from parr. *Finnocks*, *Herling*, and *Whitling* are local names of the salmon-trout on its first return from the sea to fresh water, when it has its most silvery appearance, in which state it has sometimes been described as a distinct species (*S. albus*).

The Gray Trout or Bull-trout (*S. eriox*), the only other migratory British species, is already noticed in the article BULL-TROUT. The gill-cover in this species is more elongated backwards at the lower angle than in the other two. On the banks of the Tweed and some other rivers it is often called the sea-trout, a name quite as appropriate to it as to the salmon-trout. The seasons at which the gray trout ascends rivers are partly the same with those of the salmon and salmon-trout, and partly different. The laws relative to the fishing of salmon apply equally to the bull-trout.

The most conspicuous addition which has recently been made to the salmon-producing countries of the world is the vast territory of Alaska in north-western America. When it was bought from Russia its chief commercial importance arose from the value of the furs which it produced. Now, since the American occupation, the value of the salmon-fisheries is far greater than that of the furs—the former yielding 3 millions of dollars annually, and the latter only 1 million. And, as yet, this great salmon industry is but partially and imperfectly developed, for Mr Bean, ichthyologist to the United States Fish Commission, assures us that it is capable, under judicious management, of being doubled in value. The largest and finest of the Alaskan salmon is the King or Chowichee Salmon, also known as Takou, Chinnook, Quinnat, and Columbia River Salmon (*S. quinnat;* in the American reports, *Oncorhynchus chowicha*). This valuable fish is found in the larger rivers as a rule, but runs also into some of the smaller streams. The Yukon and the Nushagak are the principal king salmon rivers. The average weight of this salmon is about 20 lb., and individuals weighing upwards of 100 lb. are on record. The flesh of the king salmon is superior in flavour to that of all the other species of Alaskan salmon. The king salmon is a great traveller, ascending the Yukon more than 1500 miles from its mouth, travelling at the rate of from 20 to 40 miles a day. Another Alaskan salmon is the Dog Salmon (*O. keta*), so called from the size of the teeth and the way in which the jaws become enlarged and distorted during the breeding season; it is the most important species to the natives, but is not used by the Americans. The Humpback Salmon (*O. gorbuscha*), so called because of the enormous hump developed on the back of the male during the breeding season, is the most abundant salmon of Alaska, and comes in enormous shoals, so that when they enter a stream in force they fill the water from shore to shore, and from top to bottom. It is the smallest of the Pacific salmon, ranging from 5 to 10 lb. The next most abundant salmon, and commercially the most important, is the Red Salmon (*O. nerka*), averaging from 7 to 15 lb. In 1889 there were thirty-six canneries in operation in Alaska, situated principally in the southern part of the territory. Nearly one-third were established on the Kadiak group of islands, and covered about one-half of the Alaskan catch. Sixty-six large vessels were engaged in carrying the equipment and workmen for these canneries and the product of their industry. Hundreds of boats are employed in the business of fishing, which is principally carried on by huge seine-nets. The seining is done chiefly by white men, and the work inside the canneries by Chinese. It is estimated that 4000 men are engaged in the salmon-fishing. In 1889 the capital invested was nearly 4 millions of dollars, and the value of the pack, at an average price of 5 dollars per case, was 3 millions of dollars. Eight millions and a half of salmon were captured, or about one-half of the whole yield of salmon in the United States. The

Schoodic or Landlocked Salmon of the United States, found in lakes, is a variety of *S. salar;* the California Salmon (*S. quinnat*) and the Rainbow Trout (*S. irideus*) are also mentioned in the article PISCICULTURE.

SALMON DISEASE.—This disease is caused by a fungus always present in running water, called *Saprolegnia ferax,* which assumes fatal activity in certain years and in certain rivers, and attacks fish, first assailing those that have sustained injuries, and kelts, and afterwards clean fish also. It attacks the poll, the fins, the sides, and gills of the fish, and from the outside eats inwards, causing ulcers and ultimately death. It is a fresh-water disease, and cannot exist or originate in the sea; and salt applied to the diseased places has in certain cases been found to act as a cure. A mysterious thing about the disease is that for many years the *Saprolegnia ferax* may remain innocuous in a river, and then develop into fatal activity and attack the fish in the river; and we are at present quite ignorant as to what are the causes, climatic or otherwise, to which this is owing, although many things have been stated to be the causes of the salmon disease by the numerous witnesses examined during the various special inquiries to which it has given rise. Over-stocking, pollutions, impassable weirs, a series of dry seasons, &c. have been assigned as the causes of the disease. But in their Report of 1880 on the salmon disease Messrs Buckland, Walpole, and Young write as follows upon this subject: 'All the different circumstances and conditions which were stated by different witnesses to be the causes of the disease are to be found existing in rivers where the disease has never been heard of. We have found the disease existing in polluted and in pure rivers, in rivers obstructed by weirs and in rivers where there are no obstructions, in under-stocked and in fully stocked rivers, in rivers flowing from or through lakes and in rivers with no lakes belonging to their catchment basins; in short, in rivers with the most opposite physical features; and we have been unable to detect in the Tweed, Nith, Annan, Doon, Esk, Eden, and other rivers attacked by the disease any special conditions to which the disease can be attributed which are not likewise to be found in some of the rivers which have escaped its ravages. Those who are acquainted with only one or two salmon rivers are rather apt to imagine that in the pollution, obstruction, or overstocking of the rivers with which they are familiar they have discovered the true cause of the disease. But to those who have an extensive acquaintance with the salmon rivers of Great Britain the most perplexing thing connected with the present inquiry is that every cause, without exception, which has been assigned as the true origin of the salmon disease in infected rivers is to be found in rivers where no disease exists, or has ever been known to exist.' The salmon disease is occasionally coincident with an excellent fishing season, as has been proved on the Deveron, Don, and Tweed. The last-named river has probably suffered more from the salmon disease than any other river in the United Kingdom, as the Report of the Tweed Commissioners for 1891 shows. There were taken out of the river and buried during the year 6,429 fish; while during the ten previous years, 1881–90, the number of fish so dealt with was 74,930, making a total of 81,359, composed of 58,386 salmon, 9,214 grilse, and 13,759 sea-trout. In the same Report it is stated that the total weight of diseased salmon, grilse, and sea-trout taken out of the Tweed and buried was 29 tons 7 cwt. and 9 lb. in 1889–90, and 31 tons 3 cwt. and 80 lb. in 1890–91.

SALMON-FISHERY LAWS.—The salmon is protected by special laws in the United Kingdom. (1) *As to England.*—The right to fish salmon in the sea and navigable rivers belongs to the public as a general rule; and the right to fish salmon in rivers not navigable belongs to the riparian owner on each bank, the right of each extending up to the centre line of the stream. But though the public have, as a rule, the right to fish in the sea and navigable rivers, there are various exceptions, which arose in this way. Previously to Magna Charta the crown, whether rightly or wrongly, assumed power to make grants to individuals—generally the large proprietors of lands adjacent—whereby an exclusive right was given to such individuals to fish for the salmon within certain limits. This right, when conferred, often applied to the shores of the sea, but more generally applied to navigable rivers and the mouths of such rivers. The frequency of such grants was one of the grievances redressed by Magna Charta, which prohibited the crown thenceforth from making such grants. But the then existing grants were saved, and hence every person who at the present day claims a several or exclusive fishery in navigable rivers must show that his grant is from the crown, and is as old as Magna Charta. It is not, however, necessary that he be able to produce a grant or chain of grants of such antiquity; for if he has been in undisturbed possession for a long time—say sixty years and upwards—it is presumed that such title is as old as Magna Charta, and had a legal origin. When a person is entitled to a salmon-fishery (and if he is entitled to a salmon-fishery he is entitled also to the trout and other fish frequenting the same place) he is nevertheless subjected to certain restrictions as to the mode of fishing salmon. These restrictions are imposed by the Salmon-fishery Acts of 1861, 1865, and 1873, which repealed prior acts of parliament. No person is now entitled to use lights, spears, gaffs, strokehalls, or snatches, or other like instruments for catching salmon; nor can fish roe be used for the purpose of fishing. All nets used for fishing salmon must have a mesh not less than 2 inches in extension from knot to knot, or 8 inches measured round each mesh when wet. No new fixed engine of any description is to be used. A penalty is incurred for violating these enactments, and also for taking unseasonable salmon, or for taking, destroying, or obstructing the passage of young salmon, or disturbing spawning salmon. During close time no salmon can be legally sold or be in the possession of any person for sale; and such fixed engines as are still legal must be removed or put out of gear during close time. By the Salmon-fishery Act, 1873, a great change has been made in the law regulating the annual close time. By bylaw, boards of conservators can vary the close season, and the sale of fish in the extended open time is made legal. The doctrine of a uniform close season for every river in England and Wales is abolished, and each river can now fix its own close time within the following rules: (1) For every salmon river in England and Wales there must be at least 154 days close time for every kind of fishing but for rod and line; (2) such close time if it does not begin before must do so on the 1st November for all kinds of fishing but with rod and line; (3) for 92 days in each year there must be no fishing for salmon whatever; (4) if the 92 days do not begin before, they must begin on the 1st December of each year; (5) no salmon can be sold after the 3d day of November in any case; (6) if no bylaw has been made on the subject of annual close time the times remain as at present, and no person can fish for, catch, or attempt to catch salmon between the 1st of September and the 1st of February, both inclusive, except with rod and line; (7) if the board of conservators have altered the time for the capture of salmon, then the salmon may be sold during such extended open time, provided its capture was lawful by other means than by rod and line at the time and place where it was caught. There is also a weekly close time—that is to say, no person can, except with rod and line, lawfully fish for salmon between 12 A.M. (noon) of Saturday and 6 A.M. of Monday following; but boards of conservators have power under the Act of 1873, by bylaw, to extend the weekly close time up to forty-eight hours. Owners of dams in existence in August 1851, need not put in a fish-pass; but in dams built after that date they are bound to provide a fish-pass. Fishing weirs must have free gaps of such size as the Act of 1861 prescribes. For the purpose of supervising the enforcement of the acts, fishery inspectors are appointed for England.

(2) In Scotland there are various important differences from the law of England as regards salmon-fisheries. In Scotland the general rule is that all salmon-fisheries in rivers, estuaries, and in the narrow or territorial seas are vested in the crown, and hence no person is entitled to fish for salmon except he can show a grant or charter from the crown. If he can only show a general grant of fishings without specifying salmon, then it is necessary not only to produce such grant, but to show that he or his predecessor has been in the habit of fishing for salmon for forty years. Moreover, while this right to catch salmon is vested in the crown, or in some grantee of the crown, the right to angle for salmon is now held to be included, and does not belong to the riparian owner. The public have no right anywhere in Scotland to fish for salmon either with net or rod. By virtue of many old statutes all fixed engines for catching salmon in rivers and estuaries are illegal, and it is settled that everything is in the nature of a fixed engine except what is held in the hand of the fisherman and is in motion while he is fishing; but a mechanical contrivance, which enables the fisherman to go a little farther into the river with his coble or boat, which is to drag the net, is not illegal. Stake and bag nets, moreover, are not illegal if they are not in a river or the estuary of a river. In 1862 and 1868 statutes were passed for regulating the Scotch salmon-fisheries. By these acts fishery districts are authorised to be managed by boards. These boards consist of the large proprietors of fisheries. The boards appoint constables, water-bailiffs, and watchers, forming a kind of river-police. The board has power to assess the various proprietors so as to raise funds for paying the expenses of working the acts—similar funds being raised in England only by license-duties. The annual close time for salmon-fishing is fixed by bylaws drawn up formerly by the Commissioners of Scotch Salmon-fisheries, and approved by the Home Secretary; but now, when any alteration is petitioned for by a District Board, it is submitted to the Secretary for Scotland, and, if he approves of the prayer of the petition, a new bylaw is drawn up and published in the *Edinburgh Gazette*, after which it becomes law. There are three groups of Scotch salmon rivers as regards annual close time. The close time of the earliest and much the largest group is from 27th August to 10th February; of the second group from 1st September to 15th February; and of the third group from 10th September to 24th February; the extension of time for rod-fishing, after the nets are off, varies from 10th October to 30th November. The Scotch acts prohibit fishing with lights or with salmon-roe, with nets having meshes less than 1¾ inch from knot to knot, or 7 inches round the mesh when wet. And there is a weekly close time from 6 P.M. on Saturday to 6 A.M. on Monday following. In 1882 the Fishery Board (Scotland) Act was passed. This act conferred upon the new board the powers and duties of Commissioners of Scotch Salmon-fisheries, and the general superintendence of the salmon-fisheries of Scotland, but without prejudice to or interference with the rights of district boards. It also appointed an Inspector of Salmon-fisheries, who has since published annual reports on the Salmon-fisheries of Scotland, which have been presented to the Fishery Board and to parliament.

(3) Ireland.—The Irish salmon-fishery laws are very similar to those of England, but are regulated by district statutes, the principal of which are the Salmon-fishery (Ireland) Act, 1863, and the Salmon-fishery (Ireland) Act, 1869. Fishery districts are there established, and the fisheries are subject to rates and license-duties for the purpose of raising funds. There is an annual and weekly close time, and fixed engines are prohibited, and free gaps enforced in all fishing weirs.

See Dr F. Day's *British and Irish Salmonidæ* (1887); J. W. Willis Bund, *Salmon Problems* (1886); Buckland, *Fish-hatching* (1863); Nicols, *Acclimatisation of the Salmonidæ at the Antipodes* (1882); Major J. P. Traherne, *The Habits of the Salmon* (1889); H. P. Wells, *The American Salmon Fisherman* (1886); and C. Hallock, *Salmon Fisher* (New York, 1890); besides the articles ANGLING, POACHING, and PISCICULTURE, with other works cited there.

Salmon, GEORGE, mathematician and divine, was born in Dublin, September 25, 1819, and had his education at Cork, and at Trinity College, Dublin, where he graduated as senior moderator in mathematics in 1839. He was appointed to a fellowship in 1841, took orders in 1844, and became regius professor of Divinity in 1866, provost of the college in 1888, being also a Fellow of the Royal Society, a D.D. of Dublin and Edinburgh, D.C.L. of Oxford, and LL.D. of Cambridge. His contributions to mathematical learning include many papers in the special journals, and admirable treatises on *Analytic Geometry*, *The Modern Higher Geometry*, *Conic Sections*, *The Higher Plane Curves*, and *Geometry of Three Dimensions*. In the department of theology his writings comprise four volumes of strong and thoughtful sermons, *College Sermons* (1861), *The Reign of Law* (1873), *Non-Miraculous Christianity* (1881), *Gnosticism and Agnosticism* (1887), and two collections of his lectures, the first forming an excellent *Introduction to the New Testament* (4th ed. 1890), the other on the *Infallibility of the Church* (1888), a vigorous and unusually readable controversial work.

Salmonidæ, a large and important family of Teleostean fishes in the order Physostomi. The family includes salmon and trout (*Salmo*), smelt (*Osmerus*), grayling (*Thymallus*), vendace, pollan, and 'white-fish' (*Coregonus*), and four or five other genera—about a hundred species in all. They inhabit both salt and fresh water, and many migrate from the one to the other. With one exception (in New Zealand), the fresh-water forms are restricted to the temperate and arctic zones of the northern hemisphere. The body is generally covered with cycloid scales, the head is naked, there are no barbules, there is an adipose or fatty fin behind the dorsal, the pelvic fins are situated about the middle of the ventral surface, the outline of the belly is rounded, the air-bladder is large and open, and with the stomach numerous pyloric cæca are associated. The eggs are large and are shed into the abdominal cavity before they are spawned. In beauty, activity, and also in palatability, the Salmonidæ rank high among fishes.

See SALMON, SMELT, TROUT, &c.; Day's *British and Irish Salmonidæ* (1887); and for the acclimatisation of Salmonidæ since 1864 at the antipodes, works by Sir S. Wilson (1879) and Nicols (1882).

Salomon, Johann Peter, violin-player and musical composer, born at Bonn in 1745. When young he was attached to the service of Prince Henry of Prussia, for whom he composed several operas. He settled in London, and his series of Philharmonic Concerts there in 1790, for the first of which he arranged to have Haydn present, form an era in the history of music, in that they led to the production of Haydn's twelve grandest symphonies. In 1800 Salomon retired from public life, but continued to compose songs, glees, and violin solos and concertos. He died on 25th November 1815, and was interred in Westminster Abbey.

Salona, an ancient and now ruined city of Dalmatia, stood at the head of a gulf of the Adriatic, about 3 miles NE. of the spot on which Diocletian afterwards built his gigantic palace of Spalato (q.v.). It was made a Roman colony in 78 B.C., and later became the capital of Dalmatia and one of the most important cities and seaports of provincial Rome. But it was frequently captured by the Goths and other barbarians, and in 639 was completely destroyed by the Avars. The inhabitants who escaped took refuge in Hadrian's palace. The ruins have been excavated during the 19th century; there are now to be seen remains of the former walls, the shell of the ancient Christian cathedral, traces of an amphitheatre, and other structures. The city was early made the seat of a bishop, who was soon advanced to the dignity of archbishop of all Dalmatia. After the destruction of the city the archbishop converted the temple of Jupiter at Spalato into his cathedral.

Saloni'ca, or Saloniki (Turk. *Selanik*), the second commercial city of European Turkey, next after Constantinople, stands at the head of the Gulf of Salonica, and since 1889 has been connected by rail with Belgrade *viâ* Uskub and Nisch, and so has direct railway communication with Vienna (820 miles distant). The city climbs up the rocky heights that stretch back from the shore, and is overlooked by a citadel, the ancient acropolis. From the sea it has a fine appearance, being surrounded with white walls, 5 miles in circumference, and having its houses and mosques embowered in trees of dark foliage. The streets previous to 1889 were narrow, rough, and dirty; since that year they have been widened and excellently paved and drained. The principal buildings of interest are the mosques, which were, most of them, Christian churches, and preserve on their walls many valuable evidences of Byzantine art. St Sophia, modelled after its namesake at Constantinople, built in Justinian's reign, and a mosque since 1589, is shaped like a Greek cross and surmounted by a dome covered with mosaics. In the great fire of September 3-4, 1890, which did £800,000 worth of damage to the town, it was a good deal injured, but not irreparably, though the archives were burned. St George, dating probably from the time of Constantine, is circular in form; its dome too is covered with fine mosaics, which were spoilt greatly when the church (mosque) was 'restored' in 1889. St Demetrius (7th century) is decorated internally with slabs of different coloured marble. The Old Mosque was anciently a temple of Venus. Here is the propylæum of the hippodrome in which Theodosius in 390 ordered the massacre of 7000 of the citizens of Salonica. The Via Equatia, the great high-road from the Adriatic coast (i.e. from Rome) to Byzantium, passes through this city. Its entrance and exit were marked by handsome Roman arches, of which that at the west end was taken down in 1867; the other, the arch of Constantine, at the east end, still stands, but in a ruinous condition. The commerce of the port is steadily increasing, especially since the opening of the railway to Servia. The imports, consisting chiefly of metal wares, textiles, coffee, petroleum, salt, sugar, rice, and soap, reach an annual average of £1,377,000. The exports—coin, cotton, opium, wool, tobacco, skins, silk cocoons, &c.—average £1,400,000. One-third of the total maritime trade (1,500,000 tons in and out) is in the hands of Great Britain. The native industries include the manufacture of cotton, flour, soap, bricks, leather, silk, and carpets. Pop. (1890) estimated at 121,600, of whom nearly 61,000 were Jews of Spanish descent, 25,000 Turks, and 14,000 Greeks.

Salonica is the ancient *Thessalonica,* to whose Christian community St Paul addressed the two Epistles to the Thessalonians. At this city too Cicero dwelt when he withdrew from Rome after the suppression of the Catiline conspiracy. Thessalonica was built by Cassander about 315 B.C. on the site of an older city named Therme, and was called after his wife, sister of Alexander the Great. It soon became a place of importance as the principal harbour of Macedonia, and later was the chief station on the Via Equatia. Under the Byzantine emperors it successfully withstood the Goths and the Slavs, but was captured by Moslems from Africa in 904, when they carried away 22,000 of its people into slavery, and by the Normans of South Italy in 1185. After several changes the city passed into the hands of the Venetians, and from them the Turks took it in 1430.

Saloop. See Sassafras.

Salop. See Shropshire.

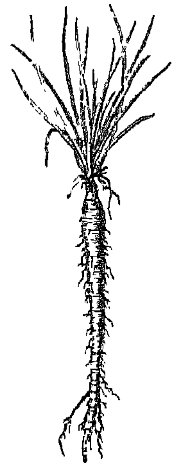
Salpa, a remarkable genus of free-swimming Tunicates, included along with Doliolum and Anchinia in the order Thaliacea. Several species occur in the warmer seas, transparent pelagic animals, complex in structure and in life-history. The body is somewhat barrel-shaped, open at both ends, ringed round by several distinct but incomplete hoops of muscle, controlled by a complex nervous system, possessed of eyes and other less definite sense-organs, with compressed lateral viscera. In the life-history there is an alternation of generations. There are asexual forms or 'nurses,' from which there grows out a long ventral 'stolon.' This stolon is segmented into a chain of sexual buds, and the whole chain is set free. As the individuals become mature they separate from one another, the chain breaks into its links. Each of these produces an ovum, which after fertilisation develops into an embryo and into the asexual 'nurse' form with which we began. The sexual forms are hermaphrodite, like all Tunicata, but cross-fertilisation seems to occur.

Sal Prunelle, purified nitre in mass, or fused and rolled into small balls. See Nitre.

Salses. See Volcano.

Salsette, an island lying N. of Bombay, with which it is connected by a bridge and a causeway. It is a beautiful island, diversified by mountain and hill, studded with the ruins of Portuguese churches, convents, and villas, and rich in extensive rice-fields, cocoa-nut groves, and palm-trees. Area, 241 sq. m.; pop. (1881) 108,149; chief town, Thana (q.v.). Nearly one hundred caves and cave-temples exist at Kánhari or Keneri, in the middle of the island, five miles west of Thana. They are excavated in the face of a single hill, and contain elaborate carving, chiefly representations of Buddha, many of colossal size. There are caves in other localities besides those at Kánhari—e.g. at Montpezir, Kanduti, Amboli, &c. It was occupied by the Portuguese early in the 16th century, and was captured by the Mahrattas in 1739 and by the British in 1774.

Salsify, or SALSAFY (*Tragopogon porrifolium*), a biennial plant growing in meadows throughout Europe, locally indigenous in the south-eastern counties of England, cultivated in gardens for the sake of its root, which is used in the same manner as the carrot, and is very delicate and pleasant, with a flavour resembling asparagus or scorzonera. Cooked in a certain way it somewhat resembles the oyster in flavour, hence the popular name *Oyster Plant.* The root is long and tapering, and in cultivation white and fleshy, with much white milky juice; the stem 3 to 4 feet high, with smooth and glaucous leaves, which resemble those of the leek; the flowers are of a dull purple colour. The seed is sown in spring, and the root is ready for use in winter. Next spring, when the flower-stalks are thrown up, they are used like asparagus. The genus Tragopogon belongs to the natural order Compositæ, sub-order Cichoraceæ. The Yellow Goat's Beard (*T. pratensis*), a native of Britain, was formerly cultivated in England for its roots, which are similar in quality to salsify. Scorzonera is sometimes called Black Salsify.



Salsify (*Tragopogon porrifolium*).

Salt, or CHLORIDE OF SODIUM (sym. NaCl; sp. gr. 2·15). This substance is called by chemists common salt to distinguish it from a great number of other bodies termed Salts (q.v.) in scientific language. Rock-salt or halite crystallises in cubes, colourless and usually transparent when pure, and sometimes measuring an inch on the side. It is, however, generally coloured by the presence of some foreign body, and occurs of yellow, red, blue, and purple tints. When decidedly impure it is often of a dull-gray colour. Salt is one of the few substances which are nearly as soluble in cold as in hot water. A saturated solution has a specific gravity of 1·205. Sea-water, which contains salt to the extent of from 2·5 to 2·7 per cent., has a mean specific gravity of 1·027. Salt has a saline but not a bitter taste, and is inodorous. Some of the physical properties of rock-salt are remarkable (see HEAT, Vol. V. p. 610). Salt is of great importance as a condiment and antiseptic, and equally so in some chemical manufactures. As rock-salt it is found in most countries, and in some extensively; but salt from any source is scarce and costly in some places—certain parts of the interior of Africa, for example. It can, of course, be obtained by evaporating sea-water. Some beds or deposits of rock-salt have no doubt been formed by the slow evaporation of large bodies of salt water, which by one means or another—by a sandbank, for example—have been cut off from communication with the sea. This process would sometimes be repeated by sea-water again getting in through a breach in the bank, and this again being filled up. There are instances where it has certainly been formed in this way on a limited scale. But geologists seem to be of opinion that beds of rock-salt have more generally arisen from the long-continued evaporation of large inland lakes without outlets; these had long been fed by rivers or streams which dissolved salt out of the soil or strata over which they flowed. The Dead Sea and the Great Salt Lake of Utah are examples of lakes without outlets at the bottoms of which rock-salt is forming. All salt, wherever found, has probably come originally in some way or other from the sea. Rock-salt beds are usually associated with deposits of sulphate of lime (calcium sulphate), and are more common in the Trias than in other geological formations.

Valuable beds of rock-salt, usually accompanied with brine, occur in England. The Cheshire deposits, which are in the basin of the river Weaver, have been long worked and are still productive. At Northwich in that county rock-salt is found at from 200 to 250 feet below the surface. There are four beds of an aggregate thickness of 240 feet, but the two lower ones are mixed with marls. The two upper beds each average about 90 feet in thickness, with some brine just above the top bed. At Winsford and Wheelock in the same county thick beds of rock-salt also occur at moderate depths. In Worcestershire, at Stoke Prior and at Droitwich, rock-salt occurs, 154 feet thick including marls in the former locality, and brine is likewise found at both places. At Stafford Common in Staffordshire the salt is 78 feet thick; and in these two counties the deposits are not far below the surface. In Cheshire some rock-salt is still mined at Northwich, but here, as in other places in the west of England, most of the salt is obtained from brine naturally overlying the rock-salt or from inundated salt-mines. In 1889 an important discovery of rock-salt was made at Walney Island and at Fleetwood (Preesall), in Lancashire, where the deposits are roundly from 100 to 500 feet in thickness, and at the former place from 270 to 360 feet below the surface. This Lancashire salt was first worked (as Preesall brine) in 1890. On the east side of England, between Middlesborough and Hartlepool, there is an extensive deposit of rock-salt, which was accidentally discovered in boring for water in 1862. Its proved area is between 30 and 40 sq. m., the salt is from 50 to 115 feet thick, and its depth below the surface varies from 800 to 1600 feet. This is greatly deeper than the beds in the west of England. Hitherto in this district the rock-salt has not been mined. A bore-hole is made, into which a double iron pipe—one within the other—is inserted, and in the jacket or annulus thus formed fresh water is let down to form brine, which is pumped up through the inner tube by a steam-engine. In 1890 the rock-salt mined in England (Cheshire) amounted to 159,000 tons, while the salt obtained from brine was as much as 1,958,000 tons, Cheshire producing more than two-thirds of the latter. Some rock-salt is mined at Carrickfergus in Ireland.

Rock-salt is found in Galicia, the mines at Wieliczka, which have been worked since the 13th century, being the most famous in the world. The system of mines extends over an area of about 6 miles from east to west, and 2 miles from north to south, with underground streets, squares, &c., and over 30 miles of tramway; the greatest depth reached being about 12,000 feet. In Wallachia, Transylvania, Hungary, Upper Austria, Styria, Salzburg, and the Tyrol important salt-mines are worked. Rock-salt is also found in Russia, Italy, and largely at Stassfurth in Germany and Cordova in Spain. Of eastern countries Persia is perhaps the best supplied with salt; India has productive mines in the Salt Range (q.v.), but salt is also largely imported; and both rock-salt and salt lakes occur in Asiatic Russia. The Wieliczka rock-salt is of Tertiary age; that of Cheshire, Bavaria, and the Austrian Alps Triassic: in Permian deposits near Berlin borings have gone down in rock-salt for nearly 4000 feet. Deposits of the same age occur also in Holstein, and in eastern Russia. Brine-springs rise from many other geological systems: thus, in Northumberland and Leicestershire they issue from Carboniferous strata, while in some parts of the Alps they come from rocks of Jurassic age. Similarly in North America saliferous formations occur on several geological horizons. Thus, the salt-works at Syracuse, New York, and in the neighbourhood of Goderich on the Canadian side of Lake Huron, are in the well-named 'Salina group' of the Upper Silurian. Brine-springs also rise from the Carboniferous strata of Michigan, Ohio, and Virginia, while a thick bed of rock-salt of apparently Cretaceous age occurs in southern Louisiana.

Not infrequently rock-salt occurs in considerable abundance at the surface; some of these accumulations are of quite recent formation, while others are of great geological age. Thus, at Cardona (Montserrat) in Spain rock-salt forms hills some 400 and 500 feet in height—the deposits being probably of Cretaceous age; and similar masses occur near Orenburg in Russia, and in the Punjab. Superficial saline deposits are met with covering extensive areas in many more or less desert regions, where they evidently indicate the sites of dried-up lakes and inland seas of comparatively recent age. As examples may be cited the rock-salt deposits of the Kirghiz Steppes, those near Lake Urumiah, and in various parts of South America. Salt lakes from the bottoms and shores of which rock-salt is obtained are met with in many regions, both in the Old and New Worlds. Thus, it is collected in Cyprus, Melos, the Crimea, and the Aral-Caspian area; and many saline lakes, pools, and marshes occur in the great western region of North America. Even in dry warm regions where no salinas may happen to exist, an efflorescence of salt not infrequently covers the ground after rains—the salt having doubtless been derived by capillary attraction from the underlying subsoils and rocks. Rock-salt also occurs as a product of sublimation in volcanic regions, from which it has been inferred that much of the steam emitted by volcanoes has come from water introduced by underground fissures from the sea.

When brine is pumped up to the surface it is run into cisterns or reservoirs situated at a higher level than the evaporating pans, into which it descends through pipes. These pans are large shallow iron vessels, heated either by coal-fires placed beneath them or by other means, such as waste steam. With a high heat and a short time in the pan a fine salt is produced; with a comparatively low heat and a longer time in the pan a coarse salt forms. Agitation of the brine tends also to produce a fine salt. Brine boils at 226° F., and it is at this temperature that ordinary table-salt, called also 'lump' or 'lumped' salt, is produced. At about 165° F. what is called 'common' salt is obtained; large-grained salt forms at between 130° and 140° F.; and fishery-salt, also large grained, at from 100° to 110° F. The salt crystallises on the surface of the brine in the pan, floats about a little, and then falls to the bottom, leaving the surface free for a fresh crop of crystals. Twice or thrice in twenty-four hours fine salt is drawn from the pans, which are kept nearly full of brine, by raking it to the side and lifting it out with perforated scoops. It is then put into moulds called 'tubs,' and left for about half an hour to let the water drain off, after which the shaped lumps are put into a stove, where they remain till they are quite dry. Sometimes even fine salt is not stoved, and it is then called butter salt or cheese salt. To make salt of the largest grain the brine is left for nearly a fortnight before removing the crystals. In this process the 'bittern' or magnesium chloride remains in solution after the common salt separates.

At different places around the British coasts salt was formerly obtained by evaporating sea-water, and to such salt the name bay-salt (often used for coarse salt) properly belongs. In Spain, Italy, and southern France the manufacture of salt in this way is practised on a large scale. Besides common salt sea-water contains much smaller quantities of potassium chloride, magnesium chloride and sulphate, calcium sulphate, and more minute quantities of other bodies. The water of the Mediterranean, which is slightly more salt than the open ocean, contains 2·72 per cent. of sodium chloride. As the evaporation goes on calcium carbonate separates first and then calcium sulphate. When the water reaches the density of between 1·22 and 1·31 sodium chloride separates along with small quantities of other salts; and when the specific gravity becomes 1·33 very little of anything but magnesium chloride remains. A series of shallow rectangular basins are usually so arranged that the water can flow from basin to basin, and when it has reached the lowest the partially concentrated sea-water is collected in a well. From this it is raised to the first of another series of basins, and finally into the series where the salt crystallises. The salt is then stacked in heaps, which are protected from rain and left for months to drain. This to a large extent gets rid of deliquescent and bitter impurities. It then contains about 95 per cent. of chloride of sodium, in which state much of it is sent into the market.

In some northern countries sea-water, suitably placed for the purpose, is frozen over in winter in order to increase the proportion of salt in what remains liquid, since the ice so formed is fresh. The water is then evaporated by artificial heat till the salt is obtained. The chief markets abroad for British salt are India and the United States. To the former country about 300,000 tons are now annually exported, and to the latter 120,000 tons were sent in 1889, or only about one-half the average quantity exported to that country a few years before. It is estimated that London consumes daily 11 tons of salt.

Besides its universal use as a condiment, salt is an all-important substance in the manufacture of soda, hydrochloric acid being obtained from it in large quantities in the process as a by-product. It is also employed in the manufacture of soap and for producing what is called a salt-glaze on stoneware. Agriculturists destroy slugs and grubs with salt, and it appears to improve the fertility of soils when mixed with certain manures. Brine is used in the pipes of freezing-machines. Rock-salt is carved into cups and vases in the Punjab, and it is said that houses are built of it in certain very dry regions, as in the Desert of Caramania, where this material is abundant.

The salt-tax was or is in some countries an important source of revenue, though it is recognised by economists as one that presses unfairly on the poor. The salt-tax of the ancient regime in France is referred to at GABELLE. In modern Italy tobacco and salt are government monopolies. In British India the revenue from the salt duty comes next in value to that from land and opium. It was equalised over all India after 1878, the rate being 2¼d. per maund of 82 lb. In Britain salt duties were first exacted in 1702; the rate was 5s. per bushel in 1798, during the great French war, but was ultimately increased to 15s. per bushel, thirty or forty times the cost of the article! The duty was finally remitted in 1825. Salt makers or salters used in some parts of Britain to be, like colliers, serfs (see SLAVERY). For the value of salt in preserving food, see ANTISEPTICS, PRESERVED PROVISIONS. For the varying saltness of the sea at various depths, see ATLANTIC, PACIFIC, SEA, &c.

See J. J. L. Ratton's *Common Salt* (1879), and E. M. Boddy's *History of Salt* (1881).

Salt, SPIRITS OF, the old name for muriatic or hydrochloric acid.

Salt, SIR TITUS, a public-spirited English manufacturer, was born at Morley, near Leeds, 20th September 1803. He began business as a wool-stapler at Bradford, and being successful started wool-spinning in 1834, and was the first to introduce the manufacture of alpaca fabrics into England. His utilisation of the alpaca, which first came under his notice during a business visit to Liverpool, is one of the romances of British commerce. As business increased he concentrated his factories in a pleasant valley, 3 miles from Bradford, on the Aire (1853), and round these factories, which cover 12 acres, rose the model village of Saltaire (q.v.). Titus Salt was mayor of Bradford in 1848, was returned as member of parliament in 1859, and was created a baronet in 1869. He died 29th December 1876. There is a statue of him in Bradford. See Life by Balgarnie (1877).

Salta, a northern province of the Argentine Republic, touching Chili and Bolivia, and nearly enclosing the province of Jujuy. Minerals are abundant, but have been neglected for agriculture and cattle-raising. Salta is watered by the Salado, San Francisco, and Bermejo. Area, 49,510 sq. m.; pop. 200,000.—SALTA, the capital, on the Rio Arias, 535 miles by rail N. by W. of Córdoba, was founded in 1582, is the seat of an archbishop, and has a seminary for priests, a national college, and a normal school for girls. Pop. 20,000.

Saltaire, a model village on the Aire, 3 miles from Bradford and 11¾ miles by rail from Leeds, founded and built by Sir Titus Salt (q.v.), who opened his worsted and alpaca factory here in 1853. This factory covers 12 acres, and is six stories high. The place possesses a church of Byzantine architecture, hospital, school, a park of 14 acres, workmen's club and institute which cost £30,000, &c. New Technical Schools were opened in 1887. Pop. about 5000.

Saltash, a picturesque ancient municipal borough and seaport of Cornwall, on the west side of the estuary of the Tamar, and 4½ miles NW. of Plymouth by a railway that crosses the Tamar by Brunel's iron Royal Albert Viaduct (1857–59), 2240 feet long and 240 high (the roadway 102 feet above high-water mark), constructed at a cost of £230,000. The church of St Nicholas dates from 1225. The town, which was frequently taken and retaken during the great Civil War, was disfranchised in 1832. Pop. (1851) 1621; (1891) 2541.

Saltburn, a picturesque Yorkshire watering-place, 4 miles SE. of Redcar. It dates only from the opening of the railway in 1861; but, built on lofty cliffs facing the sea, and possessing numerous attractions, it has prospered greatly. Pop. (1881) 1646; (1891) 2232.

Saltcoats, a watering-place of Ayrshire, on the Firth of Clyde, 1 mile ESE. of Ardrossan and 30 miles SW. of Glasgow. It was an important seat of salt manufacture from 1686 to 1827. Pop. (1841) 4238; (1891) 5895.

Saltillo, capital of the Mexican state of Coahuila, by rail 237 miles SW. of Laredo, Texas, and 603 N. by W. of Mexico city. It contains several convents, a small fort, a bull-ring, a number of cotton-factories and pulque-distilleries. Pop. 25,000. See Mrs Gooch, *Face to Face with the Mexicans* (1890).—Near it is Buena Vista (q.v.).

Saltire. See HERALDRY, Vol. V. p. 662.

Salt Lake City, the chief town and ecclesiastical capital of the territory of Utah, is on the river Jordan, 11 miles from Great Salt Lake (q.v.), and 4265 feet above the level of the sea. By rail it is 36 miles S. of Ogden, on the Union Pacific Railroad (833 miles from San Francisco and 1031 from Omaha). It was settled by the Mormons (q.v.) in 1847, and incorporated in 1851; it is divided into five municipal and twenty-one ecclesiastical wards; has an area of 12 sq. m., with corporate limits embracing 50 sq. m.; and its shaded streets, 137 feet wide, many of them freshened by streams of running water from the neighbouring mountains, are traversed by tram-cars (1872), and lit by gas (1873) and the electric light (1877). Brick and timber are the common building materials, and wooden 'shanties' still keep their place even in the principal streets. The finest public buildings are the Mormon temple (unfinished; $2,500,000 had been expended on it by 1886), with walls built of blocks of dressed granite, 20 feet thick at the basement, and tapering to 6 feet thick at the top; the Tabernacle, an immense elliptical building, with a dome-shaped ('dish-cover') roof resting on sandstone pillars, and seated for 9000; the new assembly hall, of rough-hewn granite; the endowment-house, &c. But, though the Mormon influence is still strong, other religious bodies also are represented, and there are Roman Catholic, Episcopalian, Presbyterian, Congregationalist, and Methodist churches: St Mark's Cathedral is a handsome building. Other noteworthy edifices are those of the museum, the Mining Institute, St Mary's Hospital, the university of Deseret (1850; buildings finished, 1887), and the theatres and opera-house. The mud-wall erected in 1853 has now disappeared. Something more than a beginning has been made of manufactures—bricks, paper, timber, blinds, window-glass, &c. Pop. (1870) 12,854; (1880) 20,768; (1890) 44,843. See Burton, *The City of the Saints* (1861), H. H. Bancroft's *History of Utah* (San Francisco, 1889), and the works cited in the latter.

Salto, a north-western department of Uruguay, on the Uruguay River, is a picturesque hill-country, watered by the Arepey and its many tributaries, and devoted to cattle-rearing. Area, 4863 sq. m.; pop. (1887) 25,027.—The chief town, Salto, stands on three hills almost at the head of navigation on the Uruguay, 306 miles from Buenos Ayres, and 86 by rail N. of Paysandù. It carries on an active frontier trade with Brazil, exporting goods valued at $1,500,000 yearly, and has a granite pier, and a foundry and shipbuilding establishment. Pop. 12,000.

Salt of Saturn, a name for acetate of lead.

Salt of Sorrel, the common name for binoxalate of potash. See OXALIC ACID.

Salt of Tartar, a commercial name for carbonate of potash in a very crude form.

Saltpetre. See NITRE.

Salt Range, a mountain-system in the Punjab, India, consists of two main chains running east and west, and embracing between them an elevated tableland. It begins on the south side of the Jhelum, runs west to the Indus, and varies from 3200 to 5000 feet in height. Its appearance is exceedingly bleak and barren, but not without much savage grandeur. The system gets its name from the inexhaustible beds of rock-salt that occur on the edges of the plateau. Some 60,000 tons are extracted annually, four-fifths from the Mayo mines, a few miles north-east of Pind Dadan Khan. Coal and other minerals also occur.

Salts constitute an extremely important class of substances in chemistry, of which common or sea salt (sodium chloride) may be mentioned as the most familiar example. Epsom salt (magnesium sulphate), Glauber's salt (sodium sulphate), saltpetre (potassium nitrate), Rochelle salt (sodium potassium tartrate) are other well-known salts. Common salt appears to have been known from the earliest times, and the fact that the same Greek word *hals* is used in the feminine, signifying the ocean, and in the masculine, signifying salt, would seem to indicate the sea as the source from which common salt was obtained in the first instance. The application of the name salt to substances other than common salt would follow from the more or less general similarity of these to common salt in appearance, and in the more easily observed properties, such as solubility, taste, &c.

By the term salt chemists now ordinarily understand a substance which may be looked upon as derived from an acid by the replacement of part or the whole of the hydrogen of the acid by means of a metal or of a Radical (q.v.) capable of playing the part of a metal; such as, for instance, the radical NH_4, which is called ammonium. The acids themselves are even looked upon as constituting the hydrogen terms in the various series of salts, and are sometimes called hydrogen salts.

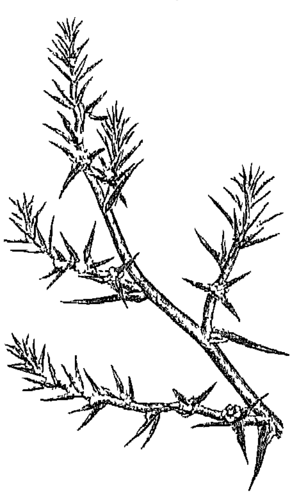
There are several general modes of formation of salts. One of the most important of these depends upon the mutual action upon each other of an acid and a Base (q.v.), when the typical characters of each of these substances disappear and a salt is produced, usually with the simultaneous production of water. For example, when nitric acid and the basic oxide of lead act upon each other, lead nitrate and water are produced, thus: $2HNO_3 + PbO = Pb(NO_3)_2 + H_2O$. Salts are also frequently produced when metals are dissolved in acids, the hydrogen of the acid being displaced by the metal. Thus, iron dissolves in dilute hydrochloric or sulphuric acid with the evolution of hydrogen and the formation of a ferrous salt: $Fe + H_2SO_4 = H_2 + FeSO_4$. Strictly analogous to the displacement of hydrogen from sulphuric acid by means of iron is the displacement of copper from cupric sulphate by the same metal—this action also giving rise to ferrous sulphate while copper is precipitated: $Fe + CuSO_4 = Cu + FeSO_4$. In the process called double decomposition (see CHEMISTRY, Vol. III. p. 152) two new salts are frequently produced when the solutions of two salts are mixed together, as, for instance, when sodium chloride and silver nitrate act mutually upon each other, yielding silver chloride and sodium nitrate: $NaCl + AgNO_3 = AgCl + NaNO_3$. There are other modes of salt formation which are of minor importance.

Salts are frequently considered as consisting of metal and salt radical, the latter comprising all that portion of a salt which is not metal, as explained in the article RADICAL. In the cases of the so-called haloid salts (fluorides, chlorides, bromides, iodides) the salt radical consists of one element only, while in other salts the salt radical contains two or more different elements. The names given to certain classes of salts may be shortly explained. Normal salts are those resulting from the displacement of the whole of the displaceable hydrogen of an acid by means of a metal. Neutral salts are such as do not exhibit either the acid or the alkaline reaction when dissolved. Basic salts and acid salts, as contrasted with the normal salts, are respectively intermediate in composition between the normal salt and the base and between the normal salt and the acid. These salts still possess the respective characters of a base and of an acid. Double salts may contain two or more metals in combination with the same salt radical, or two or more salt radicals in combination with the same metal, or they may contain more than one metal and more than one salt radical.

SMELLING-SALTS are a preparation of carbonate of ammonia with some of the sweet-scented volatile oils, used as a restorative by persons suffering from faintness. The pungency of the ammonia is all that is useful, and the oils are added to make it more agreeable. Oils of lavender, lemon, cloves, and bergamot are those chiefly used. The celebrated Preston smelling-salts are scented with oils of cloves and pimento. The manufacture of ornamental bottles to contain this preparation is an important branch of the glass and silversmith's trades.

Saltus, EDGAR, an American author, born in New York City, 8th June 1858, studied at Paris and in Germany, and in 1880 graduated at Columbia College law-school. His writings include a good biography of Balzac (1884); a history of Pessimistic philosophy—*The Philosophy of Disenchantment* (1885), and *The Anatomy of Negation*—both treated with a curious whimsical briskness and humour; and a series of striking stories, full of an odd passionate materialism and biting cynicism, painful, but original and clever, though disfigured by a fantastic style and eccentric vocabulary—*Mr Incoul's Misadventure* (1887), *The Truth about Tristrem Varick* (1888)—these two the best—*Eden* (1888), *A Transaction in Hearts* (1889), and *The Pace that Kills* (1889).

Saltwort (*Salsola*), a genus of plants of the natural order Chenopodiaceæ, having hermaphrodite flowers, with 5-parted perianth and a transverse appendage at the base of each of its segments, five stamens and two styles, the seed with a simple integument. The species are numerous, mostly natives of salt marshes and sea-shores, widely diffused. One only, the Prickly Saltwort (*S. Kali*), is found in Britain. The plant is annual, with prostrate much-branched stems, awl-shaped spine-pointed leaves, and axillary solitary greenish flowers. It was formerly collected in considerable quantities on the western shores of Britain, to be burned for the sake of the soda which it thus yields. *S. sativa* is the chief Barilla (q.v.) plant of the south of Spain.



Prickly Saltwort (*Salsola kali*).

Salutations are customary forms of address at meeting or at parting, or of ceremonial on religious or state occasions, including both forms of speech and gestures. Through the influence of heredity and habit many of these have become reflex irrepressible actions, their observance fortified with all the sanctity of moral or religious obligation. For although it is true that etiquette is entirely a matter of relative, and not absolute, obligation, and that such a feeling as modesty itself is mainly a question of latitude, yet the average modern European dreads the unfavourable judgment of society upon a solecism more than the condemnation of his own conscience on some breach of the weightier matters of the law. And it seems to be a general rule among races of men, not to speak of individuals, that extremes of ceremonious salutation stand in inverse ratio to their moral value. The ceremonious politeness of modern Europe has descended in great measure from the unworthy regime of the Lower Roman Empire, and its traditions, now as well as then, are incapable of being taken literally, its metaphors translated into fact. It is a complete mistake to suppose that savages are at all informal or extemporary in their salutations and ceremonies. Salutations tend to become less elaborate in progressive civilisation, the tendency being toward the preservation only of those which help to soften the asperities of social intercourse. Savages are much more given to gesticulation than civilised men. Yet it is unsafe to say that this depends solely upon degrees of culture, for there is a wide difference at the present day between the Neapolitan or Tarasconese and the German or Scotchman. No race has neglected the use of gesture more than the English—only among our deaf-mutes do we see what the capability of gesture is, and of what a wealth of expression we have deprived ourselves. Many of the natural gesture-signs, used as occasion arises, do not fall under the head of salutations, as involving nothing ceremonial, such as beckoning with the hand, thrusting out the tongue, snapping the fingers, or such vulgarisms as 'taking a sight'—itself a mark of respect among the Todas—and the like; nor yet such natural but significant outward expressions of inward emotion as weeping or trembling for fear, grief or joy, or yet blushing, which Darwin calls 'the most peculiar and the most human of all expressions.'

One of the most ancient and wide-spread, as well as natural, forms of salutation by gesture is the embrace in testimony of affection, as we find it in the Old Testament and in Homer. The kiss was at no time universal, being unknown among Fuegians, New Zealanders, Papuans, Australians, and Eskimos. It was used by the ancient Hebrews, Greeks, and Romans, and among the early Christians was adopted as a sign of fellowship, survivals of which are the Eastern kiss of peace at the Eucharist and the Western modified use of the *osculatorium* or *pax*. In England it was formerly the custom to kiss at the beginning and end of a dance, as well as on meeting a lady or taking leave of her; and the favourite game among the lower orders of 'kiss-in-the-ring' is the last survivor among many similar old English pastimes. As a general form of salutation, however, it appears to have been a custom peculiarly English; Æneas Sylvius describes the Scottish women of his day as 'giving their kisses more readily than Italian women their hands;' Erasmus, in a letter to a friend, describes it as a custom never sufficiently to be praised, and Bulstrode Whitelocke describes his satisfaction in teaching the English mode to Queen Christina's ladies at the court of Sweden. The Puritans objected strongly to it, but its disuse was really the result of the French airs that came in with Charles II., and it lingered among honest country-folk till the times of the *Spectator*. It is still used ceremoniously between royal personages, and still on the Continent even between men at parting or meeting again after an absence, as well as in the more servile forms of kissing the hand of a royal personage or the foot of the pope. The custom of grasping or shaking hands is now widely spread over the world, either in the English method, with its many gradations of heartiness, or the Moslem variety of pressing the thumbs against one another as well; but it is not really a primitive custom everywhere, and is by no means, as Dr Tylor has shown, to be explained with Herbert Spencer as a compromise between a simultaneous effort of two persons to kiss each others' hands in token of submission. Its real origin lies deeper in the universal gesture-language of mankind, the essential act being a joining of hands to express compact, union, peace, or friendship. The Roman *dextrarum junctio*, in making a contract of marriage, preserved by ourselves, and the early Christian 'right hand of fellowship,' point to the real origin of what has become a mere salutation with us as with the Romans themselves. Other forms of salutation that recall the civilities observed among dogs, cats, and other animals are forms of bodily contact, as the rubbing of noses of the Laplanders and New Zealanders; the patting of each other's arms, breasts, or stomachs, by North American Indians; the Polynesian stroking of one's own face with another's hand or foot; the clapping of hands and leaping backwards and forwards in Loango; the snapping the fingers in Dahomey; the Batongan rolling on the back along the ground, slapping the thighs the while; the blowing with the breath upon another, described by Du Chaillu, in Africa; or Sir Samuel Baker's description of the Abyssinian custom of holding another's hand and pretending to spit upon it. The Polynesians and Malays always sit down when speaking to a superior; a Chinaman puts on his hat instead of taking it off; on the Congo and elsewhere in Central Africa it shows respect to turn the back upon a superior in addressing him. The Tongans reserve the use of certain words for the king alone, and they employ the third person in token of respect. Still more marked is the difference between ceremonial and common speech in Samoa, and here also they use the plural in speaking to a superior. In Fiji if a great man slips or falls every one of inferior rank must at once do the same.

Other groups of ceremonial salutations are the prostrations before a superior of ancient Egypt and Assyria, as well as of modern Dahomey, and of regular Moslem divine worship; the lying with the face in the dust of China and Siam; the ancient Malagasy custom of a wife crawling on all fours before a husband and licking his feet; the Arab refinement of putting the hand upon the ground and then lifting it to the lips and forehead; the kneeling on one knee to express homage to a European sovereign, as on both in divine worship; the turning toward the east, the genuflection before the host, or bowing at the pronouncing of the name of Jesus in Christian churches. These are all originally signs of submission or of inability to resist, meant to deprecate the majesty or the wrath of superior power. We find falling on the face before a potentate in the Old Testament, and in China at the present time among the eight kinds of obeisances, increasing in humility, the first is putting the hands together and raising them before the breast; the second, bowing low with the hands joined; the third, bending the knee; the fourth, actual kneeling; the fifth is kneeling and striking the head on the ground; the sixth, kneeling and thrice knocking the head, which again doubled makes the seventh, and trebled, the eighth—the famous *kotow* which Lord Amherst refused in 1816: this last being due to the emperor and to heaven. Among the Hebrews repetition had a kindred meaning—'Jacob bowed himself to the ground seven times, until he came near to his brother.' Survivals amongst ourselves of ancient more abject forms are the *curtsy* in the one sex, and in the other the *scrape* till lately accompanying the bow, made by a backward sweep of the right foot. From the profound bow, expressive of great respect, our usage shades away to the modern curt nod, in which respect has degenerated into mere recognition.

Uncovering, again, is a characteristic symbol of submission in presence of a superior (Isa. xx. 2–4), whether to the waist, as in Tahiti, or of the entire clothes, as in the case of the female attendants upon the king of Uganda. In Europe we only uncover the head, and this in many cases is minimised to a mere touching of the hat. In the Coptic and Abyssinian churches the Semitic custom of uncovering not the head but the feet is still preserved. We find the same ceremonial uncovering of the feet in ancient Peru and Mexico; and in Burma it was long a point of dispute whether foreigners should comply with the native custom on approaching the king.

Again, as for the words and phrases which accompany the gestures of salutation, we find the widest variety in form and nature. The oriental forms, both scriptural and modern, are full of grave dignity and religious character. Mohammed took advantage of this characteristic, and made the use of certain forms rigorous as religious passwords; exactly like the once common Spanish form, 'Ave Maria purisima,' which had to be answered by 'Sin pecado concebida.' The Eastern phrases, 'The Lord be with thee,' 'Be under the guard of God,' 'Blessed be thou of the Lord,' have degenerated into the Spanish 'Vaya con Dios, Señor,' the French 'Adieu,' and our own 'Good-bye,' abridged from 'God be with ye.' The Basque verb has distinct inflectional forms for use in addressing a man, a woman, a superior, or an equal. Our familiar abridged forms, 'Bless you,' 'Mercy me,' 'Save you, sir,' show an English reticence in a light and familiar use of sacred names which is not seen in the familiar French 'Mon Dieu,' the German 'Mein Gott' or 'Herr Je.' The *citoyen* and *citoyenne* of the French revolution was but one of a hundred childish attempts to obliterate the natural growth of ages, and it is not a little striking that 'Merci, *monsieur*,' was the phrase that came to the lips of the wretched Robespierre a moment before his end. The familiar *sir*, *signor*, *señor*, mon-*sieur* are of course ultimately referable to the Latin *senior* expressive of the reverence due to age; *madame*, *mademoiselle* lead up to Latin *dominus*, 'the master of a house.' The use of 'sir' may convey a sense of scorn, just as the archaic *sirrah* always implied anger or contempt. And even 'madam' and 'mistress' are not without an odious sense. The Greek phrase, both at meeting and parting, was *χαῖρε* ('be joyful'); the Romans usually said 'Salve' at the one and 'Vale' at the other. These words express wishes for cheerfulness, peace, health; specialised forms of the same are the Pauline *χάρις καὶ εἰρήνη* ('grace and peace') and the ecclesiastical 'Pax vobiscum' and 'Benedicite.' Such ceremonial forms as 'Let the king live for ever,' 'Long live the king,' by their hyperbole betray an oriental origin; 'good-day,' 'good-night' are obviously natural salutations everywhere, as are also the Italian 'Felicità,' the German 'Gesundheit,' the Roman 'Sit faustum ac felix.' Such phrases as 'Serene Highness,' 'Grace,' 'Lordship,' 'Excellency,' 'Eminence,' 'Transparency,' 'Right Honourable,' 'Most Noble,' 'Honourable,' 'Right Reverend,' 'Very Reverend,' 'Venerable,' 'Father,' 'Reverend,' like 'my learned brother' between counsel, and 'the gallant officer' of a soldier across the floor of the House of Commons, are conventional terms that must on no account be omitted, as omission could mean nothing but intentional disrespect. Quakers alone possess an immunity, the ground of their objection being recognised as a difficulty of conscience. A special salutation is due, as everybody knows, to any one who has just sneezed, perhaps as a tribute of respect to a sign of mortality. The English 'How do you do?' the French 'Comment vous portez-vous?' the German 'Wie geht's?' are mere forms that one uses without waiting for or thinking of the answer, just as the Spanish custom of offering to a visitor anything he happens to admire in one's house is expected to be answered by a ceremonious form of refusal. Many phrases are used which may have once expressed inferiority, but are now mere forms without meaning. The Chinese in particular have an elaborate vocabulary of complimentary epithets for the person addressed, and depreciatory terms for themselves. A wife calls herself 'a mean concubine;' the speaker's opinion is 'the stupid opinion,' his house 'the tattered shed;' your father is 'the honourable grey-beard,' 'the honourable severity;' your mother, 'the good gentleness.' Even a simple question takes a ceremonious and complimentary form, as, for example, 'To what sublime religion do you in your wisdom belong?'

An interesting chapter in the study of salutations is the history of the pronouns of address in the modern European languages. In English the use of the plural for the singular form was established as early as the beginning of the 14th century. In old English *ye* was always used as a nominative, and *you* as a dative or accusative —a distinction carefully observed in the Authorised Version of 1611. In Shakespeare's time, as Abbott points out, *thou* was proper from superiors to inferiors, and as expressing companionship, affection, permission, or of contempt and anger towards strangers; *ye* and *you*, again, are proper from a servant to a master, and as expressing compliment, submission, or entreaty. Thus, says Schmidt, the constant address of Venus to Adonis is *thou*, of Adonis to Venus *you*. Tarquin and Lucrece, being both in a state of extreme emotion, constantly address each other with *thou*. The swaggering host in *Merry Wives* uses *thou* to everybody, as long as he is in his pride, but *you* when he is crestfallen. In a solemn style even princes are addressed with *thou*, whereas Falstaff uses *you* even to Jove. But already *thou* had fallen somewhat into disuse, and being archaic was naturally adopted in the elevated language of poetry and prayer.

Similarly in German usage *du* ('thou') is no longer used in address, save in domestic or familiar intercourse, or sometimes to convey the deliberate familiarity of insult or contempt; *ihr* ('ye') in modern usage is only employed in addressing more than one of such persons as may singly be addressed by *du*. The singular pronouns of the third person, *er* ('he'), *sie* ('she'), once used in customary address, are now proper only from a superior to an inferior. At present the pronoun of the third person plural, *sie* ('they'), and its possessive *ihr* ('their') are alone allowable in the sense of 'you,' 'your,' whether in addressing one person or more. When thus used they are written with capital letters, and the verb with *Sie* is always in the third person plural, whether one person or more is intended, although a succeeding adjective is singular or plural according to the sense.

In Italian the personal pronoun *Tu* is used only in poetry, or in addressing persons of the lowest rank. To inferiors or to equals it is proper to use *voi*; but when respect is to be implied, *vossignoria*, or the feminine pronoun *ella*, which is always referred to it either expressed or understood.

In Roumanian conversation it is usual, instead of using the direct personal pronouns *tu* ('thou') and *voĭ* ('you'), to use the compound words *dumneata*, *dumneavóstră*, derived from *domnia ta* ('thy lordship'), *domnia vóstră* ('your lordship'). These words have thus become personal pronouns, and the latter is also used for the singular.

In Spanish *tú* is used only to the nearest relatives, dear friends, little children, and menials. *Vos*, once generally used, is now confined to persons of high rank or office, addressing their inferiors. Public speakers use the form *Vosotros;* and where the audience is entitled to it, *Usias* ('your Lordships'). *Usted* (contr. from *Vuestra Merced*, 'your Honour' or 'your Worship') is the only word used in common polite intercourse. *Usted* and its plural *Ustedes* are common to both genders, and agree with the verb in the third person singular or plural, according to the number. At present *Usted* in writing is represented by V., *Ustedes* by VV. or Vs.

See the articles ADDRESS (FORMS OF), KISS, KOTOW, TOASTS, &c; also chapters on 'Gesture-language' in Tylor's *Early History of Mankind* (1865); Herbert Spencer's *Ceremonial Institutions* (1879); the *Cornhill Magazine* for November 1879; and E. B. Tylor in *Macmillan's Magazine* for May 1882; and generally such books as Waitz's *Anthropologie der Naturvölker*.

Salute is a compliment paid in the Navy and Army when a royal or other distinguished personage presents himself, when squadrons or armed bodies meet, when officers are buried, and on many other ceremonial occasions. There are several modes of saluting: firing great guns and small arms, dipping colours, flags, and topsails, presenting arms, manning the yards, cheering, &c. A royal salute consists in the firing of twenty-one great guns, in the lowering by officers of their sword-points, and the dipping of the colours. A form of salute of more frequent occurrence is when a soldier 'presents arms' or touches his cap to an officer.

Saluzzo, a city of Northern Italy, at the foot of the Alps, 42 miles by rail S. by W. of Turin. It contains a semi-Gothic cathedral, built in 1480, with the tombs of the old marquises of Saluzzo, their old castle (now a prison), and the ruined abbey of Staffarda (1131–1737). Silvio Pellico was born here. It manufactures silk fabrics, leather, and hats. Pop. 9716.

Salvador', the smallest but by far the most thickly populated of the Central American Republics, consists of a strip of territory stretching along between Honduras and the Pacific, and bounded on the W. by Guatemala, and on the E. by Fonseca Bay, which separates it from Nicaragua. It is 140 miles in length by about 60 in average breadth, and has an area estimated at 7225 sq. m., with a population (1886) of 651,130, or 90 to the square mile. The formation of the country is easily described. Except for a rich, narrow seaboard of low alluvial plains, Salvador consists of a level plateau, some 2000 feet above the sea, furrowed by river valleys and broken by numerous volcanic cones, and bounded along the northern frontier by a portion of the Central American Cordillera. Of the volcanoes, which rise from 4900 to 6900 feet, many are extinct, but others break into eruptions at intervals, and Izalco, at least, near Sonsonate, has been in constant eruption for more than a century. Earthquakes, of course, are of frequent occurrence (see SAN SALVADOR). Of the rivers, all of them flowing towards the Pacific, the most important are the Lempa (140 miles), which receives the surplus waters of the Laguna de Cuija—a large lake on the borders of Salvador and Guatemala—and the San Miguel, which drains the south-east portion of the republic. The former, though a rapid stream, might be made navigable for steamers for a great part of its course. The climate is equable, very healthy in the interior, and even along the coast less unwholesome than on the Atlantic side of Central America. The land is well watered, and the soil exceedingly fertile: in the neighbourhood of the capital four crops of maize are grown in the year. Agriculture is extensively carried on (largely by small proprietors), to the almost total exclusion of pastoral pursuits—though fine cattle are raised near Sonsonate. The principal products are coffee, indigo, and balsam; less important are tobacco, sugar, maize, rice, and beans. The balsam, known as the Balsam of Peru (see BALSAM), grows only in the part of the seaboard near La Libertad, known as the Balsam Coast. India-rubber, vanilla, ornamental woods, and other products of the forest are also exported. The forests present a less dense vegetation than on the Atlantic side, and beasts of prey, such as jaguars and pumas, are seldom seen. As a mining country Salvador is not of importance, although both gold and silver are mined near La Union, and coal and iron have been found and to some extent worked. Manufactures of any consequence have not yet been introduced. An active trade is carried on, and many foreign houses are represented or settled in Salvador. In 1877 the exports amounted to £1,173,600, in 1888 to £1,001,125; the imports in 1877 were £684,750, and in 1888 £604,670. Of the imports (cotton goods the principal item) 35 per cent. is from Great Britain and 25 per cent. from the United States; with the exports the proportion is a little more than reversed. The principal article of export is coffee; indigo (the so-called 'Guatemalan') held the first place until the price fell.

The bulk of the population is composed of Indians and mixed races: the whites number scarcely 20,000. The Indians are of the Aztec (Pipil) race, and all speak the Spanish language and profess the Roman Catholic religion (the one established by statute), except on the Balsam Coast, where alone they retain their old habits and language. The government is carried on by a president (four years) and four ministers. The legislature consists of a congress of seventy deputies (forty-two of them proprietors), elected by universal suffrage for one year. Education is free and compulsory, and in 1888 there were 732 primary schools (with 27,000 pupils) and 15 secondary and 2 normal schools in the state, besides a university and a polytechnic institute in the capital. The revenue (£600,000) shows a slight excess over the expenditure; the internal debt is returned at £798,335, and the external debt at £300,000. There is a standing army of 2500 men and 12,000 militia. Railways connect Acajutla (the chief port) with Santa Ana and Ateos, and when the portion between Ateos and Santa Tecla is completed (and there are no great engineering difficulties) there will be a line from the capital to Acajutla. A line is also projected between La Union, the best harbour in the republic, and San Miguel, which will ultimately be extended to San Salvador. There are 1467 miles of telegraph and 240 of telephone wires in the country.

Salvador, originally called *Cuscatlan*, was conquered after a long and obstinate contest by Pedro de Alvarado in 1525–26. In 1821 it threw off the Spanish yoke, and from 1823 to 1839 it belonged to the Central American confederacy. Since 1853 it has been an independent republic, and from 1864 till 1890 it had freedom from foreign wars, though *pronunciamientos* too often preceded or signalised the elections to the presidency. On the whole, however, steady progress has been made; the brief war with Guatemala in 1890, following on a proposed treaty of union between the five Central American states, left matters where they had been.

See Scherzer, *Wanderungen durch die mittelamerikanischen Freistaaten* (Bruns. 1857); Bates, *Central America* (1879); Guzman, *Apuntamientos sobre la geografía física de la rep. del Salvador* (San Salv. 1883); Reyes, *Nociones de historia del Salvador* (San Salv. 1886).

Salvage is the compensation made by the owner of a ship or cargo in respect of services rendered by persons, other than the ship's company, in preserving the ship or cargo from shipwreck, fire, or capture—the perils to which property at sea is peculiarly exposed. By statute, salvage is now also due for the saving of the lives of persons on board British ships. In the earliest maritime codes, such as the laws of Rhodes, Oleron, and Wisby, salvage was recognised; and it is similarly allowed by all modern maritime states. At common law the person who saves goods from loss or imminent peril has a lien upon them, and may retain them till the salvage is paid. Further, if the salvage is performed at sea, or within high and low water mark, the Admiralty Division of the High Court has jurisdiction, and the salvors may enforce their claim by the institution of an action *in rem*. The Court of Admiralty also takes care of the property pending the issue of the suit, appraises the ship or goods, fixes the sum to be paid in name of salvage, apportions the sum among the salvors or sets of salvors, and, if necessary, may direct a sale of the goods and a division of the proceeds between the salvors and the proprietors. In the case of recapture from an enemy, the rate of salvage is fixed by statute at one-eighth for the royal navy and king's armed ships, and one-sixth for private ships; in other cases, however, the rate is either fixed by agreement between the parties or is left entirely to the discretion of the judge, and varies with such special circumstances as the labour and peril of the salvors, &c. It is provided by statute that all goods saved from shipwreck in the United Kingdom are to be delivered to the Receiver of Wrecks appointed by the Board of Trade; and it is within the power of this official to detain them till satisfaction is made of the salvage, or till security is given for its payment. The crew of a ship are not entitled to salvage or unusual remuneration for any extraordinary efforts they have made in saving her; but when their duty as seamen is over—as by capture—any successful effort thereafter made by them to rescue the ship entitles them to salvage. *Salvage Loss*, in marine insurance, is a method of adjusting the loss by deducting the proceeds of the sale of the damaged goods from the original value of these goods, as represented by the invoice price. See WRECKS, DERELICTS; and H. Newson's *Laws of Salvage, Towage, and Pilotage* (1886).

Salvatierra, a town of Guanajuato, in Mexico, on the Rio Lerma, 197 miles by rail NW. of Mexico city. It has two cotton-factories, and a pop. (municipal, 1880) of 23,902.

Salvation Army, *a new religious organisation*, which took its rise in England in 1865, its founder being the Rev. William Booth (q.v.). Being in some sense a rebound from the less vigorous forms of Christianity, this movement has from the first been of a very aggressive and practical character. In theory and creed, save on some minor points, the Salvationist is at one with all the orthodox churches, but in method and organisation the army differs largely from every existing denomination. The neglected spiritual condition of the lower part of the population of London first appealed to the heart of Mr Booth; and after various efforts at conciliating the sympathy of other Christians had been rejected, and tentative lines of an old-fashioned sort had been found abortive, Mr Booth determined to strike out a new method and to adopt a quasi-military organisation, of which he himself would be the general. 'Groping,' he writes, 'our way out of the conventionalism in which we had been trained, we tried committees, conferences, and all sorts of governments, showing how far we were wrong, until the military idea was revealed to us.' Mr Booth was powerfully reinforced by the co-operation of his wife, who eloquently denounced the cold Laodiceanism of the churches. At Hastings, Margate, and Brighton, and in St James's Hall in London, crowds of the upper and middle classes became her auditors and presently her ardent supporters, to help on the movement, which was called the 'Christian Mission.'

In the spring of 1878 the entire mission was reorganised on the model of a military force with the title of 'The Salvation Army,' and as its head Mr Booth was henceforth designated 'general.' The novelty of the new designation at once attracted the notice of the press, some to approve and others to oppose; but the object was gained—viz. to attract and compel public attention to the grand question of salvation. The mission at once rose from comparative obscurity to a position of strength and public support. Since that time the advance has been almost like the rise of a city in the Arabian tales. No doubt can be felt but that the army's attitude and object answered real and wide-spread needs of men's hearts. From eighty positions or 'corps' as they are called, in the first year (1878), and 127 labourers or 'officers,' the organisation at the end of 1891 numbered 4291 corps, including outposts, and 10,617 officers. These officers are distributed as follows:

	Officers
Canada and Newfoundland	1,072
United States, California, and South America	1,381
Australia and New Zealand	1,364
India and Ceylon	497
South Africa and St Helena	201
France, Switzerland, and Italy	441
Scandinavia	865
Holland, Germany, and Belgium	307
Great Britain	4,530
Total	10,617

So mightily grew this movement, spreading itself over the whole world, that at the present time it has struck its roots and become naturalised in thirty-five countries in every quarter of the globe. Indeed, it seems to be a native of no particular race or colour or clime, but to adapt itself and make itself at home almost universally. A country is geographically mapped out into 'districts' or dioceses, each under the care of an experienced officer generally called a 'major.' Every large town and even large village in that district is occupied by one or more corps commanded by a captain, assisted by one or more lieutenants, all of these being supported and entirely employed by the army, their duty being to conduct everyday services indoors and out-of-doors, to visit those enlisted, and to plan, to advertise, and push on the attention of all around the salvation of their souls. Open-air services are held daily in the streets or market-places, and processions, accompanied by banners and bands of music; multiplied indoor services keep the attention of the public and employ the zeal of all the members; these are enlivened with bright and animated choruses, short addresses, and pointed appeals. Marriage between members is solemnised 'under the Flag,' when each pledges the other to be faithful to the War, and never to hinder the spouse from fighting and even suffering for Christ's sake. The officers can marry the parties in Scotland and America, but in England the registrar must be present. Children of members are in their infancy dedicated to become future soldiers in the War for God and souls before the whole congregation. While strict acquiescence with superior orders is expected on the part of officers and soldiers alike, the greatest freedom is conceded in spiritual matters, and the Salvationist boasts of a freedom which is the offspring of order and method. Solidarity of principles and of government once secured, the largest variety can be fully used as to details. Thus the uniform in one land differs from that adopted in another. The blue dress and bonnet of Great Britain is replaced in India by the white sheree. The unity of the spirit is maintained by diversity of operation. Every Salvationist, man, woman, and child, is taught and expected to propagate salvation; to speak for God privately and in public, to sing, to pray, to march, whenever required; to testify and to exhibit conversion to Christ in their lives, and to bring every one around them to deliverance from sin. The officers, however, are set apart and entirely maintained so as to devote themselves wholly to the work of souls. These are drawn from all ranks, with no distinction save of spiritual qualifications; the training given them is not in secular but in spiritual knowledge—viz. in the word of God, in fervour, in devotion, and in the best ways to reach souls. They are solemnly set apart with prayer when commissioned to their first appointments.

In regard to doctrine and teaching the army is very much in agreement with the Christian churches generally; emphasising the work of Jesus Christ as the sole and sufficient atonement from sin, and the application of that atonement to the heart by faith; offering at the same time the most drastic opposition to every form of Antinomian teaching; inculcating the universal obligation of believers to receive full and entire sanctification by the Holy Ghost. They believe the Bible to be God's written word, and repudiate in the strongest manner modern theories and criticisms which diminish or degrade its divine authority. Salvation from sin is with them a solid experimental reality effectuated by God's grace in the consciousness and in the conduct. Vigorous and untiring war is proclaimed against all Satan's strongholds; denouncing unsparingly the liquor traffic (all are bound to be abstainers), racing, theatre-going, gambling, Sabbath-breaking, and the living a life of ease and pleasure. They regard it as a sacred duty binding on Christians not to eat their crust of salvation by themselves, but to force the claims of God on the attention of all, to assail, warn, and awaken to repentance the unsaved. Woman takes her rightful place, and parity of privilege, position, and dignity is firmly asserted and maintained for the weaker sex. For this service the poorest brother who can hardly read is as eligible as the cultured, and woman is as eligible as man. Indeed, it is a maxim in the army that there is no position filled by man which may not be equally filled by woman. The ability and piety of the individual will alone determine his or her position. The administration of the sacraments is not provided for officially, but the observance is left optional to the members.

All the property of the army is conveyed to, and held by the general for the time being, for the benefit of the army exclusively, he being constituted a trustee of the property, in the disposal of which, and in the appointment of his successor, he is placed under the government of a deed poll enrolled in Chancery on the 13th August 1878. The finances of the army are derived partly from the voluntary offerings in their places of worship, from gifts of friends, and from the profits of the periodicals, of which the *War Cry* is the best known issued by the army press. These have a circulation in Great Britain of 439,000 weekly copies, and 101,000 monthly copies, and in foreign countries of 365,000 weekly copies and 30,000 monthly copies, making, with other numerous books, pamphlets and song-books, a total of nearly *four millions* per month. A system of accounts of a very strict character is pursued throughout the army, and the yearly accounts are published, after being in detail examined and audited by a firm of London accountants.

The master purpose of these Christians is the converting men to God and saving them from sin. The master policy adopted by them in this cause is self-sacrifice. The adherents of the army, 'rank and file,' display hardihood and endurance, a defiance of difficulties, indifference to ease or reputation, self-abandonment and joy in tribulation. Persecuted by authorities, mobbed, bruised, imprisoned, men, and even delicate women, make light of their sufferings for Christ's sake, and if disabled their places are immediately filled by fresh volunteers. One week in every year is set apart for acts of special self-denial, when every member and friend of the Salvation Army is expected to deny himself or herself some comfort or item of unnecessary expenditure, and to give the value of the same to the funds of the army. In the year 1890 the sum so saved and contributed was £33,000, of which the members, poor as they are, gave nearly £30,000 (in 1891 £40,000).

During the year 1890 a large development took place in the *benevolent and philanthropic* work of the army. A scheme for uplifting the out-of-work and homeless multitudes contained in the book entitled *In Darkest England and the Way Out*, from the pen of General Booth, attracted wide public attention, and large sums were contributed, enabling him to put it into operation. A threefold or three-storied system of help was therein proposed for this class, whereby the outcast is first of all to be received into a city colony, found shelter and food, and offered work of some kind; if found really willing to do work and to do right he is then sent to the 'farm colony;' and, if worthy and suitable, is finally shipped to the 'colony over the seas' as an emigrant. In pursuance of this scheme, by the beginning of 1892 the army had already in operation at home and abroad 13 shelters (for each sex), 14 food depôts, 15 prisoners' homes, 40 rescue homes, besides 7 labour factories, a match-box factory, and 2 bakeries, 5 'hotels,' a farm of 1400 acres, 53 slum homes, 5 crêches, besides salvage, emigration, bank, and law departments, and laundries and other women's factories. The cheap meals supplied during twelve months numbered nearly 3 million. These institutions are already being introduced into the provincial towns, as Liverpool, Bradford, Bristol, and into Australia, New Zealand, Canada, and Sweden. As promotion, a step upward socially, there is added to the shelter the Poor Man's Hotel or 'Metropole,' a superior kind of accommodation for which a charge of 6d. is made. Applicants at the shelters having no money can work for their food in the adjacent workshop. For the purposes of this salvage work extensive premises known as the Bridge Wharf, Battersea, have been acquired; and there is to be a thorough and systematic collection of old clothes, rags, bones, broken meat, bottles, tins, &c., all of which it is said can be profitably utilised. Incomplete as has been this brief description of the Salvation Army and summary of its chief activities, it will contain evidence enough to satisfy any reader that it is a most remarkable religious movement.

For further information see Booth, *Aggressive Christianity* (1882; 5th ed. 1890), and *In Darkest England and the Way Out* (1890); Mrs Booth, *Popular Christianity* (1888); Railton, *Twenty-one Years' Salvation Army*, and *Heathen England and the Salvation Army*; Josephine E. Butler, *The Salvation Army in Switzerland* (1884); and smaller pamphlets of Eileen Douglas published by the army.

Salvator Rosa. See ROSA.

Salve Regina, the first words of the antiphon, addressed to the Blessed Virgin Mary, said after Lauds and Compline, in the Roman Catholic Church, from Trinity to Advent. It dates from the 11th century, but first found a place in the Breviary of Cardinal Quignon (1536), and thence was adopted into that of Pope Pius V. (1568).

Salviati, ANTONIO. See MURANO.

Salvini, TOMMASO, tragedian, was born at Milan, 1st January 1830, his father and mother both being actors. The boy, who showed early aptitude, was trained under Modena, a distinguished player, and became well known as a member of Ristori's company. In 1849 he fought with distinction in the revolutionary war; and returning to the stage played with eminent success as Œdipus in a play written for Salvini by Nicolini, and as Saul in Alfieri's drama. In Paris he played in these, in Racine's plays, and as Shakespeare's Othello—the part with which he is identified in the minds of English playgoers. He scored successes in Brussels and Madrid, and visited the United States in 1874, England in 1875, with as great *éclat*. But after another visit to the United States in 1881, and to Britain in 1884, he retired from the stage to enjoy a life of learned leisure in his villa near Florence. Amongst his most striking parts were—besides Othello—Hamlet, Macbeth, and Lear. See an article in the *Century Magazine* for November 1881.—His son Alexander adopted his father's career, and inherited much of his talent.

Salvinia, a genus of the order of plants formerly called Rhizocarpeæ or Pepperworts, now known as the Heterosporous Ferns. They are 'ferns' because, amongst other reasons, the development of the embryo is similar to that process in the common ferns, and 'Heterosporous' because the sporophyte bears two kinds of spores instead of one. To understand these plants it is necessary to know the structure of Ferns (q.v.). The order includes two families, the Salviniaceæ and the Marsiliaceæ. The former consists of two genera, Salvinia and Azolla, the latter also of two genera, Marsilia and Pilularia. The spore-bearing generation of Salvinia is a plant that floats on the surface of water. The stem bears on its upper surface four rows of aerial leaves, and on its under surface two rows of submerged aquatic leaves, which have the outward form and functions of roots; there are no true roots at all. The stem of Marsilia creeps along the surface of marshy land, or on the bottom below the water. The upper surface of the stem bears two rows of leaves with long stalks, the under surface bears roots. Pilularia has peculiar narrow leaves. In Salvinia the sori or groups of sporangia are placed upon the aquatic leaves near the insertion, whence the old name Rhizocarpeæ. The coverings or indusia form small berry-like objects. In Marsilia the sori are borne upon fertile leaves which branch from infertile leaves just above their insertion. The fertile leaves are folded in like pea-pods, and each of them encloses several sori. The sori of Pilularia are similar, but globular. The sori of Salvinia and of Azolla are of two kinds. Some contain numerous long-stalked microsporangia with male spores; others contain fewer (in Azolla only one) short-stalked female macrosporangia with female spores. In Marsilia and Pilularia the macrosporangia and microsporangia occur within the same sori. The microspores develop into rudimentary filamentous male prothallia. The antherozoids are formed in two cells at the apex of the filament, which represent the antheridium. The macrospores develop into female prothallia which never grow more than to project a little from the spores; they bear archegonia. The oosphere within an archegonium is fertilised by an antherozoid, and produces an embryo. The Heterosporous Ferns are interesting as showing a stage in that reduction of the prothallium as an independent plant which reaches its climax in the Seed Plants. See FERNS, OVULE, and PHANEROGAMIA.

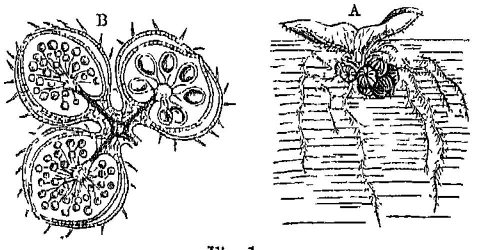


Fig. 1.

A, transverse section of the stem of *Salvinia natans*, showing aerial leaves and submerged leaf, with sporocarps. B, longitudinal section through three fertile teeth of a submerged leaf, one sporocarp with macrosporangia, two with microsporangia. (After Goebel.)

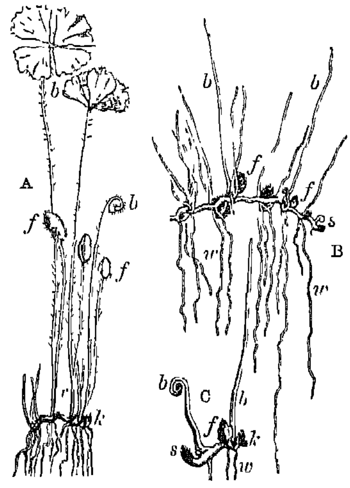

Fig. 2.

A, *Marsilia salvatrix*, anterior portion of stem with leaves; *k*, terminal bud; *b*, *b*, leaves; *f*, *f*, sporocarps springing from leaf-stalks at *x*. B, *Pilularia globulifera*; *s*, terminal bud of stem; *b*, *b*, leaves; *w*, roots; *f*, sporocarps. C, the extremity magnified; *h*, the lateral bud. (After Goebel.)

Sal Volatile, a well-known remedy for faintness, consists essentially of a solution of carbonate of ammonia in alcohol. It contains in addition free ammonia and the volatile oils of lemon and nutmeg. As it is a strongly caustic liquid, it should never be taken unless well diluted with water. See SALTS (SMELLING), and AMMONIA.

Salween, a river of Asia that flows south through the Shan country, then between Siam and British Burma, and flows into the Gulf of Martaban a little below Maulmain. It is navigable for only about 80 miles up from its mouth; its bed is then interrupted by rapids and the dangerous ravines through which it passes. The Chinese call it the Lukiang; they also give the same name to the Tibetan Giama Nu-chu. It is, however, uncertain whether this last, which has a course of some 700 miles through Tibet, and whose course is known down to 27° 45′ N. lat., is the upper part of the Salween or the upper part of the Irawadi (q.v.). The course of the Salween (also spelt *Salwen*, *Salwin*, and *Saluuain*) is known only as high as 25° N. lat. The question can only be settled when the gap of 2½ degrees has been explored. See the discussion in *Proc. Roy. Geog. Soc.* (1887).

Salzbrunn, a group of three villages (New, Lower, and Upper Salzbrunn) in Prussian Silesia, 40 miles by rail SW. of Breslau; they have eight mineral springs, which attract nearly 4000 visitors in the season. The water is alkalo-saline; some 1,100,000 bottles are exported every year. There are glass and porcelain factories, yarn-spinning works, brick-works, and coal-mines. Pop. 6459.

Salzburg, a crown-land of Austria, bounded on the W. by Bavaria and the Tyrol, on the S. by Carinthia, and on the E. by Styria. Area, 2762 sq. m.; pop. (1880) 163,570; (1888) 169,470. It lies on the northern face of the eastern Alps, and is a mountainous region, reaching altitudes of 12,000 feet in the Hohe Tauern. Snow-fields and glaciers cover 115 sq. m. in the more elevated regions. The river Salzach (190 miles), a tributary of the Inn, flows east and then north through one of the most picturesque of the Alpine valleys, and drains the greater part of the crown-land. The climate is variable but healthy. Two-fifths of the surface are covered with forests, and two-fifths consist of Alpine meadows. The rearing of cattle and horses is an important branch of industry. Salt is obtained in large quantities, especially at Hallein (q.v.). Iron, copper, gypsum, and marble are mined. The hot springs of Gastein (q.v.) are widely celebrated.

SALZBURG, the capital, occupies a charming situation on the Salzach, by rail 195 miles W. by S. of Vienna and 80 miles E. by S. of Munich. At this point the river passes between two extensive but isolated masses of rock (1716 and 2133 feet), one of which, the Monchsberg (Monk's Hill), is crowned by the old citadel, dating originally from Roman times, but frequently rebuilt. These hills and those that close in the valley are picturesquely wooded. The river divides the city into two parts; on the west is the old city, with many dark, winding streets, getting access to the valley and plain on the north through a gallery (440 feet long, 39 feet high, and 23 feet wide), hewn (1767) in the solid rock of the Mönchsberg. This portion of the city contains the fine cathedral, with a white marble façade, and built (1614–34) in imitation of St Peter's at Rome; the Romanesque abbey church of St Peter (1127), in the graveyard of which are old monastic cells and a couple of chapels hewn out of the Mönchsberg, besides the chapel of St Margaret (1485); the palace of the Grand-duke of Tuscany, in the Italian style (1592–1725); and the former grand stables (now barracks) of the archbishops, partly constructed of marble (1607); the Benedictine monastery, with a valuable library of some 65,000 vols. and 900 MSS.; and the archbishop's palace. On the opposite bank—both banks are laid out as tree-shaded drives and promenades—lies the modern town, with Italian-looking, flat-roofed houses; here the most prominent buildings are Castle Mirabell (1607), the former summer-residence of the archbishops; the Capuchin monastery (1599), and St Sebastian's Church (1505–12), with the monument of Paracelsus. The city possesses also a theological faculty, all that remains of the former university (1623–1810); a public library (1617) of 82,000 vols. and 1400 MSS.; a museum of Celtic and Roman antiquities, &c.; a bronze monument (1842) to Mozart, a native of the place; a new park on the east bank; the government buildings (1588); the town-house (1407), &c. Industry is not much developed, being confined chiefly to the manufacture of musical instruments, marble ornaments, &c. Pop. (1880) 24,952. The city stands on the site of the Roman settlement *Juvavum*, which was ruined by the Goths and Huns. The nucleus of a new city was made by St Rupert of Worms, who established a monastery here in the 6th century. Boniface made it a bishop's seat in the 8th century, and in 798 it was elevated to an archbishopric. The archbishops had a seat and vote in the German diet, and were perpetual legates of the pope, primates of Germany, and princes of the empire. They were generally noted for their ecclesiastical severity; in 1498 the Jews were expelled from the archbishopric; in 1525 the peasantry rose in revolt; in 1732, after five years' bitter persecution (in spite of all friendly efforts on the part of the Protestant princes of Germany), 30,000 Protestants left their homes (as illustrated in Goethe's *Hermann und Dorothea*) and settled, on the invitation of Frederick-William I, in Prussia, mainly in Lithuanian districts that had been desolated by plague. The archbishopric was secularised in 1803, and given to the Grand-duke of Tuscany, he being made an electoral prince. The archbishopric was re-erected in 1824. Except for a short interval (1810–14), it has belonged to Austria since 1805. Since 1849 it has formed a separate crown-land of the Austrian empire.

See Zauner and Gartner, *Chronik von Salzburg* (11 vols. 1797–1827), and Zillner, *Geschichte der Stadt Salzburg* (1885).

Salzkammergut, called the *Austrian Switzerland,* one of the most picturesque districts of Europe, lies wedged between the Austrian crown-land of Salzburg on the west and Styria on the east. Area, about 230 sq. m.; pop. 17,500. The scenery combines in rare beauty the features of valley, mountain, and lake. The highest peak, the Dachstein, reaches an altitude of 9830 feet. But the district derives its principal attraction from its lakes, the most famous of which are Hallstatt, Traun or Gmunden, Atter, St Wolfgang, Aber, Mond, and Zell. It derives its name of 'Salt-exchequer Property' from its salt springs and mines, which yield some 33,000 tons of salt annually. The chief seats of the salt-works are Ischl (q.v.), Hallstatt, and Ebensee. Little or no agriculture is carried on; the inhabitants not engaged in the salt-industry are employed in cattle-breeding and in the timber trade.

Salzwedel, an old town of Prussian Saxony, 72 miles by rail NW. of Magdeburg, with manufactures of sugar, linen and woollen fabrics, needles, chemicals, &c. Pop. 8883.

Samara, a town of European Russia, stands on the left bank of the Volga, at the influx of the Samara, and on the railway from Moscow (656 miles to WNW.) to Orenburg (261 miles to SE.). One of the principal river ports on the Volga, it carries on a large trade in corn, salt, tallow, timber, &c.; it has also tanneries, tobacco factories, soap-boiling-works, and tile-works. It is the seat of a bishop. Several hundred consumptive patients resort every year to the Koumiss (q.v.) establishments here. Pop. (1869) 34,500; (1880) 51,947; (1886) 75,478.—The *government* has an area of 58,302 sq. m. and a pop. of 2,412,887, including 100,000 Germans living in agricultural colonies.

Samara, a dry indehiscent, usually one-sided fruit, with a wing—as in Ash (q.v.), Elm (q.v.), and Maple (q.v.)—the last a *double* samara.

Samarang, a seaport on the north of Java, 255 miles E. of Batavia, is the principal port for the trade of Middle Java. Since 1873 it has been connected with Jokjokarta and Surabaya by railway. The European quarters have all the appearance of a typical Dutch town. The more important buildings are a military hospital (550 beds), the town-house (1854–64), and Christian churches and schools. A fort and a coast-battery provide defence for the town. The river is silted up at its mouth; but a canal, constructed in 1879, serves as a harbour. The roadstead is exposed during the west monsoon. Pop. 69,894.—The *residency* has an area of 1998 sq. m. and a pop. of 1,376,806, and produces rice, coffee, sugar, tobacco, and timber.

Samarcand, a city of western Turkestan, stands in the valley of the Zerafshan, about 4 miles S. of that river, and amongst the western spurs of the Tian-Shan Mountains, 130 miles E. by S. of Bokhara and 150 miles N. by E. of Balkh in Afghanistan. It is the ancient *Marcanda*, the capital of Sogdiana, which was taken and destroyed by Alexander the Great. It was again captured in 712 A.D. by the Arabs, who supplanted the Græco-Bactrian civilisation, of which it was the centre, by the creed and customs of Islam. Ever since that time it has been a sacred city in the eyes of the Moslems, especially after the conqueror Timur made it the capital of his kingdom in the 14th century. It had, however, suffered terribly from Genghis Khan, who took it (1219) and destroyed three-fourths of its half a million inhabitants. In Timur's time it had a population of 150,000. Its best and handsomest buildings, as the Ulug-beg *madrasa* or College, the tomb of Timur, the tombs of his wives, the gigantic stone he used as a throne from which to dispense justice, and his audience-hall, date from the reign of the great conqueror or his immediate successors. The Ulug-beg, the graves of Timur and his wives, as well as the tomb of one of the Prophet's companions, and two other colleges, the Tilla-Kari and Shir-dar, both dating from the beginning of the 17th century, are magnificent structures, grandly decorated with arabesques, enamelled tiles of different colours, marble pavements, inscriptions in gold, and similar rich ornamentation. In the 15th century Samarcand was renowned as a school of astronomy and mathematics. After the decay of Timur's empire the city had a chequered history, figuring in most of the wars that raged in that region, until at last it fell into the hands of the emirs of Bokhara, from whom it was taken by the Russians in 1868. They have established themselves in the citadel, built on a steep hill 4 miles in circuit, and have laid out a new town, with broad and handsome streets, to the west of it. On the other side of the citadel is the old city, walled, with dark and narrow streets, and dirty houses. The ruins of still more ancient Samarcands extend for 3 miles or more to the west and north of both the Russian and the native town. Since 1888 Samarcand has been connected by rail with Merv and the Caspian Sea. The present population of the city (1886) amounts to 33,117, mostly Tajiks and Uzbegs (Sarts), with a garrison of some 6000 Russians. The people carry on gardening, their gardens being irrigated by water drawn off from the Zerafshan, and the manufacture of textiles, harness, gold and silver wares, leather, pottery, boots, &c., and conduct a brisk trade in cotton, silk, fruits, wheat, rice, salt, and horses.

Samaria, the capital of the northern kingdom of Israel, after Israel (the ten tribes) and Judah became two independent states. It was founded by Omri, on a commanding site, about 5 miles NW. of Shechem, and near the middle of Palestine. It stood on the long flat summit of an isolated hill (1450 feet), that was reached by a succession of terraces, and itself commanded a magnificent view on all sides. Consequently it was easy to make it a place of considerable strength; the Syrians indeed laid siege to it unsuccessfully more than once during the following reigns. But about 721 B.C. it fell before the three years' persistency of the Assyrian monarchs, Shalmaneser and Sargon. These potentates carried away nearly all the Hebrew inhabitants of Samaria and the country of the Israelites, to which it had by then given its own name, captive into Babylonia. In their place they sent Assyrian colonists, from Babylon, Hamath, Sepharvaim, and Cuthah; hence the Jews call the Samaritans 'Cuthæans.' The new settlers, whilst retaining a good deal of their heathen forms of worship, adopted many of the characteristic religious practices and beliefs of the remnant of the Israelites amongst whom they dwelt. When the Jews returned from the Captivity and set about the rebuilding of the temple under the leadership of Ezra, the Samaritans came desiring to participate in the work. But the Jews rejected their assistance, and would not permit them to have any part or share in the revival of the worship of Jehovah, on the ground that they were unorthodox and condoners of idolatry. This of course caused an estrangement between the two sections of the nation, and the Samaritans tried to prevent the Jews from fortifying their new city. The breach seems to have grown suddenly wider after the expulsion in 432 B.C. from Jerusalem of a member of the high priest's family and a son-in-law of Sanballat, the civil governor of the Jews. Not many years later the Samaritans, augmented from time to time by numbers of renegade Jews, built (409 B.C.) on Mount Gerizim beyond Shechem a sanctuary to Jehovah intended as a rival to the temple at Jerusalem. This converted them into bitter enemies, so that henceforward, at all events for very many years, the 'Jews had no dealings with the Samaritans,' and the Samaritans none with the Jews. At some time during the growth of this enmity between the two peoples, the Samaritans introduced the revised Pentateuch of Ezra as their religious code-book, and became extremely strict and puritanical in the observance of its laws. Of the prophets and other historical books of the Old Testament they had no knowledge. Thus they began a separate religious development from that of the Jews. In contrast to the Jews, they had no belief in the resurrection or in a Messiah, and gave no tithes to their priests; but in common with the Jews, especially the Talmudic sects, they practised circumcision, observed the Sabbath, kept up synagogues, and entertained beliefs as to the existence of demons and other superstitions. Yet they never made much real headway; and at the present day there do not survive more than 150 of them, collected at Nâblus, the ancient Shechem. The Samaritan language is an archaic Hebrew, or rather Hebrew-Aramaic, dialect; and in it are written a very ancient version of the Pentateuch (see below), certain chronicles, hymns, and books of religious devotion (see Schürer's *Jewish People*).

Samaria was taken by Alexander the Great, and colonised by Macedonians and Hellenised. They fortified it, and it grew and prospered. Twice it was besieged and taken by the successors of Alexander—viz. by Ptolemy I. (312), and by Demetrius Poliorcetes (*circa* 296). The Jewish captain John Hyrcanus laid siege to it (*circa* 110 B.C.), and at the end of a year destroyed it utterly. Nevertheless the Samaritans joined the Jews in offering fierce resistance to the Romans: they entrenched themselves on Mount Gerizim, and only submitted after a desperate and bloody siege. Their city was again destroyed; but the consul Gabinius ordered it to be rebuilt. Augustus gave it to Herod the Great, who refounded it under the name of Sebaste. The Samaritans seem to have been involved in the 'dispersal' of the Jews, as they were well known at Byzantium, at Rome, in Egypt, and elsewhere. Yet some of them remained in the old city, and in

529 revolted against the rulers of the eastern empire. On the ruined site of the ancient place, now called Sebastiya, there still exist parts of a colonnade of the age of Herod, remains of a temple to Augustus, and an old crusading church (now a mosque) built over the tomb of John the Baptist. The tombs of six or eight (Omri, Ahab, Jehu, &c.) of the kings of Israel and those of the prophets Obadiah and Elisha were also at Samaria. See *Memoirs of Palestine Survey*.

Samaritan Pentateuch, a recension of the Hebrew text of the Pentateuch, in use with the Samaritans, and accepted by them as canonical to the exclusion of the other Old Testament writings. That such a recension had once existed had always been known from certain allusions in Origen, Jerome, and Eusebius, and also in the Talmud; but Julius Scaliger was the first modern scholar to suggest that it might still be recoverable, and to point out its possible importance if obtained. Early in the 17th century the famous traveller Pietro della Valle succeeded after much inquiry in procuring at Damascus a copy not only of the original of this Pentateuch of the Samaritans, but also of the ancient translation, or Targum, of this in the Samaritan dialect; both documents passed in 1623 into the hands of the Oratorians in Paris, and were published in 1631 in the Paris Polyglott by J. Morinus. In his *Exercitationes Ecclesiasticæ*, with which Morinus accompanied the Pentateuch of the Samaritans, he placed it far above the received Hebrew text, a view which had a polemical bearing on current theological discussions between Protestants and Catholics about the 'rule of faith,' and led accordingly to prolonged controversy, the principal disputant on the Protestant side being the Zurich theologian, J. H. Hottinger. Both the Samaritan Pentateuch and the Samaritan Targum of Morinus were afterwards printed by Brian Walton in the London Polyglott (1657), with a collation of the various readings of the Massoretic and Samaritan Hebrew texts. Through Ussher and others a number of additional Samaritan codices were brought to Europe in the course of the 17th century, so that Kennicott was able to use for his Hebrew Bible sixteen MSS. more or less complete. The first to arrange the variants in a systematic way, and to determine with any scientific accuracy the kind and amount of authority that can be claimed for the Samaritan recension of the Pentateuch was Gesenius (*De Pent. Sam. origine, indole, et autoritate*, 1815). Its various readings are most of them of a quite trifling nature and do not at all affect the sense, representing merely a different fashion in spelling or grammatical expression; and perhaps the only one that would seem to indicate an essentially different point of view from that of the Massoretic text is the substitution of Gerizim for Ebal in Deut. xxvii. 4. As is well known, the Samaritan Pentateuch varies from the received text in the figures it gives in Gen. v. and xi. and also in Exod. xii. 40, thus presenting a scheme of chronology materially different both from the Massoretic and from that of the LXX. Of the MSS. that have reached Europe none are older than the 10th century. All are written in a peculiar modification of the old Semitic character which used to be spoken of as Samaritan or Phœnician (see ALPHABET), but is now known to have been at one time common to the entire Semitic domain, and also to have constituted the basis of the Greek alphabet. There is no ground, either external or internal, for assigning to the Samaritan Pentateuch an age earlier than the 4th century B.C., though, from its use in northern Palestine, it was formerly argued that it must have originated before the fall of the northern kingdom, or even before the revolt of Jeroboam. The Samaritan Targum, a translation of the Hebrew Samaritan Pentateuch into Samaritan Aramaic, is hardly older than the 4th Christian century. It was printed in a very corrupt form in the Paris and London Polyglotts, and there is a critical edition by Petermann and Vollers (*Pentateuchus Samaritanus, ad fidem librorum Manuscriptorum apud Nablusianos repertorum*, 1872–91); see also Nutt, *Fragments of a Samaritan Targum* (1874). The Samaritan Targum of Genesis, in Hebrew characters, is given in Heidenheim's *Bibliotheca Samaritana* (1884). There is also an Arabic translation of the Samaritan Pentateuch, made in the 11th or 12th century by Abu Said, based on the work of Saadia. The Samaritan Pentateuch itself can be read in the Paris and London Polyglotts, or in the separate edition, in square Hebrew characters, by Blayney (Oxford, 1790).

Sâmaveda. See VEDA.

Sambhal, a town in the North-western Provinces of India, 23 miles SW. of Moradabad, is built on the ruin-mounds of an ancient city. Cotton-cloth is manufactured and sugar refined; this last commodity, with cereals, *ghi*, and hides, is the chief article of trade. Pop. 21,373.

Sambor, a town in Austrian Galicia, on the Dniester, 41 miles SW. of Lemberg, with manufactures of linen, beer, and flour. Pop. 13,586, one-fourth Jews.

Sambre, a tributary of the Meuse or Maas, rises in the French dept. of Aisne, flows 112 miles in a north-easterly direction, and at Namur in Belgium joins the Meuse from the left. It is navigable up to Landrecies, 90 miles, and is connected with the Oise by a canal 40 miles long. Valuable prehistoric remains have been discovered in caves in the Sambre valley, and are now preserved in the neighbouring museums of Charleroi, Floreffe, and Namur.

Sambul. See MUSK-PLANTS.

Sambur (*Cervus aristotelis*), a species of stag abundant in the forest-land of some parts of India, Burma, and China. It stands about five feet high, is a powerful animal, and is much hunted. The colour is dark brown; the antlers are rounded, and belong to a type known as Rusine.

Samland, a district of the province of East Prussia, stretching between the Frisches Haff and the Kurisches Haff. Its western coast is known as the Amber (*Bernstein*) coast. This district gave title to a bishopric from 1249 to 1525.

Samnites, an ancient Italian people of Sabine origin, who occupied an extensive and mountainous region in the interior of Southern Italy. They were surrounded on the north by the Peligni, Marsi, and Marrucini; on the west and south-west by the Latins, Volscians, Sidicini, and Campanians; on the south by the Lucanians; and on the east by the Apulians and Frentani. It was not till after a long series of wars (of which the first began in 343 B.C., and the third did not conclude till 272 B.C.) that the Romans conquered the Samnites, ultimately making them allies; see ROME, Vol. VIII. p. 788. It was in the second Samnite war that the Romans endured the humiliation of the *Caudine Forks* (q.v.).

Samoa. The Samoa or Navigators' Islands are a group of islands in the Western Pacific, lying in 13½° to 14½° S. lat. and 168° to 173° W. long. They are some 350 miles N. of Tonga, and between 400 and 500 miles NE. of Fiji. From Auckland in New Zealand their sailing distance is 1580 miles, and from Sydney in New South Wales 2570. The group consists of nine islands, in addition to rocks and islets. They are all, with the exception of Rose Island, of volcanic formation, and are for the most part surrounded with coral-reefs. They are very mountainous, but at the same time well wooded, for the decomposition of the volcanic rock has resulted in a very rich soil, which produces a most luxuriant vegetation. Four islands alone are of any size, Savaii, Upolu, Tutuila, and Manua (Manua really consisting of three islands, the largest of which bears the name of Tau Island). These four lie in order of size from west and north-west to east and south-east. Savaii, the westernmost and largest, is about 40 miles in length by 20 in breadth, and has an estimated area of 700 sq. m. Its centre is filled up with rocky mountains, one peak of which, the highest in the group, is said to rise to a height of from 4500 to 5000 feet. Upolu, about 8 miles SE. of Savaii, is a rich and fertile though mountainous island, with an area of between 550 and 600 sq. m. On its northern side is the bay and harbour of Apia, entered between coral-reefs; and along the shore of the bay is built the town of Apia, which is 'the centre of political and commercial life in the Samoan group.' In 1889 Robert Louis Stevenson made Upolu his island home. Thirty-six miles SE. of Upolu is Tutuila, much smaller than either Savaii or Upolu, but possessing a well-sheltered and easily accessible harbour in Pango Pango, a deep indentation in the southern coast, which nearly cuts the island in two. The climate of Samoa is very moist and variable; the pleasantest time of the year is from May to November, when the south-east trade-winds prevails; during the rest of the year heavy gales and rains are frequent, and occasionally, especially from January to the middle of April, the most disastrous hurricanes occur. One of these storms, on the 16th of March 1889, was signalised by a memorable feat of British seamanship, H.M.S. *Calliope*, which was lying in Apia harbour, side by side with American and German men-of-war, having been taken safely out to sea by Captain Kane and his crew, while all the other ships were lost or stranded. The products of Samoa are almost entirely vegetable, consisting of tropical trees and plants. Cocoa-nut trees take the first place in importance, copra, the dried kernel of the cocoa-nut, being the chief article of export; cotton and coffee are grown and exported to a small extent, tobacco is cultivated, and the sugar-cane grows wild throughout the islands. Fruit is plentiful, and bananas and citrons are exported to New Zealand and Australia. There are rich pastures, upon which imported live-stock thrive; almost the only indigenous mammal being a kind of bat. Among birds there is or was to be found on the island of Upolu a very rare species of ground pigeon. The consular report for 1890 shows that the trade of Samoa has latterly been much depressed, the following figures being given:

	Imports.	Exports.
1883	£93,007	£52,074
1887	87,500	71,345
1890	43,626	20,609

The statistics of 1890 show that more than half of the ships entered and cleared at the port of Apia in that year were British, but that on the other hand the value of the imports carried in German vessels was greater than of those carried in British or American. There is regular steam communication with San Francisco, Auckland, and Sydney.

The Samoans belong to the brown Polynesian race, and are therefore akin to the New Zealand Maoris. Samoa is by tradition the birthplace of the race, and the Samoans are perhaps the lightest in colour of all the Pacific islanders. They are a well-formed and prepossessing race, but decreasing in numbers, the population being, it is said, about 35,000. The islands were visited by Bougainville in 1768, and from him they received the name of Îles des Navigateurs, as a tribute to the skill of the native boatmen. In 1787 some members of a French exploring expedition under La Pérouse were killed in a quarrel with the natives at Massacre Bay in Tutuila. The Christian religion was first introduced in 1830, and the result of over sixty years of missionary enterprise is that the Samoans are now nearly all Christians. Of late years Samoa, like other groups of Pacific islands, has suffered from the want of a stable government, able to control at once the native inhabitants and the European settlers. In 1889, however, a conference on Samoan affairs was held at Berlin between representatives of the three civilised powers most interested in the matter, viz. Great Britain, Germany, and the United States, and on the 14th of June a final act was signed, under which the three powers recognised the independence of the Samoan government, and the free right of the natives to elect their chief or king, and choose their form of government according to their own laws and customs, but at the same time made provision for the establishment of a supreme court of justice, for the adjustment of claims and titles to land, for the organisation of a municipality at Apia, for the raising of taxes, and for the restriction of the sale and use of arms and intoxicating liquors. Under this settlement the government is carried on in the name of the native sovereign at the present time.

See consular reports, Admiralty Pilot (*Pacific Islands*, vol. 2); G. Turner, *Samoa a Hundred Years Ago* (1884); Findlay's *South Pacific Ocean Directory*; W. B. Churchward, *My Consulate in Samoa* (1887); O. Finsch, *Samoafahrten* (1888); Von Werner, *Ein Deutsches Kriegschiff in der Sudsee* (1889); the Rev. Charles Phillips, *Samoa, Past and Present* (1890); and a paper by Dr G. A. Turner in *Scot. Geog. Mag.* for 1889.

Samogitia, a district in the Russian government of Kovno, inhabited by pure Lithuanians.

Samos (Turk. *Susam Adassi*), an island in the Ægean Sea, lying close to the coast of Asia Minor, about 45 miles SSW. of Smyrna. Its length is 30 miles, its mean breadth about 8, and its area 180 sq. m. A range of mountains, which may be regarded as a continuation of Mount Mycale on the mainland, runs through the island, whence its name—'Samos' being an old word for 'a height.' The highest peak, Mount Kerki (anc. *Cercetcus*), reaches 4725 feet. Between its eastern extremity and the mainland is the narrow channel of Mycale (called by the Turks the Little Boghaz), scarcely a mile wide, where in 479 B.C. the Persians were totally defeated by the Greeks under the Spartan Leotychides. Between Samos and Nicaria (anc. *Icaria*) on the west is the Great Boghaz, from 3 to 8 miles broad, the passage traversed by vessels sailing from the Dardanelles to Syria and Egypt. Samos is well watered and very fertile. Its principal product is wine, which, though little esteemed in ancient times, is now largely exported to France, Germany, Italy, and Austria. Besides wine, the exports embrace olive-oil, carob beans, raisins, and hides, and reach an annual value of £193,000. The imports, principally manufactured goods, corn and flour, tobacco, spirits, groceries, hides, amount to £179,000. The chief industry is tanning. The capital of the island is Vathy (pop. 6000), on the north coast. Previous to 1832 the capital was Chora, near the south coast. The site of the ancient city of Samos is occupied by Tigani. This ancient city was renowned for three architectural works of great magnitude, an aqueduct cut through the heart of a mountain nearly one mile long, a gigantic mole to protect the harbour, and a large temple to Hera, a rival to that of Diana of the Ephesians. All that now stands of this last is a solitary pillar; the mole exists below the level of the water, and is being built up again by the people of Tigani; the aqueduct was rediscovered in 1882. The island was in Greek times celebrated for its red glossy pottery, which was imitated by the Romans in their so-called Samian ware (see POTTERY, Vol. VIII. p. 365). Pop. of island (1891) 44,953, all Greeks.

Anciently Samos was one of the most famous isles of the Ægean. At a very remote period it was a powerful member of the Ionic Confederacy, and (according to Thucydides) its inhabitants were the first, after the Corinthians, who turned their attention to naval affairs; Colæus the Samian was the first Greek who sailed through the Pillars of Hercules into the Atlantic. The Samians founded numerous colonies in Thrace, Cilicia, Crete, Italy, and Sicily. But the celebrity of the island reached its acme under Polycrates (q.v., 532–522 B.C.), in whose time it was mistress of the archipelago. Subsequently it passed under the power of the Persians, became free again after the battle of Mycale, stood by Athens during the Peloponnesian war, and after several vicissitudes became a portion of the Roman province of Asia (84 B.C.). Being a Byzantine possession, it was conquered by the Turks. When the war of independence broke out in 1821 no Greeks were more ardent and devoted patriots than the Samians; and deep was their disappointment when, at the close of the struggle, European policy assigned them to their former masters. They are, however, governed (since 1833) by a Greek, who bears the title of Prince of Samos, and by a native council, and pay tribute to the Porte.

See Guérin, *Patmos et Samos* (Paris, 1856), and Tozer, *Islands of the Ægean* (1890).

Samos'ata (mod. *Samisat*), the capital till 73 A.D. of the Syrian kingdom of Commagene, on the Euphrates, 130 miles NNE. of Aleppo. It was the birthplace of Lucian and of Paul of Samosata (q.v.).

Samothrace, an island of the Ægean Sea, lies in the north-east corner, nearly opposite the mouth of the river Maritza and 40 miles NW. of the Dardanelles. Next to Mount Athos it is the most conspicuous object in the northern Ægean, rising to 5248 feet in Mount Saoce (Phengari), which occupies nearly the whole of its surface (68 sq. m.). It was from this peak that Poseidon watched the fights on Troy plain (*Il.* xiii.). Bare and repellent, the island possesses no harbour and only one village, Chora, of 2000 inhabitants, and is the meeting-place of the Ægean storms. In ancient times it was celebrated for the worship of the Cabeiri (q.v.), mysterious divinities of (probably) Pelasgo-Phœnician origin, and was one of the most sacred sites in the Ægean. The temples and subsidiary buildings forming the sanctuary of these deities were excavated in 1873–75 by Professor Conze (see his *Archäologische Untersuchungen auf Samothrake* (1875 and 1880). Parts of the cyclopean walls of the ancient city still remain. For several centuries the island belonged to the Byzantine empire; but in 1355 it was given to the princely merchant family of the Gatilusi. They kept it until it was conquered in 1457 by the Turks, who then, and again in 1821, nearly exterminated the population. See Tozer, *Islands of the Ægean* (1890).

Samoyedes, the name of a Ural-Altaic race widely spread over the extreme north of Europe and Asia, especially along the middle course of the Obi River and on the Arctic coast west of the Yenisei. They seem formerly to have possessed nearly all the vast regions between the Altai Mountains and the Arctic Ocean. Numerous grave-mounds of the bronze period that have been found in western Siberia are attributed to a semi-civilised nation of Ugro-Samoyedes. The Samoyedes were gradually driven northwards by the Turko-Tartar races (Huns, Ugrians, &c.), and are now rapidly disappearing under the combined influence of spirits and smallpox. They number about 20,000 in all probability, dress in skins, use bone and stone implements, keep reindeer, live by hunting and fishing, and are Shamans in religion (mixed with fetichism). They have always enjoyed a high reputation for honesty and courage.

Samphire (*Crithmum*), a genus of plants of the natural order Umbelliferæ; having compound umbels, and an oblong fruit, rather flattened at the back, with five winged ridges, and many *vittæ* spread all over the seed. Common Samphire (*C. maritimum*) is a perennial, native of Europe, growing chiefly on rocky cliffs near the sea. It is rare in Scotland, but common in the south of England, and so late at least as March 1886 was still gathered on Dover cliffs, as it was in Shakespeare's day (*King Lear*, IV. vi. 15). Its radical leaves are triternate; those of the stem have lanceolate and fleshy leaflets. The stem is about 1½ feet high, the flowers yellow. Samphire makes one of the best of pickles, and is also used in salads. It has a piquant, aromatic taste, and is considered very diuretic. It is generally gathered where it grows wild, but is sometimes very successfully cultivated in beds of sand, rich earth, and rubbish, occasionally supplied with a little salt. *Inula Crithmoides*, a perennial plant, allied to Elecampane (q.v.), and of the natural order Compositæ, a native of the sea-coasts of England, is used in the same way as samphire, and is often called Golden Samphire. The young shoots of *Salicornia herbacea* (see GLASSWORT) are also substituted for it as a pickle, and sold under the name of Marsh Samphire.

Common Samphire (*Crithmum maritimum*).

Samsö, an island belonging to Denmark, lies in the entrance to the Great Belt, between Zealand and Jutland. Area, 42 sq. m. The people, 6600 in number, are engaged in cultivating the fertile soil and in shipping.

Samson (Heb. *Shimshon*, LXX. and Heb. Judges, xi. 32 *Sampson*, Vulg. *Samson*; the name is derived from *Shemesh*, 'sun'—cf. 'Shimshai the scribe,' Ezra, iv. 8, 17—and the Greek transliteration represents an older pronunciation than that of the present Hebrew text) 'judged Israel twenty years' (Judges, xv. 20, xvi. 31), being the last of the series of twelve in the Book of Judges. The narrative of his adventures, however (Judges, xiii.–xvi.), does not represent him in the capacity of ruler of Israel, or even as leader of his own tribe, either in war or in peace; his action is always that of a private individual and for his own hand, without co-operation. He was a native of Zorah, one of the ancient stations of the Danites before they removed to Laish at the roots of Mount Hermon; and the name of his father, Manoah, reappears in that of the Manahethites (1 Chron. ii. 52, 54; cf. Gen. xxxvi. 23). The circumstances of his birth were similar to those of Gideon's, with the addition that he came under the Nazarite vow, or something equivalent to it (for the unshorn head and abstinence from wine used to be observed by the Arabs also when they were engaged in war or pursuing revenge). His numerous exploits, variously reckoned as seven, or eight, or twelve, have suggested to such modern interpreters as Goldziher (*Hebrew Mythology*, Eng. trans. 1877) the idea that possibly elements of solar mythology may have come into his story, and it is in any case obvious that it owes much to popular legend (e.g. in the etymology of Lehi); but there is no reason to doubt that there underlies it an authentic tradition of a strong, childlike, patriotic hero who on various occasions in the days of Israel's oppression had wrought havoc among the Philistines. The narrative, which is a unity, and shows comparatively few editorial touches, is one of the relatively early portions of the Book of Judges (see JUDGES).

Samuel (Heb. *Shemû'el*, i.e., most probably, 'name of God'), the last of the judges (Acts, xiii. 20), the first of the prophets (Acts, iii. 24), and next to Moses the greatest personality in the early history of Israel as a nation (Jer. xv. 1; Ps. xcix. 6), was, according to the narrative in 1 Sam. i.-iii., an Ephraimite, native of Ramathaim or Ramah in Mount Ephraim (probably the Arimathea of the New Testament, the modern Er-Ram, about five miles north of Jerusalem). As a child he was dedicated by his mother to the priesthood (not to the Nazirate, Num. vi. 1-21, as is sometimes supposed), and, clothed in priestly ephod and robe (1 Sam. ii. 18, 19), he became a temple attendant under Eli the high-priest at Shiloh, having his sleeping-place within the sacred building 'where the ark of God was.' Later tradition represented him as a Levite (1 Chron. vi. 27, 28, 33, 34). While still a child he received the prophetic gift and foretold the fall of Eli and his house, a prediction soon fulfilled in the national disaster at Ebenezer. The story of Samuel contained in 1 Sam. vii.-xvi. combines two widely different accounts of the rest of his career. According to one of these, Israel lay for twenty years under the Philistine yoke; at the end of this period a national convocation was summoned to Mizpah by Samuel, who, for a still longer time, had been known and recognised from Dan to Beersheba as a prophet of the Lord. While prophet and people were engaged in religious exercises the Philistines came upon them, but only to sustain a decisive repulse which drove them within their own borders, where they remained during all the days of Samuel. The prophet thenceforward enjoyed a profoundly peaceful and prosperous rule as judge over all Israel, till his advancing years compelled him to associate his sons with him in the government. Dissatisfaction with their ways gave the elders of Israel a pretext for coming to Samuel and asking him to give them a king such as every other nation had. Although clearly seeing the folly of this and well aware that it was equivalent to a rejection of Jehovah, he, after some remonstrance, granted their prayer (1 Sam. viii.) and held a national convocation at Mizpah (x. 17-27), at which Saul, son of Kish, was chosen by lot to the sovereignty over Israel. Saul's exploit against the Ammonites shortly afterwards led to another convocation at Gilgal, where the kingdom was 'renewed' (xi. 14) in what was, presumably, one of the last acts of the public life of Samuel. The other account, which is also the older, gives a wholly different impression of the prophet's career. He comes before us as a 'man of God,' a man 'held in honour,' and a seer whose every word 'cometh surely to pass,' but occupying a position hardly so prominent as that of judge of all Israel. Saul is divinely made known to him as the instrument chosen by God in His mercy to deliver Israel out of the hands of the Philistines, under whose oppression they are (and long have been) groaning. The seer secretly anoints the young Benjamite and gives him certain signs, with the injunction, 'let it be, when these signs are come unto thee, that thou do as occasion serve thee, for God is with thee' (ix. 1-x. 16). The 'occasion' arose about a month afterwards (x. 27; R. V. marg.), when the 'spirit of God came mightily upon Saul,' and his magnificent relief of Jabesh-Gilead resulted in his being immediately afterwards chosen and recognised as king. The accounts of Samuel's conduct during Saul's reign are also discrepant, and neither version of Saul's rejection by Samuel appears in the oldest narrative, which is also silent about the anointing of David.

Samuel, BOOKS OF. The Book of Samuel (for it is in reality but one) forms the third in the series of the four 'former prophets,' being preceded by Joshua and Judges, and followed by the (also undivided) Book of Kings. In the LXX. it appears as two books, entitled respectively A and B 'of kings,' or rather 'of kingdoms' (*basileiōn*); this, through the Vulgate (Jerome preferred 'Regum' to 'Regnorum'), is the source of the corresponding division in the authorised version, and of the alternative titles, 'otherwise called the first (or second) Book of Kings.' In Coverdale's version the title of 1 Sam. runs: 'the first boke of kynges, otherwise called the first boke of Samuel.' In the Revised Version the alternative title is dropped. In printed editions of the Hebrew Bible since Bomberg's time the Hebrew text has also shown the division of Samuel into two books, the first covering the period of Samuel and Saul, the second that of David. A more natural division would have been into three, the partitions being marked by 1 Sam. xiv. 52, 2 Sam. viii. 18, and 2 Sam. xxiv. 25, or rather by 1 Kings, ii. 46, respectively. Of the sections thus indicated the third presents fewest difficulties to the critic. It is held to extend from 2 Sam. ix. 1 to 1 Kings, ii. 46, and —apart from 2 Sam. xxi.-xxiv, which constitutes an appendix to the main narrative, of miscellaneous contents—it is a quite continuous piece of history, showing in a singularly vivid way how it was that Amnon, Absalom, and Adonijah, failing in turn to secure the succession, cleared the way for Solomon. It was, obviously and admittedly, written at a date comparatively near the events to which it relates. Thenius attributes it to a quite contemporary writer, and Klostermann even names Ahimaaz, the son of Zadok, as the probable author. The second section (1 Sam. xv. 1—2 Sam. viii. 18), containing the history of David from the time when he was first brought to court down to that of his elevation to the throne of all Israel, and his victory over all external foes, is somewhat more complex in its structure. A clue to its analysis is sought by most recent critics in the twofold account of the manner in which David was first brought into close personal relations with Saul. The first and earlier (xvi. 14-23) represents him as already of mature age, a mighty man of valour, and practised in affairs, as well as a gifted musician, when, on account of his skill with the harp, he is introduced into Saul's service after his malady had begun to show itself; here he soon becomes the king's armour-bearer. In the second and later account (xvii. 1-xviii. 5), which appears in a considerably shorter form in the LXX. (see R.V. marg.), he is a shepherd lad, inexperienced either in war or in affairs, who first attracts the king's attention by his heroic encounter with Goliath. The earlier of the two narratives—of Saul's growing fear and jealousy of David, the flight of the latter, his wanderings to Adullam, Keilah, the Negeb, and the Wilderness of Judah, Saul's last struggle with the Philistines, David's elevation to the throne, first of Judah and then of all Israel, the transference of his capital to Jerusalem, his victories over the Philistines, Moabites, Aramæans, Ammonites, and Edomites—finds its continuation (approximately) in xviii. 6–8, 12*a*, 16, 20–29*a*, xix. 8–10, 11–17, xxi. 2–7, xxii., xxiii. 1–18, xxv., xxvii. 1–6, xxviii. 1–2, xxix., xxx.; 2 Sam. ii.–v., viii. The analysis of the first section (1 Sam. i. 1–xiv. 52) begins with the narration (*again twofold*) of the steps which led to Saul's elevation to the throne (see SAMUEL). The earlier account is contained in ix. 1–x. 16, x. 27*b* (LXX.), xi. 1–11, 15, xiii. 2–xiv. 51; the later (substantially) in 1 Sam. vii. 2–viii. 22, x. 17–27*a*, xi. 12–14, xii. 1–25. Closely related to the former (and in any case earlier than the latter) are 1 Sam. i.–iii. (with the exception of ii. 27–36 and Hannah's song) and 1 Sam. iv. 1–vii. 2.

According to the Talmud, 'Samuel wrote his own book;' Abrabanel attributes it to Jeremiah; but the Christian church has no definite tradition on the subject. The attempt systematically to analyse the composition of Samuel was first made by Gramberg (1830), who saw in it two parallel narratives editorially combined. Similar essays were afterwards made by Stahelin, Schrader, and Bruston. The criticism, both 'lower' or textual, and 'higher' or literary-historical, of the Book of Samuel was raised to a new level of scientific precision and accuracy by Wellhausen (in his *Text der Bucher Samuelis*, 1871, in his analysis of the 'former prophets' in Bleek's *Einleitung*, 1878, and in *Die Composition des Hexateuchs u. der histor. Bucher*, 1889). He pointed out the literary unity of the narratives in 2 Sam. ix.—1 Kings ii. (apart from 2 Sam. xxi.–xxiv.) and its early date, and also disentangled the main thread of 1 Sam. xiv. 52—2 Sam. viii. 18, which represents a form of the tradition that must have been committed to writing comparatively soon. The older narrative in the first section he also regarded as early. In some early form, which almost certainly included some matters which have since been dropped, but of course did not contain the additions of a later age, these three sections were brought together into one great continuous historical work, corresponding to the present series, Judges, Samuel, Kings, before the reign of Josiah. The whole work afterwards underwent a Deuteronomistic redaction, which, however, from the nature of the material, was not so systematic and thorough in the case of Samuel as it was in those of Judges and Kings. The division into these three books was made by the Deuteronomist; and it was not till after this had taken place that the miscellaneous collection of passages (some of them very ancient) which now forms the last four chapters of Samuel, and breaks the original continuity, was introduced. Among the passages that help to fix the date of the final redaction of Samuel are 1 Sam. ii. 27–36, which Wellhausen considers to be pre-exilic, but not earlier than Josiah's reign, and the whole of the later form of the history of Saul's elevation to the throne (see SAMUEL), which in his opinion cannot have been written before the fall of the Judean monarchy. Budde's work on the structure and sources of Judges and Samuel (1890) is in substantial agreement with the conclusions of Wellhausen; Budde, however, is inclined to assign an earlier date for the 'Mizpah' passages (1 Sam. vii. 2 *et seq.*, &c.), and to put them on a level with the E of the Pentateuch.

For the exposition of Samuel, see the commentaries of Thenius (1842; 2d ed. 1864), Keil (1864; Eng. trans.), Klostermann (1887), Kirkpatrick (in *Cambridge Bible for Schools and Colleges*, 1881, and in *Smaller Cambridge Bible for Schools*, 1889); and especially for textual criticism, the very excellent work of Driver, *Notes on the Hebrew Text of the Books of Samuel* (1890).

San. See TANIS.

Sanaa', the former capital of the Imáms of Yemen, is situated 200 miles N. by W. of Aden, in a broad grassy valley, sheltered by hills 1200 and 1500 feet high, and is itself 4000 feet above the sea. The population of the city was estimated at 40,000, and of the valley at about 70,000, in 1836; the former is now probably about 20,000. The city and its suburbs are surrounded by walls, and overlooked by a couple of ruined fortresses. Few of the buildings are older than the 16th century, although the city has been in existence from the remotest ages. It was long the capital of the independent Imáms of Yemen, and during that period was noted for its handsome buildings, and gardens, its palaces, mosques, baths, &c. In 1872 it submitted to Turkish rule, and has since then declined in commercial importance, and been allowed to fall into decay.

San Antonio, capital of Bexar county, Texas, and after Dallas the largest city in the state, is on the San Antonio River, 210 miles by rail W. of Houston. It carries on a large trade in the produce of the fertile country around, and has flour-mills, breweries, tanneries, &c. It contains a Roman Catholic cathedral and seminary, an arsenal and a United States government building, court-house, and large park, and still retains some picturesque traces of its Spanish origin. Fort Alamo, just across the river, was the scene of a ruthless slaughter, by Santa Anna, of the American garrison of 188 men, including Crockett and Bowie, in 1836. Pop. (1880) 20,550; (1890) 37,673.

Sanbenito. See AUTO DA FÉ.

San Carlos, a well-built town in the Venezuelan state of Zamora, 125 miles SW. of Carácas. The town lies in a fertile plain, given up to agriculture and the rearing of cattle. Pop. 10,741.

San Cataldo, a town of Sicily, 10 miles W. of Caltanisetta. Pop. 15,105.

Sanchez, THOMAS, a Jesuit moralist and casuist, was born at Cordova in 1550, and became director of the school at Granada, where he died 19th May 1610. His best-known work, in virtue of which he ranks as an *Auctor Classicus*, is the treatise *De Sacramento Matrimonii* (3 vols. Genoa, 1592). In this notorious work, parts of which Pascal and Voltaire treated with scathing sarcasm, the legal, moral, and religious questions that arise out of the sacrament of marriage, and the relations, regular and irregular, of the sexes, are treated in portentous detail. Yet the author was throughout his life esteemed a devout, pure-minded, and holy man.

Sanchi. See TOPE.

Sanchuniathon (SANCHONIATHON, SOUNIAITHON), the supposed author of a Phœnician history of Phœnicia and Egypt, called *Phoinikika*. He is supposed to have been a native of Berytus; and the accounts which speak of him as born at Sidon or Tyre probably take these cities in their wider sense for Phœnicia itself. Our principal information about him is derived from Philo of Byblus, a Greek writer of the beginning of the 2d century A.D., who translated Sanchuniathon's history into his own tongue; but both the original and the translation are lost, save a few small portions of the latter, preserved by Eusebius, who uses them as arguments in a theological dispute against Porphyry. According to Philo, Sanchuniathon lived during the reign of Semiramis, queen of Assyria, and dedicated his book to Abibalus, king of Berytus. Athenæus, Porphyry, and Suidas speak of him as an ancient Phœnician, who lived 'before the Trojan war.' There is also a discrepancy between the various ancient writers respecting the number of books contained in the *Phoinikika*. Orelli (1826), and after him C. Muller (1849), published the remaining fragments of Sanchuniathon, and the discussion raised on their genuineness and value can hardly be said to be yet at rest. Several critics went so far as to deny the fact of the existence of a Sanchuniathon point blank. According to some (Lobeck, *Aglaophamus*, &c.) it was Eusebius, according to others (Movers, &c.) Philo, who fathered his own speculations upon an *ancient authority*. The latter was actuated, Movers thinks, partly by the desire of proving that the whole Hellenistic worship and religion was simply a faint imitation of the Phœnician; partly by the desire of lowering the value of the Old Testament, by showing the higher authority of the Phœnician writer; and partly, as was the fashion among the unbelieving philosophers of his age, to bring the popular creed into a bad reputation, by proclaiming his own views under the guise of an ancient sage. Yet even those who deny the authenticity of Sanchuniathon agree in allowing the fragments current under his name a certain intrinsic value, they being founded on real ancient myths. This, in fact, is now, with more or less modification on the part of the different investigators, Ewald, Bunsen, Renan, &c., the prevalent opinion. Ewald contends for the real existence of a Sanchuniathon, in which he is supported by Renan. Even if there never was a Sanchuniathon it was not Philo who forged him. There seems no doubt that we have but a very dim and confused reproduction of what, after many modifications, misunderstandings, and corruptions, finally passed the hands of Philo and Eusebius, and was by the Church Father, as has been said, quoted in a theological disputation. Yet, even assuming the person of a Sanchuniathon, his age—and Eusebius insists upon a very remote one indeed—must be placed much lower: into the last centuries before Christ, at the earliest. He would then, it seems, have endeavoured to stem the tide of Greek superiority in all things, by collecting, grouping, and remodelling the ancient and important traditions of his own country, and thus proving to both his countrymen and the Greeks their high importance, in comparison with the Greek productions, in the field of religion and philosophy.

The *Phoinikika* was not only a cosmogony, it would appear, but a history of his own and the surrounding nations; and, like similar ancient histories, it probably began with the creation of the world, and contained an account of the Jews. All the historical parts, however, are lost, and nothing remains but a fragmentary cosmogony, or rather two or three different systems of cosmogony, or, according to Movers, merely an Egyptian and Phœnician patchwork. One of the chief difficulties for us consists in the Phœnician words of Sanchuniathon, which Philo either translated too freely or merely transcribed so faultily in Greek characters as to leave them a puzzle.

Eusebius further contains a fragment of a treatise by Sanchuniathon, *Peri Ioudaiōn*, but it is doubtful whether this is the work of Philo of Byblus or of Sanchuniathon; and if it be that of the latter, whether it is a separate work, or merely a separate chapter out of his larger work. A forgery, said to contain the whole nine books of Sanchuniathon, and to have been found by a Portuguese, Colonel Pereira, at the convent of St Maria de Merinhão, and to have been by him entrusted to a German corporal in Portuguese service, named Christoph Meyer, was published by Wagenfeld (Bremen, 1837), and translated into German (Lübeck, 1837), but was very soon consigned to disgrace and oblivion by Movers, K. O. Muller, and Grotefend, the last of whom at first believed and even wrote a preface to the *editio princeps*. There never was such a convent, nor such a colonel; but the facsimile taken by 'Pereira' in the convent in Portugal was found to have been written on paper showing the water marks of an Osnabrück paper-mill.

See Ewald, *Abhandlungen d. Göttinger Gesellschaft der Wissenschaften* (vol. v. 1851); Renan, *Mémoire sur Sanchoniathon* (1858); and Baudissin, *Studien zur Semitischen Religionsgeschichte* (vol. i. 1876); also chap. 6, vol. i. (1877) of Abbott's trans. of Duncker's *History of Antiquity*.

San Cristóbal, (1) capital of Chiapas state in Mexico, has a handsome capitol, a cathedral, a secondary school, and 8500 inhabitants.—(2) A town of Venezuela, in the state of Los Andes, with streets straight, but much cut up by small ravines; an important trade (especially in coffee), mainly in the hands of Germans and Danes; deposits of coal beside the town, and near by copper-mines and petroleum wells. Pop. 5000.

Sancroft, William, Archbishop of Canterbury, was born at Fressingfield in Suffolk on 30th January 1616-17, and from Bury St Edmunds grammar-school passed in 1634 to Emmanuel College, Cambridge, of which in 1642 he was elected a Fellow. In 1651 he was expelled from his fellowship for refusing to take the 'Engagement;' and in 1657 he crossed over to Holland, whence, after a year and a half at Utrecht, he visited Geneva, Venice, and Rome. In 1660, the Restoration accomplished, his friend Bishop Cosin of Durham appointed him his chaplain, and his subsequent advancement was rapid, to be a king's chaplain and rector of Houghton-le-Spring (1661); prebendary of Durham and master of Emmanuel (1662); Dean first of York and next of St Paul's (1664), as such having a principal hand in the rebuilding of the burnt cathedral; Archdeacon of Canterbury (1668); and Archbishop (1678). A Tory and High Churchman, he is of course belittled by Burnet and Macaulay; but the manner in which he discharged his high duties deserves the warmest commendation—the one flaw, perhaps, in his conduct that he employed an Italian spy in Holland who dared propose to him the assassination of Sir William Waller. Sancroft attended Charles II. on his deathbed, and used great freedom of speech to him on the nature of his past life. He refused to sit in James II.'s Ecclesiastical Commission (1686); and in 1688 was sent to the Tower for presenting the petition of the Seven Bishops (q.v.) against the reading of the second Declaration of Indulgence, but on their trial in Westminster Hall he and his six brethren were acquitted. In the events that immediately preceded and attended the Revolution he preserved on the whole a position of non-intervention; still, having taken the oath of allegiance to James, he would not take it to William and Mary. Accordingly, he was suspended by act of parliament (1st August 1689), though he did not quit Lambeth until his ejectment on 23d June 1691. He then retired to his native village, where he died on 24th November 1693. Of eight works ascribed to him one only retains much interest—*Fur Prædestinatus* (1651), a dialogue between a Calvinist minister and a thief condemned to the gallows; and this seems to be really a translation from a Dutch pamphlet.

See Nonjurors, with works there cited; the *Life of Archbishop Sancroft*, by George D'Oyly, D.D. (2 vols. 1821); and Miss Strickland's *Lives of the Seven Bishops* (1866).

Sanctuary, a consecrated place which gives protection to a criminal taking refuge there; or the privilege of taking refuge in such a consecrated place. Among the Jews there were cities of refuge to which the slayer might flee who killed a man unawares (see City), and something analogous to a right of sanctuary may also be traced in pagan communities. In the ancient Greek states certain temples afforded protection to criminals, whom it was unlawful to drag from them, although the supply of food might be intercepted. As early as the 7th century the protection of sanctuary was afforded to persons fleeing to a church or certain boundaries surrounding it. The canon law recognises this protection to criminals as continuing for a limited period, sufficient to admit of a composition for the offence; or, at all events, to give time for the first heat of resentment to pass before the injured party could seek redress. In several English churches there was a stone seat beside the altar where those fleeing to the peace of the church were held to be guarded by its sanctity. One of these *frith-stools* ('peace-stools') still remains at Beverley and another at Hexham; while the sanctuary knocker is still visible at Durham. The privilege of sanctuary did not extend to persons accused either of the crime of sacrilege or of the crime of treason. Connected in England with the privilege of sanctuary was the practice of *abjuration of the realm*. By the ancient common law, if a person guilty of felony took the benefit of sanctuary, he might within forty days afterwards go clothed in sackcloth before the coroner, confess his guilt, and take an oath to quit the realm and not return without the king's license. On confessing and taking the oath he became attainted of the felony, but had forty days allowed him to prepare for his departure. All privileges of sanctuary and abjuration were entirely abolished by statute 21 Jac. I. chap. 28. Yet as regards the execution of civil process, sanctuaries continued in defiance of the law for another century. This is shown by the statutes 8 and 9 Will. III. chap. 27, which makes it penal in sheriffs not to execute process in certain 'pretended privileged places,' such as Whitefriars or Alsatia and the Savoy; and 9 Geo. I. chap. 28, which contains provisions against resistance to process in the Mint and Stepney.

By the ancient canons of the Scottish councils, excommunication was incurred by the offence of open taking of thieves out of the protection of the church. The most celebrated ecclesiastical sanctuaries in Scotland were the church of Wedale, now Stow, near Galashiels, where was an image of the Virgin, believed to have been brought by King Arthur from Jerusalem; and the church of Lesmahagow, near Lanark, fugitives to which had the benefit of the 'King's Peace,' granted by David I., in addition to the protection of the church. The institution of sanctuary, though probably useful in early times in enabling innocent persons to escape oppression or private enmity pursuing them under the name of law, tended after the rise of settled government to become highly mischievous by enabling criminals to bid defiance to the civil power. Consequently for a century before the Reformation we find a continuous struggle going on between the legislature and the church, caused by attempts on the part of the former to check the evils arising out of the privileges of sanctuary and to maintain the authority of the law. The Reformation finally abolished all religious sanctuaries in Scotland.

Of the places which owe their privilege of giving sanctuary to the respect due to the person of the sovereign the most famous is the Abbey of Holyrood House and its precincts. The precincts of the palace, to which the privilege belongs, are extensive, including Arthur's Seat and the Queen's Park; and the whole are placed under the protection of a bailie appointed by the Duke of Hamilton, the heritable keeper of Holyrood House. This time-honoured sanctuary afforded protection against imprisonment for debt only; to a criminal it gave no protection. For twenty-four hours after passing the confines the debtor was protected against personal diligence; but in order to enjoy protection for a longer period he must enter his name in the books kept by the bailie of the abbey. Neither crown debtors nor fraudulent bankrupts nor persons under an obligation to perform an act within their power could claim protection; while within the precincts there was a prison for debtors against whom diligence had been brought for debts contracted within the sanctuary. To retire to the abbey is by 1696, chap. 5, made one of the circumstances which, combined with insolvency, constitute legal bankruptcy. The Castle of Edinburgh, the Mint or 'cunzie-house,' and several other places seem to have enjoyed the privilege of giving sanctuary; but Holyrood is now the only sanctuary which the law of Scotland recognises, and the abolition of imprisonment for debt in 1880 has rendered it practically obsolete.

By the *privilege of Clan Macduff*, alleged to have been granted by Malcolm Canmore, any person related within the ninth degree to the chief of Clan Macduff who should have committed homicide without premeditation was entitled, on fleeing to Macduff's Cross in Fife, to have his punishment remitted for a fine, or at least to be repledged from any other jurisdiction by the Earl of Fife. See Mazzinghi, *Sanctuaries* (Stafford, 1888).

Sanctus. See Liturgy, Bell.

Sand, one of the products of the disintegration of rocks, is composed mainly of grains of quartz—some sands being more purely quartzose than others. Speaking broadly, we may say that all rocks undergoing disintegration are eventually resolved into two kinds of sediment—viz. sand and clay or silt—the former representing the practically insoluble quartz of the original rock, the latter the insoluble constituents of the other minerals. Sand is formed in various ways. It is, as every one knows, one of the most common sediments of rivers, lakes, and seas. Sea-sand exactly resembles river-sand—one cannot be distinguished from the other except by means of included organic remains. As a rule the grains of aqueous sands are angular and subangular in form, especially in the case of fine-grained deposits. When the grains are large they may be more or less well rounded. These last have been rolled over each other and pushed forward in the bed of stream or sea, while the smaller particles, carried in suspension, have in some measure escaped trituration. Aqueous sands are very widely distributed. They are commonly met with forming terraces along the courses of streams and rivers—not infrequently they occupy the sites of ancient lakes and estuaries—and now and again they form what are known as raised beaches in maritime districts. Most of these sands are of recent geological age; others, however, such as the sands of the Tertiary basins of England, France, Belgium, Austria, &c., represent the sea-floors of much more remote times. Sands of wind-blown origin occur frequently in maritime regions and in dry desiccated desert countries. In coastlands the material of the dunes is obviously washed up by the sea; while in certain inland tracts, as in Poland, the sand which is there blown about by the wind is derived from wide-spread fluvio-glacial deposits—relics of the ice age. But in other countries, as in the Libyan Desert, the sand has resulted from the subaerial degradation of granites, schists, sandstones, and other rocks. As the rock-ingredients are swept forward over the ground they are subjected to much attrition, so that eventually even the smallest grains become well rounded, and when seen under a magnifying glass resemble little pebbles. Sand-deposits are also the result of volcanic action. These consist of the very finely comminuted debris of volcanic rocks, and are readily distinguished from sedimentary and æolian sands. Now and again, however, volcanic sands are sifted by the winds and heaped up into dunes.

Sand varies in texture from extremely fine-grained, almost dust-like material, up to coarse granular grit. Indeed all gradations occur from sand through coarse grit into fine gravel. Pure white sands are not uncommon, but shades of yellow, brown, and red predominate, especially in the case of æolian and aqueous sands. The colour is generally due to the presence of iron. Gray, dark-brown, green, and black sands are also met with. The latter are often largely composed of magnetite, and have been derived from the disintegration of certain igneous rocks such as basalt. Green sands usually owe their colour to glauconite. Volcanic sands are generally dingy—chiefly dull gray or black. Some sands are rich in gold, others in precious stones and gems. These are alluvial deposits which have been derived from the disintegration of crystalline igneous rocks, schists, &c. Pure white sands are in demand for the manufacture of glass, while others are employed as abrasives in sawing marble, &c., and in smoothing the surfaces of that and other ornamental stones. Sharp sand, again, is largely used for mixing with mortar. See Drift, Gravel, Pliocene System, Quicksand, Sahara, Sandstone.

Musical Sand.—Some kinds of sand, which consist of well-rounded and polished grains of tolerably uniform size, and which are clear or free from dust and small particles, exhibit remarkable sonorous qualities when struck or subjected to friction. The well-known 'musical sand' of the island of Eigg (Inner Hebrides) is a good example, and was at one time believed to be almost unique; but, as Professor Bolton of Hartford, Connecticut, and Dr A. Julien of New York have shown, sonorous sands are widely distributed in Europe and America. The sounds emitted are often decidedly musical, and distinct notes can be produced, high or low, according to the nature of the friction and the quantity of sand operated upon. When one walks over a bed of strongly sonorous sand a tingling sensation is perceived even through the boots. After being subjected to friction for some little time musical sand gradually loses its peculiar qualities, and the same result is produced when the sand is wetted. There is nothing in the appearance of musical sand to distinguish it from mute sand—sonorous and non-sonorous sand of precisely similar aspect lying side by side on the same beach. No satisfactory explanation of the phenomenon has been given.

Sandbanks.—These are met with in the beds of rivers and estuaries and shallow seas. In rivers the banks are usually elongated in the direction of the current, and are liable to constant changes as the force and direction of the current become modified. Opposite the mouths of rivers sandbanks tend to accumulate. Much of the material of which these bars are composed is brought down by the rivers, but a large proportion is also swept up by the sea itself. Such banks are constantly changing their form, and oscillating to and fro, according as the sea or the river is the more active. The sea also tends to form sandbanks across the mouths of shallow inlets and other indentations of a coast-line, so that eventually a secondary coast-line may come to be formed in this way—shallow lagoons separating the new from the old coast-line. Islands are in like manner converted into peninsulas by the heaping up of sandbanks by tidal-currents between them and the mainland. The Eye peninsula in the Island of Lewis is an example, and there are many islets off British coasts which in time will be converted into similar peninsulas by the growth of sandbanks, which in some cases has proceeded so far that the islets become peninsulas at low tide. In the shallow seas that surround the British Islands sandbanks are of common occurrence. Some of these are doubtless due to tidal action, as is the case with the sandbanks of similar shallow seas all the world over. Others again probably mark the sites of undulating land-surfaces submerged during a recent geological period. It is thought by some that the Dogger Banks of the North Sea may consist largely of the morainic debris laid down by the great Scandinavian ice-sheet of the glacial period, now more or less modified by current-action.

Sand, George, the *nom de guerre* of Armandine (or Amantine) Lucile Aurore Dupin, 'Baronne' Dudevant, was born in Paris on the 5th July 1804, and died at Nohant in Berri on the 7th June 1876. Her father Maurice Dupin was the son of M. Dupin de Francueil (well known in the writings of Rousseau and his circle) by a natural daughter of the Marshal de Saxe and of Mdlle. Vérriere, also well known in the 18th century. Aurore's own mother was a Parisian milliner. Her father died when she was very young, and she was the subject of continual disputes between her mother and her grandmother, Madame Dupin (by her first marriage Comtesse de Horn). Aurore lived with both in turn, but principally at Nohant with her grandmother, on whose death the property descended to her. She was educated partly at home, partly at the English convent in Paris, and represents herself in her voluminous *Histoire de ma Vie* (which contains little fact and much fancy) as a child full of reverie of all kinds. An heiress as has been said, though in no great way, and with no near relations except her mother, she was married at the age of eighteen to a certain M. Dudevant, the natural son of a colonel and baron of the empire, who also had some small fortune. The marriage was quite of the ordinary French kind, with no love, but also no particular dislike, between the parties. Two children were born of it—a boy, Maurice (1825–89), who afterwards took his mother's assumed surname and became a man of letters of some little accomplishment, and a girl, Solange, who married the sculptor Clésinger. Very little is known of M. Dudevant, who seems, however, to have been by no means especially tyrannical or offensive, but merely an ordinary squireen, devoted to sport, not actively sympathising with, but also not violently opposing his wife's bookish tastes, and probably, as her letters show, a good deal tried by the increasing number of her doubtless Platonic friendships. After nine years of married life, towards the end of which the situation became very much strained, she 'threw her cap over the mills,' and at first resigning her property to her husband as the price of an amicable separation, went to Paris to make her living by literature, to associate (often in men's clothes) with the Bohemian society of the time (1831), and in short to 'see life' generally in a very full sense. Nevertheless after some years the local tribunals found sufficient cause in her husband's behaviour to turn the amicable into a legal separation, and to give her the complete enjoyment of her own property. For the best part of twenty years her life (apart from its literary features, to which we shall come presently) was spent in the company and partly under the influence of divers more or less distinguished men, with some of whom she certainly, and with others probably, was on the terms which might be expected in such circumstances. But George Sand's was a very peculiar temperament, and it is not safe to take too much for granted in respect to her. During the first few years her interests were chiefly directed towards poets and artists, the most famous being Alfred de Musset and Chopin, with the former of whom she took a journey to Italy notable in the lives of both; while the second was more or less her companion for several years, including a dismal winter which they spent together at Majorca, and which she has recorded in a noteworthy book. In the second decade her attention shifted to the wilder sort of philosophers and politicians, such as Lamennais, Pierre Leroux, and Michel (de Bourges). But the advance of years and the revolution of 1848 with its consequences put an unexpected end to her rather protracted *Sturm-und-Drang* period. By a revolution not by any means universal among men and almost unexampled among women, she settled down as the quiet 'châtelaine of Nohant,' and spent her life for more than a quarter of a century thus, occupying it with wonderful literary activity, varied only by foreign travel now and then, and by occasional visits to Paris. She was exceedingly hospitable: almost all French and many foreign men of letters of eminence visited at Nohant, which was an unostentatious but pleasant Liberty Hall, the especial diversion being a marionette theatre. No private event of any importance disturbed this long and quiet period, which only closed by her death with the words '*Laissez la verdure*' on or almost on her lips.

We must now pass from this curious existence—a youth of dream, a womanhood of racket and license, an old age of laborious calm—to her work. In this some have marked three, others four periods, the last two of which do not seem to be separated by any very real gap. The threefold division corresponds almost exactly to her life experiences as above sketched. When she first went to Paris, and with her companion Jules Sandeau, from the first half of whose name her pseudonym was taken, settled, partly under the guidance of Henri de Latouche, to novel-writing, her books partook of the Romantic extravagance of the time, specially informed and directed by a polemic against marriage and by the invention and glorification of the *femme incomprise*. *Indiana*, *Valentine*, *Lélia* (the most remarkable of all), and *Jacques* are the chief works of this period. In the next her philosophical, political, and (if they can be so called) religious teachers got the upper hand, and in a fashion fathered the rhapsodies of *Spiridion*, *Consuelo* (one of her best books, however), and the *Comtesse de Rudolstadt*. Between the two groups should be placed in time the fine novel of *Mauprat*. Towards the middle of the century appeared the extraordinary study called *Lucrezia Floriani*, the chief characters of which are undoubtedly in part drawn from herself and Chopin; while she also now began to turn towards the studies of rustic life, of which *La Petite Fadette*, *François le Champi*, and *La Mare au Diable* are the chief, and which some of her admirers regard as her greatest works. Some critics (the chief of whom is M. Caro) would make these rustic novels a third division by themselves, and construct a fourth for the miscellaneous and less spontaneous works of the last twenty years of her life. Some of those last, such as *Les Beaux Messieurs de Bois Doré*, *Le Marquis de Villemer*, *Mlle. la Quintinie* (a duel with Feuillet), and others, are of high merit. Not a tithe of her enormous list of novels can be mentioned here, while there has to be added to it a considerable *Théâtre*, the bulky *Histoire de ma Vie* already referred to, some nondescript work, such as the *Hiver a Majorque* referred to above, and *Elle et Lui* (a sort of vindication of her relations with Musset (q.v.), written after his death), and a delightful and extensive collection of letters published posthumously. One division of this last—those to Flaubert—is of the very first literary and personal interest, and the whole exhibits the personal and literary character of the writer in such a light as to have conciliated to her the affection of some who had previously been rather recalcitrant.

The popularity of George Sand, like that of most very voluminous authors, has sunk considerably since her death. Nor have critical estimates invariably agreed about her. The one thing which both friends and foes accord her is the possession of a most remarkable style, somewhat too fluent and facile, but never slipshod or commonplace, if never exquisite or distinguished. To this gift may be added the still more important one of a faculty of imagination which always idealised the subject and treatment to the point necessary to fix the work as literature. A third, though a more disputable gift, was a singular faculty of receptivity which enabled her to catch and render not merely the aspects of scenery and the outline of personages, but the fleeting ideas of the day on all manner of subjects. She had no great or deep originality; despite her fertility, she scarcely ever (the sole great exception is the wonderful study of insatiable jealousy and outwearied love in *Lucrezia Floriani*) achieved the analysis which results in synthesis and fixes a character for ever. She wrote with something like the business-like regularity of Mr Anthony Trollope in England; and her work cost her so little that in a very few years she as regularly forgot all about it, and read her own novels as if they were those of others. It is scarcely paradoxical to doubt whether—though her books are unceasingly occupied with love, and a good portion of her life was at least not closed to it—she ever felt in her own person a passionate affection. In conversation, it is said, she was awkward and dull, and there is hardly any wit or humour even in her books. They are also notoriously destitute of plot or composition. It seems to have been her portion to produce or reproduce with a certain passivity, but in never-failing yield, novels as the earth produces crops. All this sounds like unfavourable criticism, and so to a certain extent it is and must be. It is a commonplace of criticism on her to say that George Sand's novels are seldom read a second time. Story they have as a rule not much to tell, and their characters, though never exactly unreal, are too slightly provided with life to exercise an absorbing fascination. Yet after all exceptions are made, and after allowing the utmost that criticism can demand, it is difficult to speak with anything but admiration of this enormous work, the very bulk of which perhaps does it harm, because the same defects recurring almost throughout become more obvious than they would be in a smaller total. The charm—not strange or deep, but constant—of the style, the vast variety and volume of the creations, the constant faithfulness to the one law of art, 'idealise, always idealise,' stand in lieu of many ornaments which are not there. If George Sand had written nothing but *Lucrezia Floriani* and the Letters to Flaubert men would have gone about saying what a marvellous novelist, what an acute critic of life and letters had given but glimpses of herself. As it is we have a whole Sandian panorama, and we find fault with it.

The *Œuvres Complètes* of George Sand, which amount to about a hundred and twenty volumes in their compactest form, were and are all published by Messrs Lévy of Paris. Critical and biographical writings on her (these latter rather meagre, but supplemented by the

Letters) are numerous. The best is the volume in the *Grands Écrivains* series (Paris, Hachette), by the late M. Caro, which, under a style at first appearing rather desultory and affected, will be found to contain excellent criticism. But the subject is so huge that no book in a small compass can be really complete. There is a fair life in English by Miss Bertha Thomas in the series of 'Eminent Women.'

Sand, KARL LUDWIG, the Jena theological student and member of the Burschenschaft (q.v.), who assassinated Kotzebue (q.v.) as a traitor to his country. Born in 1795, he was executed by the sword, 20th May 1820.

Sandakan, the capital of the territory of the British North Borneo Company. Founded about 1880, it had a pop. (1891) of over 7000, one-half being Chinese, 131 Europeans, and the rest Sulus, Malays, and Javanese.

Sandal Magna, a small town in the West Riding of Yorkshire, 2 miles SE. of Wakefield. Near it are the remains of the old castle of John Baliol, ruined during the great Civil War. Pop. (1851) 1546; (1891) 5082.

Sandals. See BOOTS.

Sandalwood (a name corrupted from *Santal* wood), the wood of several species of the genus Santalum, of the natural order Santalaceæ (q.v.), natives of the East Indies and tropical islands of the Pacific Ocean. Sandalwood is compact and fine grained, very suitable for making work-boxes, desks, and small ornamental articles, and is remarkable for its fragrance, which is fatal to insects; so that cabinets of sandalwood are extremely suitable for the preservation of specimens in natural history, though much too expensive for general use. White Sandalwood, the most common kind, is the produce of a small tree (*Santalum album*), a native of mountains in the south of India and the Indian Archipelago, much branched, resembling myrtle in its foliage and privet in its flowers. The girth of a mature tree varies from 18 to 36 inches.

It is a government monopoly in India, the exports being now to the value of £80,000 a year. The annual sale in 1889 was 2420 tons, chiefly obtained in the Mysore province. Other species of sandalwood are now brought into commerce, among which may be named *S. Freycinetianum* of the Sandwich Isles, which has a peculiarly rich perfume, from the mountains of Hawaii, *S. Yasi* of Fiji, *S. austro-caledonicum* from New Caledonia, *S. Preissianum* of South Australia, and *S. cygnorum* of Western Australia. Of the latter 4500 tons have been exported in one year, valued at £36,200. The precious oil is obtained by slow distillation from the heartwood and root. The bark and sapwood have no smell, but the heartwood and roots are highly scented, the billet nearest the root being most esteemed. The average yield is about 2½ per cent. or more of oil; indeed 100 lb. of good sandalwood should yield from 15 to 20 oz. of otto. As imported from India it is very dense, of a pale straw colour and of a mild but lasting odour. The best is that prepared in Europe, principally in France and England. From its high price sandalwood-oil is especially liable to adulteration.

The oil forms the basis of many perfumes, and is sometimes used for disguising with its scent articles which, really carved from common wood, are passed off for true sandal. The roots, which are the richest in oil, and the chips go to the still; while the Hindus can afford to show their wealth and respect for their departed relatives by adding sticks of sandalwood to the funeral pile. The wood, either in powder or rubbed up into a paste, is used by all Brahmins in the pigments for their distinguishing caste-marks. In China the wood is used for carving, for incense, and for perfume, the imports ranging there from 100,000 to 146,000 cwt. annually.

Red Sanderswood, sometimes called Sandalwood, is the produce of a very different small tree, *Pterocarpus santalinus*, of the natural order Leguminosæ, sub-order Papilionaceæ, a native of the tropical parts of Asia, particularly of the mountains of the south of India. The tree is about 40 feet high, with pinnated leaves, having generally three leaflets, and axillary racemes of flowers. The heartwood is dark red, with black veins, and so heavy as to sink in water. It is used as a dyestuff, imparting a pale pink colour to cloth, and also by apothecaries to colour certain preparations. In India it is chiefly employed to mark idols and the forehead in ceremonies. The Arabs use it as an astringent, and it is the basis of some of our tooth-powders.

Sandalwood Island, called also Tjindana and Sumba, one of the Sunda group belonging to the Dutch East Indies, has an area of 4385 sq. m. and a pop. of 200,000. The produce consists chiefly in sandalwood and cotton, horses and poultry. The island belongs to the residency of Timor.

Sandarac, or SANDARACH RESIN, is a friable, dry, almost transparent, tasteless, yellowish-white resin, which is imported from Mogador, Morocco. It is completely soluble in oil of turpentine, but not completely soluble in alcohol. When heated, or sprinkled on burning coals, it emits an agreeable balsamic smell. It exudes from the bark of the Sandarac tree (*Callitris quadrivalvis*), a native of the north of Africa, of the natural order Coniferæ. The quantity of sandarac used is not great; it is employed in making varnish, and generally speaking for the same purposes as Mastic (q.v.). The Australian species also exude sandarac. The finely-powdered resin is rubbed, as *Pounce*, on the erasures of writing-paper, after which they may be written upon again without the ink spreading. The mottled butt-wood of the sandarac tree is highly balsamic and odoriferous, extremely durable and valuable for cabinet-makers. It fetched fabulous prices in Pliny's time. A current error is that the gum of the Juniper is identical with sandarac.

Sanday. See ORKNEY ISLANDS.

Sandbach, a market-town of Cheshire, near the right bank of the Wheelock, 5 miles NE. of Crewe. It has a good parish church, public rooms (1859), a grammar-school (1594), and manufactures of boots and shoes, fustian, iron, &c. Pop. (1851) 2852; (1891) 5824.

Sandbags, in military works, are canvas bags (sometimes tarred) 32 inches by 16. They are partially filled with sand or earth, averaging then 20″ × 10″ × 6″, and forming a ready means of giving cover against the enemy's fire, or tamping the charge in a mine. See MINES (MILITARY). They are also very useful in forming revetments to parapets, loopholes for rifle pits, and lining for embrasures, when they should be covered with raw hides to prevent them from taking fire.

Sand-blast, a method of engraving figures on glass or metal. See GLASS, Vol. V. p. 245.

Sandby, PAUL, 'the father of the water-colour school,' was born in 1725 at Nottingham, where he and his brother Thomas, afterwards an architect and R.A., kept a school for some years. In 1741 Paul obtained a post in the military drawing department at the Tower of London; and in 1746–52 he was draftsman of the survey of the Scottish Highlands, which was one result of the rebellion of 1745. Settling at Windsor, he made some seventy-six drawings of Windsor and Eton; and he subsequently made a series of drawings of castles in

Wales. He was a member of the St Martin's Lane Academy, of the Incorporated Society of British Artists, and an original member of the Royal Academy, to whose exhibitions he regularly contributed water-colour landscapes. Appointed drawing-master to the Woolwich Military School, he became famous as a fashionable teacher of painting. His drawings of Scottish scenery were published as etchings by himself, his Welsh views in aquatint; and he was known also as a caricaturist. His water-colours are outlined with the pen, and only finished with colour; his perspective is good, and his architectural drawings admirable. But his landscapes are 'mere tinted imitations of nature,' and for his figures he was often indebted to other hands. He died 9th November 1809.

Sand-crack. See HOOFS, CRACKED HEELS.

Sandeau, LÉONARD SYLVAIN JULES, French novelist and playwright, was born at Aubusson in Creuse, February 19, 1811, and went at an early age to Paris to study law, but soon gave himself entirely to letters. His short-lived intimacy with George Sand produced one joint-novel, *Rose et Blanche* (1831), and suggested to the more famous of the pair her literary name. Sandeau's first independent novel was *Madame de Sommerville* (1834), his first hit *Mariana* (1839). These were followed by a long series of novels, many of which first appeared in the *Revue de Deux Mondes*; the best *La Maison de Penarvan*, *Mademoiselle de Kérouare*, *Mademoiselle de la Seiglière*, *Le Docteur Herbeau*, *Cathérine*, *Madeleine*, *Jean de Thommeray*, and among shorter stories, perfect in their kind, *La Château de Montsabrey*, *Le Jour sans Lendemain*, and *Un Début dans le Magistrature*. As a dramatist Sandeau collaborated much with Émile Augier, his most celebrated plays being *Le Gendre de M. Poirier*, *La Pierre de Touche*, and *La Ceinture dorée*. Sandeau became keeper of the Mazarin Library in 1853, was elected to the Academy in 1858, and appointed librarian at St Cloud in 1859. He died at Paris, 21st April 1883. As a novelist he never attained the popularity of some of his contemporaries, most probably because he steadily refused to make illicit love the staple of his plots. A pleasing style of reflection and an honest interest in the past are characteristic notes; his range of subjects is small and mostly confined to provincial life, but the work is fine, the characters distinct. See Saintsbury's *Essays on French Novelists* (1891).

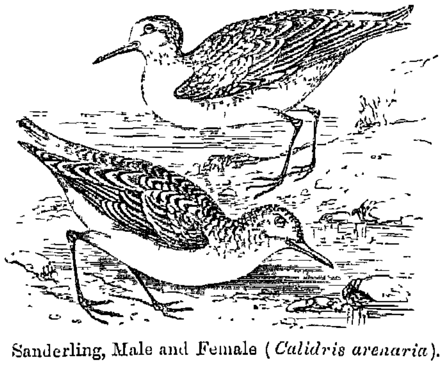
Sandec, a town of Galicia, on the Dunajec, 45 miles SE. of Cracow. It was the scene of a great fire in April 1890. Pop. 11,185, half of them Jews.

Sand-eel. See EEL.

Sandefjord, a watering-place of Norway, 86 miles by rail SSW. of Christiania. Pop. 2307.

Sandemanians. See GLASSITES.

Sanderling (*Calidris*), a genus of birds of the Snipe family, Scolopacidæ, sub-family Tringinæ, characterised by the absence of a hind-toe. There is only one species, the Common Sanderling (*C. arenaria*), which is widely distributed, breeding in the Arctic regions, and ranging from Iceland and east Greenland in the north to Cape Colony and Natal and to Chili and Patagonia in the south, and from north Alaska in the west to Ceylon, Borneo, Java, China, Japan, and the Hawaiian Islands in the east. It visits the British Isles in winter, coming about the middle of August, and beginning to depart in April, but found even till June. It is common on the coast, and is occasionally found near inland lakes. It is about 8 inches long, and it is very fat. The winter plumage is ash gray; the under parts are all white. The summer dress has the feathers of the upper surface of a reddish tinge with black markings. The sanderling in its breeding-places feeds on the buds of saxifrages and on insects, but in Britain its food is chiefly marine worms, small crustaceans, and bivalve molluscs. Its note is a shrill *wick*. It is often found in company with small plovers, and occasionally with dunlins.



Sanderling, Male and Female (*Calidris arenaria*).

Sanders, DANIEL, German lexicographer, was born at Alt-Strelitz in Mecklenburg on 12th November 1819. Educated at Berlin and Halle, he was head of the school in his native town from 1843 to 1852, and thenceforth devoted his energies to the making of dictionaries of the German language, books that enjoy a high reputation amongst his own countrymen. The most important and most popular are a *Worterbuch* (3 vols. 1859–63), *Katechismus der deutschen Orthographie* (4th ed. 1878), *Handworterbuch* (4th ed. 1888), *Fremdwörterbuch* (2 vols. 1871), *Worterbuch der Hauptschwierigkeiten in der deutschen Sprache* (18th ed. 1888), and *Deutsche Sprachbriefe* (1878; 5th ed. 1885). He has also written *Geschichte der deutschen Sprache und Litteratur* (3d ed. 1886), and has edited, in conjunction with Rangabé, *Geschichte der neugriechischen Litteratur* (1884).

Sanders, NICHOLAS. See SAUNDERS.

Sanderson, ROBERT, Bishop of Lincoln, the greatest of English casuists, was born on 19th September 1587, either at Sheffield or at his father's seat, Gilthwaite Hall, near Rotherham. From Rotherham grammar-school he passed in his thirteenth year to Lincoln College, Oxford, of which he became a Fellow (1606), reader of logic (1608), and thrice sub-rector (1613–16), in the last year being also chosen senior proctor. He had taken orders in 1611, and in 1618 was presented to the rectory of Wyberton in Lincolnshire, in 1619 to that of Boothby-Pagnell, near Grantham, in the same county. In 1631 he was appointed a king's chaplain: 'I carry,' said Charles I., 'my ears to hear other preachers, but I carry my conscience to hear Mr Sanderson, and to act accordingly.' He was created D.D. in 1636; from 1646 to 1648 filled the regius chair of divinity at Oxford; and continued parson of Boothby-Pagnell for upwards of forty years, even (in spite of one imprisonment and frequent plunderings) through all the Great Rebellion. In October 1660 he was consecrated Bishop of Lincoln, and in 1661 he was moderator of the Savoy Conference; to him are due the present preface to the Prayer-book and the General Confession. He died at his palace of Buckden, Hunts, 29th January 1663. His works, collected and edited by Professor Jacobson (6 vols. Oxford, 1854), comprise, besides sermons, the *Logicæ Artis Compendium* (1615), *De Obligatione Conscientiæ Prælectiones* (1647; new ed. by Whewell, 1851), *Nine Cases of Conscience resolved*

(1628-78), and *Episcopacy not Prejudicial to the Regal Power* (1661).

See the beautiful Life by Izaak Walton, reprinted in vol. iv. of Wordsworth's *Ecclesiastical Biography* (1853); Bishop Alexander in *Classic Preachers of the English Church* (2d series, 1878); and Guest's *Historical Notices of Rotherham* (1879).

Sandgate, a small watering-place on the south coast of Kent, within the parliamentary limits of Hythe, from which it is, however, nearly 3 miles E. by rail. Sandgate Castle dates from 1539; near by is Shorncliffe Camp. Pop. (1891) 1756.

Sand-glass. See HOUR-GLASS.

Sand-grouse (*Pterocletes*), a small order of birds, quite distinct from the true grouse. There are two genera, Pterocles and Syrrhaptes—the former, including over a dozen species, frequenting sandy tracts in Asia, India, and especially in Africa, the latter represented by two species, both Asiatic. The sand-grouse are birds of beautiful plumage, with heavy body, long and pointed wings, very short legs and toes. They are awkward on the ground, but swift and graceful in flight. They seem to feed chiefly on seeds. *Pterocles alchata* is sometimes called Ganga.

Pallas's Sand-grouse (*Syrrhaptes paradoxus*), named after the traveller Pallas (q.v.), is at home on the sandy steppes of central Asia, migrating northwards in winter, but at intervals since 1859 this bird has wandered westwards over Europe; in 1863, 1872, 1876, 1888, and 1889 flocks reached British shores; flocks have been seen in Ireland also, and hundreds, 'following their instinctive desire to explore the extreme west,' have found an end in the waves of the Atlantic. The predominant colour is buff, barred with black; the total length of the bird is about 15 inches. The eggs, usually three in number, are buff-coloured with purple-brown blotches, and are laid in a slight hollow in the sand. On the plateaus of Tibet *S. tibetanus*, the other species of this genus, has its home. See Macpherson, *The Visitation of Pallas's Sand-grouse to Scotland* (1889).

Sand-hopper (*Talitrus locusta*), a small crustacean in the order Amphipoda, which so abounds on the sandy seashores of Britain that the whole surface of the sand often seems to be alive with the multitudes which, leaping up for a few inches into the air, look like swarms of dancing flies. This activity is not, however, displayed at all times; but if a mass of seaweed left by the retiring tide be turned over, countless sand-hoppers may be seen to leap away, or they may be found by digging in the sand, in which they burrow. The animal leaps by bending the body together, and throwing it open with a sudden jerk. It feeds on almost any vegetable or animal substance, particularly on what is already dead and beginning to decay. It is itself eaten by crabs, beetles, and by many shore-birds. To some other species of Talitrus and to some species of Orchestia the name sand-hopper is equally applicable, but *T. locusta* is commonest.

Sandhurst. See MILITARY SCHOOLS.

Sandhurst, formerly called Bendigo, from the district in which it is situated, stands on Bendigo Creek, 101 miles by rail NNW. of Melbourne, in Victoria, Australia, in the centre of a rich auriferous country. It owes its rise to the discovery of gold here in 1851. The mines give employment to 4600 persons, and yield about 144,500 oz. in the year. Pop. (1881) 28,662; (1891) 26,735. The chief public edifices are the government buildings in Rosalind Park, the banks, hospital, mechanics' institute, churches, and government offices. The town possesses fine botanical gardens, and is excellently supplied with water. Besides gold-mining, the principal industries are brewing, iron-founding, coach-building, brick and tile making, and in the district farming and vine-growing. Sandhurst was proclaimed a municipality in 1855, a borough in 1863, and a city in 1871.

San Diego, the principal port of southern California, and capital of San Diego county, stands on the beautiful bay of the same name, 124 miles by rail SSE. of Los Angeles. The bay, 6 miles long, forms an excellent harbour, and the port is now a very busy one, exporting much wool and other chief products of the country. The climate is genial, the temperature moderate, although the orange and olive flourish here; water is supplied by a long 'flume,' which cost nearly $1,000,000. Pop. (1880) 2637; (1890) 16,159. A monument to R. A. Proctor (q.v.) was erected near San Diego in 1890-91.

San'diver (Fr. *suint de verre*, 'scum of glass'), a product of the glass furnaces. When the materials used in the manufacture of glass are melted a scum arises which has to be removed; this is called sandiver, and is, when powdered, used as a polishing material.

Sand-martin. See SWALLOW.

San (or **Santo**) **Domingo,** capital of the Dominican Republic, stands on the south coast of the island of Hayti, at the mouth of the Ozama. It was founded by Columbus as early as 1494. The principal buildings are the Gothic cathedral (1514-40), where the ashes of Columbus found a rest from 1536 till 1796, a college, a hospital, an arsenal, and the government buildings. The streets are broad and straight, the houses mostly of wood, and the town is surrounded by a wall. The harbour is defended by forts and batteries. Pop. 25,000.—See also HAYTI, and DOMINICAN REPUBLIC.

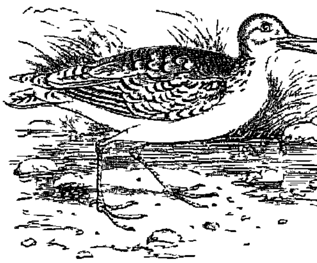
Sandoway, a district in the south of Arakan (q.v.) in Burma, named after its chief town (pop. 2000), 15 miles from the mouth of a small river of the same name, and 150 miles NW. of Rangoon.

Sandown, a watering-place on the south-east coast of the Isle of Wight, 6 miles by rail S. of Ryde. Pop. (1881) 3120; (1891) 3592.

Sandown Park, a well-known race-course (130 acres) in Surrey, near Esher, 15 miles SW. of London. All the inmates of an old hospital here were swept off by plague in 1348. See HORSE-RACING, Vol. V. p. 797.

Sand-paper is made like Glass Paper (q.v.), but with sand in place of glass particles.

Sandpiper, the common English name for a group of birds of the Snipe family, Scolopacidæ. The name as now used is applied to all the birds in three sub-families, Totaninæ, Tringinæ, and Phalaropodinæ. In characters and habits they are all very similar. Their size is not large; their movements are active and graceful; their plumage is not gay, but pleasing and finely diversified in colour; legs rather long; lower part of the tibia naked; tail very short; wings moderately long; bill rather long and slender, grooved throughout the whole or a considerable part of its length, straight in some, a little arched in others. The feet have three long toes before, and one short toe behind, either partially webbed at the base or completely separate. They swim well, but are not often seen swimming; they frequent sandy sea-shores, some of them congregating in numerous flocks in autumn and winter, and seek their food by probing the sand with their bills, and by catching small crustaceans in pools or within the margin of the sea itself. Many are birds of passage, visiting high northern latitudes in summer, and spending the winter in the south. The flesh of all the species is good, and some of them are in much request for the table. The following is a summary of the British species. (1) Of the Totaninæ: bill stiff and acute, no change to summer plumage. The Common Sandpiper or Summer Snipe (*Totanus hypoleucus*) is a regular summer visitor to the British Isles, especially to Scotland, Ireland Wales, and the south-east of England. In summer it ranges from the Arctic circle to the south of Europe; in winter it frequents the Mediterranean basin, and reaches Abyssinia and Madagascar and ranges through the oriental region to Australia and Tasmania. The Wood Sandpiper (*T. glareola*) is a much less common visitor to the British Isles, and is much more restricted in its range northwards than the common sandpiper. In winter it reaches Cape Colony. The Green Sandpiper (*T. ochropus*) differs in nesting habits from all other waders. It lays its eggs in the nests of other birds, such as thrushes, blackbirds, jays, wood-pigeons, and in old squirrels' dreys, and occasionally on stumps and broken-down trees, but always near pools The Solitary Sandpiper (*T. solitarius*) and the Yellowshank (*T. flavipes*) are American species which are found extremely rarely as stragglers to Britain. The Common Redshank (*T. calidris*), resident in Britain, is a summer bird of passage to the most northern parts of Europe and Asia, and occurs in winter in Morocco and Cape Colony and in Abyssinia and Natal; also in Japan, China, Borneo, and Java. The Spotted Redshank (*T. fuscus*) and the Greenshank (q.v.) are the only other species found in Britain.



Common Sandpiper (*Totanus hypoleucus*).

Redshank (*Totanus calidris*).

(2) Of the Tringinæ: bill flexible and blunt; the plumage usually assumes a chestnut or reddish-brown tint in summer; more frequently found on the shore. The Dunlin, the Curlew Sandpiper, the Knot, the Sanderling, and the Ruff are described in other articles. The Broad-billed Sandpiper (*Tringa* or *Limicola platyrhyncha*) is a straggler to the British Isles. The Pectoral Sandpiper (*T. maculata*), Bonaparte's Sandpiper (*T. fuscicollis*), the American Stint (*T. minutilla*), the Buff-breasted Sandpiper (*Tryngites rufescens*), and Bartram's Sandpiper (*Bartramia longicauda*) are all stragglers from America, some being fairly common, others extremely rare. The other species are the Little Stint (*Tringa minuta*), Temminck's Stint (*T. temmincki*), and the Purple Sandpiper (*T. striata*).

(3) Of the Phalaropinæ: swimming sandpipers; toes lobed and webbed at the base; lower plumage as close as that of a duck. The Gray Phalarope (*Phalaropus fulicarius*), an irregular visitor, breeding in the northern regions, the courtship being conducted by the larger and handsomer female, while incubation is performed chiefly by the male; the southern range of this bird extends to Chili, North Africa, and New Zealand. The Red-necked Phalarope (*P. hyperboreus*), also an irregular visitor. The only other and largest species of this sub-family, Wilson's Phalarope (*P. wilsoni*), is confined to America.

Sandpipes are cylindrical hollows existing in chalk deposits. They descend perpendicularly into the chalk at right angles to the surface, tapering downwards, and ending in a point; they reach occasionally a depth of 60 feet, and have a diameter varying from 1 to 12 feet. They are most probably produced by the chemical action of water, charged with carbonic acid, which exists more or less in all rain-water, and is especially abundant in water that has been in contact with decaying organic matter. The pipes are filled with sand, clay, or gravel from the overlying deposit.

Sandringham, a Norfolk estate, 3 miles from the sea and 7½ miles NNE. of Lynn. Comprising over 7000 acres, it was purchased in 1862 by the Prince of Wales for £220,000 of the Hon. C. S. Cowper. The then existing mansion was demolished, and the present hall built in 1869-71, a red-brick Elizabethan country-house, standing in a pleasant park of 200 acres; special features are the iron 'Norwich gates,' the dairy, and the splendid cottages. A fire on 1st November 1891 did damage to the amount of over £10,000. Sandringham was the scene of the six-weeks' illness of the Prince of Wales (Nov.-Dec. 1871), and of the death of his eldest son, the Duke of Clarence (14th January 1892). See Mrs Herbert Jones, *Sandringham, Past and Present* (2d ed. 1888).

Sandrocottus, or CHANDRAGUPTA, the Hindu king of Pâtaliputra or Palibothra, to whom in 306 B.C. Megasthenes (q.v.) was sent by Seleucus Nicator.

Sandstone is a rock formed of compacted, and more or less indurated sand. The grains generally consist of quartz, though other mineral substances are often mixed with this; they are colourless, or of a dull white, yellow, brown, red, or green colour. The grains vary in size, forming, as the case may be, a fine or coarse grained stone. The loose sand becomes solidified by pressure simply, but generally there is some binding material present, as argillaceous matter; or the grains may have become cemented by infiltrating water, carrying with it carbonate of lime, or silica, or ferric oxide. The colour of the rock is often due to the cement. Highly indurated sandstones often pass into Quartzite. See the classification at PETROGRAPHY; also OLD RED SANDSTONE.

Sandstorm. See SIMOON.

Sandus'ky, a city and port of Ohio, and capital of Erie county, on the south shore of Sandusky Bay, an arm of Lake Erie, 56 miles by water (by rail 65) W. of Cleveland. The bay, 15 miles long and 5 wide, forms an excellent harbour. The city is built upon a bed of limestone, on a site rising gradually from the shore. It has several machine-shops, railway-car factories, manufactories of cutlery and edge-tools, wheels, and especially of carved and turned woodwork. From its busy wharves are shipped large quantities of fish, lime, limestone, lumber, salt, coal, ice, wool, wheat, flour, and native wine. Pop. (1880) 15,838; (1890) 18,471.

Sand-wasp. See WASP.

Sandwich, a decayed seaport of Kent, on the right bank of the Stour, 12 miles E. of Canterbury and 68 (by rail 84) ESE. of London. It now stands 2 miles from the sea, or 4 if one follows the windings of the river; but in the 11th century, when Edward the Confessor made it one of the Cinque Ports (q.v.), it was the 'most famous of all the English harbours.' It was the place of landing or embarkation of St Wilfrid, Canute, Becket, Cœur-de-Lion, &c.; under Edward IV. had 95 ships and 1500 mariners; but has never recovered the silting up of its harbour in the 16th century, in spite of the settlement at it of Protestant refugees (c. 1561), and of some harbour improvements since 1847. To-day its chief fame is as a headquarters of golf. The old walls have been converted into a pleasant promenade, but it retains the Fisher Gate and Barbican, and offers a good deal of interest in its two churches and hospitals, guildhall (1579), grammar-school (1564), a house that lodged Queen Elizabeth, and other quaint old buildings. Richborough, 1½ mile N., was the Roman *Rutupiæ*, the predecessor of Sandwich, like which it declined as the sea receded from its port. A great fortress, 460 feet square, it still has a wealth of Roman remains—walls, towers, the base of a pharos, and a castrensian amphitheatre. Sandwich was made a borough by Edward III., and with Deal and Walmer returned two members, but was finally disfranchised in 1885. Pop. (1851) 2966; (1891) 2796.

See works by Boys (1792), Smith (1830), Bell (1831), and Montagu Burrows (1888).

Sandwich, EDWARD MONTAGU, EARL OF, born 27th July 1625, fought for the parliament at Marston Moor, sat in the House of Commons 1645-48, divided the command of the fleet with Blake from 1653, and used his position to forward the Restoration: hence his earldom. He commanded in several battles against the Dutch, was ambassador to Spain in 1666-69, and lost his life in a naval engagement with the Dutch, 28th May 1672. The fourth earl (1718-92) is famous as the inventor of *sandwiches*, which he could eat without having to rise from the gaming-table.

Sandwich Islands. See HAWAII.

Sand-worm, a general name for any of the numerous worms living in the sand of the shore. Most of them are Chætopods, with setæ on their feet, but the title might also include forms without setæ, such as the Nemerteans and the Sipunculids. The fisherman's Lobworm (q.v.) is one of the most important of the more sedentary sand-worms; the tubes of *Terebella conchilega*—mostly composed of fragments of shell—are familiar on the flat beach; while hidden under stones or burrowing deeply in the sand there are numerous species of errant Chætopods, belonging to the genera Nereis, Nephthys, Polynoe, Syllis, &c.

Sandwort (*Arenaria*), a numerous genus of plants belonging to the natural order Caryophyllaceæ. The species are small, much-branched annuals, or tufted or prostrate perennials, usually glabrous and having small white flowers like those of the common chickweed, to which they are closely related. The Sea Sandwort (*A. marina*) has sprouts so succulent that in Cornwall and the Isle of Wight they are pickled and sold as samphire.

Sandy Hook, a narrow sandy peninsula of New Jersey, between the Atlantic and Sandy Hook Bay, 16 miles S. of New York. It is some 6 miles long, and extends northward towards New York Lower Bay. Near the north point are a fort, a fixed light 90 feet high, and a life-saving station.

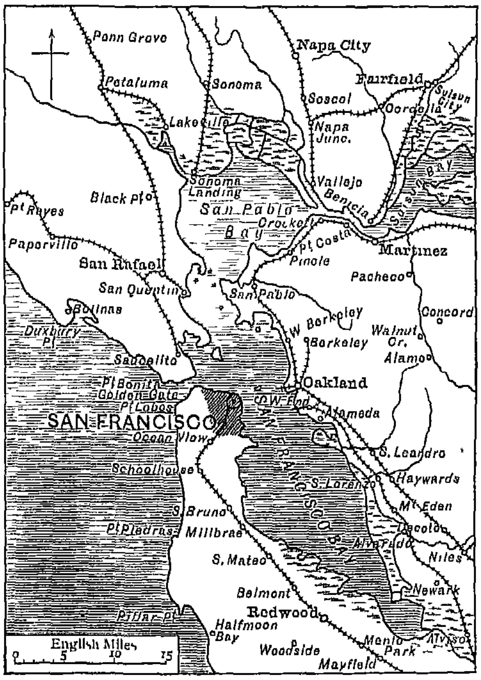
Sandy Point. See PATAGONIA.

San Felipe, (1) capital of the Chilian province of Aconcagua, in the fertile valley of the Aconcagua, 60 miles ENE. of Valparaiso. Pop. 12,000.—(2) A town of Lara state in Venezuela, 140 miles W. by S. of Caracas, in a district producing much coffee, cacao, sugar, and indigo. Pop. 7000. See also JATIVA.

San Fernando, a Spanish town on the same Isle of Leon on which Cadiz stands, is near the head of the bay and 9 miles by rail from Cadiz. Much salt is manufactured from sea-water. Pop. 29,287.

San Francisco, the largest city of the Pacific coast, and the commercial emporium of California, is situated in 37° 47′ 22″ N. lat. and 122° 25′ 40·76″ W. long. The city occupies the end of a peninsula or tongue of land, having the ocean on one side and the Bay of San Francisco on the other. The site is uneven, two hills within the city rising to the height of 360 feet and 294 feet respectively; from these heights and other smaller elevations the land inclines gently towards the bay. The entrance to this landlocked bay is through the Golden Gate, a worn waterway about 5 miles long and about 1 mile wide, with a depth of water averaging 100 feet, but only 30 feet on the bar at the entrance. The Bay of San Francisco gives the city much of its commercial importance, and extends from East Point past the city in a southerly direction for about 40 miles, varying in width from 6 to 12 miles. Northwards, this bay connects by a strait with San Pablo Bay, 10 miles in length, having at its northerly end Mare Island and the Navy Yard. This bay is again connected with Suisun Bay, 8 miles long.

Copyright 1892 in U S by J B Lippincott Company



The total length of these bays and connecting straits is 65 miles. The Sacramento and San Joaquin rivers debouch near the head of Suisun Bay. Nearly in front of the city are three important islands—Alcatraz (fortified), Angel Island (fortified), and Yerba Buena or Goat Island.

The original site of the city was a grant made by the king of Spain of four square leagues of land. This grant was afterwards confirmed by congress, and is now wholly within the limits of the municipality, which extends its jurisdiction also over the islands in the bay. In the early part of 1849 the population of San Francisco was about 2000; at the close of that year the population had increased to 20,000. A large part of the mining immigration made it a point for supplies and departure for the mines in the interior (for the discovery of gold and the social conditions of that period, see CALIFORNIA). The city was originally built of wood, the first houses and stores being constructed in the Atlantic States, brought round Cape Horn, and set up as wanted. Three great fires in 1850 swept the greater part of these wooden structures away. Many of the business houses were thereafter built of brick and iron, but to this day the dwellings are chiefly of wood, for climatic reasons. Most of the pioneer business structures have disappeared; many large and costly buildings have been erected; and marble, granite, and terra-cotta are coming into extensive use, with interior frames of iron and steel. The public edifices for the most part are not of an imposing character; there are seven theatres and opera-houses, a sub-treasury, mint, custom-house, stock exchange, city hall, and other structures of less note. The largest edifice in the city is the Palace Hotel, costing upwards of three million dollars, with accommodation for 1200 guests. There are eleven public squares. The Golden Gate Park covers an area of 1050 acres; originally a barren tract of sand-dunes, it has been gradually converted into one of the most attractive places in the state. It is about 3 miles in length and 1 mile in breadth; and it is bounded on the west side by the ocean.

The number of churches and chapels is about one hundred. Of these seventy or more are Protestant, and not less than twenty are Catholic. Nearly every religious denomination in the civilised world has a representative in the city. There are few church edifices of the first class. The new Roman Catholic cathedral, the Unitarian church, Grace Church, and the First Congregational Church are the more notable edifices for religious worship. The charities of the city are numerous and well supported. San Francisco is distinguished for the number and excellence of its free schools and other institutions of learning. There are sixty-five public schools which are practically free. In these the instruction is carried far enough to qualify pupils for admission to the state university at Berkeley, which is the culmination of the free-school system. In addition to these there are a large number of schools under private or denominational control. The higher institutions include the law, medical, and dental departments of the university, the Cooper Medical College, the Hahnemann Medical College, the School of Mechanic Arts, founded by a bequest from James Lick of $540,000, and the Academy of Sciences, enriched by another large bequest from the same benefactor. The city has also a free library with 55,000 vols.; the Mercantile Library and the Mechanics' Library have nearly the same number, the Oddfellows' Library 40,000 vols., and the Law Library 25,000.

Most of the streets are laid out in rectangular form, and with little reference to the conformation of the surface. The horse tramway was the pioneer method of street transit. But the abrupt elevation required some better facilities; and the cable-road (see TRAMWAYS) was first invented and put into successful operation in San Francisco. There are now in operation in the city not less than 75 miles of cable-roads, constructed at a cost ranging from $80,000 to $100,000 a mile. Gas, electric light, and water are supplied by private corporations. The daily consumption of water now exceeds 20,000,000 gallons, which is brought in pipes from springs, creeks, and reservoirs from points about 20 miles distant from the city.

San Francisco is the western terminus of the continental railroads, and of many short lines extending to various parts of the state. Lines of steamships ply between the port and Mexico, Central and South America, Australia, Japan, and China, and coast lines to all the principal ports as far north as Puget Sound, with summer trips extended to Alaska. Shipbuilding is now extensively prosecuted in the city: two large government war-ships, the *Charleston* and *San Francisco*, are amongst those already constructed and placed in commission. A stone dry-dock admits vessels of 6000 tons, and smaller docks take up the coasting fleet for repairs. Three or more whaling companies send out fleets to the Arctic, comprising both sail and steam vessels. About half a million dollars in value of oil and bone are annually brought in by these vessels. San Francisco is one of the most important grain ports in the United States. The annual exports of wheat range from 750,000 to 1,000,000 tons, and more than three hundred ships are employed in transporting this wheat to foreign countries. Iron and steel vessels of British register have the preference for wheat charters.

The city is rapidly acquiring large manufacturing interests. It gives employment to about 20,000 persons in the various manufactories, with an estimated annual product of $45,000,000. There are large sugar-refineries, rolling-mills, foundries, machine-shops, where the largest steam-engines are constructed, ship-yards, cordage-works, sash and door factories, woollen-mills, tanneries, breweries, boot and shoe factories, and type-foundries. The whole range of mechanic arts, with few exceptions, is now represented in San Francisco. Pop. (1860) 56,802; (1870) 149,473; (1880) 233,959; (1890) 298,997, including about 25,000 Chinese. See works cited at CALIFORNIA (Soulé, Hittell, Bancroft), and the Johns Hopkins Studies, Feb.-Mar. 1889.

San Fratello, a town of northern Sicily, 53 miles WSW. of Messina. Here is the cave of San Teodoro, discovered in 1859, and containing prodigious quantities of bones of mammals mixed with flint implements. Pop. 7554.

Sangaree′ (Span. *sangría*), a West Indian beverage, consisting of wine, sugar or syrup, water, and nutmeg, drunk cold.

Sangerhausen, an old town of Prussian Saxony, on the SE. of the Harz Mountains, 22 miles E. of Nordhausen, with manufactures of machinery, iron, copper, and beet-root sugar. Pop. 10,188.

San German, a town in the SW. of the Spanish island of Porto Rico, about 10 miles from the sea. Pop. 30,146.

San Germano, now more generally called CASSINO, a town of Italy, standing 3 miles E. of the celebrated monastery of Monte Cassino (q.v.) and 69 miles NW. of Naples. It is built on the site and from the ruins of the ancient Volscian town of *Casinum*. The principal ruins are a monument and an amphitheatre. The first, now employed as a church, is built in the form of a Greek cross, constructed with enormous Cyclopean blocks of stone. Here, too, was Terentius Varro's villa, in which Antony lived for some time. Pop. 6380.

San Gimignano, a town of Italy, 25 miles S. by W. of Florence, with several churches, some containing fine frescoes by Ghirlandajo and Gozzoli. Pop. 3591.

San Giovanni a Teduccio, a suburb of Naples, 3 miles to the SE. by rail. Pop. 14,397.

San Giovanni in Fiore, a town of South Italy, 25 miles E. of Cosenza. Pop. 10,500.

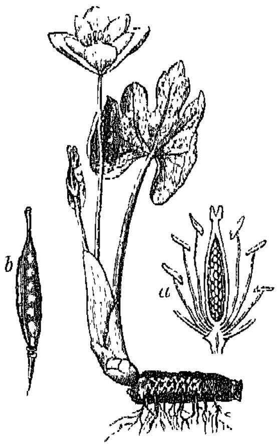
San Giovanni Rotondo, a town of South Italy, 27 miles NE. of Foggia, near Monte Gargano. Pop. 8312.

Sangir Islands, a group of fifty islands, lying between the Philippines and Celebes, measure in all 323 sq. m. and contain 50,000 inhabitants, the largest, Great Sangir, being 28 miles long by 9 broad, and having nearly one-fourth of the population. All the islands are mountainous, volcanic, and fertile. The volcano Abu on Great Sangir was the scene of an eruption in 1856 that cost more than 6000 lives. The people are Malays, and are ruled by their own chiefs under the sovereignty of the Dutch government.

Sang-koi. See TONQUIN.

Sangreal. See GRAIL.

Sanguinaria, a genus of plants of the natural order Papaveraceæ, having eight to twelve petals, two stigmas, an oblong, swollen, and many-seeded capsule with two deciduous valves. *S. canadensis*, the Blood-root or Puccoon of North America, has a fleshy root-stalk abounding in a red juice, which abounds also in the leaf-stalks; and solitary radical leaves, which are roundish, deeply heart-shaped, and with about seven toothed angles. The flowers are solitary and spring from the root, on short stalks. The whole plant is acrid and narcotic, emetic and purgative in large doses; and in small doses stimulant, diaphoretic, and expectorant. From its use by the Indians for staining, it is also called 'red Indian paint.' It is supposed to owe its properties to an alkaloid called *Sanguinarin*. The large white flowers appear early in spring, and are a frequent ornament of flower-borders.



Blood-root (*Sanguinaria canadensis*): *a*, section of ovary; *b*, fruit. (Bentley and Trimen.)

Sanguine, a term used in art for a drawing in red chalks.

Sanguisorbaceæ, or SANGUISORBEÆ, according to some botanists a natural order of plants, but more generally regarded as a sub-order of Rosaceæ (q.v.). About 150 species are known, all of which are herbaceous or half shrubby, some of them spiny. The leaves of *Acæna sanguisorba*, a native of Van Diemen's Land, are said to be an excellent substitute for tea. Of British species Burnet (q.v.) is the best known.

San'hedrim, or SANHEDRIN (*Sanhedrin* being the Hebrew spelling of the Gr. *sunedrion*, 'assembly,' 'council'), the supreme national tribunal of the Jews, established at the time of the Maccabees, probably under John Hyrcanus. It consisted of seventy-one members, and was presided over by the Nasi ('prince'), at whose side stood the Ab-Beth-Din ('father of the tribunal'). Its members belonged to the different classes of society: there were priests (Gr. *archiereis*); elders, that is, heads of families, men of age and experience (Gr. *presbyteroi*); scribes, or doctors of the law (Gr. *grammateis*); and others, exalted by eminent learning—the sole condition for admission into this assembly. The presidentship was conferred on the high-priest in preference, if he happened to possess the requisite qualities of eminence; otherwise, 'he who excels all others in wisdom' was appointed, irrespective of his station. The limits of its jurisdiction are not known with certainty; but there is no doubt that the supreme decision over life and death, the ordeal of a suspected wife, and the like criminal matters were exclusively in its hands. Besides this, however, the regulation of the sacred times and seasons, and many matters connected with the *cultus* in general, except the sacerdotal part, which was regulated by a special court of priests, were vested in it. It fixed the beginnings of the new moons; intercalated the years when necessary; watched over the purity of the priestly families, by carefully examining the pedigrees of those priests born out of Palestine, so that none born from a suspicious or ill-famed mother should be admitted to the sacred service; and the like. By degrees the whole internal administration of the commonwealth was vested in this body, and it became necessary to establish minor courts, similarly composed, all over the country, and Jerusalem itself. Thus we hear of two inferior tribunals at Jerusalem, each consisting of twenty-three men, and others consisting of three men only. These courts of twenty-three men (Lesser Synedrion), however, as well as those of the three men, about both of which Josephus is silent, probably represent only smaller or larger committees chosen from the general body. Excluded from the office of judge were those born in adultery; men born of non-Israelitish parents; gamblers; usurers; those who sold fruit grown in the Sabbatical year; and, in individual cases, near relatives. All these were also not admitted as witnesses. Two scribes were always present, one registering the condemnatory, the other the exculpatory votes. The mode of procedure was exceedingly complicated; and such was the caution of the court, especially in matters of life and death, that capital punishment was pronounced in the rarest instances only. The Nasi had the supreme direction of the court, and convoked it when necessary. He sat at the head, and to his right hand was the seat of the Ab-Beth-Din; in front of them the rest of the members took their places according to their dignity, in a semicircle. The court met on extraordinary occasions in the house of the high-priest; its general place of assembly, however, was a certain hall (*Lishcat Hagaziz*), probably situated at the south-west corner of one of the courts of the temple. With exception of Sabbath and feast days it met daily. The political troubles forced the Sanhedrim (70 B.C.) to change its meeting-place, which was first transferred to certain bazaars (*Hannyoth*) at the foot of the temple mount. After the destruction of the temple and Jerusalem it finally established itself, after many further emigrations, in Babylon.

The question as to the origin and development of the Sanhedrim is a difficult one. It is said it was intended to be a faithful reproduction of the Mosaic assembly of the seventy (Moses himself making seventy-one), supposed to have been re-established by Ezra after the Exile. There are widely different opinions respecting the jurisdiction and competence of the Sanhedrim at the time of Christ and the apostles. It has even been questioned how far, save for a few matters of small importance, it may be said to have existed at all, curtailed and circumscribed as it was by the Romans, who seem to have recognised only the 'high-priest.' Nor is it agreed whether it was really from the Sanhedrim at all some of those well-known acts recorded in the New Testament had their origin; and it is difficult to account, by what we know of its constitution, for many of the proceedings against the apostles ascribed to this body.

See the histories of the Jews by Ewald, Herzfeld, Jost, Graetz, Kuenen, and others; Hausrath's *Neutestamentliche Zeitgeschichte* (1868); Schurer's *History of the Jewish People in the Time of Jesus Christ* (Eng. trans. 1886-90).

Sanhitâ is the name of that portion of the Vedas which contains the Mantras or hymns. See VEDA.

Sanidine, a clear, glassy variety of orthoclase. See FELSPAR.

Sanitation, in the widest sense of the word, is the science of sanitary conditions and of preserving health, and is accordingly synonymous with Hygiene; but the term is usually restricted to the methods and apparatus for making and maintaining houses healthy, for removing waste and nuisance by means of drainage and otherwise, for securing abundance of fresh air, and for the excluding of poisonous gases, especially sewer gas—in short, the province of the sanitary engineer. Sanitary science falls under various heads in this work: a sketch of the progress of sanitary knowledge and legislation is sketched under HYGIENE. Other branches of the subject are treated in the articles on Food and Diet, on Contagion, Infection, Disinfectants, Antiseptics, the Germ Theory of Disease, on Baths, Gymnastics, Hospitals, Nursing, and the Feeding of Infants, on Lodging-houses, the Factory Acts, Slaughter-houses, Nuisance, and Vital Statistics. The relation of churchyards to health, and legislation in that regard, is dealt with in the article Burial, and in that on Cremation. The subjects of Building, Ventilation, Warming, and Water-supply are dealt with under their own heads, and one of the most important subjects in sanitary science—how to remove waste substances without offence to health by drainage, how, by trapping and other methods, to prevent the entrance of poisonous sewer gases into bedrooms and dwelling-rooms through fixed wash-hand-basins and bath-rooms—is treated in the article on Sewage. The diseases that arise from blood-poisoning by foul air, poisonous gases, and lack of precautions to secure cleanliness are dealt with in the articles on Disease, Typhoid and Typhus Fevers, Jail Fever, Diphtheria, Pyæmia, &c.

Sanjak, a Turkish word signifying 'a standard,' is employed to denote a subdivision of a vilayet.

San Joaquin', a river of California, rises in the Sierra Nevada, and runs first SW., then NNW. to Suisun Bay, near the mouth of the Sacramento River. It receives numerous branches—the Merced, Tuolumne, Stanislaus, &c.—and has a course of 400 miles, mostly navigable for small steamboats.

San José, capital of Santa Clara county, California, on the Guadalupe River, 8 miles from the Bay and 50 miles by rail SE. of the city of San Francisco. Besides a fine court-house and a city hall, it contains the state normal school and a Roman Catholic college (Notre Dame) for girls; and the University of the Pacific (Methodist Episcopal; 1852) and the Roman Catholic Santa Clara College are both at Santa Clara, close by. Lick Avenue extends from San José to the Lick Observatory (q.v.). The city enjoys a dry and delightful climate, has wide streets and three parks, and is noted for its gardens and fruit. Its manufactories include a number of foundries, fruit-canneries, woollen and flour mills, a furniture-factory, &c.; and much wine is made in the neighbourhood. Pop. (1880) 12,567; (1890) 18,060.

San José, (1) the capital since 1823 of Costa Rica, stands in a fertile plain, 3711 feet above the sea, and 15 miles by rail WNW. of Cartago. It is 25 miles distant from Carillo, the terminus of the railway (70 miles) from Limon, the Atlantic port. Its streets are regular and well kept, with many squares and two large parks; the houses are low, and nearly all of brick, with gray-tiled, sloping roofs. The notable buildings are the presidential and national palaces, and that of justice, the cathedral and the bishop's palace, a seminary, the old university buildings (now a museum and national library), two colleges for young men and women, the covered market, a small Protestant church, and the hospitals (one for lepers) and asylums. The principal manufactory is the government distillery (a monopoly); the others include steam flour-mills and two foundries. Pop. (1889) 14,488.—(2) A port of Guatemala, on the Pacific, 80 miles by rail from the capital. It has only an open roadstead, with an iron pier running out past the surf, but not to where ships can approach. It has, however, a considerable trade: the imports alone reach £250,000. Pop. 1500.—(3) A town of Lower California, on the south-east coast, with an insecure harbour, but much visited by the whalers. Pop. 2500.—(4) A thriving inland town of Uruguay, capital of the southern department of the same name, 60 miles by rail NNW. of Montevideo. Pop. 6000. See also CÚCUTA.

San Juan', (1) a frontier province of the Argentine Republic, bordering on Chili, with an area of 37,697 sq. m. and a pop. (1886) of 85,480. Half of the surface is occupied by mountains—Andean and pampa chains—and the province is rich in minerals, little of which, except coal, has yet been worked. Agriculture—lucerne, corn, and grapes—is the chief occupation. The capital town, San Juan, on the river San Juan, is by rail 735 miles W. by N. of Buenos Ayres and 98 N. of Mendoza. It exports cattle and fodder to Chili, and has a custom-house, a national college, normal school, school of engineering, and a seminary, a library, hospitals for men and women, a gaol, public baths, a bull-ring, &c. Pop. 12,000.—(2) Of several San Juans in Mexico the chief is in Queretaro, 191 miles by rail NW. of Mexico city, with fruit and market gardens, and 10,000 inhabitants.—(3) For San Juan in Porto Rico, see ST JOHN'S.—(4) For San Juan del Norte in Nicaragua, see GREYTOWN.—(5) For San Juan in Juan de Fuca Strait, see FUCA.

Sankara, or SANKARA ACHARYA ('the spiritual teacher Sankara'), is the name of one of the most renowned theologians of India. His date, as is the case with most celebrities of that country, is unknown. Tradition places him about 200 B.C., but the best authorities assign him to the 8th or 9th century after Christ. Most accounts agree in making him a native of Malabar, and a member of the caste of the Nambúri Brahmans. All accounts represent him as having led an erratic life, and engaged in successful controversies with other sects. He may be regarded as having finally brought into its completed form the Vedanta philosophy or Mimânsâ; he taught that there was one sole supreme God, and is the origin of the sect of Smarta Brahmans. Towards the close of his life he repaired to Cashmere, and finally to Kedarnáth, in the Himalayas, where he died at the early age of thirty-two. His principal works, which exercised a great influence on the religious history of India, are his commentary on the Vedanta Sûtras and his commentaries on the Bhagavad-gîtâ and the principal Upanishads. His learning and personal eminence were so great that he was looked upon as an incarnation of the god Siva, and was fabled to have worked several astounding miracles.

Sankey, IRA DAVID. See MOODY.

Sânkhya is the name of one of the three great systems of orthodox Hindu philosophy. See SANSKRIT LITERATURE.

Sanlúcar de Barrameda, a seaport of Spain, stands 15 miles N. by W. of Cadiz, on the left bank of the Guadalquivir, and at the mouth of that river; it exports wines. Pop. 22,667.

San Luis', a west-central province of the Argentine Republic, with an area of 29,304 sq. m. and a pop. (1886) of 76,500. It is mountainous in the north, and a series of dry and sterile plains in the south. Its mineral wealth, though unquestionably great, has as yet scarcely been tapped, and agriculture requires constant irrigation.—The capital, San Luis, founded in 1597, is on the transcontinental railway, 480 miles W. by N. of Buenos Ayres, and has a national college and a normal school, and 6000 inhabitants.

San Luis Potosi', capital of the Mexican state of the same name, stands on the edge of a plateau, 7400 feet above the sea, by rail 362 miles NNW. of Mexico city and 275 W. of Tampico. It is well built, though with steep streets, and contains a handsome cathedral, a seminary, railway workshops, a cotton-factory, and great smelting-works. There are silver-mines near by. Founded in 1586, the city has taken a prominent part in the country's civil wars, and in 1863 was the seat of Juarez' government. Pop. (1889) 62,573.—The inland *state* of San Luis Potosi, largely mountainous and so far healthy, has an area of 27,503 sq. m. and a pop. (1889) of 546,447. Some districts are very fertile, and much gold and silver is mined, besides salt and other minerals.

San Marco in Lamis, a town of South Italy, 16 miles inland from the Gulf of Manfredonia and 18 N. of Foggia. Pop. 15,345.

San Marino, the smallest independent state of Europe and a republic (Monaco, though smaller, is a protectorate of France), lies among the eastern spurs of the Apennines, 9 miles SW. of Rimini on the Adriatic. It has an area of 33 sq. m., and comprises a town of the same name (pop. 1600) and some villages. The town is built on a mountain crag, and is accessible only by one road; the streets are steep and narrow. Agriculture and cattle-breeding are the principal occupations. In the 13th century the little community of San Marino cast in its lot with the house of Urbino; but on the annexation of this duchy to the Papal States in 1631 its independence was recognised by the pope, and it has been maintained down to the present day. Its constitution is that of a republic; but it acknowledges the king of Italy as its friend and protector. The real governing body is the Grand Council of sixty life-members, self-elected, of whom one-third are nobles. From this number are selected the Council of Twelve, who superintend agriculture, and, with the assistance of two foreign lawyers, form the supreme court of the state. The executive is committed to two captains-regent, who are chosen, the one from the nobles, the other from the bourgeoisie. They each hold office for six months. The militia of the republic numbers 950 men. Total pop. (1886) 7840.

See *Macmillan's Magazine* for Jan. 1891, and works by Delfico (2 vols. Milan, 1804), Brue (Paris, 1876), Jonas (Vienna, 1878), and Cazeneuve (Paris, 1887).

San Miguel', a town of Salvador, at the foot of the active volcano (7775 feet) of San Miguel, is famous for a great annual fair. Pop. 10,000.

San Miguel Alende, a town in the Mexican state of Guanajuato, built on the side of a high hill overlooking the Rio de la Lara, 253 miles by rail NW. of Mexico city. It has manufactures of ponchos, saddles, small-arms, &c. Pop. of municipality, 39,290.

San Miniato, a city of Central Italy, 22 miles W. by S. of Florence, has a cathedral with fine sculptures. It is the original seat of the Bonaparte family. Pop. 2147.

Sannazaro, JACOPO, an Italian poet, of Spanish descent, was born at Naples, July 28, 1458. He attached himself closely to the court of Naples, and accompanied King Frederick III. when he took refuge in France (1501-4). It was during his absence that he published the *Arcadia*, a medley of prose and verse, which was greatly admired, and went through numerous editions (one at Turin in 1888). It has given its author the reputation of an Italian classic. Sannazaro died at Naples on 27th April 1530. Other works are *Sonetti e Canzoni* and *De Partu Virginis Libri III.*, mostly written in Latin verse. See Tiraboschi's *Storia della Letterat. Ital.*, and Life by Corniani (1806).

San Nicandro Garganico, a town of Southern Italy, 26 miles N. of Foggia. Pop. 8257.

San Nicolás de los Arroyos, the second city of Buenos Ayres province, in Argentina, stands on the Paraná, 150 miles by rail NW. of Buenos Ayres. It has a busy river trade, a large meat-freezing establishment, steam-mills, soap-factories, and slaughter and salting houses. Pop. 12,000.

Sanpo. See BRAHMAPUTRA and TIBET.

Sanquhar, a town of Dumfriesshire, on the Nith, 26 miles NNW. of Dumfries. It has a ruined castle, was the birthplace of the 'Admirable' Crichton, and has many Covenanting memories—including the affixing to the cross of the two Sanquhar Declarations, by Richard Cameron in 1680 and by Renwick in 1685. The *Corda* of Ptolemy, Sanquhar was made a royal burgh in 1598, and with Dumfries, &c. returns one member. Pop. 1315. See James Brown's *History of Sanquhar* (Dumfries, 1891).

San Remo, a city of Northern Italy, stands on a bay of the Gulf of Genoa, 26 miles by rail ENE. of Nice and 84 SW. of Genoa. It is built on rising ground, and is sheltered by hills behind. This, combined with its delightful climate, makes it one of the favourite winter-resorts of the Riviera (q.v.), especially for Englishmen and Germans. It is also much frequented during the summer. There are two quarters, an old town of steep, narrow streets, and a new town of handsome streets and picturesque villas, hotels, and palaces. Its little harbour serves a brisk trade in olive-oil, palms, and lemons. Pop. 12,285.

San Roque, a town of Spain, 8 miles N. by W. of Gibraltar. Pop. 8793.

San Salvador', or BANZA CONGO—the former being the Portuguese and the latter the native name—a town of Africa, in the Portuguese province of Angola, 170 miles E. by S. from the mouth of the Congo. A ruined fort and ruins of several churches are the only signs of what was an important town during the 16th and 17th centuries. Pop. 700.

San Salvador, the capital of the republic of Salvador (q.v.), stands in the midst of a fertile plateau, among green hills, and at the foot of the extinct volcano of San Salvador (8360 feet). Immense ravines, crossed for the most part only by narrow tracks, have been worn by streams in the surrounding plain, and serve as a protection to the city in time of war. The houses are mostly of one story, with walls built thick to resist the shocks of earthquake, and enclosing pleasant courts. The climate is agreeable and healthy. The government buildings are handsome, and the new cathedral promises to be a splendid structure when finished. The city, however, in spite of an excellent water-supply, is far from notable for its cleanliness. There is a busy trade, and coffee is extensively cultivated on the flanks of the volcano and in the surrounding country. San Salvador was founded in 1528. In 1854 it was a fine, well-built city, adorned with numerous splendid buildings, and containing a population of more than 25,000; but on the night of 16th April it was completely destroyed by an earthquake. A town of Nueva San Salvador was built 12 miles to the south-west, and thither the government removed until 1858. Violent shocks of earthquake have since visited the capital in 1873, 1879, and 1891. Pop. (1888) 16,327.—San Salvador is also one of the names for Bahia (q.v.), and for Cat Island in the Bahamas (q.v.).

Sansanding, or SANSANDIG, a town of Africa, stands on the left bank of the Niger, some 370 miles SW. of Timbuktu, and is a place of some commercial importance. Pop. 40,000.

Sansculottes, i.e. 'without breeches,' was the name given in scorn, at the beginning of the French Revolution, by the court party to the democratic party in Paris. The latter accepted the title with pride, and used it as the distinctive appellation of a 'good patriot.' According to the current interpretation in England (as in Carlyle's works), a *sansculotte* was a radical revolutionist who made a point of neglecting his apparel, and cultivating rough and cynical manners. But Littré makes no mention of breechlessness in the sense of raggedness in his definition of the word; on the contrary, he says that the sansculottes 'were so called because they gave up the knee-breeches in fashion during the *ancien régime* and took to wearing trousers or pantaloons.'

San Sebastián, a fortress and seaport in the north of Spain, 402 miles by rail NNE. of Madrid, and 11 miles from the French frontier. It is built on a peninsula, stretching from the base of a conical hill, Orgullo (400 feet), which is crowned with a castle strong enough to be called the Gibraltar of the north of Spain. Since its almost total destruction by the British, when they stormed it under Wellington during the Peninsular war, the town has been rebuilt on a regular plan. On the west is a magnificent roadstead, well protected, but difficult of access. It is bordered by a beautiful shore, which, on account of its suitability as a watering-place, attracts many summer visitors, especially from Madrid. Most of the loading and unloading is done at the more easily accessible harbour of Pasages, 2½ miles to the E. The two ports are entered every year by some 1000 vessels of 380,000 tons burden, bringing principally coal, metals, fish, spirits, and yarn, to the average value of £672,000. The exports consist chiefly of wine, minerals, textiles, and matches, and average £1,140,000 in annual value. San Sebastian has suffered from numerous sieges in the wars between France and Spain. Pop. (1887) 29,047.

San Severo, a city of Southern Italy, by rail 18 miles NW. of Foggia and 141 NE. of Naples, has a fine cathedral. Pop. 19,756.

Sanskrit (*saṃskṛita*, 'perfected,' 'polished'—viz. *sam*, together or completely, = ἅμα, Eng. 'same,' and *kṛita*, 'made,' probably connected with Lat. *creo*) is the name of the ancient literary language of India. It forms the easternmost branch of the great Indo-Germanic (Indo-European, Aryan) stock of languages, and the one which, thanks to its early literary cultivation (from *c.* 1500 B.C.) and grammatical fixation, and its consequent transparency of structure and fullness of form, approaches nearest to the parent language. In some respects, however (notably in the retention of a single *a*-vowel in place of the differentiation into *a*, *e*, *o*, prevailing in the European languages—e.g. Sansk. *bharantam* = φέροντα), the primitive appearance of the Sanskrit, as of the closely allied Iranian or Persic branch, is now generally ascribed to a special Indo-Iranian development, or to a later return to a phonetic phase already outgrown by the parent language at the time of the separation. Whilst it is admitted on all hands that the Aryan dialect out of which the literary language of India has developed cannot have been indigenous to the peninsula, but must have been introduced from the north-east, there is still considerable difference of opinion as to the original home of the primitive Aryan community—whether it is to be sought for in Asia, as used to be universally believed till recent years, or whether, as many scholars are now inclined to think, it was from some part of Europe that the Asiatic Aryans—the Armenians and Indo-Persians—originally came. On entering India, the Aryan tribes found the country occupied by people of different races; but, favoured by physical and intellectual superiority, they gradually succeeded in extending their sway, as well as their language and their social and religious institutions, over the whole of Northern India. Owing, however, to various causes, such as new political formations or racial or tribal differences in the population absorbed by the ruling race, local dialects gradually sprang up within this area, which eventually developed into the modern vernaculars of Northern and Western India. See INDIA, Vol. VI. pp. 101-2.

Although the term Sanskrit, as the 'perfected' language, properly speaking only belongs to the grammatically fixed form of the language which was employed from about the 4th or 5th century B.C., and which came more and more to assume the character of a mere literary and learned idiom, it is usual to extend the term so as to include an earlier form of the same language used in the Vedic writings, and hence often called Vedic Sanskrit. The two phases of the language show considerable differences, as regards both vocabulary and grammar. The vocabulary of the older language includes numerous words which are no longer used in classical Sanskrit, and the very meaning of which had often become unknown; whilst, on the other hand, many of the commonest words of the later language are not found in the Vedic writings. As regards the inflectional system, the original wealth of grammatical forms has become considerably reduced in the later phase of the language. Thus, whilst the classical Sanskrit has but a single infinitive in *tum*—being the accusative case of a verbal abstract noun in *tu*, and corresponding to the Latin first supine (e.g. Sansk. *dâtum*, *yuktum* = Lat. *dătum*, *junctum*)—the Vedic Sanskrit also makes use for the same purpose of different case-forms of quite a number of verbal noun-stems, several of which occur again with a similar function in one or other of the allied languages—e.g. Sansk. *vidmane* = ἴδμεναι; Sansk. *dâvane* = δοϝέναι, δοῦναι; Sansk. *jîvase* = Lat. *vivere*; Sansk. *bharadhyai* = φέρεσθαι. Similarly the subjunctive mood, which formed a regular feature of the Indo-

Germanic and Vedic verb-systems, has almost entirely disappeared from the classical Sanskrit; and alternative declensional and conjugational forms have usually been reduced to a uniform level. Indeed, levelling processes of this kind are seen to have been at work from the earliest times. Thus, a comparison of the language of the older portions of the Rigveda with that of the later hymns, and the closely allied Atharvaveda, shows how, both in declension and conjugation, vowel-stems gradually supersede the original radical and consonantal stems, which less readily adapt themselves to case and personal affixes, and hence are apt to produce anomalies and irregularities. Such modifications become still more marked in the later Vedic prose-writings, the Brâhmanas and Sûtras, which may be considered an intermediate link between the two periods of the language. Though the process of change was at length arrested by rigid grammatical rules, to which every cultivated writer had to conform, it found all the more scope in the popular dialects, which soon lost touch of the literary language and became more and more removed from it.

Literature.—In accordance with the general development of the language, the history of the ancient literature of India may conveniently be divided into two chief periods, the *Vedic Literature* and the (*Classical*) *Sanskrit Literature.* It must be understood, however, that the two periods overlap each other to some extent, inasmuch as certain classes of works, on account of their subject-matter as well as the archaic character of their language, have to be grouped along with the Vedic literature, though they cannot have originated, in their present form, till after the language had become settled. The Vedic Literature forms the subject of a separate article. See VEDA.

Classical Sanskrit Literature.—The dates of many important Sanskrit works being still very uncertain, it is not yet possible satisfactorily to subdivide this period chronologically; and the usual practice of treating it under the different departments of literature is therefore adhered to.

A. Poetic Literature.—(1) *Epic Poetry.*—The Hindus possess two great national epics, the *Mahâbhârata* (q.v.) and the *Râmâyaṇa* (q.v.). Along with these may be classed the *Purâṇas* (q.v.), which, although in their present form they were doubtless composed or recast for sectarian purposes several centuries after Christ, seem to contain a considerable amount of genuine old legendary matter akin to large portions of the Mahâbhârata. Though the final redaction of the two epics can scarcely be assigned to an earlier period than about the beginning of our era, it can hardly be doubted that the vast mass of legendary lore and complete epic lays of which the Mahâbhârata is composed, at all events, must have required centuries to grow and assume its present shape. At a subsequent period, from about the 5th or 6th century A.D. onwards, there arose a second crop of epic poems of an entirely different character. Whilst the old poems are composed in easy, natural language, such as might well have formed the living though cultured language of the people, these later works are evidently the artificial product of an age when the literary language had long lost touch of the popular mind. Their subject-matter, such as there is, is entirely derived from the old legends; but the form in which it is here presented has nothing of the old popular ring about it—elaborate metres, long and complicated compounds, and laboured figures of speech through which the epic narrative hardly progresses at all being the characteristic features of most of these productions, built up in accordance with a narrow code of rhetoric. They are nevertheless replete with poetic thoughts and genuine artistic feeling, which only require a less artificial form of presentment to please even the western taste. Of such poems (*kâvya*) there existed a considerable number; but the native taste has singled out six of them as *mahâkâvyas* or great poems—viz. two by Kâlidâsa (q.v.), by far the greatest poet of this period, the *Raghuvaṃs'a* and the *Kumârasambhava;* further the *Kirâtârjunîya* by Bhâravi (probably a contemporary of Kâlidâsa, ? *c.* 500-550 A.D.); the *S'is'upâlabadha* by Mâgha, hence also called *Mâghakâvya;* the *Râvaṇabadha* or *Bhaṭṭikâvya*, composed by Bhaṭṭi with the view of illustrating the less common grammatical forms of speech; and the *Naishadhîya* of S'rî Harsha (12th century).

(2) *Lyric, Descriptive, and Didactic Poetry.*—In this class of poetic production the palm is usually assigned to two poems by Kâlidâsa—viz. the *Meghadûta*, or cloud-messenger, where an exiled demigod sends a message of love to his wife by a cloud, to which he describes, in glowing verse-pictures, the places and scenes it will have to traverse; and the *Ritusaṃhâra*, a description of the seasons. Of high poetic merit, though of a very sensuous character, is also the melodrama *Gîtagovinda* (12th century) of Jayadeva (*q.v.*), which describes the love-making of the god Krishṇa among the milkmaids, his separation from, and ultimate reconciliation with, his wife Râdhâ; and which, like the biblical Song of Songs, is considered capable of being explained in a mystic-allegorical sense. Moreover, scattered over dramas and manuals of rhetoric, or collected in poetic anthologies, there are extant thousands of single stanzas, composed with the view of depicting some striking local scene or emotional sensation. They may be likened to our sonnets, being like them artificial productions, though often composed with much skill and neatness, and inspired by genuine poetic sentiment. Didactic poetry, in Indian literature, takes chiefly the form of moral maxims, or sententious truths, expressed in single couplets or stanzas. There are a number of collections of such stanzas, intended to serve as manuals of ethical and social science, the best known of which are the *Râjanîtisamuchchaya*, or 'collection on the conduct of kings,' ascribed to Châṇakya; the *Kâmanḍakîya-Nîtisâra*, by Kâmanḍaki; and the *Nîtis'ataka*, or century (of stanzas) on ethic science, by Bhartṛihari, who also wrote two centuries of erotic and devotional verses. To render moral instruction more attractive to the youthful mind, sententious verses of this kind were also combined with humorous stories and fables; the most famous reading-books of this class being the well-known *Panchatantra* (q.v.), or 'five books,' and the popular recast of it called *Hitopades'a* (q.v.), or 'good counsel;' further, the *Vetâlapanchaviṃs'ati*, or twenty-five (tales) of the goblin; the *Siṃhâsanadvâtriṃs'ikâ*, or thirty-two (stories) of the throne; and the *S'ukasaptati*, or seventy (tales) of the parrot. Two highly popular collections of versified fairy-tales are Kshemendra's *Vṛihatkathâ*, or great story (*c.* 1030 A.D.), and Somadeva's *Kathâsaritsâgara* (trans. by C. H. Tawney), or 'ocean of rivers of story' (*c.* 1120). The Sanskrit novellistic prose literature, on the other hand, is very scanty, and characterised by a stilted, highly involved style, the few best-known works of this class being Daṇḍin's *Das'akumâracharita* (6th century), or adventures of the ten princes (trans. by P. W. Jacob); Subandhu's *Vâsavadattâ;* and Bâṇa's *Kâdambarî* (*c.* 620 A.D.).

(3) *Drama.*—Though dramatic performances of some kind seem to go back to pretty early times, none of the existing plays are probably older than the 5th century of our era. The language is usually

of a mixed nature, higher male characters speaking in Sanskrit, whilst women and lower male characters use Prâkrits, or popular dialects. Plays invariably begin with a benediction and a prelude in the form of a dialogue between the stage-manager and one of the actors, containing some allusion to the author, and leading over to the opening scene. Two standing and interesting characters of the Indian stage are the Vita, or dissolute associate of the hero, somewhat resembling the parasite of the Greek comedy, and the Vidûshaka, his humorous companion, or Gracioso. The extant plays number about fifty. Their plots are usually based on the epic legends. The greatest of Indian playwrights is Kâlidâsa (q.v.; *c.* 500 A.D.), the author of the *S'akuntalâ*, the *Vikramorvas'i*, and *Mâlavikâgnimitra*. Possibly somewhat older than these, and certainly highly interesting as a vivid picture of the social life of the time, is the *Mrichchhakaṭikâ*, or toy-cart, ascribed to a king Sûdraka. Next to Kâlidâsa, in the estimation of native scholars, ranks Bhavabhûti (q.v.; *c.* 700), likewise the author of three plays—viz. the heroic dramas *Mahâviracharita* and *Uttararâmacharita*, and the domestic drama *Mâlatimâdhava*. He is, however, far less of an artist than his great rival, and his language is much more artificial. Besides these may be mentioned S'rî Harshadeva, king of Kanauj (*c.* 625), the reputed author (or patron) of the *Ratnâvali*, *Nâgânanda*, and *Priyadars'ikâ*; Bhatta Nârâyaṇa, author of the *Veṇîsaṃhâra*; and Krishṇamis'ra (12th century), who wrote the *Prabodhachandrodaya*, or 'moonrise of Intelligence,' a rather tedious allegorical play, the characters of which consist entirely of abstract ideas—virtues and vices—ranged in two contending armies (see H. H. Wilson, *Theatre of the Hindus*).

B. Scientific Literature.—The first beginnings of nearly all the branches of scientific inquiry cultivated in mediæval India may be traced back to the later Vedic times, being the natural outgrowth of the Vedic religion and of the study of the sacred writings. This fact indeed receives a direct recognition in the traditionary classification itself, inasmuch as it includes among the Vedic literature, under the title of *Vedânga*, or members of the Veda, the original or fundamental treatises of six sciences—viz. phonetics (s'ikshâ), prosody (chhandas), grammar (vyâkaraṇa), etymology (nirukta), astronomy (jyotisha), and ceremonial law (kalpa). Though some of these treatises, in their present form at all events, cannot justly lay claim to so high an antiquity, it is not improbable that they are based on older treatises on their respective subjects.

(1) *Law* (*dharma*).—The earliest attempts at an orderly statement of social and civil usages are to be found in the *Dharmasûtras*, or rules of law, which form part of some of the Kalpasûtras, or ceremonial rules (see VEDA), in close connection with the Grihyasûtras, or rules of domestic rites, out of which they may indeed have originally grown. The few still extant sets of Dharmasûtras—viz. those of *Baudhâyana*, *Âpastamba*, *Gautama*, and *Vâsishṭha* (all trans. by G. Bühler)—though mainly composed in aphorisms, are interspersed with couplets or stanzas, giving the substance of several rules; and it is in these detached verses that many scholars would trace the first tendency toward the composition of the versified codes of law, the *Dharmas'âstras* or *Smṛitis*, which, somewhere about the beginning of our era, came to supplant the Sûtra-codes, and remained for centuries the standard authorities on matters of law. Whilst some few of these new codes, like their prose prototypes, appear to have been directly connected with certain Vedic schools, such does not seem to have been the case as regards the vast majority of them, which were called by their authors, more or less fancifully, either after some old semi-mythic teacher or sage, such as Atri, Hârîta, S'âtâtapa, or even after some god, such as Vishṇu, Bṛihaspati, Yama. Hindu law usually recognises three distinct divisions—viz. *âchâra*, or established usage; *vyavahâra*, or civil procedure; and *prâyas'chitta*, or penance. The three most important Smṛitis are those of *Manu* (q.v.), *Yâjnavalkya*, and *Parâs'ara*. This last code lacks, however, the section on civil law, which was only supplied some 500 years ago by the famous exegete Mâdhava, who composed a digest of law, based on Parâs'ara, with a special chapter on Vyavahâra. The new school of practical jurisprudence to which this work belongs was ushered in by Vijnânes'vara's *Mitâksharâ* (11th century), which, though primarily a commentary on Yâjnavalkya, constantly quotes other authorities, and thus serves the purposes of a digest of law, and remains to this day one of the standard works on Hindu law. Amongst other famous digests may be mentioned Devaṇṇabhaṭṭa's *Smṛitichandrikâ* (13th century), highly esteemed in Southern India; Jîmûtavâhana's *Dâyabhâga*, the chief authority on inheritance in the Bengal school; the *Vîramitrodaya*, by Mitramis'ra (*c.* 1625); and the *Vyavahâramayûkha*, being the civil law section of a general digest by Bhaṭṭa Nîlakaṇṭha (*c.* 1640).

(2) *Philosophy.*—While the main body of the Vedic hymns are the immediate outgrowth of a worship of the elemental forces of nature, not a few of the hymns, especially the later ones, evidence a strong tendency towards metaphysical speculation. It is only in the *Upanishads* (see VEDA), however, that we meet with the first attempts at some kind of systematic treatment of the great problems of mundane existence, and of the nature of the absolute spirit, and its relation to the human mind. The drift of speculative inquiry in those days, as ever afterwards, is determined by two cardinal notions which are never questioned, and have assumed the force of axioms in Hindu philosophy—viz. the pantheistic notion of the spiritual unity of all sentient beings, and the transmigration of souls. To the Hindu mind the latter notion seems the necessary consequence of the former. All individual souls are identical in nature, having emanated from, and being destined to return to, the infinite, all-pervading spiritual essence, the Brahman or Âtman. The apparent difference of the spiritual element in different kinds of animated beings (elemental gods, men, animals, plants) is due to a greater or less degree of contamination with matter, and consequent obscuration; and it is only by a gradual process of improvement and purification, in repeated terms of bodily existence—i.e. through metempsychosis—that lower beings can raise themselves to the state of purity requisite for their union with the Supreme Spirit (paramâtman). Ignorance of its own real nature, and of its identity with the world-soul, is what alone keeps the individual soul chained to matter, and to material existence with its hateful accompaniment of passion and suffering. To dispel this ignorance by setting forth the true relations between the individual being and the Brahman, as a preliminary to final emancipation, is the task and aim of philosophy.

Six philosophical systems (*dars'ana*) are recognised by orthodox Hindus, which fall, however, into three pairs so closely connected that each pair forms a common school of philosophy—viz. *Mîmâṃsâ* and *Vedânta*, *Sânkhya* and *Yoga*, *Nyâya* and *Vais'eshika*. Nothing certain is as yet known as to their date or order. The tenets of each system are propounded in a manual of concise aphorisms (sûtra), ascribed to the respective founder, and commented upon by numerous writers.

The *Mîmâmsâ*—or properly *Pûrva-Mîmâmsâ*, 'Prior Inquiry'—is mainly a systematic exposition of the principles of scriptural interpretation. Its chief object is to maintain the authority of the Veda, and to urge the necessity of performing the duties enjoined therein, especially those of a ceremonial kind, with a view to securing the benefits, temporal and eternal, accruing from these meritorious works as the logical effect of an operative cause. A philosophical basis is secured for these dogmatic theories by the inclusion of verbal communication (s'abda) among the five or six sources of knowledge, or modes of proof, agreed upon by both schools of the Mîmâmsâ. The sage Jaimini is the reputed founder of this school, and author of its fundamental sûtras, which were afterwards commented upon and supplemented by S'abara Svâmin (c. 500 A.D.) and Kumârila Bhaṭṭa (c. 700).

The *Vedânta*, i.e. 'end of the Veda'—as the *Uttara-Mîmâmsâ* ('Later Inquiry') is more commonly called—is the system most closely in accord with the development of religious thought in Brahmanical India. In its main features it simply formulates and carries on the speculations of the older Upanishads. According to this system, God is the omniscient and omnipotent cause, efficient as well as material, of the world: He is both creator and nature; *and at the consummation of things* all are resolved into Him. The individual soul is of the same essence as the supreme one; it emanates from Him like one of the sparks that issue from a blazing fire, *and* ultimately returns to Him. It is not a free agent, but ruled by God; its activity—the source of its suffering—being solely due to its bodily organs. Whilst the evolution of the elements and organised bodies is minutely expounded in the original aphorisms—the Brahma-sûtras of Bâdarâyaṇa—the questions as to the *raison d'être* of material existence and the origin of evil find no satisfactory explanation. It is only by a later school of Vedântists, represented by the famous theologian S'ankara-âchârya (q.v.), in his commentary on those sûtras, that a solution is found in the theory that the material world has no real existence, but is a mere illusion (mâyâ). This school is called the *Advaita*, or non-duality, school of Vedânta philosophy. In opposition to it arose two other schools, both of which identify the supreme spirit with Vishnu—viz. that of *Râmânuja* (11th century), the founder of the S'rî-Vaishṇava sect, usually called the *Vis'ishṭâdvaita*, or qualified non-duality school, because they allow the Brahman to be 'qualified' by all good qualities, and to be 'distinct' from matter; and the school of Madhva-âchârya (12th century), called the *Dvaita*, or duality, school from their maintaining the supreme spirit to be distinct both from man and from matter. These schools in fact show a certain leaning towards Sânkhya doctrines. The Râmânujas and other Vaishṇava sects—especially the one founded by Chaitanya (c. 1500)—have, moreover, grafted on the Vedânta the doctrine and practices of *bhakti* (implicit faith, fervent devotion), which had early found expression in works such as the famous philosophic episode of the Mahâbhârata, the Bhagavadgîtâ (trans. by J. C. Thomson, and by K. T. Telang), and the Bhâgavatapurâṇa, and had been formulated in the *S'âṇḍilya-Bhakti-sûtra* (trans. by E. B. Cowell).

The *Sânkhya* system, as propounded in the Sânkhya-sûtras ascribed to Kapila, represents the materialistic school of orthodox Indian philosophy. It maintains the external co-existence of a material first cause—the *mûla-prakriti*, or prime originant (plastic nature); also called *pradhâna*, or 'principal (cause)'—and a plurality of spiritual entities or selves (*purusha*) connected with matter from all eternity. From the material first cause, devoid of intelligence, the phenomenal universe has been developed by a gradual process of unconscious evolution. The school, thus denying the existence of an intelligent ruler (*îs'vara*), is often called 'godless' (*niris'vara*). The most popular summary of the doctrines of this system is the Sânkhya-sâra (trans. by H. J. Colebrooke, and by J. Davies), by Vijnâna Bhikshu (16th century).

The *Yoga* school, founded by Patanjali, accepts the speculative system of the Sânkhya with its twenty-four principles; but adds thereto a twenty-fifth—viz. the '*nirguṇa Purusha*' ('the self devoid of attributes'), the supreme god of the school, whence the Yoga is also called the Theistic (*ses'vara*) Sânkhya. Moreover, the school has developed, as its most characteristic feature, a complicated system of ascetic practices for the mortification of the senses, with a view to bringing about, even during life, a spiritual union (*yoga*) with the supreme spirit.

The *Nyâya* and *Vais'eshika*, though differing from each other on some important points, such as the number of the modes of proof, may be considered as two branches of a single analytical system of philosophy which supplement each other and are commonly studied together. The *Nyâya* (lit. 'method,' 'rule'), ascribed to Gotama (or Gautama, also called Akshapâda), though, like the other systems, it professes to deal with the whole round of metaphysical subjects necessary for complete knowledge and final emancipation, is especially remarkable for the very complete system of dialectics which it has developed, and which has gained for it the title of the Hindu science of logic. A regular argument, or complete syllogism (nyâya), according to this system, consists of five members—viz. (*a*) the proposition (pratijñâ): e.g. 'this hill is fiery;' (*b*) the reason (hetu): 'for it smokes;' (*c*) the instance (udâharaṇa): 'as a culinary hearth;' (*d*) the application (upanayana): 'accordingly the hill is smoking;' (*e*) the conclusion (nigamana): 'therefore it is fiery.' The *Vais'eshika* system, put forward by Kaṇâda, also called Kâs'yapa, whilst on the whole accepting the analytical principles of the Nyâya, occupies itself more especially with the physical or cosmic aspect of metaphysics; its name being derived from the assumption of atoms (*aṇu*), or ultimate substances possessed of separate individuality (or 'particularity,' *vis'esha*), which are innumerable and eternal, and of which the phenomenal world is composed. Their aggregation, according to the original view of the school, is caused by an invisible force (adṛishṭa), whilst at a later stage it is ascribed to a supreme soul (paramâtman), distinct from the individual souls (jîvâtman) forming the immaterial atoms.

Of heterodox systems of philosophy—besides those of the Jainas (q.v.) and Buddhists (q.v.)—only one deserves special mention—viz. the *Chârvâkas*, or *Lokâyatikas* ('materialists'). The doctrines of this school, traditionally ascribed to Bṛihaspati, admit but one source of knowledge and proof—viz. perception. According to them there is neither a supreme spirit, nor a future life, nor a soul distinct from the body; and the sole end of man is enjoyment derived from sensual pleasures.

A kind of mystic philosophy—in the sense in which the peculiar practices of the Yoga are regarded as such—underlies the doctrines promulgated by the *Tantras*, the religious text-books of the numerous sects of *S'âktas*—i.e. worshippers of the *s'akti*, or active divine energy, personified in some female deity, especially in one of the many forms of Pârvatî, the wife of S'iva. In its origin, the worship of the female principle as a means of obtaining transcendental powers is probably based on the Sânkhya notion of the *prakṛiti* (fem.) or plastic material principle as the prime cause of the universe; and considering that this form of belief is referred to amongst the heterodox doctrines contended against by S'ankarâchârya (? *c.* 700 A.D.), it would seem to be of tolerable antiquity, though probably not in the grossly licentious form in which it is inculcated in many of the Tantric writings. The number of original Tantras is usually fixed at sixty-four. The best-known works of this class are the *Rudrayâmala*, *Kulârṇava*, *S'yâmârahasya*, and *Kâlikâtantra*.

The best native survey of the Indian systems (except Mîmâṃsâ) is Mâdhava's *Sarvadars'anasaṃgraha* (trans. by E. B. Cowell and A. E. Gough); for other accounts, see Colebrooke's *Essays*, and Goldstucker's *Literary Remains.*

(3) *Grammar* (*vyâkaraṇa*).—Grammatical research in India probably goes back to nearly as early times as the redaction of the Vedic hymns. The work traditionally accepted as the Vedânga-treatise in this science—viz. the *Ashṭâdhyâyî*, or 'eight chapters' of aphoristic rules, by Pâṇini (q.v.)—marks the very highest point of its development, and would seem to presuppose a long period of growth. To the same author is ascribed the original treatise of another Vedânga—viz. phonetics (*s'ikshâ*), treating of the nature of the letters and accents, and the proper mode of sounding them. To this latter branch of science have to be referred the *Prâtis'âkhyas*, elaborate treatises on the phonetic changes undergone by words in the connected form of the Vedic texts. Such treatises are in existence for all the Samhitâs, except the Sâma-veda; those of the Ṛik and Atharvan being ascribed to S'aunaka, that of the Vâjasanayi-samhitâ to Kâtyâyana, whilst the author of the Taittirîya-prâtis'âkhya is unknown. Whether these works are anterior or posterior to Pâṇini is still doubtful. Here must also be mentioned the oldest work on etymology and Vedic interpretation, Yâska's *Nirukta*, which is probably older than Pâṇini's grammar. Pâṇini's rules were partially amended and supplemented in Kâtyâyana's *Vârttikas*, which on their part were critically examined by Patanjali (? 2d century B.C.), in his *Mahâbhâshya*, or 'great commentary.' So minute and complete was the grammatical analysis of the language presented in these works that the efforts of subsequent authors of grammars were mainly directed towards the best rearrangement of the linguistic matter for practical educational purposes. The most important of these grammars, forming the text-books of special grammatical schools, are the *Chândra-vyâkaraṇa*, by Chandra-gomin of Kashmir (2d century, A.D.); the *Kâtantra*, by Sarvavarman (? 6th century); the text-book of the Kâlâpa or Kaumâra school; the *Sârasvatî prakriyâ*, by Anubhûti-svarûpâchârya; the *Haima-vyâkaraṇa*, by Hemachandra (12th century); the *Mugdha-bodha*, by Vopadeva (13th century); and the *Siddhânta-kaumudî*, by Bhaṭṭoji-dîkshita (17th century).

(4) *Lexicography.*—Native dictionaries (*kosha*), generally composed in verse, are either homonymous or synonymous. In the former the words explained are usually arranged according to the final consonant and then according to the number of syllables they contain. The most famous dictionary (chiefly synonymous), and one of the oldest, is the *Amarakosha*, or 'Immortal treasury,' by Amarasiṃha (*c.* 550). Of others the most important are Hemachandra's *Abhidhâna-chintâmaṇi*, Halâyudha's *Abhidhâna-ratnamâlâ* (11th century), and the *Medinî* (*c.* 13th century).

(5) *Prosody* (*chhandas*).—The privilege of representing this science among the Vedângas is assigned to the *Chhandaḥ-sûtra*, ascribed to Pingala, who is traditionally identified with Patanjali, the grammarian. But, strange to say, the section of this work treating of Vedic metres is very meagre, whilst the chapter on post-Vedic metres is tolerably complete, and, with a commentary on it by Halâyudha (probably the lexicographer), still forms one of the chief authorities on prosody. Of other important manuals may be mentioned the *Vṛitta-ratnâkara*, or 'jewel-mine of rhythms,' by Kedâra bhaṭṭa (before the 13th century); and the *Chhando-manjarî*, or 'cluster of metres,' by Gangâdâsa. See Colebrooke's excellent essay on Sanskrit and Prâkrit Metres, *Misc. Ess.* ii.

(6) *Music* (*saṃgîta*).—The existing treatises on music are of comparatively modern origin. The two most important are the *Saṃgîta-ratnâkara*, or 'jewel-mine of harmony,' by S'ârngadeva, and the *Saṃgîta-darpaṇa*, or 'mirror of harmony,' by Dâmodara. These works treat not only of music proper—including the notes, melodies, and measures, singing, concerted music, and instruments—but also of dancing, acting, and mimic representation.

(7) *Rhetoric* (*alankâra-s'âstra*).—The theory of poetic composition and the approved forms of literary style has been a favourite subject with Hindu writers; and the result of their labours is a minute classification of the various forms of composition, and an elaborate system of rules regarding the different sentiments and forms of speech applicable to certain characters and conditions of life. Dramatic poetry, as the most varied form of literary composition, usually occupies a large share of the attention of rhetorical writers. The *Bharata-s'âstra*, which is only imperfectly known, is considered the most ancient of the existing manuals of this art. Whether the author preceded the brilliant period of artificial poetry from the fifth century of our era onwards is still uncertain. The earliest work the date of which has been fairly ascertained is the *Kâvyâdars'a*, 'mirror of poetry,' by Daṇḍin (6th century). Of other works on poetics generally may be mentioned the *Kâvya-prakâs'a*, or 'lustre of poetry,' by Mammaṭa (*c.* 12th century), and especially the *Sâhitya-darpaṇa*, or 'mirror of composition' (trans. in *Bibl. Ind.*), by Vis'vanâtha Kavirâja (15th century), the standard authority on literary criticism. The favourite manual of dramaturgy is the *Das'arûpa*, or 'ten forms' (of plays), by Dhananjaya (*c.* 10th century).

(8) *Medicine* (*ayurveda*, *vaidyas'âstra*).—The oldest systematic treatises on medical subjects are the *Saṃhitâs* of Charaka and Sus'ruta (? *c.* 550 A.D.). Both works are composed in verse mixed with prose sections, and are characterised by great diffuseness. Of later handbooks of medical science may be mentioned Vâgbhaṭa's *Ashṭângahṛidaya* and Bhâvamis'ra's *Bhâvaprakâs'a*; whilst the *Râjanighaṇṭu*, by the Kashmirian Narahari, is the most approved manual of materia medica. Cf. T. A. Wise, *Commentary on Hindu Medicine* (1845), and *History of Medicine* (vol. i. 1867).

(9) *Astronomy and Mathematics.*—This science appears as one of the Vedângas, or members of the Veda; and the treatise which has been handed down as such in the Ṛik and Yajus recensions—viz. the *Jyotisham*—presents indeed a comparatively primitive appearance, as it knows only a lunar year of 360 days, and mentions neither the zodiac nor the planets. Much the same phase of knowledge is represented by some other works, such as the *Gârgî Saṃhitâ* (? *c.* 50 B.C.). A new scientific era, brought about by a knowledge of Greek astronomy, commenced about 250 A.D., and gave rise, in the first place, to five works called Siddhânta (*Sûrya-siddhânta*, &c.), and later on to the standard works on astronomy—viz. Âryabhaṭa's *Âryabhatîyam*

(c. 500), Varâhamihira's *Bṛihatsaṃhitâ* (c. 540), Brahmagupta's *Brahmasiddhânta* (c. 625), and Bhâskara Âchârya's *Suryas'iromaṇi* (completed in 1150). The mathematical sections of several of these works, especially those of Âryabhaṭa and Bhâskara, have remained standard text-books of mathematics down to recent times.

Sanson. See EXECUTION.

San Stef'ano, a village 6 miles W. of Constantinople, where was signed, on 3d March 1878, the preliminary agreement between Russia and Turkey. Its provisions were considerably modified by the treaty of Berlin, signed on 13th July following.

Santa Ana, a prosperous town of Salvador, some 40 miles NNE. of Sonsonate. It has a large trade in coffee, of which the province of Santa Ana produces 200,000 cwt. annually. Pop. 15,000.

Santa-Anna, ANTONIO LOPEZ DE, president of Mexico, was born in Jalapa, 21st February 1795. At the age of fifteen he entered the Spanish army, and served against his countrymen until 1821, when he joined Iturbide, who made him brigadier and governor of Vera Cruz. Iturbide had established an imperial rule over Mexico (q.v.), but in 1822 Santa-Anna proclaimed a republic, and brought about his patron's downfall. In 1828 he headed a rising which placed Guerrero in the presidential chair; and in 1829 he defeated and captured a division of Spanish troops which had landed near Tampico, with the view of again bringing Mexico under Spanish rule. He now engaged in a series of intrigues which culminated in an open revolt against the president, Bustamente, in 1832, and his own election. Santa-Anna, however, desired power without responsibility for the irksome details of government, and he retired to his country seat, leaving the executive in the hands of the vice-president; and when he ceased to be able to control this lieutenant, in 1834 he headed a rising against him, and had him deposed in 1835, and another appointed in his stead. But Santa-Anna's reactionary policy, which reduced the states to provinces and placed all the power in the hands of the central government, in 1836 cost the country Texas (q.v.). He invaded the revolted province with 6000 men, and defeated and massacred his opponents with unbroken success until April, when he was routed at San Jacinto by Houston, and soon after taken prisoner. He escaped with eight months' imprisonment and a short detention in the United States; but at home his influence was not restored until, luckily, in 1838 the French attacked Vera Cruz, and in the gallant defence of the city he lost a leg. He was now encouraged to renew his intrigues, which were again successful, and from 1841 to 1844 he was either president or the president's master. Then there was a revolution on the other side, the army deserted him, and he fled towards the coast, but was arrested, imprisoned for a time in 1845, and ultimately permitted to retire to Havana. From this exile he was recalled in 1846 to be first commander-in-chief and then president. The war with the United States had begun, and begun badly: Palo Alto and Resaca had been lost, and in September Monterey fell. In February 1847 Santa-Anna, who had brought together some 20,000 men, attacked Taylor's weakened force of 5000 at Buena Vista; but the narrow pass and the strength of the American artillery were fatal to him, and he was repulsed with heavy loss. At Cerro Gordo, in April, Scott defeated him and took 3000 prisoners. Santa-Anna retired on the capital, but when its fall became certain he resigned the presidency and withdrew from the city by night. He was allowed to retire to Jamaica in 1848, but was recalled by a revolution in 1853, and appointed by an obedient congress president for life, with the title of Most Serene Highness. His harsh rule quickly produced a number of revolts, and in 1855 he was driven from the country, finally finding a refuge in St Thomas. On the establishment of the empire under Maximilian he was permitted to return on condition of his not interfering in political affairs; but he could not refrain from intriguing for himself and issuing the old proclamations, and so before long Bazaine sent him back to St Thomas. Even the appointment of grand-marshal of the empire could not keep him faithful, and a second conspiracy against Maximilian ended in another flight. He now vainly endeavoured to obtain employment against the empire, and in 1867, after the emperor's death, tried to effect a landing at Sisal, but was captured, tried by court-martial, and sentenced to death. Juarez, however, pardoned him on condition of his leaving Mexico; and the old man spent the succeeding years mainly on Staten Island, New York, in conspiring, cock-fighting, and card-playing, until a general amnesty in 1872 enabled him to return to his own country. There, disregarded and harmless, he died in the capital, 20th June 1876.

Santa Caterina, a town in the centre of Sicily, 9 miles NW. of Caltanisetta, with sulphur-mines and manufacture of earthenware. Pop. 6979.

Santa Catharina, a southern coast state of Brazil, with an area of 27,436 sq. m. and a pop. (1888) of 236,346. The coast is very irregular, the interior mostly a plateau sinking gently to the west. The climate is not unhealthy, but moist, and thick primeval forests remain. Agriculture and the rearing of cattle are the principal industries, largely carried on by colonies of Europeans. The capital is Desterro (10,000), on the hilly, fertile island of Santa Catharina (210 sq. m.).

Santa Clara. See ABRAHAM.

Santa Claus. See NICOLAS (ST).

Santa Cruz (also spelt Sainte Croix), (1) one of the Virgin Islands, belonging to Denmark, with an area of 74 sq. m. and a pop. (1880) of 18,430. Sugar, rum, and cotton are the chief products; the capital is Christianstadt (pop. 5500). Discovered by Columbus on his first voyage, the island was held by Dutch, English, Spanish, French, and the Knights of Malta at various dates, and was bought by Denmark in 1733.—(2) The largest of a group of Melanesian islands, sometimes called Queen Charlotte Islands, east of the Solomon archipelago and 100 miles N. of the New Hebrides. The largest is also called Nitendi (area, 216 sq. m.). The kidnapping of natives for service in Australia embittered the islanders, so that when Bishop Patteson landed on Nukapu, one of the smaller isles, he was murdered. Then some villages were bombarded in retribution; and in 1875 Commodore Goodenough was murdered.—(3) Santa Cruz, called also Teneriffe, the capital of the Canary Islands (q.v.), and the chief seaport of the group, stands on the north-east side of the island of Teneriffe. Its port, recently enlarged and improved, is protected by moles, and affords excellent anchorage. It is a clean, well-built little town, with houses of the Spanish style, flat-roofed and with square court-yards, and is defended by forts and redoubts. It is the seat of a bishop and the headquarters of the Spanish governor. This port is entered every year by an average of 1585 vessels of 1,019,400 tons. The exports, chiefly potatoes, tomatoes, and other garden produce, cochineal, wine and spirits, tobacco, sugar, and grain, increase steadily in value (£248,774 in 1887 and £302,175 in 1889); the imports, embracing coal, cotton and woollen goods, hardware, and provisions, are also increasing gradually (£428,680 in 1887 and £517,918 in 1889). The greater part of the trade is to and from England, which supplies one third of the imports and takes more than one-half of the exports. Santa Cruz is being much resorted to by steamers for re-coaling. See BLAKE, ROBERT (under date 1657), and NELSON (1797).—(4) Santa Cruz de la Palma is the capital of Palma, another of the Canary Islands (q.v.); it stands on the east coast, on a spacious bay. Pop. 6617.—(5) Santa Cruz, a southern territory of the Argentine Republic, between 46° S. lat. and Cape Dungeness, and stretching from the Atlantic to the watershed of the Andes. Area, 106,890 sq. m. It is, so far as known, a land of desolate plateaus, with little water and scanty pasturage, where, however, thousands of wild horses range.

Santa Fé, a wealthy province of the Argentine Republic, stretching north from Buenos Ayres to 28° S. lat., and so embracing a considerable portion of the Gran Chaco. Area, 54,790 sq. m.; pop. (1887) 220,332. The province is well watered by the Paraná and its tributaries. Agriculture and manufactures are the important industries. The largest town is Rosario. The capital is Santa Fé, on the Rio Salado, by rail 7 miles from its port, Colastiné, on the Paraná. It has also railway connection with Rosario and Buenos Ayres, possesses tramways and telephones, and contains a normal school, a seminary, and a Jesuit college with 400 pupils. Pop. 15,099.

Santa Fé, the capital of New Mexico, is built among the Rocky Mountains, 6840 feet above the sea, and 1327 miles by rail WSW. of Chicago. The climate is very dry, so that irrigation is necessary for agriculture; and most of the houses are built of *adobe*. It is an old Spanish-American town, and is still a Roman Catholic archbishop's see. Pop. (1890) 6713.

Santalaceæ, a natural order of exogenous plants, mostly trees and shrubs. The leaves are undivided, sometimes minute. There are about 110 known species, natives of various parts of the world, the European and most of the North American species being obscure weeds, whilst the trees of the order occur chiefly in the East Indies, New Holland, and the South Sea Islands. Sandalwood (q.v.) is the produce of plants of this order. The leaves of *Osyris nepalensis* are used for tea. Some species are used in medicine in their native countries. *Fusanus acuminatus* is the Quandang Nut of New Holland. Its taste and qualities resemble those of Sweet Almonds, as do also those of the seed of the *Cervantesia tomentosa* of Peru. *Pyrularia oleifera*, the Buffalo Tree or Oil Nut, has a large seed, from which, in the southern states of America, oil is obtained.

Santalin, or SANTALIC ACID, the colouring matter of red Sandalwood (q.v.).

Santals, an aboriginal tribe of India, belonging to the Kolarian family, occupy a long narrow strip of country between the mouth of the Mahanadi in Orissa and the Ganges near Bhagalpur. In 1881 they numbered, excluding converts to Christianity and to Islam, 1,094,202; but this included 7000 absent as labourers in the Assam tea-plantations. They are fond of change, and prefer to live on the edges of the great forests: when the ground gets well cleared and cultivated they move to a new site. In personal appearance they are not unlike negroes, having a broad round face, a broad flat nose, a large mouth with projecting lips, and coarse black hair. Their chief occupations are cultivating the soil, hunting, playing the flute (in which they are great proficients), and dancing round dances. They worship the sun for their supreme god, and after him a number of malignant spirits, whose evil influence they seek to avert. They are divided into twelve tribes, and their village government is patriarchal in type. The exactions of the Hindu money-lenders provoked the Santals to revolt in 1854; the rising was not suppressed without a good deal of bloodshed. Since then this people have been allowed to exercise their own forms of self-government, under the supervision of the British authorities. There is a Santal grammar by Skrefsrud (Benares, 1873).

Santa Lucia. See ST LUCIA.—Santa Lucia is also the name of a town of Uruguay, 30 miles NW. of Montevideo. Pop. 5000.

Santa Marta, a town of Colombia, on the Caribbean Sea, was founded in 1525, the second Spanish town planted on the mainland. In 1834 an earthquake almost utterly destroyed the place, which is still, however, a bishop's see and the capital of Magdalena province, and has an excellent harbour, formerly defended by two forts. Simon Bolivar died close by in 1830. Pop. 6000. See also SIERRA NEVADA.

Santa Maura. See LEUKAS.

Santander, a thriving seaport on the north coast of Spain, stands on an inlet of the Bay of Biscay, about equally distant from Oviedo on the west and San Sebastian on the east, and by rail 316 miles N. of Madrid. The bay on which it stands is accessible to the largest vessels at all times. The town occupies a picturesque site, but is quite modern in appearance, and has few buildings of note. Of its former convents one now serves as a theatre, another as a cigar-factory, giving employment to about 1000 people. The remaining industries are chiefly breweries, cotton, paper, and flour mills, iron-foundries, and ship-building-yards. The commerce of the port increases steadily: the exports—flour, wine, food-stuffs, and metals—reached in 1889 a value of £898,000, and the imports—tobacco, food-stuffs, codfish, iron and steel goods, textiles, coal, petroleum, chemicals, timber, &c.—a value of £2,109,466. The shipping too increases at the same regular rate: in 1889 there entered 520 vessels of 553,224 tons. One-half of this shipping is Spanish, one-fourth French, and one-seventh British. Santander is a favourite seaside resort in summer. Pop. (1887) 41,829. It was here Charles I. embarked for England after his trip to the Spanish court. The town was sacked by Soult in 1808.—The *province*, a mountainous land, with fertile transverse valleys, is the seat of active industries (cotton, paper, flour, beer, &c.), and rich in minerals (iron, coal, copper, zinc, lead). Area, 2113 sq. m.; pop. (1887) 242,843.

Santarem, capital of the Portuguese province of Estremadura, stands on the right bank of the Tagus, 46 miles NE. of Lisbon by rail. An old Moorish castle, crowning a hill that overlooks the town, was during the middle ages the residence of the kings of Portugal. It has a cathedral and several churches; the kings Diniz I. and Henry died here, and Ferdinand I. lies buried here, as well as Cabral, the discoverer of Brazil. The army of Pedro of Brazil under Napier and Villaflor routed here the forces of the usurper Miguel on 16th May 1834. Pop. 7500.

Santa Rosa, capital of Sonoma county, California, on Santa Rosa Creek, 51 miles by rail N. by W. of San Francisco. Its manufactures include iron, soap, and carriages, and it contains a Methodist college and another. Pop. (1890) 5216.

Santa Rosa, (1) a town of Chili, on the Aconcagua, 82 miles by rail E. by N. of Valparaiso. Pop. 6000.—(2) A mining-town of Colombia, in Antioquia, 8335 feet above the sea, with gold-washings. Pop. 8000.—(3) A town of Boyacá in Colombia, 9055 feet above the sea, with silver-mines, and 6000 inhabitants.

Santee, a river of South Carolina, is formed in the centre of the state by the junction of the Congaree and Wateree, flows south-east, and empties into the Atlantic Ocean. It is about 150 miles long, and is navigable for steamboats to Columbia and to Camden.

Santerre, ANTOINE JOSEPH, a French revolutionist, who for some time exercised an influence quite out of proportion to his abilities, was born at Paris, 16th March 1752. He followed the trade of a brewer in the Faubourg Saint-Antoine, and his wealth and generosity gave him an immense influence in the district. On the establishment of the National Guard in 1789 he received the command of a battalion, and took part in the storming of the Bastille. During the year 1792 the Jacobin agitators of the faubourgs often met in the brewery of Santerre, and it was there that the *émeute* of the 20th June was preconcerted, on which occasion Santerre marched at the head of the mob who invaded the National Assembly and turned out the Girondists. He also played a conspicuous part on 10th August, when he was made commander-in-chief of the National Guard. He was charged to keep order at the execution of the king, and it was he who bade the drummers drown the king's voice when he essayed to speak to the people from the scaffold. On 30th July he was appointed a general of division in the French army, and marched at the head of 20,000 men against the Vendéan royalists, but was miserably beaten (18th September), and in consequence recalled and imprisoned, and he only obtained his liberty after the death of Robespierre. He then withdrew into private life, and died 6th February 1809. Though he was hugely fond of 'brave words,' and menaced his opponents with all the bellicose grandiloquence of a French revolutionist, he was nearly as soft at heart as he was in the head. See Life by Carro (Paris, 1847).

Santhals. See SANTALS.

Santiago. See CAPE VERD ISLANDS.

Santiago, the capital of Chili and of Santiago province, stands in a wide and beautiful plain near the western base of the Andes, 1700 feet above sea-level, and 115 miles by rail ESE. of Valparaiso. The snow-capped cordilleras seem to enclose it on the north and east; while on the east side the picturesque Cerro de Santa Lucia—now dotted with grottoes, statues, kiosks, restaurants, a historical museum, and an observatory—rises abruptly within the city, some 800 feet from the level of the plain. Through the northern part rolls a small but turbulent stream, the Mapocho, now crossed by five handsome bridges. The city is regularly laid out, with streets comparatively broad, lit with gas and the electric light, and tramways in all directions; most of the houses, however, are of one story only, owing to the earthquakes (the most serious have occurred in 1575, 1647, 1730, 1822, 1835), though handsome private buildings are becoming every year more numerous. The principal square is the great Plaza Independencia, its sides formed by the government palaces, the Grand English Hotel, several arcades, and the cathedral and archbishop's palace. The cathedral is a large plain building of brick and stone, but inside it is very richly furnished. The Dominican church, only recently completed, is also worthy of notice. The Jesuit church which was burned down in 1863 has not been rebuilt; and on the site, opposite the capitol, a monument of marble and bronze has been erected (1872) in memory of the 2000 worshippers, mostly women, who perished in the fire. The capitol itself is a large two-story building of yellow stucco. Other government buildings are the mint, with the official residence of the president; a large and well-managed prison; two excellent hospitals; a deaf and dumb asylum, &c. Santiago boasts a noble Alameda, with four rows of fine poplars, running nearly the whole length of the town, and adorned with numerous statues. Facing it are the university (1842), with 912, and the National Institute, with 1148 students. The city has also a military school; a school of arts; and a school of agriculture, with a large model farm; a conservatoire; two normal schools; a valuable national library (1813), with 65,000 volumes; botanical and zoological gardens; exposition buildings; and finally, three theatres, several club-houses, and a jockey-club. The suburbs of Santiago are very pretty, with villas and gardens bright with flowers. The climate is dry and generally agreeable, but the changes of temperature are somewhat trying. The city is of importance as a commercial place, and it has a busy stock exchange. Its manufactures include cloth, ship's biscuits, beer, brandy, &c., and it has also an ice-factory, a fruit-conserving establishment, and copper-smelting works. Santiago was founded by Pedro de Valdivia in 1541. Pop. (1865) 168,553; (1885) 236,412.—Area of the *province*, 5223 sq. m.; pop. (1890) 368,615.

Santiago de Compostella, a city of Spain, formerly the capital of Galicia, stands in a picturesque situation, surrounded by hills, 33 miles S. by W. of Corunna and 26 by rail NE. of its port, Carril. Here in 835 the bishop of Iria discovered, according to the legend, the bones of St James (San Iago), being guided to the spot by a star, whence Compostella (*campus stellæ* = 'field of a star'); the relics were in 1884 solemnly affirmed by the pope to be still beneath the cathedral. This building, Romanesque in style, was built 1078–1188, and contains some fine sculptures and metal-work. It was the shrine that attracted every 25th July so many thousands of pilgrims in the middle ages, it being an especial favourite with Englishmen. It is now, however, out of repute, and is scarcely ever visited. This fact and the many ruined monasteries give the town a deserted and dreary appearance. Nevertheless it is still an archbishop's see, and has a university (1504) with 700 students, and a couple of colleges besides. Gold and silver ornaments are made and linen is woven. Pop. (1887) 24,302. The town is the headquarters of the knightly order of Santiago of the Sword, for which see ORDERS OF KNIGHTHOOD. For Santiago and the festival of St James, see *Fraser's Magazine* (1864).

Santiago de Cuba, formerly the capital of the island of Cuba, and now the chief town of the eastern department of the island, stands on a bay on the south coast, and has a harbour, deep, well protected, and fortified. It contains a cathedral and seminary, foundries, cigar-factories, sawmills, &c. Its exports of sugar, rum, cacao, coffee, tobacco, and mahogany average three-quarters of a million sterling. It communicates by railway and telegraph with the other towns of the island. Pop. 71,307.

Santiago del Estero, a north central province of the Argentine Republic, with an area of 39,510 sq. m. and a pop. (1886) of 150,000. Except for a few insignificant sierras, it forms a vast plain, inclining gently from the north-west to the south-east. In the south-west and elsewhere there are great salt marshes. The only rivers are the Salado and Dulce; agriculture (sugar, maize, wheat, grapes, cotton, tobacco) depends mainly on irrigation. Cattle-farming is a leading industry.—The capital, Santiago, on the Rio Dulce, 750 miles by rail NNW.

of Buenos Ayres, was founded in 1553, has a national college and a normal school, and a pop. of 10,000.

Santipur, a town of Bengal on the Hooghly, 43 miles N. of Calcutta. Pop. 29,687.

Säntis, or SENTIS, a mountain on the borders of the Swiss cantons of St Gall and Appenzell, consists of three parallel ridges, separated by deep valleys and connected by lofty saddles. The highest point is 8216 feet above sea-level. There are on the mountain, which commands very beautiful views, an observatory (since 1887) and a hotel.

Santley, CHARLES, baritone singer, was born in Liverpool on 28th February 1834, and trained as a singer partly in Milan (1855–57). He made his first appearance in England in Haydn's *Creation* in 1857, singing the part of Adam. Two years later he made his début on the stage of Covent Garden; and three years later still he made his first essay in Italian opera. He possesses a voice of fine quality and power, and of wide compass, and justly ranks as the first English baritone. He has sung almost every year at the great sacred concerts of the Midland towns.

Santo Domingo. See SAN DOMINGO.

Santo Espiritu, a town of Cuba, 40 miles by rail ENE. of Trinidad on the south coast. Pop. 32,600.

Santonin, $C_{15}H_{18}O_3$, is a crystalline neutral principle extracted from Santonica, the latter being defined in the British Pharmacopœia as the dried unexpanded flower-heads or capitula of *Artemisia maritima*, var. Stechmanniana. The plant grows in Russia, and belongs to the natural order Compositæ. Santonin occurs in brilliant white flat crystals, which become yellow on exposure to light, few specimens being colourless unless they have been recently prepared or very carefully kept in the dark. It is odourless, and almost tasteless; practically insoluble in water. Santonin is used in medicine solely as an anthelmintic, and is especially poisonous to the round worm (*Ascaris lumbricoides*), being much less so to the thread-worm (*Oxyuris vermicularis*). The dose is 2 to 6 grains for an adult, and 1 to 4 grains for a child; it may be given in powder, alone or mixed with sugar, or dissolved in a little olive or castor oil, or as the officinal lozenge (1 grain in each). It should be used with caution in weakly children. It is excreted in the urine, to which it imparts a deeper yellow colour, changing to red if the urine become alkaline. On colour vision it has often a peculiar effect, the cause of which has never been satisfactorily determined. Objects appear first purple or blue and then yellow, colour vision becoming finally destroyed.

Santorin, or THERA, an island of the Ægean, the southernmost of the Cyclades, 70 miles N. of Crete. It is shaped like a crescent, the horns pointing west; between them lies the island of Therasia. The space so enclosed, 18 miles in circuit, resembles a volcanic crater, and three small islands it encloses (the Kaumenes) are all of volcanic origin. Santorin and Therasia have lofty and precipitous shores (up to 1000 feet) next the crater; on their outer sides they slope away gradually to the sea, except that in the south-east of the former Mount St Elias rises to 1887 feet. The chief town, Thera or Phera, on the west coast of Santorin, is built in the cliffs of tufa and perched some 900 feet above the water's edge. Pop. of island (1889) 17,382. Excellent wine is grown on the disintegrated volcanic soil. Eruptions have taken place, chiefly near the Kaumenes, in the years 196 B.C., 726 A.D., 1573, 1650, 1707, and 1866. Interesting prehistoric dwellings, containing pottery and other remains, have been found in the southern half of Santorin. The pottery is believed to be older than that of Mycenæ. There are also ruins of Greek temples and other buildings. This island is regarded as the special home of the vampire. See Tozer, *Islands of the Ægean* (1890); Fouqué, *Santorin et ses Éruptions* (Paris, 1879); and Bent, *Cyclades* (1885).

Santos, a port of the state of São Paulo in Brazil, founded in 1546, on the island of São Vicente, and at the foot of the church-crowned Monserrate. It has fine wharves, gas and tramways, and a good water-supply; but it is a hot, dirty, damp, unhealthy place, and yellow fever is endemic. A railway (40 miles, 5 of them by cable up the Serra do Mar—2500 feet) connects it with São Paulo, whose port it is. Of the exports the principal item is coffee. Pop. 15,000.

Sân Vicente, a pretty town of Salvador, 40 miles NE. of San Salvador, close to an extinct volcano of the same name, whose sides are among the most fertile places in the world, and produce especially coffee, indigo, and tobacco. Pop. 6000.

São Francisco, a large river of Brazil, rises in the south-west part of the province of Minas Geraes, flows north, north-east, and east-south-east to the Atlantic, and in its lower course separates the provinces of Bahia and Sergipe from Pernambuco and Alagoas. Length, 1800 miles; drainage area, 248,000 sq. m. It is navigable as far up as its junction with the Paraopéba, except at three points—at the rapids of Pirapóra, near the frontier of Bahia, and where it breaks through the granite wall of the coast range, and forms the falls of Paulo Affonso (275 feet); traffic is carried past this last point by a railway (68 miles). Over the wide mouth there is a bar, with only 10 feet of water.

Saône, a river of France, an affluent of the Rhone (q.v.), rises in the dept. of Vosges, in the Faucelles Mountains, flows south-west as far as Châlons, thence south to the Rhone at Lyons. It is joined by the Doubs from the left. Entire length, 282 miles, of which 170 are navigable. Area of basin, 11,418 sq. m. See Hamerton's *The Saône: a Summer Voyage* (1887), a description of the river with numerous illustrations.

Saône, HAUTE, a department in the east of France, slopes south-west from the southern extremity of the Vosges, whose spurs diversify the north-east. It is watered chiefly by the Saône and its tributaries. Forests abound everywhere (31 per cent. of area). One-half of the total area of 2061 sq. m. is cultivable. The principal natural products are wheat, potatoes, and oats, iron, coal, and salt; and the manufactured, iron goods, glass and pottery, bricks, paper, and cottons. Fruit, especially cherries, is extensively cultivated. There are several mineral springs, the best known at Luxeuil. Pop. (1861) 317,183; (1886) 290,954. The arrondissements are Gray, Lure, and Vesoul, and Vesoul is the capital.

Saône-et-Loire, one of the largest departments of France, part of ancient Burgundy, is bounded on the SE. by the Saône and on the W. by the Loire. Area, 3300 sq. m.; pop. 625,885. The country consists for the most part of fertile plains, separated by rich vine-clad hills. The wines, of which 11,000,000 gallons are made annually, are well known as *vins de Mâcon*. Agriculture, iron and coal mining, and manufactures of cotton fabrics, pottery, iron rails and plates, machinery, engines, glass, &c. are carried on. The cattle are an exceptionally fine breed (white). There are five arrondissements—Autun, Châlon, Charolles, Louhan, and Mâcon; capital, Mâcon. The iron-town of Creusot, the pilgrimage resort of Paray-le Monial, and the once famous abbey-town of Cluny are all in this department.

São Paulo, capital of the Brazilian state of the same name, stands on a wide plain bounded by low hills, 4 miles from the Rio Tiete and 310 by rail W. by S. of Rio de Janeiro. It has houses of one story, a handsome public garden, and tramways running out to the beautiful suburbs. The principal buildings are the old Jesuit college, now the government palace, the bishop's palace, and a celebrated law-school. São Paulo is the headquarters of the coffee trade, and four railways connect it with the great coffee districts in the interior. There are cotton-weaving and printing works, and manufactories of tobacco, cigars, spirits, matches, gloves, and hats. Pop. 50,000, including 12,000 Italians and 1500 Germans; the latter have a school, a club-house, and a newspaper of their own.—The *state* (area, 112,330 sq. m.; pop. in 1888, 1,386,242), the most promising in the republic, stretches from the ocean to the river Paraná, and consists of a strip of coast-land (8 to 80 miles broad) and an elevated region, the latter occupying all the interior, and rising from 1600 feet: all this part is healthy, and the climate pleasant. The principal ranges are the Serras da Mantiqueira and do Mar. The rivers are numerous, and many of them of importance; regular steamboat service is maintained over a distance of 400 miles. The state possesses also 1133 miles of railway. Its mineral wealth includes magnetic iron, gold, marble, and precious stones. There is some cattle-rearing and a few manufactures; but the chief industry is agriculture. The principal crop is coffee; next follow sugar, cotton, tobacco, manioc, maize, and vines. The exports of the state—by either Rio de Janeiro or its own chief port, Santos—amount to some 40 per cent. of the total for the republic.

Sap. See VEGETABLE PHYSIOLOGY.

Sap, in Military Engineering, is a narrow ditch or trench by which approach is made from the foremost parallel towards the glacis or covert-way of a besieged place (see SIEGE). For Sappers and Miners, see ENGINEERS.

Sapajou, a name sometimes applied to all that division of American monkeys which have a prehensile tail, and sometimes limited to those of them which are of a slender form, as the genera *Ateles* (see SPIDER-MONKEY), *Cebus* (q.v.), &c.

Sapindaceæ, a natural order of exogenous plants, consisting of trees and twining shrubs furnished with tendrils, very rarely herbaceous climbers. Their leaves are often marked with lines or pellucid dots. The order contains seventy genera and about 400 known species, natives of warm climates, especially of South America and India; none of them natives of Europe. The individuals of this natural order exhibit the most varied properties. Some produce delicious fruits, others are purely medicinal, some again abound in a saponaceous principle, while a few are dangerously poisonous, and still fewer yield wholesome food-products. The root of *Cardiospermum halicacabum* (Heart-seed) is diaphoretic, diuretic, and aperient, while in the Moluccas its leaves when cooked are eaten as a vegetable. The genus Serjana is poisonous; *S. ternata* (Supple Jack), a native of South America, is used to stupefy fish, and the long rambling stems from which it takes its popular name are cut into lengths for walking-sticks. The same poisonous principle resides in the genus Paullinia (see GUARANA); yet from the seeds of *P. sorbilis* Guarana bread is made. In the genus Schmidelia the same contradictory qualities are exhibited. The Soapberry (q.v.) is the fruit of *Sapindus saponaria*, the type of the order.

Sapodilla Plum, the name given in the West Indies to the fruit of *Achras sapota* and other species of Achras, a genus of the natural order Sapotaceæ. The seeds are aperient and diuretic, but an overdose is dangerous. The pulp of the fruit is subacid and sweet, and it is much esteemed for the dessert in the West Indies. Marmalade, Naseberry, &c. are names given to various species.

Saponification. See OILS, FATS, and SOAP.

Saponin is a vegetable principle contained in various plants, including the *Saponaria officinalis*, or Soap-wort, the *Polygala senega*, several varieties of Lychnis, the fruit of the horse-chestnut, and in Quillia bark. It is readily extracted from the root of soap-wort by means of boiling alcohol, which, as it cools, deposits the saponin as an amorphous sediment. It derives its name from its behaviour with water, in which it is soluble in all proportions, yielding an opalescent fluid which froths when shaken like a solution of soap, if even $\frac{1}{1000}$th part of saponin be present. Its solution, or an infusion of soap-wort, is sometimes employed in place of a solution of an alkaline soap for cleansing the finer varieties of wool from grease. The various preparations for cleaning kid gloves, &c., which are sold under fancy names at every exhibition, owe their virtues to saponin. It is also employed by aerated water makers to give apparent body to their lemonade, &c., the public regarding a persistent head or froth as a guarantee of excellence.

Sapotaceæ, a natural order of exogenous plants, consisting of trees and shrubs, often abounding in milky juice. The leaves are leathery, entire, and without stipules. The order comprises about 20 genera and over 200 species. They are natives of the warmer regions of both hemispheres, but are comparatively rare in Australia, the Cape of Good Hope, North-west Africa, and South America. The most important species from an economical point of view is the Gutta-percha Tree (q.v.; *Isonandra gutta*). The substance called *Monesia*, an extract from the bark of *Chrysophyllum glycyphlœum*, employed in France in medicine, is a moderate stomachic excitant, alterative, and mild astringent The fruit of *C. cainito* is the Star Apple (q.v.). *C. roxburghii*, a native of Silhet, also produces a fruit prized by the natives; but neither of these fruits find much favour with Europeans. The Mammee-Sapota, or American Marmalade, is the fruit of *Lucuma mammosa*, a lofty tree of tropical America and the West Indian Islands (not the Mammee-apple, q.v.). The pulp is luscious, but the kernels abound to a dangerous extent in prussic acid, a very little of one kernel being capable when eaten of causing sickness. The Sapodilla Plum (q.v.) is the fruit of *Achras sapota*. The flowers of some of the species of Bassia are edible; they are eaten raw or cooked in various ways; those of *B. latifolia* yield a strong ardent spirit by distillation. Oil is also expressed from the fruit of some of these, which is used in the manufacture of soap and as an inferior lamp-oil and lubricant. *B. butyracea* and *B. parkii*—the latter the Stea Tree of South Africa—both yield from kernels of their fruits a fine vegetable-butter. Valuable timbers are produced by some species of this order; one of the Ironwoods (q.v.) is the timber of *Sideroxylon inerme*. The Galimeta Wood of Jamaica is the timber of *Bumelia salicifolia*. The flowers of *Mimusops elengi*, a native of the East Indies, are powerfully aromatic, and yield a fragrant water by distillation, and the seeds abound in oil which is used by painters.

Sappan Wood is the wood of *Cæsalpinia Sappan* (see CÆSALPINIA), used in Dyeing (q.v., p. 139).

Sapper, the name given to a private soldier in the corps of Royal Engineers (q.v.).

Sapphire, a gem excelled in value by no precious stone except diamond, and regarded as a variety of Corundum (q.v.), highly transparent and brilliant. It is sometimes colourless or nearly so. It more frequently exhibits exquisite colour, generally a bright red (i.e. the ruby) or a beautiful blue—the latter being that commonly called sapphire. Purplish or greenish colour indicates a flaw; and usual defects are clouds, milky spots, flakes, or stripes. It is found crystallised, usually in six-sided prisms, terminated by six-sided pyramids; it is sometimes found imbedded in gneiss, but more frequently occurs in alluvial soils. It occurs in Bohemia and Saxony, but European sapphires are of no commercial importance. The finest are found in Ceylon; Cashmere and Burma also produce fine specimens; and sapphires are found in Victoria, New South Wales, and parts of the United States. The value depends on quality more than on size, and does not increase with the size as does that of the ruby. Smaller ones vary from £2 to £12, carat-sized ones from £12 to £25. One of 165 carats, shown at the Paris Exhibition of 1867, was sold for £8000. In spite of its hardness it is sometimes engraved. It is doubtful if the sapphirus named in Scripture was our sapphire or the Hyacinth (q.v.). By a 'male sapphire' (as in Browning) the ancients meant a dark-hued or indigo sapphire, by a 'female sapphire' one pale blue, approaching to white.

Sappho, one of the great poetesses of the world, was born either at Mitylene or at Eresos in Lesbos. She was only six years old when she lost her father Scamandronymus, and she must have flourished about the end of the 7th century B.C., as she was contemporary with Alcæus, Stesichorus, and Pittacus. But little is known with certainty of her life, save that she had a daughter named Cleis, and was acquainted with Alcæus. We are told, with much less certainty, that she fled about 596 from Mitylene to some place of refuge in Sicily, but after some years was again at Mitylene, the centre of a group of girls with a passion for poetry. Her famous plunge into the sea from the Leucadian rock, because Phaon did not return her love, seems to have no historical foundation whatever. The traditional account of her moral character was first assailed by Welcker (1816), who carried his argument to the absurd extreme of making her a paragon of virtue. This view Bergk and Colonel Mure both attacked, and the progress of the controversy may be seen in the *Rheinisches Museum* (1857-58). Without believing her the exceptionally immoral woman of Greek tradition, we can scarcely take her at Welcker's valuation, looking at the poetry itself and the easy standard of her age. But about the much more important question of her genius there can be no doubt whatever. For sincerity, depth of feeling, passion, and exquisite grace of form her lyrics stand alone among the masterpieces of antiquity. Her poems were divided by the Alexandrine scholars into nine books, according to their metres. But two of her odes, one to Aphrodite, with a number of short fragments, are extant. Most of these were composed in the metre named from her the *sapphic strophe*, rendered familiar from its use by Horace.

The best text is that contained in Bergk's *Poetæ Lyrici Græci* (vol. iii. 4th ed. 1882). See Poestion, *Griechische Dichterinnen* (Vienna, 1876); Arnold, *Sappho, ein Vortrag* (Berl. 1871); Kochly (in *Akademische Vorträge*, Zurich, 1859); Schone, *Untersuchungen uber das Leben der Sappho* (Leip. 1867); and H. T. Wharton's edition of the text, with life, translation, &c. (Lond. 1885). The last contains a good bibliography of the books and papers written on Sappho, to which may be added the metrical translation by James S. Gasby-Smith (Washington, 1891).

Saprolegnia. See SALMON, p. 117.

Saprophytic Plants are plants that feed upon decaying organic matter. In common with many of the Parasitic Plants (q.v.), which are plants that live on or in and at the expense of other organisms, they are often devoid of chlorophyll. The reason of this peculiarity is obvious. Chlorophyll being the material used by ordinary plants for the decomposition of the carbonic acid of the air in order that they may retain the carbon, and with it build up all the carbon compounds characteristic of organic nature (see VEGETABLE PHYSIOLOGY), it is plain that those plants which in virtue of a saprophytic or a completely parasitic habit obtain their carbon compounds ready-made up to a certain point do not require a special mechanism of green stuff to manufacture those compounds. If the saprophytism be not complete or 'pure' there will be at least some chlorophyll remaining, as in the flowering axis of the orchid Neottia. Saprophytes may obtain their nourishment and especially their carbon compounds either from the remains of dead organisms or from organic compounds formed by living organisms. The fungi that live upon the bark of trees and the leaf-soil of forests and meadows (e.g. mushrooms) are examples of the former case; those that feed upon the juice of fruits and sugary solutions (e.g. moulds and yeasts) of the latter case. Examples of saprophytes are found in the Phanerogams, the Fungi, and the Bacteria. Among the Phanerogams are some common native Orchids—Neottia, Corallorhiza, Lathræa, and Monotropa. After prolonged nourishment within the loose humus such plants send up flowering shoots above the surface.

Fungi (q.v.) may be physiologically classified as parasites and saprophytes; but this classification does not coincide with a morphological one. Further, there are certain species which lie between the two extremes, and these may be described as parasites which may become wholly or in part saprophytic, through the whole course of their development or during certain stages of it; and also there are saprophytes which, with the same variations, may become parasitic. Hence the complete physiological classification of the Fungi becomes (1) Pure saprophytes; (2) 'Facultative' saprophytes—i.e. parasites which become saprophytic; (3) 'Obligate' parasites—i.e. species to which the parasitic life is indispensable; (4) 'Facultative' parasites.

The external conditions necessary for the commencement of germination of Fungi are the same as those needful to the germs and seeds of other plants: they are a certain temperature, a supply of oxygen and of water, in certain cases a supply of nutrient substances. The spores of the Peronosporeæ and of the Uredineæ germinate on drops of pure water; nutrient solutions may even be a hindrance. The Mucorini, on the other hand, emit only rudimentary germ-tubes in pure water; they require a nutrient solution for germination. Most Fungi vary towards one extreme or other according to the species.

A further characteristic of many Fungi is that certain species are only to be found upon a specific substratum. For instance, the Saccharomycetes, which excite alcoholic fermentation, appear on fruits only when these are ripe, and in the winter are found in soil around those plants whose ripe fruit they attack, and very rarely in any other place. Further, the effect upon the substratum varies with the species to a greater or less extent. On the other hand, many diverse species live on the same substratum and effect the same results upon it—e.g. many species of Saccharomycetes and certain species of Mucor produce very similar fermentations in saccharine fluids (see FERMENTATION). A destructive effect is witnessed in the reduction of timber to a mass of dirt by *Merulius lacrymans.*

Bacteria (q.v.) may be classified physiologically in the same terms as the Fungi. And their functions vary in the same way. Many oxidise their substratum; the Micrococcus of vinegar oxidises ethyl-alcohol into acetic acid, and by further combustion into carbonic acid and water. Others excite characteristic fermentations, lactic acid, butyric acid fermentations, &c., produced by specific organisms. Others incite Putrefaction (q.v.).

For further information, see Goebel's *Outlines of Classification and Special Morphology;* De Bary's *Morphology of the Fungi, Mycetozoa and Bacteria;* Sachs's *Physiology of Plants;* Vines's *Physiology of Plants;* and the literature referred to in these works.

Sapucaia Nut, the seed of *Lecythis ollaria* and *L. zabucajo* trees, plentiful in the forests of the north of Brazil, and belonging to the natural order Lecythidaceæ. The fruit is urn-shaped, as large as a child's head, and opens by a lid which falls off. Each fruit contains a number of seeds or nuts, as in the case of the allied Brazil nut; but the flavour is finer than that of the Brazil nut. Its form is oval, somewhat pointed at both ends, which are slightly bent in opposite directions.

Saraband (Fr. *sarabande,* Span. *zarabanda*—word and thing both derived from the Moors), originally a slow dance, and hence a short piece of music, of deliberate character, and with a peculiar rhythm, in ¾ time, the accent being placed on the second crotchet of each measure. The saraband was of frequent occurrence among the *suites* or series of short pieces written by Handel, Sebastian Bach, and others of the old masters, for the harpsichord or clavichord.

Saracens, a name variously employed by mediæval writers to designate the Mohammedans of Syria and Palestine, the Arabs generally, or the Arab-Berber races of Northern Africa, who conquered Spain and Sicily, and invaded France. At a later date it was employed as a synonym for all infidel nations against which crusades were preached, and was thus applied to the Seljuks of Iconium, the Turks, the Gypsies, and even the pagan Prussians. The true derivation of the word was long a puzzle to philologers; Du Cange deduced it from Sarah, the wife of Abraham, an opinion coinciding with that of the mediæval Christian authors; Hottinger, from the Arab. *saraca,* 'to steal;' Forster, from *sahra,* 'a desert;' while others strove to see its origin in the Hebrew *sarak,* 'poor;' but the opinion which has been most generally supported, and prevails at the present time, is that the word was originally *Sharkeyn* (Arab., 'eastern people'—as opposed to *Maghribe,* 'western people'—i.e. the people of Morocco), corrupted by the Greeks into *Sarakēnoi,* from which the Romans derived their word *Saraceni.* The epithet Sarakenoi was applied by the Greek writers (from the 1st century of the Christian era) to some tribes of Bedouin Arabs in eastern Arabia, though they do not agree among themselves as to the particular tribe so denominated. Pliny and Ammianus place the Saracens in Arabia Petræa and Mesopotamia, on the common frontier of the Roman and Persian empires; and the description of them by Ammianus, a most painstaking and accurate historian, coincides, in every important particular, with what is known at the present day of the Bedouin tribes of those regions. See ARABIA, CALIFS, CRUSADES, MOHAMMEDANISM, MOORS, SALADIN, SPAIN, TEMPLARS; and for Saracenic architecture, see ARABIAN ARCHITECTURE, and the section on architecture in the articles INDIA (Vol. VI. p. 109) and PERSIA (Vol. VIII. p. 70).

Saragossa (Span. *Zaragoza*), a city of Spain, formerly the capital of the kingdom of Aragon, by rail 212 miles NE. of Madrid and 227 W. by N. of Barcelona, stands on the Ebro, which divides the city into two parts, and is crossed by a noble stone bridge of seven arches, built in 1437. The city has an imposing appearance from a distance, being adorned with numerous slender towers and spires; but inside the walls it is full of narrow winding lanes, with brick houses of most solid structure, though many of them are now falling into decay. The quarters that have been rebuilt since the French siege are of course different; the streets wide and the houses of better appearance. Saragossa was the Celtiberian *Salduba,* changed to *Cæsarea Augusta* in 25 B.C., of which the present name is a corruption. Although a place of importance under the Romans, there are few remains of the Roman city. One of the first cities of Spain to adopt Christianity (3d century), it afterwards became rich in relics, to which miraculous powers were ascribed. Saragossa was taken by the Goths in the 5th and by the Moors in the 8th century, and was recovered from them in 1118 by Alphonso of Aragon after a siege of five years, during which great part of the inhabitants died of hunger. The most momentous event in its recent history was the siege by the French (June to August 1808 and December 1808 to February 1809), in which the inhabitants, led by Palafox (q.v.), offered a most determined resistance, some 60,000 in all perishing. The services of the 'Maid of Saragossa,' said to have assisted or fought by the side of her artillery-man-lover, seem to have been greatly exaggerated by Southey, Byron, and Sir David Wilkie in treating the theme. Saragossa has two cathedrals, the older a Gothic edifice (1316); the more modern (17th century) boasts of a pillar on which the Virgin descended from heaven (40 A.D.), to which pilgrims still flock. Its defences include the citadel (Aljaferia), anciently the palace of the kings of Aragon and later the headquarters of the Inquisition in this part of Spain. There are also a university (1474) with 800 students, a library of 18,000 vols., an academy of sciences, and a large archiepiscopal palace. The leaning Torre Nueva, dating from 1504, was in 1890 deemed unsafe and doomed by the authorities to demolition. The leading industries turn out cloth, silks, leather, soap, and chocolate. Pop. (1887) 92,407.—The *province* has an area of 6727 sq. m. and a pop. of 414,007.

Sarakhs, a town in the extreme north-east of Persia, stands on the Heri-Rud, in a position of considerable strategic importance. It was destroyed by the Persians in 1832, and is now a miserable place of Turkoman tents and huts; but there is a strong fort. The Russians in 1885 occupied the opposite bank of the river; and the place has been often mentioned in connection with the delimitation of boundaries between Russian, Persian, and Afghan territory. See the map at AFGHANISTAN.

Saransk, a town of Russia, 65 miles N. of Penza; pop. (1885) 13,921.

Sarasate, MARTIN MELITON, violinist, was born of Basque parentage at Pamplona in Spain, 10th March 1844. Taken to Paris whilst still a child, he studied at the conservatoire there from 1856, and won the first prize for the violin in 1857; then, having finished his studies, he began what was to be his life's occupation, travelling from town to town and from continent to continent giving concerts. He first appeared at London in May 1874, playing at one of the Philharmonics. He always draws large audiences, his style being pure, easy, and graceful: he can play with fire and passion, and his taste is nearly faultless. He has composed only light pieces, chiefly Spanish dance tunes.

Saraswatî is, in Hindu Mythology, the name of the wife, or the female energy, of the god Brahma, the first of the Hindu Trimûrti or triad. She is also the goddess of speech and eloquence, the patroness of music and the arts, and the inventress of the Sanskrit language and the Devanâgarî letters.

Saratoff, a city of Russia, on the right bank of the Volga, exactly 500 miles by rail SE. of Moscow. It is a city of broad streets and fine squares, and stands on terraces rising from the river. There are nearly thirty churches: a handsome new cathedral (1825), an old cathedral (1697), and Radistcheff's Museum, sheltering a fine art gallery and a library. Manufactures of brandy, liqueurs, flour, oil, and tobacco are carried on. Fishing is prosecuted in the river, and market-gardening (especially fruit and the sunflower) in the vicinity. There is an important trade in corn, salt, iron, wooden wares, textiles, and groceries. The population has grown rapidly—50,000 in 1830; 70,000 in 1860; 123,410 in 1888. The city was pillaged by Pugatcheff in 1774 and suffered severely from fire several times during the 19th century.—The *government*, the east side of which is washed by the Volga, has much fertile soil, growing rye, oats, wheat, oil-plants, and flax; it has few industries except agriculture, distilling, and corn-grinding, but considerable trade. It was colonised in the end of the 18th century. The population, 2,311,220 in 1889, embraces several flourishing German colonies (pop. 120,000) which settled here in 1763-65. Total area, 32,624 sq. m.

Saratoga Springs, one of the chief watering-places in the United States, is in New York, 38 miles by rail N. of Albany. It contains more than a score of mineral springs, whose waters, prescribed in diseases of the liver, chronic dyspepsia, &c., are bottled in large quantities for exportation. In the village are a large number of hotels, some accommodating over 1000 guests. There is a race-track, and regattas are held on Saratoga Lake, 4 miles distant. Twelve miles to the east a handsome obelisk (1877), 155 feet high, on a bluff 350 feet above the Hudson River and overlooking the scene, commemorates the surrender of Burgoyne (q.v.) to Gates, on October 17, 1777. Pop. (1890) 11,975.

Sara'wak, a state on the north-west of the island of Borneo, in the East Indies, placed by its ruler, Rajah Brooke, in 1888 under the protection of Britain. The Chinese Sea washes its north-west side; on the north-east is the protected state of Brunei; and on every other side it is surrounded by Dutch Borneo. The boundaries next Dutch Borneo were fixed by an Anglo-Dutch commission appointed in 1891. The area of Sarawak is estimated to be 41,000 to 45,000 sq. m., and its pop. 300,000. The coast belt is in many parts low, the interior hilly, rising to close upon 8000 feet near the frontiers. The country is drained by a number of short streams, several of which have wide estuaries; the longest, the Rajang, has a sinuous course of 350 miles, and is easily navigable for 150 miles up. The state contains some valuable minerals: antimony, quicksilver, gold, and coal are mined to some extent, and copper, diamonds, and manganese exist, though hardly in paying quantities. The most important products are sago, pepper, gambier, gutta-percha, india-rubber, birds' nests, rattans, tea, coffee, and timber, all of which are exported. Trade is carried on principally with Singapore. The exports average £234,800, the imports £202,700 a year. The people consist principally of Malays, Chinese, and Dyaks. Chief town, Kuching, with a pop. of 25,000, standing 20 miles up the Sarawak River. Dying in 1868, Sir James Brooke (q.v.) was succeeded by his nephew Sir C. J. Brooke, who, after greatly extending his territory northwards after 1881, put it in 1888 under the protection of Britain. The English bishop of Singapore is also bishop of Sarawak.

See Spencer St John, *Life in the Forests of the Far East* (1862); Charles Brooke, *Ten Years in Sarawak* (1866); N. Denison, *Tour amongst the Land Dyaks of Upper Borneo* (Singapore, 1879); Helms, *Pioneering in the Far East* (1882); and books quoted at BROOKE.

Sarcenet. See SARSNET.

Sarcina. See BACTERIA, Vol. I. p. 647.

Sarcocystis. See GREGARINIDA.

Sarcode. See PROTOPLASM.

Sarcolemma is the term applied to the delicate sheath which invests each primary muscular fibre. See MUSCLE.

Sarcoma is an ancient term which was vaguely used of tumours of a more or less flesh-like consistence, but had fallen into disuse. It was adopted by Virchow as the general name for a large and important class of new formations, and is at present universally employed as defined by him. The tumours now called Sarcomata are mainly composed of cells resembling those of some form of embryonic or imperfectly developed connective tissue, rather than those of any part of the adult organism. Their structure, as well as their individual cells, usually suggests an embryonic condition: the cells are imbedded in a structureless matrix; and the blood-vessels are often mere channels between the tumour-cells. They are thus distinct from the Carcinomata, or cancers proper, which consist of epithelial cells in a framework of fully organised fibrous tissues; though they share with them the property of malignancy (see TUMOURS). They are generally classified, according to the form of their most characteristic cells, as round-celled, spindle-celled, and myeloid sarcomata. They are most common before middle life, and may occur in any organ of the body. Their course presents the greatest possible variety: some myeloid and spindle-celled sarcomata are slow in their growth, and but little apt to recur after removal: some forms of round-celled sarcoma may rival and even surpass the true cancers in rapidity of growth and diffusion through the body. When secondary tumours occur they are not commonly in the neighbouring lymphatic glands, as in cancer, but in distant organs, and particularly in the lungs.

Sarcophagus (Gr., 'flesh-eater'), any stone receptacle for a dead body. The name originated in the property assigned to a species of stone, found at Assos in Troas and used in early times, of consuming the whole body, with the exception of the teeth, within the space of forty days. The oldest known sarcophagi are those of Egypt, some of which are contemporary with the pyramids. The earliest of these are of a square or oblong form, and either plain or ornamented with lotus leaves; the later are of the form of swathed mummies, and bear inscriptions. The pyramids were sepulchral tombs built to contain the sarcophagi of the kings of Egypt: the Phœnician and Persian kings were also buried in sarcophagi. The Roman sarcophagi of the earlier republican period were plain. Sarcophagi were occasionally used in the later republic, although burning had become the more general mode of disposing of the dead. The use of stone chests for the interment of distinguished persons has not been altogether discontinued in modern times. See BARROW, BURIAL, COFFIN, MAUSOLEUM.

Sard, or SARDA, a variety of quartz, differing from carnelian only in its very deep red colour, blood-red by transmitted light. It is rare, and brings a much higher price than common carnelian. The name is probably from Sardis. The Sardonyx is an Onyx (q.v.) containing layers of sard.

Sardanapa'lus. See ASSYRIA.

Sardes. See SARDIS.

Sardine (originally 'the Sardinian fish,' and applied to a kind of tunny), the French name for Pilchard (q.v.), in England used for small pilchards specially prepared. In France and Portugal sardines are cured with oil in tin boxes, forming a much-esteemed delicacy, and, at the same time, a most wholesome article of food; in this form they are exported to all parts of the world. To cure them in this way, they are first carefully washed in the sea, then sprinkled with fine salt, and after a few hours the head, gills, &c. are removed; they are then washed again, and spread out on willow branches or wire-work, exposed to the sun and wind, if the weather is dry, but in damp and rainy weather to a current of air under cover. They are next put into boiling oil, in which they remain for a short time, and when they are taken out the oil is drained away from them as much as possible, and they are put into the tin boxes whose shape and appearance are so familiar to every one. The boxes, being filled with sardines, are filled up with oil, the lid is soldered on, and they are placed for a short time in boiling-water, or exposed to hot steam. The boxes which have leaked or have burst in boiling are rejected, and those which remain sound are now ready for the market. Sardines have of late years been much less abundant off the French coasts. A large manufacture of *sardines à l'huile* from sprats instead of pilchards has been established at Deal in Kent. In the south of France sardines are sometimes cured in red wine, and those so cured are called *sardines anchoisées*, or anchovied sardines.

Sardinia, an island of Italy, after Sicily the largest in the Mediterranean, lies 135 miles W. of the Tiber mouth, and immediately south of Corsica, being separated from it by the Strait of Bonifacio, 7½ miles wide. In shape it resembles an oblong set on end, with a deep wide bay, the Gulf of Cagliari, in the south, and another, the Gulf of Porto Torres, in the north. From north to south it measures 170 miles, and from east to west, on the average, 75 miles. Area, 9206 sq. m. Off various points along the shores lie islands, the largest being San Antioco, San Pietro, Dell' Asinara, Maddalena, Caprera, Tavolara, &c. The surface is generally mountainous, the configuration that of a tableland running up into ranges and isolated peaks. The highest points occur along the eastern side of the island, and reach 6233 feet in Gennargentu in the centre, and 4287 in the mountains of Limbara in the north. The western side of the island ranges at about 1240 feet, though the extinct volcano of Monte Ferru reaches 3400. The south-west corner is separated from the main mass of the island by the low alluvial plain of Campidano, which stretches from the Gulf of Cagliari to the Gulf of Oristano, on the west coast; at both extremities of it there are extensive salt lagoons. The only other low-lying tracts are the lower portions of the river valleys. The streams, however, are mostly short, the longest not exceeding 65 miles. The north-eastern shores are high and rocky. On the west the coast-line is more irregular than on the east; the grotto of Neptune, on this west coast, is one of the finest in Europe. Ever since the time of the Roman possession the climate of the island has been in evil repute. This is because of the malaria that prevails in the low-lying tracts, where there is often much stagnant water after the rains, and much decaying vegetable matter in the hot season. The parts that lie at a higher level are quite as healthy as the corresponding districts of Italy. A more extended cultivation of the soil and the drainage of the marshes or inland lagoons would greatly diminish the malaria, as experiment in certain districts has proved.

Sardinia is in nearly all respects a backward island. It has fine natural resources—fertile soil, valuable mines, extensive forests, rich fisheries, and excellent facilities for manufacturing industry. But owing to the old-fashioned conservatism of the people, their apathy, their primitive methods of agriculture, lack of enterprise and capital, and want of means of communication, and long years of negligent if not inefficient government, its resources are by no means developed to the extent they could be; many lucrative industries are in the hands of foreigners, others are neglected by the Sardes, and those that they do carry on are often carried on in a half-hearted manner and with obsolete methods. Feudalism was not finally abolished in the island until 1856. Of the total area about one-third is arable land, one-third pasture, and nearly one-third (28 per cent.) forest. The first place amongst the natural resources is taken by the agricultural products, in spite of the backward farming, the heavy taxation, and the extremely minute subdivision of the soil. The principal produce is wheat, barley, beans, potatoes, wine (21,500,000 gallons per annum), olive-oil (1½ million gallons), oranges, lemons, tobacco, flax and hemp, cheese, butter, and wool. The breeding of horses is an important industry; and large numbers of cattle, sheep, swine, and goats are kept. The growing of fruits and the breeding of the domestic animals are both carefully attended to, and the products of both industries are improving; but the only improvement in the management of the soil is the drainage of the marshes by the government (who own one-fifth of the area) and private individuals. Besides being in ancient times the granary of Rome, Sardinia was renowned for its mineral wealth. After lying unused from the fall of the Roman empire the mines were again worked by the Pisans in the 14th and 15th centuries; but work was not resumed in them with any degree of energy until towards the middle of the 19th century. At the present time some 10,000 persons are employed in extracting of lead (with silver) and zinc, and to a less extent lignite, antimony, and manganese. Iron and copper also exist. Granite, marble, and clay for pottery are quarried. Salt is manufactured from sea-water, chiefly by convicts at Cagliari. The mines are mostly situated in the south-west, in the neighbourhood of Iglesias. The total produce for a year averages £675,000 in value. The centre and north of the island are chiefly covered with forests, though they are being all too rapidly diminished. The commonest as well as the most valuable trees are the oak, ilex, cork, and wild olive, which yield timber, cork, bark for tanning, acorns, and charcoal to the annual value of close upon £300,000. The seas yield large quantities of tunny, sardines, anchovy, and coral, though the fisheries, except for tunny, are not prosecuted by Sardinians, but by Italians; the native fishermen prefer to catch trout, eels, lobsters, crabs, &c. in the rivers and inland lagoons. Sardinia has no extensive manufacturing industries, though there is some tanning and making of cigars, aerated waters, macaroni, flour, and spirits. There are, however, a variety of domestic industries for home use; most of the women still ply the spinning-wheel. Until the year 1828 Sardinia had no roads for wheeled vehicles, the Roman roads having gone to ruin centuries ago. Now there are good roads throughout the island; and they are supplemented by 350 miles of railway. In spite of their maritime situation the Sardinians are not fond of the sea. The island has numerous fairly good ports—Cagliari (the capital), Porto Torres, Terranova, Tortoli, Alghero, Carloforte, and Bosa—most of which are being improved by the construction of harbour-works. About 6000 vessels of 1¼ million tons enter every year. The inhabitants are for the most part of mixed race, Spanish and Italian elements predominating. Pop. (1815) 352,867; (1840) 524,000; (1871) 636,660; (1881) 682,000; (1887) 726,522; (Sicily, with an area of 9961 sq. m., has a pop. of 3,265,688). This gives a density of 79 persons to the square mile; Italy has 292 to the square mile. Education is in a very backward state, 83 per cent. of the population being unable to read and write. The two universities at Cagliari and Sassari are frequented by only 260 students in all. The practice of the vendetta and brigandage were extremely prevalent amongst this people; but both have now almost entirely ceased. The language is a mixture of Latin, Spanish, and Italian; but the dialects of different parts differ considerably. Classical Italian is the official language, and is used by the educated classes. The moufflon or wild sheep, with red deer, fallow deer, wild boar, and an abundance of smaller game, such as hares, partridges, woodcock, snipe, &c., are the creatures chiefly hunted. Administratively the island is divided into the two provinces of Cagliari and Sassari. There are three archbishoprics, Cagliari, Sassari, and Oristano, and eight bishoprics. Sardinia sends twelve members to the Italian chamber of representatives and three to the senate.

There are numerous remains of a remote and now wholly forgotten antiquity, about which nothing is known beyond the *nurhags* or Nuraghe (q.v.) and 'giants' graves,' and other memorials. The 'giants' graves' are excavated spaces, 15 to 30 feet long and 4 to 6 feet wide, surrounded by stones.

History.—The aboriginal inhabitants are believed to have been of Iberian stock, though this is by no means certain. They seem to have been conquered by the Phœnicians at an early period; but little authentic is known before the conquest by the Carthaginians in 512 B.C. For two centuries and a half this people bitterly oppressed the native inhabitants, so that when the Romans came in the 3d century they were hailed as deliverers. But the Sardinians did not at first bear the Roman yoke very patiently, though afterwards, from the reign of Tiberius onwards, they enjoyed three hundred years of continuous peace, and prospered greatly. After the fall of the Roman empire evil days again fell upon the island: it was overrun by Vandals and Goths, and then for many years was incessantly harassed by the Saracens. During this time its nominal masters were the Byzantine emperors (till 774) and the popes. In the beginning of the 11th century the Pisans and Genoese undertook the task of driving out the Saracens and holding the island against them; but they had a hard task for twenty years or more. Then, the Moslems beaten off, they took to quarrelling with one another, and only agreed to divide the island between them in 1299, Genoa taking the north, Pisa the south. But the real internal government was in the hands of four 'judges' or chiefs, each ruling a separate province; this arrangement existed several centuries before the Pisans came, and continued to exist for several centuries longer. The pope, who still claimed the over-lordship, at this time gave Sardinia to the king of Aragon; and he made himself definitively master of it in 1416. The Aragonese and their sovereign successors, the Spaniards, kept possession of it till the treaty of Utrecht (1713); it then passed to Austria, but in 1720 was given to the House of Savoy in exchange for Sicily. United with Savoy and Piedmont, it gave title to a new kingdom, the kingdom of Sardinia. See SAVOY.

See Tennant, *Sardinia and its Resources* (Rome, 1885); Tyndale, *Island of Sardinia* (3 vols. 1849); C. Edwardes, *Sardinia and the Sardes* (Lond. 1889); *Annali di Statistica*, No XI. (Rome, 1887); *Nineteenth Century* (June 1887); La Marmora, *Voyage en Sardaigne* (5 vols. 2d ed. Paris, 1837-57); and the historical works of Manno (4 vols. Turin, 1825, and 1 vol. Florence, 1858).

Sardis, the capital of ancient Lydia in Asia Minor, stood at the northern foot of Mount Tmolus (5906 feet) and 2½ miles S. of the Hermus. Through its market-place flowed the Pactolus over sands rich in gold, an allusion in all probability to the wealth of the inhabitants, who wove woollen stuffs and carpets, and organised the traffic between the highlands of the interior and the coast; it was, moreover, the grand and luxurious capital of Crœsus, a monarch of fabulous wealth. In spite of the strength of its citadel, it was destroyed by the Cimmerian Gauls in the 7th century B.C., by the Athenians in the 6th, by Antiochus the Great in 215 B.C., and by Timur in 1402; besides this it was overwhelmed by earthquake in the reign of Tiberius. Both Xerxes and Cyrus the Great resided here before setting out on their great expeditions. As Byzantium rose to importance, Sardis lost the advantages of its situation on the great land-route between Persia and Rome, and gradually declined. At the present day there is nothing left at its site, Sart, except a small village and ruin mounds. The cemetery of the ancient city, 4 miles distant across the Hermus, is of great extent, and has been in part opened up in recent times.

Sardonic Smile is a term applied by the older medical writers to a convulsive affection of the muscles of the face, somewhat resembling laughter. It may occur in tetanus or lock-jaw, and other convulsive affections, or may result from the action of certain vegetable poisons. The name is said to be from a ranunculus termed *Herba sardonica*, a Sardinian plant; but is probably from the root *sar*, 'to grin' (Gr. *sairein*).

Sardonyx. See ONYX, and SARD.

Sardou, VICTORIEN, a French dramatist, was born at Paris on 7th September 1831. He studied medicine, but took to the writing of dramas instead of practising. His first efforts were decidedly failures, but through his marriage with an actress, who nursed him when sick and in the extremity of want, he became acquainted with the celebrated Déjazet, for whom he wrote two very successful pieces, *Monsieur Garat* and *Les Prés Saint-Gervais* (1860). In a few years he had amassed a fortune. He has been almost as prolific as Scribe, with whom he may be fitly compared, but whom he in many respects excels. With a first-rate knowledge of stage-effect he combines an unrivalled instinct for what will just suit the taste of the playgoing public. His comedies are in general loosely constructed, but full of rapid action; the character-sketching and the emotional elements are both superficial; the dialogue is brilliant and witty, but the episodes are often very improbable. Sardou makes fun of the foibles of his contemporaries in a very clever, amusing fashion. His works are hardly literature; they are much better suited for acting than for being read. Pieces like *Nos Intimes* and *Les Ganaches* (1861), *Les Vieux Garçons* and *La Famille Benoîton* (1865), *Nos Bons Villageois* and *Maison Neuve* (1866), *Rabagas* (1872), *Dora* (1877), *Daniel Rochat* (1880), *Odette* (1882), and *Marquise* (1889) make a fair sample of his capabilities and style. For Sarah Bernhardt he wrote the well-known

Fedora (1883), *Théodora* (1884), and *La Tosca* (1887). He has, moreover, attempted the higher historical play in pieces like *La Patrie* (1869), *La Haine* (1874), and *Thermidor* (1891). The last excited such a furor at its opening as to be quickly suppressed. Sardou was elected to the Academy in 1877. See Montégut in *Revue des Deux Mondes* (1877).

Sargasso Sea. See ATLANTIC, GULF STREAM, GULFWEED.

Sargon. See ASSYRIA, Vol. I. p. 516.

Sari, capital of the province of Mazanderan, Persia, lies 18 miles S. of the Caspian Sea. It is a greatly decayed place of some 8000 inhabitants, the principal town in the province being the seaport Balfrush on the Caspian.

Sark (Fr. *Cers*), the smallest of the four Channel Islands (q.v.), 6 miles E. of Guernsey and 12 NNW. of Jersey. Only 2 sq. m. in area, it is almost entirely rockbound, and consists of two portions, Great and Little Sark, connected by an isthmus called the Coupée, 456 feet long, 5 to 8 broad, and 384 high. Lead was mined during 1835-45; fishing and agriculture are now almost the only occupations. Pop. (1841) 785; (1891) 571.

Sarmatians (anc. *Sarmatæ*, *Sauromatæ*), a race who spoke the same language as the Scythians (*q.v.*), and who are believed to have been of Median descent and so Iranian in stock, though some authorities think they belonged to the Ural-Altaic family. They were nomads, wild and savage in appearance, excellent horsemen and archers, and dressed in leather armour. Their young women went into battle on horseback; hence probably the Greek legends about the Amazons. Several tribes were embraced under the name; they roamed over the wide plains of eastern Europe, from the Vistula and the Danube to the Volga and the Caucasus. Their country was arbitrarily divided by the ancient writers into European and Asiatic Sarmatia, the river Don being made the dividing-line. In the second half of the 4th century B.C. they subjected the Scythians to their yoke. Their empire lasted until the 4th century A.D., when it was overthrown by the Goths. Shortly after that their name disappears from history. The Jazyges (q.v.) were a Sarmatian tribe who also disappeared amongst Goths and Huns. But the name of Sarmatia is sometimes applied to the vast region in which the Sarmatians roamed, and is sometimes rhetorically used for Poland.

Sarnia, a town and port of Canada, just below the issue from Lake Huron of the St Clair River, 170 miles WSW. of Toronto by rail. A great tunnel beneath the St Clair (q.v.) connects it with Port Huron (q.v.) on the American side. Pop. 3847.

Sarno, a city of Southern Italy, 30 miles by rail E. of Naples, on the farther side of Vesuvius, has an ancient castle, a cathedral (1625), a seminary, paper, cotton, linen, and ribbon manufactories, and produces fine silk. Pop. 14,464. Here Teia, king of the Goths, was vanquished and slain in a desperate battle with the Greeks, commanded by Narses, in 552.

Sarpi, PIETRO, better known by his monastic appellation, FRA PAOLO, was born at Venice on 14th August 1552, embraced the monastic life, and took the vows in the religious order of the Servites (q.v.) in 1565. Five years later the Duke of Mantua made him his court theologian; but he was soon after summoned to be professor of philosophy in the Servite monastery at Venice, and there he remained all the rest of his life. For nine years, however (1579-88), he was absent in Rome looking after affairs connected with the reform of the Servite order. In early life his thoughts were principally given to the study of oriental languages, mathematics, astronomy, and other branches of natural philosophy, including the medical and physiological sciences, in which he attained to great proficiency, being by some writers regarded (although without sufficient grounds) as entitled to at least a share in the discovery of the circulation of the blood. He kept up a correspondence with Galileo, Harvey, Bacon, and W. Gilbert. In the dispute between the republic of Venice and Paul V. (q.v.) on the subject of clerical immunities Sarpi stepped forward as the valiant champion of the republic and of freedom of thought. On the repeal (1607) of the edict of excommunication launched against Venice Sarpi was summoned to Rome to account for his conduct. He refused to obey, and was excommunicated as contumacious; and an attempt was made upon his life by a band of assassins, who professed to be actuated by zeal for the papal cause. Seriously wounded, he after his recovery confined himself within his monastery, and busied himself with writing his celebrated *History of the Council of Trent*, a *History of the Interdict*, and other works. The first named was published in London in 1619 by Antonio de Dominis (q.v.), the ex-bishop of Spalato, at first under the pseudonym of Pietro Soave Polano, an anagram of Paolo Sarpi Veneto; and it almost immediately rose into popularity with the adversaries of Rome as well in England as throughout the Continent. It is by no means a simple history of the proceedings of the council, but rather a controversial narrative of the discussions, in which the writer freely enters into the merits of the doctrines under discussion, and in many cases displays a strong anti-Catholic bias. His judgment of the motives and conduct of the members of the council, especially of the representatives of the pope and his partisans in the assembly, is uniformly hostile. Ranke, who criticises the work in an appendix to his *History of the Popes*, ranks Sarpi, in spite of the partisan spirit of his writing, as the second of Italian historians, next after Machiavelli. A voluminous history of the Council of Trent from the papal standpoint was written by the Jesuit Pallavicino (q.v.). Sarpi died on 15th January 1623. His life as an ecclesiastic was above reproach; and his long-tried zeal in the cause of the republic had made him the idol of his fellow-citizens, who accordingly honoured him with a public funeral. His *History of the Council of Trent* has been reprinted in numberless editions; his collected works were published at Naples, in 24 vols., in 1789-90.

See Lives by A. G. Campbell (1869), Bianchi-Giovini (Zurich, 1836), and T. A. Trollope's *Paul the Pope and Paul the Friar* (1861), largely based upon the Italian work of Bianchi-Giovini.

Sarracenia. See INSECTIVOROUS PLANTS.

Sarrakhs. See SARAKHS.

Sarreguemines. See SAARGEMÜND.

Sarsaparilla, or SARSA. This is the dried root of the *Smilax officinalis*, a plant belonging to the natural order Smilaceæ, and a native of Central America. In the British Pharmacopœia it is known as *Sarsæ Radix*, or Jamaica Sarsaparilla, being imported from that island, and having first been brought into Europe from the West Indies about 1530. There are, however, several other species of Smilax having the same properties, and growing in the warmer parts of America. They are twining shrubs, sometimes attaining a very considerable height, and growing only where there is abundance of water. The root is many feet long, about the thickness of a goose-quill, brownish in colour, with numerous rootlets. They are folded and packed into bundles about 18 inches long and 4 inches in diameter, bound by a long root. The taste is mucilaginous, slightly bitter and acrid; it has no smell. The root contains a crystalline glucoside, *smilacin*, a volatile oil, resin, starch, &c. A decoction, a compound decoction, and a liquid extract made from the root are all officinal. These preparations act as diuretics and diaphoretics, and are used as alteratives in syphilis, rheumatism, and some skin diseases. Their value is much disputed, and they are not nearly so often prescribed as formerly. The root of *Hemidesmus Indicus* is also officinal, and is sometimes called Indian Sarsaparilla. The root of *Smilax aspera* is known as Italian Sarsaparilla, while those of various species of Carex are known as German Sarsaparilla. The form *Zarsaparella* occurs in Lyte's *Dodoens* (1578), the word being perhaps a compound of the Spanish *çarça* or *zarza*, 'bramble,' and *parilla*, 'a little vine.'

Sarsden Stones, a name given to the Greywethers (q.v.) of Cornwall, and erroneously interpreted to mean Saracen stones, as the piles of old mining refuse are called *attal-Sarsen* and Jews'-leavings—on the theory that Saracens, Jews, Phœnicians had wrought there; but really a corruption of a Celtic word.

Sarsfield, PATRICK, Irish Jacobite, had fought abroad under Monmouth, and in England at Sedgemoor against him, when in 1688 he was defeated in the skirmish of Wincanton, and crossed over to Ireland (he was member for Dublin county). Created Earl of Lucan by James II., he drove the English out of Sligo, was present at the battles of the Boyne and Aghrim, defended Limerick (q.v.), and on its final capitulation in 1691 entered the service of France. He fought at Steenkirk (1692), and was mortally wounded at Neerwinden, 29th July 1693.

Sarsnet, or SARCENET, a thin tissue of fine silk, plain or twilled, used for ladies' dresses and for linings. It is said to have been introduced from the Orient in the 13th century. See RIBBON.

Sarthe, a dept. of France, north of the Loire, formed out of the old provinces of Anjou and Maine. Area, 2396 sq. m.; pop. (1866) 465,615; (1886) 436,111. The Sarthe flows south through the department, and the Loir west along the southern border. The department is fairly level, and the soil fertile. Essentially an agricultural department, it produces wheat, oats, barley, and potatoes, sends its geese, chickens, eggs, cattle, and swine to Paris, is famous for its breed of horses, and makes every year nearly 4 million gallons of wine and 15½ million gallons of cider. Coal is mined, and there are manufactures of hemp, linen, and cotton textiles, paper, glass, leather, machinery, &c. The departments are Le Mans, La Flèche, Mamers, and St Calais; capital, Le Mans.

Sarti, GIUSEPPE, musical composer, was born at Faenza on 1st December 1729, and held the office of organist to the cathedral of Faenza from 1748 to 1750. The success of two operas—*Pompeo in Armenia* (1751) and *Il Re Pastore* (1753)—brought him a royal invitation to Copenhagen in 1753; and there he remained until 1775. After his return to Italy he was successively director of the conservatory at Venice (till 1779) and *maestro di capella* of Milan cathedral; in this last post Cherubini was his pupil and assistant. During this period he composed some of his most successful operas, *Le Gelosie Villane* (1775), *Giulio Sabino* (1781), *Le Nozze di Dorina* (1782), and others. In 1784 Catharine II. invited him to St Petersburg. On his way he made the acquaintance of Mozart at Vienna. His most notable productions whilst in Russia were the opera *Armida* (1786) and a Te Deum in celebration of the taking of Otchakoff, in which real fireworks and cannon were discharged to heighten the realism. Sarti died at Berlin, on his way home to Italy, on 28th July 1802. He composed, in addition to operatic music, several masses, sonatas, and other pieces.

Sarto, ANDREA DEL, a painter of Florence, where he was born in 1487 or 1486. The family name was Vannucchi; and Andrea was nicknamed *Del Sarto* ('*the tailor's son*') from his father's occupation. He studied under one or two Florentine painters, and gained greatly by copying from Leonardo da Vinci and Michelangelo. In 1509–14 he was engaged by the Servites in Florence to paint for their church of the Annunciation a series of seven frescoes, of which the first four illustrated the life of St Philip Benizzi, the founder of the order; the two last, depicting the 'Nativity of the Virgin' and 'Journey of the Three Kings,' are esteemed the best in the series. During the next eleven years he painted a second series of frescoes, those illustrating the Life of John the Baptist and intended for the cloisters of the Recollets or Barefooted Friars. But in 1518 he accepted the invitation of Francis I. of France and went to Paris, and was warmly received. In the following year he returned to Italy with a commission from the king to purchase works of art; but Andrea squandered the money entrusted to him, and so dared not return to France. The rest of his life was spent at Florence, where he died of the plague on 22d January 1531. The most celebrated of the single pictures painted by Andrea are the 'Madonna del Sacco,' for the Servites; the 'Last Supper,' for S. Salvi near Florence; the 'Madonna with the Harpies,' now in the Uffizi; the 'Fathers of the Church Disputing,' an altar-piece, likewise in the Uffizi; a Pietà, now at Vienna; a copy of Raphael's portrait of Leo X., which deceived even Giulio Romano into believing it was the original, although he himself had had a hand in that original; and two fine Annunciations, in the Pitti Palace at Florence. Andrea was a rapid worker, had a quick, sure brush, excelled in accurate drawing, and displayed a refined feeling for harmonies of colour, but, though called 'the Faultless,' lacks the elevation and spiritual imagination of the greatest masters.

See Crowe and Cavalcaselle, *Painting in Italy*; and Life by Von Reumont (Leip. 1835), and by Janitschek, in Dohme's *Kunst und Kunstler*, part iii.

Sartoris, ADELAIDE. See KEMBLE.

Sarts, a name given to the settled inhabitants, whether agriculturists or traders, as distinguished from the nomad inhabitants of Turkestan, Afghanistan, Persia, and the adjacent regions of Asia. Strictly speaking, the name has no ethnological significance, though it is often used, but incorrectly, to designate the Aryan aborigines of those same regions, properly called Tajiks (q.v.).

Sarum. See SALISBURY, LITURGY.

Sarzana, a city of Northern Italy, 8 miles by rail E. of Spezia. It has a cathedral (1355–1470), and an ancient fortress (now a prison), and is the birthplace of Pope Nicholas V. Pop. 4016.

Sasin. See ANTELOPES.

Sasine. See INFEFTMENT.

Saskatch'ewan, a large river of British North America, draws its waters from the Rocky Mountains, and is formed by two head-waters called the South and North Branches. The North Branch rises among the glaciers near Mount Hooker, the South Branch in the very north of Montana. The former has a course of 770, the latter of 810 miles, before they meet at about 105° W. long. and 53° 15′ N. lat. The river then flows east 282 miles to Lake Winnipeg, from which its waters are carried to Hudson Bay by the Nelson River (q.v.). Including the Nelson, its total length is 1514 miles; catchment basin, 450,000 sq. m. It is now navigated by steamers from Lake Winnipeg to Edmonton (700 miles); the Nelson is rendered unnavigable by rapids. The upper Saskatchewan drains a rich prairie country; near Medicine Hat it is sunk almost 300 feet below the general surface.—The river gives name to one of the Western Territories, lying between Manitoba and Keewatin, Assiniboia, Alberta, and the parallel 55° N. lat. Both branches of the river traverse the territory, and on their banks are the settlements of Prince Albert, Battleford, &c. Area, 114,000 sq. m.; pop. (1885) 10,746.

Sas'safras (*Sassafras*), a genus of trees or shrubs of the natural order Lauraceæ. The Sassafras-tree (*S. officinale*) of North America, found from Canada to Florida, a mere bush in the north, but a tree of 50 feet in the south, has deciduous leaves, yellow flowers, which appear before the leaves, and small dark-blue fruit. The wood is soft, light, coarse in fibre, dirty-white and reddish brown, with a strong but agreeable smell, resembling that of fennel, and an aromatic, rather pungent and sweetish taste. The wood of the root possesses these properties in a higher degree than that of the stem, and the thick spongy bark of the root most of all. The wood is brought to market in the form of chips, but the bark of the root is preferred for medicinal use, is a powerful stimulant, sudorific, and diuretic, and is employed in cutaneous diseases, gout, rheumatism, and syphilis, generally in combination with other medicines. It contains a volatile oil, *Oil of Sassafras*, which is often used instead. An agreeable beverage is made in North America by infusion of sassafras bark or sassafras wood; and a similar drink was once commonly sold in the streets of London under the name of *Saloop*. The leaves of sassafras contain so much mucilage that they are used for thickening soup.—Another species of Sassafras (*S. parthenoxylon*), possessing similar properties, is found in Sumatra; and the name, with or without explanatory prefixes, is given to trees of various orders found in Victoria, New South Wales, Tasmania, Brazil, and Chili.

Sassafras (*Sassafras officinale*):
a, branch of male tree in flower; *b*, branch with ripe fruit and developed foliage. (Bentley and Trimen.)

SASSAFRAS NUTS, a name given to the cotyledons of the seed of the South American tree *Nectandra puchury*, used as medicinal aromatics. They are also called Pichurim Beans and Brazilian Beans.

Sassanidæ. See PERSIA, Vol. VIII. p. 67.

Sas'sari, a city in the north-west of Sardinia, ranking next after the capital Cagliari, which it has indeed attempted to supplant as the capital; it stands 12 miles by rail from the Gulf of Asinara, where its port, Porto Torres (pop. 2034), is situated, and 162 miles N. by W. of Cagliari. A prosperous-looking town, with both old and new houses, embosomed in orange and olive groves, it has a cathedral (1531), an old castle (1327-31), a university (1677, reopened in 1766) with about 120 students, a museum of Roman antiquities, a natural history collection, and a library (1556) of 25,000 vols., and is the seat of an archbishop and of several of the old Sardinian nobles. There is a busy trade in grain, olive-oil, cheese, and hides. Pop. (1881) 31,596; (1885) 38,000.—The *province* has an area of 3922 sq. m. and a pop. (1889) of 286,174.

Sassoferrato, an Italian painter, whose real name was GIAMBATTISTA SALVI, was born at Sassoferrato in the March of Ancona on 11th July 1605, studied at Rome and Naples, worked most of his life at the former city, and died there on 8th April 1685. He painted innumerable Madonnas, conceived in a devout spirit and with a humble yet noble expression. The most notable of his other compositions, which were few in number, are a couple of Holy Families, an Annunciation, and an Assumption.

Satan. See the articles DEVIL, HELL.

Sátárá, a town of Bombay presidency, India, occupies a high, healthy site on the Deccan plateau, near the Kistna, 56 miles S. of Poona. It is commanded by a hill-fort, which came into the hands of the British in 1848. Pop. 29,028.—The *district* has an area of 4988 sq. m. and a pop. of 1,062,350.

Satellites are small members of the solar system, taking the place of attendants of the larger planets, by which their motions are controlled. In relation to them, the controlling planet is called their 'Primary.' For a discussion of the satellite of the earth the reader is referred to the article MOON. The satellites of *Mars* are interesting as by far the smallest known. One of them, Phobos, revolves round its primary so quickly that its rising and setting are determined chiefly by its own motion. To an observer on Mars it will rise in the *west*, and cross the sky in a few hours. Both were discovered in 1877. The first three of Jupiter's satellites are eclipsed at every revolution, the fourth less frequently. Their frequent passages before and behind their primary form one of the most attractive spectacles for small telescopes. Their orbits differ but little from circles, and between the first three a curious relation exists—viz. the mean sidereal motion of the 1st added to twice that of the 3d is equal to three times that of the 2d; so that, except at a vast interval, the three cannot all be eclipsed at once, although *each* is eclipsed once in every period. Long observation and careful calculation have enabled the places of these satellites to be so accurately predicted that their eclipses have been used to determine the velocity of light. Jupiter, owing to the earth's orbital movement, is at one time 183,000,000 miles nearer us than at another. The eclipses of his satellites are therefore delayed or hastened, according to the velocity of light, as the strokes of a hammer at a distance are delayed in reaching us by the finite velocity of sound (see LIGHT, SUN). From this difference (about 500 seconds) the velocity of light has been calculated. One of the satellites of Saturn, *Titania*, is much the largest of all, approaching in size the smaller planets. Regarding the satellites of Uranus and Neptune little is known beyond the information furnished in the table, save that the motion of the satellites of Uranus is retrograde. The following table gives the principal facts hitherto discovered regarding the different satellites :

Primary	Name of Satellite	Mean Distance from Primary	Sidereal Period			Diameter	Discoverer
		Miles	d	h	m	Miles.

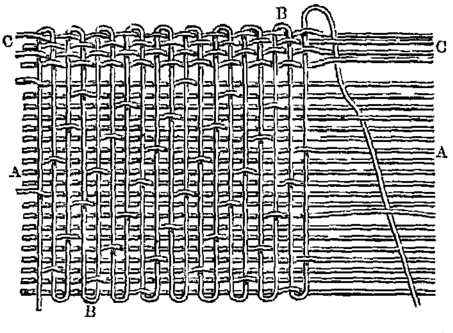
Satí. See SUTTEE.

Satin, a fabric in which so much of the weft is brought uppermost in the weaving as to give a more lustrous and unbroken surface to the cloth than is seen when the warp and weft cross each other more frequently; this will be better understood by reference to the figure than by any verbal description. A are the warp threads, of which only every tenth one is raised to allow the shuttle to pass, but they are all raised in regular succession, so that the weaving is quite uniform throughout; B are the weft threads; and C is the selvedge, which is formed on each side of the piece of stuff by the regular method of plain weaving—that is, by raising every other warp thread for the passage of the weft. The figure shows a ten-thread satin twill, but there are various others made, such as a five, a six, a seven, and an eight-thread satin. The lowest satin twill that can be produced is a four-thread, which is sometimes called the satinet twill. The term satin is rarely applied to other than silk textiles (see SILK). A cotton, and sometimes even a woollen, fabric woven in the way described is called sateen.



Satin-bird. See BOWER-BIRD.

Satin Spar. See ARAGONITE, GYPSUM.

Satinwood. This is perhaps the most valuable of the light-coloured furniture woods. Two kinds of satinwood are known in commerce, both being somewhat similar in appearance, although they do not appear to be closely allied botanically. One kind is obtained from a moderate-sized deciduous tree (*Chloroxylon swietenia*), growing in Central and South India, including Ceylon. It is allied to the mahogany-tree, and as regards appearance the wood might be called a yellow mahogany In India satinwood is used for house-building and agricultural implements, as well as for furniture purposes; but richly figured pieces of it, especially, are exported to England for cabinet-work. West Indian satinwood is the better of the two kinds —at least it is more commonly used for furniture. It comes chiefly from San Domingo and Porto Rico, but, although the wood has been long used in Europe, its botanical source is not certainly known. It is, however, supposed to be furnished by an Ebenaceous tree. Satinwood, of either kind, is hard, very close-grained, and takes a fine polish. It can be cut into small mouldings better than most woods, but it is of a 'greasy' nature, and does not hold glue well. In colour it is of a subdued yellow passing into brown, and much of it has a rich satiny or feathery figure which is very beautiful. It has been much used in costly furniture, but not so extensively in recent years. The cabins of passenger steamers are often panelled with satinwood, which is also a good deal employed for small ornamental articles.

Satire, one of the capital divisions of literature, is in its essence criticism of man and his works, whom it holds up either to ridicule or to scorn. One of the greatest masters in the art (Dryden) describes it as—

> The boldest way, if not the best,
> To tell men freely of their foulest faults,
> To laugh at their vain deeds and vainer thoughts.

The chief instruments of the satirist's equipment are irony, sarcasm, invective, wit, and humour, this last generally in its lower or inferior grades. The satiric denunciation of a writer burning with indignation at some social wrong or abuse is capable of reaching to the very highest level of literature. The writings of a satirist of this type, and to some extent of every satirist who touches on the social aspects of life, present a picture, more or less vivid, though not of course complete or impartial, of the age to which he belongs—of the men, their manners, fashions, tastes, and prevalent opinions; thus they have a historical as well as a literary and an ethical (or philosophical) value. All types of satirist, except the philosophical and the social, tend to be personal in their criticism. Their invective too often slips into scurrilous abuse, or verbal insolence and the calling of opprobrious names; and their ridicule is either light badinage, or playful irony, or sarcastic mockery, or caricature, or rollicking fun, or jeering laughter. How powerful an instrument satire is for influencing men's actions, especially in the sphere of politics, has been abundantly manifested from the day when Elijah taunted the prophets of Baal on Mount Carmel to the latest cartoon of *Punch* or *Kladderadatsch* or *Puck*. Satiric writers have made use of many different forms of literature: Dryden and Pope, for instance, adopted the mock-heroic epic, Ulrich von Hutten chose epistles, Langland (*Piers Plowman*) and Quevedo imaginary visions, Cervantes and Swift the mock romance, Marnix and the writers of *Reynard the Fox* the beast-fable, Voltaire fictitious travels, Molière and Gay plays, John Barclay the allegory, James and Horace Smith the parody. Pictorial illustration was turned to splendid purpose as a satiric weapon by Hogarth, and by the caricaturists (Rowlandson, Gilray) and cartoonists of more modern times; and medals even have been put to satiric purposes.

Ancient Greece, though she never produced a school of satire, had in Aristophanes and others men of the highest satiric genius. Archilochus (720-680 B.C.) is the first we read of as having used the iambic metre for the purposes of satire. He wrote with such effect that certain of his victims are said to have gone and hanged themselves. Simonides of Amorgus and Hipponax of Ephesus intervene between Archilochus and Aristophanes. The last named is the most brilliant representative of the Athenian Old Comedy, the writers of which, bold and outspoken, constituted themselves censors of public morality and critics of current events. Satire as a special branch of literature was the creation, the *only original* literary creation, of the practical-minded Romans. It grew out of the rude dramatic medleys (*saturæ*) with which, in primitive republican times, the citizens were wont to be diverted on the occasion of large festive gatherings. The father of poetical satire was Lucilius, who criticised boldly and freely, equally without moral indignation and without any desire to provoke laughter. It is, however, Horace and Juvenal whose names are principally associated with Roman satire. Both expended their chief efforts upon social topics; but whilst the former uses satire as a medium for recording his personal tastes and distastes, and enlarging on his own experience, and writes with the easy good-nature of a thorough man of the world, Juvenal dwells upon the tragic and sombre aspects of the society of his time (the age of Domitian and Trajan), and denounces them with the scornful indignation of the moralist. Horace is the model, the archetype of 'classic satire,' the form that was imitated or adapted by the French satirists of the school of Boileau and by their English successors. For grim intensity of scorn and sustained power of invective Juvenal's work has never been equalled; indeed the only man who can at all be put on the same level with him is Dean Swift. The Greek Lucian, and the Romans Persius, Petronius, Martial, and Apuleius, all wrote satire, but, in different forms; and some of the strongest satire ever written stands in the grave pages of the historian Tacitus.

During the long night of the dark ages satire, like most other branches of good literature, was almost entirely neglected. It began to revive in the 10th century: certain of the early versions of *Reynard the Fox* (e.g. *Reinardus Vulpes* and *Reinaert Vos*) are thinly disguised satires on the clergy. This class continued a favourite butt until past the Reformation; they were attacked, for instance, by the *goliards*, wandering scholars with a turn for witty buffoonery, who jotted down their effusions in doggerel Latin verse. Walter Mapes, whose name is connected with the preservation of the Grail legends, wrote (12th century) vigorous Latin verses in the same strain.

The first notable name in the annals of English satire is that of William Langland, who in *Piers Plowman* inveighs against the clergy and mendicant orders, the law-courts, and abuses generally. Skelton, who railed at Wolsey, and at the clergy, was perhaps the wildest and most reckless of English satirists. Thomas Nash, one of the most able opponents of the Martin Marprelate writers, puts a good deal of strong vituperation into his *Anatomie of Absurdity* (1589). The invectives of Gosson and Stubbes are not satire, for they are hardly literature. In the same century Scotland had two satirists of rare quality, one in Sir David Lyndsay, whose *Satyre of the Thrie Estaitis*, written in the vernacular, helped to pave the way for the Reformation, and the other in George Buchanan, the ripest scholar of his country, who made the Franciscans smart under his cutting irony. Bishop Joseph Hall and John Donne are chiefly notable as the forerunners of Dryden and Pope, both writing classic satire in the heroic verse measure. Then came John Barclay, the author of the clever political allegory *Argenis* (1621); Andrew Marvell, who was very skilful in the use of banter, with which he assailed the private and social corruptions of the reign of the second Charles; Oldham (1653-83), an imitator of Horace and Juvenal, and a writer who in spite of much extravagance had something of the gift of true satiric wrath, which he expended upon the Jesuits; and Congreve, the master of witty repartee, who went in for light lampooning, and in *The Double-dealer* and other pieces ridiculed the fashionables of the Restoration. But the reputations of all these is eclipsed by Samuel Butler, the writer of *Hudibras*, a burlesque character-sketch, in doggerel rhymes, of the Puritan anti-royalist. He was seconded, though at a long distance, by the royalist Cleveland, who enjoyed great popularity in his day for his satires on Cromwell and the Scotch. The greatest English writer in the field of classic satire was John Dryden; a manly, large-hearted man, a stranger to meanness and spite, he spoke out boldly and dealt downright stunning blows, pouring the most unsparing ridicule upon Shaftesbury, the supporters of Monmouth, the literary satellites of the Whigs, and the poet Shadwell. Amongst others who had to repent for having provoked 'Glorious John' were the Duke of Buckingham, author of the *Rehearsal*, and Tom Brown 'of facetious memory.' The reign of Anne is, however, the golden age of English satire, its brightest ornaments being Swift, Pope, and Addison. The first named is both philosophical and personal in his treatment, and writes with marvellous force of invective and savage scorn. Pope, as a man almost the direct opposite of the masculine Swift, had a wholly inimitable way of putting things, with the finest point and precision, elegance and ease, and the keenest wit. His satire is by preference personal, strongly spiced with malice, and feminine spite, and elfish fun. Next to these two comes Addison, whose subtle irony and exquisite literary touch and admirable character-sketching are familiar to all readers of good English. Gay, the friend of satirists, had literary partnerships with Swift, Pope, and Arbuthnot, and won enormous success with *The Beggars' Opera*, a hit at the social vices of the day. Dr Arbuthnot, the chief if not sole author of *Martinus Scriblerus*, in which he gibbeted the pedantic follies of antiquaries and metaphysicians, is best known for his *History of John Bull*, an amusing attack on Marlborough and the war policy of the Whigs. Dr Johnson too tried his hand at satire, and wrote *London* and *The Vanity of Human Wishes* in free imitation of Juvenal. Young of the *Night Thoughts* wrote on *The Universal Passion* (i.e. love of fame), but without much point. Charles Churchill is the most important satirist between Pope and Byron. A literary swashbuckler, he assailed with plenty of Drydenic vigour the actors, critics, and opponents of Wilkes (of whom he was a rabid partisan), as well as Dr Johnson, Warburton, and other individuals. Sir C. Hanbury Williams, one of Walpole's men, was accounted by his admirers a master of the light political squib in gay and easy verse. But he is altogether overshadowed by 'Junius,' whose polished sarcasm, cutting invective, and dignity of style elevated the political pamphlet to the level of permanent literature. Wolcot (Peter Pindar), a sort of street buffoon in letters, a man with more rollicking wit and impudence than real malice, poked rare fun at the oddities of George III., at Sir Joseph Banks, the French philosophers, &c. Gifford, the founder of the *Quarterly*, was a translator of Juvenal and author of some vigorous but ill-bred invective; thus, Peter Pindar, who had assailed him personally, is styled a 'dotard,' 'reptile,' and 'brutal sot.' Cowper denounced in old-fashioned satire the extravagances of a society he knew at second hand only. A much greater name than any of these in the annals of satire is that of Burns, who hated as he loved, well and ardently; uniting reckless glee with fine irony and boisterous fun with keen wit, he hit out boldly at hypocrisy and pride of birth, as well as at individuals. Byron turned his ready command of easy verse and fluent sarcasm, and his keen appreciation of an opponent's weak places, to admirable account in his celebrated rejoinder to the Scotch critics, and in his attack upon the Lake poets (*Vision of Judgment*). But his satiric masterpiece is of course *Don Juan*. Tom Moore's political squibs in verse are full of sparkle, waggery, and airy fancy. Political warfare indeed has always been very prolific of satirical effusions, especially in England; *The Rolliad* (1784–85) and *The Anti-Jacobin* (1797–98) series may be instanced. Theodore Hook wrote in *John Bull* satires, vigorous, scurrilous, but funny, upon the Whigs and lampoons upon Queen Caroline. James and Horace Smith in *The Rejected Addresses* raised parody to perhaps its highest level. A more or less distinctive vein of satire occurs in the writings of Douglas Jerrold, Leigh Hunt, and Landor. Thackeray has said some very fine things about quacks and fools, snobs and toadies, and has many exquisite touches of satire scattered through his novels. He is also distinguished as the author of some of the finest burlesques in English. Carlyle employed the resources of his powerful genius—thundering invective, grand rhetoric, indignant scorn, grim humour, satiric gloom—in denouncing the shams of human society and human nature; and admirable social satire, in prose or verse, in article, in novel or in poem, has been written by Sydney Smith, Hood, Dickens, Disraeli, Browning, George Meredith, Lytton, Tennyson, and Swinburne.

On the other side of the Atlantic satire has been cultivated by Washington Irving (*Knickerbocker*), Paulding, Lowell (*Biglow Papers*), Holmes, Artemus Ward, Charles Dudley Warner, and others. Some of the best American satire—not always the best known—is remarkable alike for its delicacy and its effectiveness, and takes rank not unworthily with that of other countries.

Many of the best French *Fabliaux* (12th and 13th centuries) are essentially social satires, and of these not a few are of high literary quality; Jean de Meung (13th century) was a true satirist; the first in France to write satires on the classic model was J. Vauquelin de la Fresnaye, in the 16th century. The Huguenot D'Aubigné made a bold, impetuous onslaught upon the Roman Catholic ecclesiastics; nor did he spare Henry of Navarre. His greater contemporary Regnier, a writer of pungent but polished verse, confined himself to general satire of poets, pedantic dryasdusts, hypocrites, and the types of which French satire has always been so fond. Rabelais, to lash the abuses of monkery, had long before written one of the greatest masterpieces of the world's literature. Pierre Pithou had a hand in the *Satire Ménippée*, which cast so much discredit upon the chiefs of the League. But the real exponent of classic satire in France was Boileau, who set the example to Dryden, Pope, and the English school. But few among the countless *mazarinades* attained the dignity of permanent literature. La Bruyère wrote, by the way, exquisite social satire, influenced by Theophrastus; Molière, besides his other gifts, stands among the greatest satirists of the world; the *Histoire Amoureuse des Gaules* of Bussy-Rabutin and the *Historiettes* of Tallemant des Réaux supply a form of malicious personal satire, hardly found out of French literature. There is ample store of fine satire alike in the fiery wrath of Saint-Simon's *Mémoires* and the sprightly malice of Madame de Sévigné's letters. Pascal's onslaught upon the Jesuits is a piece of work that for polished irony and literary grace, as well as for effect, still stands unrivalled. Théophile de Viaud, Motin, and Berthelot all wrote satirical books. Voltaire is the next great satirist of France; a downright scoffer, a master of mocking irony and stinging sarcasm, he penned personal lampoons with the same gusto with which he sneered at religion and the politics of the day. Contemporary with him were M. J. Chénier, and Piron. Béranger turned the *chanson* or song into a powerful weapon of political warfare; Courier too wrote political satires.

Ulrich von Hutten, though he wrote chiefly in Latin, is the first great German satirist. He made fiery and fierce attacks upon papal rule. His name recalls that of his greater contemporary Erasmus, who, besides satirising the superstition and ignorance of the ecclesiastics, found ample opportunity in numerous personal quarrels for the effective use of a biting sarcasm. Sebastian Brant's *Narrenschiff* ridicules certain typical classes of men. Murner and Fischart followed in the footsteps of Hutten. Gryphius and Moscherosch deal with characters of the Thirty Years' War. Rabener, Liscow, and Kastner wrote general satire. Wieland ridiculed popular credulity and litigiousness. The true successors of Hutten are Jean Paul and Lichtenberg. The former indulges in general social satire, and steeps all he says in a golden bath of the rarest humour; Lichtenberg is much more bitter and severe. Goethe and Schiller both wrote satire—e.g. in the *Xenien*, a collection of verses on their literary contemporaries. Goethe also had a hit at Wieland, and Schiller at tyrannical rulers. Tieck, Hauff, and Hamerling all deserve mention here; and especially so does Heine, first because of the mocking spirit he breathed upon nearly everything he touched, and second because of his *Atta Troll*, a burlesque sketch of his countrymen.

The satirists of the remaining countries of Europe must be very briefly enumerated. Spain has two men of the highest rank in Cervantes and Quevedo. Holland boasts of Marnix (St Aldegonde) and Anna Bijns, who took opposite sides in the Reformation quarrel; and it produced much fair satire through the literary guilds. Italy's principal satirists are Dante, Ariosto, Salvator Rosa, the writers of macaronic verse, Alfieri, and Carlo and Gasparo Gozzi. In Scandinavian literatures we have the nithing verses of the ancient Norsemen, and in more recent times admirable satire by Wessel, Holberg, Paludan-Müller, Ibsen, Kjelland, and Strindberg. The corruptions of the officers of government in Russia have been mercilessly exposed by Gogol and Schtchedrin (Soltykoff).

See the articles under the several writers' names in this work; the standard histories of literature mentioned under the respective countries; such articles as BURLESQUE, CARICATURE, FABLIAUX, and PARODY; and more especially Hannay, *Satire and Satirists* (1854); and 'English Political Satires,' in *Quar. Rev.* (1857).

Satisfaction. See ATONEMENT.

Satrap was the governor of a province in the ancient Persian monarchy. Their duties and position were clearly defined by Darius I. in the 6th century B.C., although there had been satraps before his day. They enjoyed the right to command the royal army in the province (though not the troops in the fortresses), to levy mercenaries, and to coin money. Alexander in the 4th century greatly curtailed their power. When the Persian monarchy began to decline some of the satraps founded independent kingdoms, the most famous being that of Pontus.

Satsuma. See JAPAN, Vol. VI. p. 284; POTTERY, Vol. VIII. p. 368.

Saturn, an ancient Italian divinity, who presided over agriculture. His name, from the same root as *satum* (*sero*, 'I sow'), indicates what was probably one of the earliest personifications in the Italian religion Saturn being the god who blessed the labours of the sower. His identification with the Greek Kronos by the later Græcising mythmongers was a peculiarly infelicitous blunder, the two having absolutely nothing in common except their antiquity. The Greek *Demeter* (Ceres) approaches far more closely to the Italian conception of the character of Saturn. The process of amalgamation in the case of Kronos and Saturn is visible enough. First, there is the Greek myth. Kronos, son of Uranos ('Heaven') and Gæa ('Earth'), is there the youngest of the Titans. He married Rhea, by whom he had several children, all of whom he devoured at birth except the last, Zeus (Jupiter), whom his mother saved by a stratagem. The motive of Kronos was his hope of frustrating a prophecy which declared that his children would one day deprive him of his sovereignty, as he himself had done in the case of his father Uranos; but fate is stronger even than the gods, and when Zeus had grown up he began a ten years' war against Kronos and the Titans, which ended in the complete discomfiture of the latter, who were hurled down to Tartarus, and there imprisoned. So ran the common myth. But other myths added that after his banishment from heaven Kronos fled to Italy, where he was received hospitably by Janus, who shared his sovereignty with him. At this point the Greek myth coalesced with the Italian. Saturn, the old homely deity of the Latin husbandmen, was transformed into a divine king, who ruled the happy aborigines of the Italian peninsula with paternal mildness and beneficence, taught them agriculture and the usages of a simple and innocent civilisation. Hence the whole land received from him the name of *Saturnia*, or 'land of plenty,' and his reign was that 'golden age' of which later poets sang as the ideal of earthly happiness. At the foot of the Capitoline, where the fugitive god had formed his first settlement, there stood in historical times a temple dedicated to his worship. Ancient artists represented him as an old man, with long, straight hair, the back of his head covered, his feet swathed in woollen ribbons, a pruning-knife or sickle-shaped harp in his hand. Other attributes are of later invention. For the planet Saturn, see PLANETS.

The SATURNALIA was most probably an ancient Italian rural festival of the old Italian husbandmen, commemorative of the ingathering of the harvest, and therefore of immemorial antiquity. Its characteristic cessation from toil and its self-abandoning mirth were expressive of the labouring man's delight that the work of the year was over, and not of an artificial enthusiasm for a 'golden age' that never had been. During the festival the distinctions of rank disappeared or were reversed. Slaves were permitted to wear the *pilcus*, usually the mark of freedom, and sat down to banquets in their master's clothes, while the latter waited on them at table. Crowds of people filled the streets, and roamed about the city in a peculiar dress, shouting '*Io Saturnalia!*' sacrifices were offered with uncovered head; friends sent presents to each other; all business was suspended; the law-courts were closed; schoolboys got a holiday; and no war could be begun. During the Republic the Saturnalia proper occupied only one day—the 19th of December (xiv. Kal. Jan.). The reformation of the calendar by Julius Cæsar caused the festival to fall on the 17th (xvi. Kal. Jan.), a change which produced much confusion, in consequence of which the Emperor Augustus ordained that the Saturnalia should embrace the whole three days 17th, 18th, and 19th of December. Subsequently the number was extended to five, and even seven; but even in the times before the Empire it would appear that the amusements often lasted for several days. But while the whole week was regarded in a general sense as devoted to the Saturnalia, three distinct festivals were really celebrated—the Saturnalia proper; the *Opalia*, in honour of *Ops*, the wife of Saturn, and the goddess of field-labour (from *opus*, 'a work'); and the *Sigillaria*, in which *sigilla*, or little earthenware figures, were exposed for sale, and purchased as children's toys. The modern Italian carnival would seem to be only the old pagan Saturnalia baptised into Christianity.

Saturnian Verse, the name given by the Romans to that species of verse in which their oldest national poetry was composed. In the usage of the later poets and grammarians the phrase has two different significations. It is applied in a general way to denote the rude and unfixed measures of the ancient Latin ballad and song, and perhaps derived its name from being originally employed by the Latin husbandmen in their harvest-songs in honour of the god Saturn (q.v.). It is also applied to the measure used by Nævius, and a common opinion, sanctioned by Bentley, is that it was a Greek metre introduced by him into Italy. But most scholars now maintain that the measure of Nævius is of Italian (Hermann even thinks of Etruscan) origin, and that it merely improved on the primitive Saturnian verse. According to Hermann, the basis of the verse is contained in the following *schema:*

⏑ –́ ⏑ – ⏑ –́ ⏑ | – ⏑ – ⏑ – ⏑,

which, as Macaulay points out, corresponds exactly to the nursery rhyme,

The queen was in her párlour | eating bréad and honey,

and is frequently found in the Spanish poem of the *Cid*, the *Nibelungenlied*, and almost all specimens of early poetry; but in the treatment of it a wide and arbitrary freedom was taken by the old Roman poets, as is proved by the extant fragments of Nævius, Livius Andronicus, Ennius, and the old inscriptionary tables in the Capitol.

Satyriasis is a phase of insanity in man of which the characteristic is ungovernable sensuality. The term has also sometimes been applied to Leprosy (q.v.), on account of the disfigurement of the face to which it leads. See SATYRS.

Satyrs, in Greek Mythology, were a race of woodland deities, half human, half animal in their attributes. They are generally described as roaming the hills in the train of Dionysus (Bacchus). In appearance they were at once grotesque and repulsive, like all old woodland demons. They are described as robust in frame, with broad snub noses, large pointed ears like those of animals (whence they are sometimes called *theres*, 'wild beasts'), bristly and shaggy hair, rough skin, little horny knobs on their foreheads, and small tails. The satyrs are of course sensual in their inclinations, and ravishers of the woodland nymphs, fond of music, dancing, wine, and of the deep slumbers that follow a debauch. To men they were mostly inimical. The Roman poets identified them with the *Fauni* of their own mythology, and gave them larger horns and those goats' feet with which they are so often represented (see FAUNS). Ancient sculpture was fond of the Satyr as a subject; the older satyrs were called Sileni, and were represented as already described; the younger had a handsomer and more pleasing exterior—e.g. Praxiteles' famous Satyr at Athens.

Sauces. See DIET, Vol. III. p. 809.

Sauchieburn. See JAMES III.

Sauerkraut, a preparation of the common white cabbage, in extensive use in Germany and the north of Europe. The cabbages are gathered when they have formed firm white hearts, are sliced or cut fine, and then placed in a succession of thin layers in a cask, each layer being sprinkled with fine salt, to which some add juniper-berries, cumin-seed, caraway-seeds, or other condiment. A board is placed on the top, with a heavy weight, so as to press the whole down firmly, but gently; and ere long fermentation takes place. Sauerkraut is generally eaten boiled, in the same way as fresh cabbage, but is sometimes sweetened. Sauerkraut is also made of red cabbage.

Saugor. See SAGAR.

Saul, the first king of Israel, was the son of Kish, a wealthy chief of the tribe of Benjamin. The circumstances that marked his election to the royal dignity are familiar to all readers of Scripture. Gigantic in stature, noble in mien, and imperious in character, he was admirably fitted to accomplish the task of consolidating the tribes of Israel. His earlier achievements augured hopefully for his future. The deliverance of the men of Jabesh Gilead, above all his victories over the Philistines, Ammonites, and Amalekites, were unmistakable proofs of his military capacity; but gradually there showed itself in the nature of the man a wild perversity—'an evil spirit of God' it is called—which found vent, along with other forms, in a mad jealousy of David, his son-in-law and the chief of his bodyguard, and culminated in paroxysms of insane rage, which led him to attempt David's life with his own hand, and to commit such frightful deeds as the massacre of the priests of Nob. Saul had, however, apparently the strong opposition of the priestly class to contend against, for at length Samuel retired from court, and secretly anointed David as king; see the article SAMUEL. Saul fell in a disastrous and bloody battle with the Philistines on Mount Gilboa. The Afghans claim to be descended from Saul.

Saulcy, FÉLICIEN CAIGNART DE, numismatist, was born at Lille, 19th March 1807, became an artillery officer, and after lecturing for a few terms on mechanics, was made keeper of the artillery museum in Paris in 1842. A member of the Academy and a senator, he travelled in Iceland and Greenland, and subsequently in Syria and Palestine. Besides innumerable works on numismatics (Roman, Greek, Carthaginian, French, &c.) he wrote a description of the Dead Sea in which there were many discoveries noted (1852–54), a *Voyage en Terre Sainte* (1865), the illustrated Jerusalem (1881), and books on Julius Cæsar in Gaul and on Jewish history. He died at Paris, 4th November 1880.

Sault Ste Marie (pron. *Soo*), a port of Ontario, on the St Mary River, near the outlet of Lake Superior, 622 miles by rail W. of Montreal. A canal avoids the obstruction caused by the rapids (*sault*), and nearly three times as many boats pass as through the Suez Canal (tonnage in 1889, 7,221,935). An immense iron bridge connects with railway lines to Duluth and St Paul. Here are Indian schools for boys and girls. Pop. 1000.

Saumarez, JAMES, BARON DE, English naval commander, was born at St Peter-Port, in Guernsey, on 11th March 1757. He entered the navy as midshipman at the age of thirteen, and served in the American war (1774–82), for his gallantry at the attack of Charleston (1775) being promoted to lieutenant. He did good service in the action against a Dutch convoy fleet off the Dogger Bank (August 1781), and was made commander, being soon afterwards placed under the orders of Admiral Kempenfeldt on the Jamaica station. In the great fight between Rodney and De Grasse (12th April 1782) Saumarez commanded the *Russell*, a line-of-battle ship, and gained much distinction by his coolness and intrepidity. For his gallant capture on 20th October 1793 of the French frigate *La Réunion*, with one inferior in size and equipment, he received the honour of knighthood; and in command of the *Orion* he served under Lord Bridport at the battle of L'Orient, June 23, 1795. He also took a prominent part in the battle off Cape St Vincent (February 14, 1797), and was second in command at the battle of the Nile, in which he was severely wounded. In 1801 he was created a baronet and vice-admiral, and in the same year fought his greatest action, off Cadiz (July 12), defeating a French-Spanish fleet of fourteen ships with a squadron of only six, causing to the enemy a loss of 3000 men and three ships. This contest, than which, according to Nelson, 'a greater was never fought,' gained for Saumarez the Order of the Bath, the freedom of the city of London, and the thanks of parliament. In the war that broke out between Sweden and Russia in 1809 he commanded the English Baltic fleet that was sent to the assistance of the Swedes. In 1814 he was promoted to the rank of admiral, to that of vice-admiral of Great Britain in 1821, was created a peer in 1831, and died in Guernsey, 9th October 1836. See Sir John Ross, *Memoirs of Admiral Lord de Saumarez* (2 vols. 1838).

Saumur, a town of France, dept. Maine-et-Loire, on the left bank of the Loire and on an island in it, 38 miles by rail W. by S. of Tours. The most prominent buildings are an old castle (now arsenal and powder magazine), the 16th-century town-house, some interesting churches, and private houses of good French architecture. There are a town museum and a cavalry school with some 400 pupils. Rosaries and articles in enamel are manufactured. Pop. 13,772. Saumur was a stronghold of the Protestants during the reign of Henry IV., at which time it contained 25,000 inhabitants. Its prosperity was annihilated by the revocation of the Edict of Nantes, and its population reduced to a fourth. From 1598 till 1685 it was the seat of a famous school of Protestant theology, the most conspicuous professors being John Cameron of Glasgow (1577–1625) and his pupils Amyraut (or Amyraldus, 1596–1664) and Cappel (1585–1658). The school was noted for its freedom in biblical criticism and its less rigid doctrine of the divine decrees; it was even denounced by the opposing school of Sedan as heretical for teaching a hypothetical universalism—the view that God had not by arbitrary decree excluded any from being saved by the death of Christ. Saumur was brilliantly captured by Larochejaquelein and the Vendeans in the summer of 1793. The largest dolmen in France is 1½ mile south of the town; and prehistoric caves line the river close by.

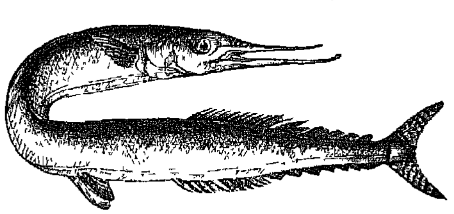
Saunders, NICHOLAS, polemical writer, was born in 1527 of a good old Surrey family at Charlwood Place near Reigate, and from Winchester passed to New College, Oxford, being admitted scholar in 1546, and fellow in 1548. Regius professor of Common Law (1558), in 1561 he resigned his fellowship and quitted England, at Rome was created D.D. and ordained priest, and thereafter accompanied Cardinal Hosius to the Council of Trent, 'where he showed himself to be a man of great parts by his several disputations and arguments.' He had lived at Louvain for some thirteen years as professor of Theology, and had paid two visits to Spain (1573–77), when in 1579 he landed in Ireland; and here in 1580, 1582, or 1583 (all three dates are given) he 'died,' says Lord Burghley, '*wandering in the mountaines, and raving in a phrensy*.' Saunders, who is to Protestants what Foxe is to Catholics, was the author of fourteen works (1565–1610), of which the best known are *De Visibili Monarchia Ecclesiæ* (1571) and *De Origine ac Progressu Schismatis Anglicani*, edited and completed by Edward Rishton (Cologne, 1585). See the translation of the latter by D. Lewis (1877).

Saunderson, NICHOLAS, the blind mathematician, was born at Thurlstone in Yorkshire in January 1682. He lost his eyesight from smallpox at the age of twelve months, but received a good education in both classics and mathematics. In 1707 he proceeded to Cambridge, and there delivered a series of lectures on the Newtonian philosophy, including Newton's theory of optics. Four years afterwards he was appointed to succeed Whiston as Lucasian professor of Mathematics. He was on friendly terms with Newton, Demoivre, Halley, and other eminent mathematicians amongst his contemporaries. He died 19th April 1739. A Life is prefixed to his *Elements of Algebra* (2 vols. 1740); another treatise by him on *Fluxions*, including a discussion of the principal propositions in Newton's *Principia*, appeared in 1756. It is said that, in spite of his blindness, he understood the rules of perspective, the projections of the sphere, and some of the more recondite propositions of solid geometry.

Sauria, in the system of Cuvier an order of reptiles, including what are now distinguished as separate orders—the lizards (Lacertilia) and the crocodilians (Crocodilia). Saurian is often used as a very general title for extinct reptiles, and Huxley applied the term Sauroid to birds and reptiles which he included under the technical title Sauropsida. See REPTILES.

Saurin, JACQUES, a celebrated French Protestant preacher, was born at Nîmes, 6th January 1677, studied at Geneva, and was chosen minister of a Walloon church in London in 1701. But the climate of England did not agree with his delicate health; and in 1705 he settled at the Hague, where his extraordinary gift of pulpit oratory was prodigiously admired. But at length his clerical brethren enviously assailed him with the accusation of heresy. The dispute was carried to the synod of the Hague, and Saurin was subjected to a series of petty persecutions that shortened his days. He died at the Hague on December 30, 1730. As a preacher he has often been compared with Bossuet, whom he rivals in force, if not in grace and subtlety. His chief productions are *Sermons* (12 vols. the Hague, 1749; abridged Eng. trans. 6 vols. 1775–76); *Discours sur les Événements les plus Mémorables du V. et du N. T.* (Amst. 1720–28), often called Saurin's Bible; and *Etat du Christianisme en France* (the Hague, 1725).

Saury Pike (*Scomberesox saurus*), a species of fish of the family Scomberesocidæ, having the body greatly elongated, and covered with minute scales; the head also much elongated, and the jaws produced into a long sharp beak, as in the Garfish (q.v.); from which, however, the present species differs in the division of the dorsal and anal fins into finlets, as in mackerels. The Scomberesocidæ are usually placed among the Physostomi, although the air-bladder has no opening. They resemble the Physostomi in the abdominal position of the pelvic fins. The saury pike is about 15 inches long, the back dark blue, the under parts white; the fins dusky-brown. It approaches the coast in summer and autumn and enters firths in shoals, which are pursued by larger fishes, porpoises, &c.; and in order to escape from these it often leaps out of the water, or rushes along the surface, for a distance of one hundred feet, scarcely dipping or seeming to touch the water. Hence the name Skipper, which it very commonly receives on the British coasts. Vast shoals sometimes enter bays, so that they may be taken by pailfuls, and great numbers are sometimes found among the sludge at the ebbing of the tide in the upper parts of the Firth of Forth and elsewhere. It is not uncommon on the east and west coasts of England, but most abundant on the south coast, where it is often taken in pilchard nets. The eggs are furnished with long filaments, like those of other species of the family, by which they are entangled in clusters and attached to solid objects. As food the saury pike is said to be palatable, but it is not commonly sent to the market.



Saury Pike (*Scomberesox saurus*).

Sausage-poison. It is well known that sausages made or kept under certain unknown conditions are occasionally highly poisonous; and in Germany, where sausages form a staple article of diet, fatal cases of sausage-poisoning are by no means rare. The symptoms are slow in appearing, three or four days sometimes elapsing before they manifest themselves. They resemble those of poisoning by Atropia or Belladonna (q.v.), and are believed to be due to the presence of animal alkaloids or Ptomaines (q.v.) developed by putrefaction. Cases observed in Britain differ from those commonly occurring in Germany in this respect, that in England the sausages are usually comparatively fresh, while the sausages which have proved poisonous in Germany had always been made a long time.

Saussure, HORACE BÉNEDICT DE, a Swiss physicist and geologist, was born at Conches, near Geneva, 17th February 1740. He early showed an interest in the study of nature, his inclination being quickened by his uncle Bonnet, the naturalist, and his friend Haller, the physicist. In 1762 he obtained the chair of Physics and Philosophy in the university of Geneva. In 1768 he commenced a series of journeys which were fraught with important consequences to science; he visited the Jura and Vosges Mountains, Germany, England, Italy, Switzerland, Sicily and the adjacent isles, the extinct craters of Auvergne, and traversed the Alps in nearly all directions. He was the first 'traveller' (a party of guides were actually the first) who ever ascended to the summit of Mont Blanc, in 1787. During this course of travel he made numerous observations on the minerals, physical features, botany, and meteorology of the districts he visited; and these were put together in the work *Voyages dans les Alpes*, &c. (4 vols. Geneva, 1779-96). His observations were made with considerable labour; he had in many cases to perfect or even invent the instruments he used. In 1786 he resigned his chair, and, after a long period of suffering, died at Geneva, 22d January 1799. He always took a deep and active interest in the public affairs of his native canton. Besides the great work above mentioned, and some minor productions, he wrote *Sur l'Hygrométrie* (1783), which, according to Cuvier, is one of the most important contributions to science in the 18th century. His Life was written by Senebier (1801), by Cuvier in *Biographie Universelle*, and by De Candolle in *Phil. Magazine*, i. 4. See also Douglas Freshfield, *De Saussure and the Alps*, in 'Great Explorers' (1892).—His son NICOLAS THÉODORE (1767-1845) lived a very retired life, but wrote a valuable work on the physiology of plants, entitled *Recherches Chimiques sur la Végétation* (Paris, 1804).

Saussurite (named after Saussure), a dull, opaque, white, gray, or greenish compact mineral, of indeterminate or variable composition, which has resulted from the alteration of felspar, as in the rock called Gabbro (q.v.). Examined microscopically saussurite is seen to consist of a compound aggregate of minute fibres and grains of zoisite and other minerals.

Sauvage, FRÉDÉRIC, a shipbuilder of Boulogne, whom the French regard as the inventor of the screw-propeller, in virtue of his having in 1832 improved the pattern in use.

Savage, RICHARD, a minor English poet, who loudly claimed to be the illegitimate child of Lord Rivers and the Countess of Macclesfield—a story for which he himself was the only original authority. His alleged mother married in 1683, but lived unhappily with her husband, and separated from him in March 1685. She bore two children to Richard Savage, fourth and last Lord Rivers, during the period of separation; the one, christened Ann Savage, was born in 1695, and died in infancy; the other, whom Richard Savage afterward claimed to be, was born January 16, 1697, was baptised and registered as Richard Smith, and most probably died also at nurse. The Earl of Macclesfield raised proceedings against his wife in the Arches Court in 1697, and obtained a divorce in the House of Lords in 1698, but some extenuation seems to have been found in the husband's conduct, for the whole of the wife's fortune was restored to her. Two years later she married Colonel Henry Brett, who died in 1724, apparently before the startling story was made fully public. Meantime the disreputable claimant, having no profession, had become by necessity an author, and had assumed the name of Savage at least as early as 1717 in the title to a pamphlet on the Bangorian controversy. In the title-page and dedication to *Love in a Veil* (1718) he first claims the parentage openly, but in Curll's *Poetical Register, or Lives of the Poets*, edited by Giles Jacob (1719), the story is for the first time fully given, no doubt by his own pen. Aaron Hill befriended him, and in June 1724 published in *The Plain Dealer* a brief outline of his story. Further letters and allusions followed, together with significant hints of pecuniary distress, which brought subscribers for his *Miscellanies* (1726). A Life appeared in 1727, from the pen of Beckingham and another, and undoubtedly helped to get him off the sentence of death for murder in a tavern brawl. His insulting attacks upon Mrs Brett now became louder and more bitter—in a 'Preface' (1728) to the Life of the year before; in his poem, *The Bastard* (1728). Mrs Brett herself took not the slightest notice of the claim; but her nephew, Lord Tyrconnell, seems to have laboured privately to procure Savage's pardon, and after the publication of *The Bastard* to have silenced him with a bribe. *The Wanderer* was dedicated to him in 1729, but his bounty soon ceased, and Savage was again thrown upon the world. His disreputable habits brought with them misery and hunger, and the pension of £50 which the queen allowed him in return for a birthday ode was usually dissipated in a week's debauchery. On the queen's death Pope set agoing a subscription to find him the means of living quietly at Swansea, but after about a year of impatient exile he went over to Bristol, where he wearied out the benevolence of the most long-suffering sympathising friends, was flung into gaol for debt, and there languished till he died, July 31, 1743.

Neither to his poetry nor yet to his remarkable story does Savage owe his enduring reputation, but solely to the noble and touching Apology in which Samuel Johnson immortalised his ill-fated friend (1744). He knew Savage in his own years of hunger in London, had walked round St James's Square with him all night for want of a lodging, warmed only by the resolution to stand by their country, and out of the profound pity of his heart for a dead friend's sufferings wrote what is perhaps the most perfect shorter Life in English literature. He had heard Savage's story from his own lips, and the natural strength and shrewdness of his own intelligence was betrayed by the partiality of friendship. Yet Savage had not been communicative of the facts of his early life, and he never furnished the world with the proofs he boasted in 1724 that he possessed. All Johnson's authorities were traceable to Savage himself, and the story remains imperishably enshrined in literature, although marked, as Mr Moy Thomas has proved, by 'inherent improbabilities, cautious vagueness, inconsistencies, and proved falsehoods.' But even so stout a friend as Johnson should have paused for proof of such startling and unnatural charges as that Mrs Brett kept the child out of a death-bed legacy (1712) of six thousand pounds by giving Lord Rivers a false assurance of his death, and still further that she tried to kidnap him to the American plantations, and even laboured to prevent his obtaining a pardon when lying under sentence of death.

See the five papers by W. Moy Thomas in *Notes and Queries*, November 6 to December 4, 1858.

Savage Island, or NIUE, a coral islet to the east of the Friendly Islands. The 5000 inhabitants belong to the same Polynesian stock, and were formerly notorious for their ferocity, but are now Christianised.

Savaii. See SAMOA.

Savanilla, a port of Colombia, on a bay of the same name on the Caribbean Sea, 17 miles WNW. of Barranquilla by the railway to Puerto Colombia. The roadstead is roomy but shallow, and its trade is passing away to Puerto Colombia.

Savannah (Span. *sabana*, 'a sheet;' at first used of a plain covered with ice or snow), a name given by the early Spanish settlers to the great treeless plains of the North American continent. It is practically the equivalent of 'prairie' and 'steppe;' but is a term in use mainly in the southern Atlantic States of the American Union, especially Florida.

Savannah, a river which, with its right branch, forms the boundary between Georgia and South Carolina, rises near the southern border of North

Carolina, and flows south-south-east to the Atlantic. Its length is 450 miles, and it is navigable from November to June for large vessels to Savannah, for steamboats of 150 tons to Augusta.

Savannah, a city and port of Georgia, capital of Chatham county, stretches several miles along the south bank of the Savannah River, 18 miles from its mouth, and 115 miles by rail SW. of Charleston. It is built on a sandy plain, 40 feet above the river, with broad streets shaded by beautiful trees. The dozens of commodious parks are a delightful feature of the place; and almost in the centre of the city is Forsyth Place (30 acres), thickly planted with forest pines. Here is a monument to the Confederate dead; and others in the city commemorate General Nathaniel Greene and Count Pulaski, who fell here. Savannah has tramways, gas, and electric light, and many handsome private houses. The chief edifices are the custom-house, city exchange, cotton exchange, court-house, Hodgson Hall, the Telfair Academy of Arts and Sciences, a Roman Catholic cathedral, the Independent Presbyterian Church, Christ Church, on the site of the chapel where John Wesley first ministered to the colonists, and the hospitals and asylums. The coloured people have churches and good schools for themselves. Savannah has long been the first naval stores station and the second port of the United States in respect of the quantity of cotton exported; this was valued in 1890 at £5,464,428. Other articles of export are spirits of turpentine (£439,154), resin (£212,847), lumber, and cotton-seed; total in 1890, £6,189,447. In the same year the imports reached only £81,163 (in 1889, £97,685), including principally fertilisers, brimstone, fruit, cotton ties, and salt. More than half of the foreign trade is with Germany and Britain. The entire business of the port in 1890 was estimated at £26,800,000. River and harbour improvements have provided a channel of 22 feet, and this is to be deepened to 28 feet. The industrial works of Savannah comprise rice-mills, foundries, planing-mills, flour, cotton, and paper mills, cotton-presses, packing-houses, ice and furniture factories, &c. The city was founded in 1733, and incorporated in 1789. It was taken by the British in 1778, and by General Sherman in December 1864. Pop. (1880) 30,709; (1890) 43,189. See *Harper's Magazine*, January 1888.

Savary, Anne Jean Marie René, Duc de Rovigo, a French general and diplomatist, was born at Marcq, in Ardennes, 26th April 1774, entered the army as a volunteer in 1790, and served with distinction under Custine, Pichegru, and Moreau on the Rhine, under Desaix in Egypt, and in the battle of Marengo (1800). Napoleon, whose notice he had attracted, made him commander of his bodyguard, and employed him in diplomatic affairs, for which he showed an admirable capacity. In 1804, as commandant of the troops stationed at Vincennes, he presided at the execution of the Duc d'Enghien, an event which he is believed to have unduly hastened; and in the wars of 1806-8 he acquired high military reputation at Jena, in the capture of Hameln, and by his victory at Ostrolenka (February 16, 1807), a brilliant achievement. Created Duke of Rovigo in the beginning of the following year, he was sent to Spain by the emperor, and negotiated the perfidious arrangement by which the Spanish king and his son were kidnapped. In 1810 he superseded Fouché as minister of Police. After the fall of Napoleon, to whom he had always been passionately devoted, and whom he served with a fidelity that stopped not at unscrupulous acts, he wished to accompany him to St Helena; but he was confined by the British government at Malta for some months, and at last made his escape to Smyrna. After experiencing several vicissitudes he returned to Paris in 1819, and was reinstated in his titles and honours. In 1831 he was appointed commander-in-chief of the army in Algeria; but ill-health forced him to withdraw to France in March 1833, and on the 2d of June following he died at Paris. Savary's *Mémoires* (Paris, 8 vols. 1828) are among the most curious and instructive documents relating to the first empire.

Save, a river in the south of Austria, and an important affluent of the Danube, rises in the north-west of Carniola, and flows south-east, passing Laibach, and forming in part the boundary between Carniola and Styria; then it traverses Croatia, and going eastwards separates Bosnia and Servia on the south from Slavonia on the north, and after a course of 556 miles effects its junction with the Danube at Belgrade. It is navigable up to Sissek in Croatia, 366 miles from Belgrade.

Savernake, a beautiful woodland region in Wiltshire, to the south of the town of Marlborough. Its 40,000 acres of farm and forest and hill, yielding only £12,000 net per annum, were sold in 1891 to Lord Iveagh for £750,000 by the Marquis of Ailesbury, whose ancestor acquired it by marriage in 1676.

Savigliano, a town of North Italy, by rail 32 miles S. of Turin. It is surrounded by old fortifications, and has a triumphal arch to Victor Amadeus I. of Savoy. Pop. 9932.

Savigny, Friedrich Karl von, writer on jurisprudence, was born, of an old Alsatian family, on 21st February 1779 at Frankfort-on-the-Main, and studied law at Marburg and other German universities. In 1800 he began to teach as a *privat-docent* at Marburg; three years later he was made professor of Jurisprudence there and published a treatise on the Roman law of property, *Das Recht des Besitzes* (Eng. trans. 1849), that quickly won him European fame. In 1808 he was called to the chair of Jurisprudence at Landshut, but in 1810 removed to the corresponding chair at Berlin. This he held, along with several state offices, such as member of the commission for revising the code of Prussia, member of the Supreme Court of the Rhine Provinces, &c., until 1842. In that year he devoted his energies entirely to the task of reforming the laws. He resigned office in 1848, and died in Berlin on 25th October 1861. His greatest books were *Geschichte des römischen Rechts im Mittelalter* (6 vols. 1815-31) and *System des heutigen römischen Rechts* (8 vols. 1840-49), and the continuation of this last, entitled *Das Obligationenrecht* (2 vols. 1851-53). Savigny in those works applied the principles of the historical school to the study of the historical aspects of Roman law with brilliant success. From 1815 onwards he edited in conjunction with Eichhorn and others the *Zeitschrift für geschichtliche Rechtswissenschaft*. His writings appeared as *Vermischte Schriften* (5 vols. 1850). There are biographies by Arndt (1861), Rudorff (1862), Bethmann-Hollweg (1867), Enneccerus (1879), and others.

Savile. See Halifax (Marquis of).

Savile, Sir Henry, a learned scholar, was born in Yorkshire, 30th November 1549, entered Brasenose College, Oxford, but migrated in 1561 to Merton College, where he was elected to a fellowship. He travelled on the Continent (1578), after his return was Queen Elizabeth's tutor in Greek and mathematics, became Warden of Merton College in 1585, Provost of Eton in 1596, was knighted in 1604, and died February 19, 1622. Three years before he had founded chairs of Geometry and Astronomy at Oxford which still bear his name.

His principal works are *Rerum Anglicarum Scriptores post Bedam præcipui* (1596), a folio containing the works of William of Malmesbury, Henry of Huntingdon, Roger Hoveden, and Ingulph; *Commentaries concerning Roman Warfare* (1598); *Fower Bookes of the Histories* and the *Agricola* of Tacitus (1581); and a magnificent edition of St Chrysostom's works (8 vols. folio, 1610-13), a work which cost £8000, one-fourth for paper alone.

Savine, or SAVIN (*Juniperus Sabina*), a low, much-branched, and widely-spreading shrub, with very small, imbricated, evergreen leaves, which grows in Europe, Siberia, Canada, and the northern United States. It bears small black berries, covered with a pale blue bloom. Its foliage has a strong, aromatic, penetrating odour. The fresh and dried tops, and a volatile oil distilled from the former, are used in medicine. Their odour is strong and terebinthinate, and their taste acrid, bitter, resinous, and disagreeable. The therapeutic properties of savine are due to the volatile oil, of which it contains about 2 per cent., consisting chiefly of a body having the chemical composition $C_{10}H_{16}$ and isomeric with oil of turpentine (see JUNIPER).

Savine exerts a stimulating effect on the pelvic organs, and is employed in cases of amenorrhœa and chlorosis. It is best given in the form of the oil, 1 or 2 minims of which may be prescribed in a pill, to be taken twice a day. This drug is sometimes employed for the purpose of procuring abortion; but if given in a sufficiently large dose to produce the desired effect, the life of the mother is placed in the greatest possible peril. Savine in the form of ointment is used as an external application, with the view of keeping up the discharge from a blistered surface. The ointment cannot, however, be kept long without losing its properties.

Savings-banks.—*General History.*—Savings-banks, for the receipt of small deposits by poor persons, and their accumulation at compound interest, are either (1) voluntary associations, the property and management of which are vested in their trustees and officers, and which are termed *trustee* savings-banks, or (2) institutions established and managed by the state, such as the post-office savings-banks.

The formation of trustee savings-banks was first suggested by Defoe in 1697. Though, however, the project was revived by Francis Maseres, Cursitor Baron of the Exchequer, in 1771, and by Jeremy Bentham in 1797, it was not practically carried out in England till the year 1799. The first savings-bank established in Europe is said to have been that of Brumath in France, established in 1765, which was followed by one at Loire (dept. Rhone) in 1790. In Germany savings-banks were first established at Hamburg in 1778 and Oldenburg in 1786; in Switzerland at Berne in 1787, Basel 1792, Geneva 1794, and Zurich 1805; and in Denmark at Kiel in Holstein in 1796. The first English bank was established in 1799 by the Rev. J. Smith, rector of Wendover, Bucks, who, in order to encourage frugality in his parish, offered with two other inhabitants to receive any weekly sums not less than 2d., and if the amount were not touched before Christmas to add 1s. 3d. to it as bonus or encouragement. In Scotland the Rev. John Mackay established a friendly bank for savings of the poor at West Calder in 1807, and in 1810 the Rev. Henry Duncan founded a similar institution at Ruthwell in Dumfries, which has served as a model for all subsequent ones. In Ireland a savings-bank was established at Stillorgan, County Dublin, in 1815; and one of the earliest founded in Wales appears to have been that at Brecon, established in 1816. In the same year the first savings-banks in the United States—the Philadelphia Savings Fund Society, suggested by Condy Ragnet, and the Boston Savings-bank—were established, and in 1819 were followed by one at New York.

The establishment of savings-banks under government supervision was proposed as early as 1806 by Mr Whitbread; but the credit of first suggesting their formation in connection with the post-office is due to George Hans Hamilton, the Ven. Archdeacon of Northumberland. In 1852 he propounded a scheme to this effect to the Financial Secretary to the Treasury, Mr Alexander Hamilton, which at the request of the latter he again published in 1858, and which was in many respects identical with that now in force. In 1859 a paper, containing many valuable suggestions subsequently adopted by Mr Scudamore, then Postmaster-general, was read by Mr Sikes of the Huddersfield Banking Company, before a Social Science Congress at Bradford; and in 1860 Mr Chetwynd of the post-office drew up the plan of the present system, which was established by the Post-office Savings-bank Act, 1861 (see below).

The system is now established in India and in nearly all the colonies, as well as in all the principal European states, excepting Germany. Its remarkable growth throughout the world will be seen from the following compendium of a table compiled by the Controller of Post-office Savings-banks, published in the report of the Postmaster-general for 1889. It may be added that it has also been adopted by the following countries not noticed in the table: Russia (including Finland), Servia, Norway, Japan, and Hawaii; but has not yet been introduced into the United States.

POST-OFFICE SAVINGS-BANKS IN 1887.

Trustee Savings-banks.—The first two savings-banks acts were passed in 1817, and authorised the formation of banks in Ireland and England for the benefit of depositors, deducting thence only sufficient to provide for the expenses of management, but 'deriving no benefit from such deposits or the produce thereof.' In 1818 the rules, like those of friendly societies, were made subject to confirmation by justices at quarter sessions, and in the following year the system was introduced into Scotland. In 1828 it was, however, enacted that the rules should be submitted to a barrister appointed by the National Debt Commissioners, who was to certify that they were in conformity with law; and in 1844 it was provided that one of the two copies of rules thus certified was to be returned to the institution, and the other transmitted to the commissioners, while the barrister was also empowered to settle all disputes between the trustees and the depositors. In 1863 the law was consolidated by an act which repealed all previous acts, and enacted that the rules of all banks should contain regulations providing for (1) the attendance of at least two trustees, managers, or specially appointed paid officers on all occasions of public business; (2) the comparison of the pass-books of the depositors with the ledger on every repayment, and also on their first production at the bank after each 20th November; (3) the audit half-yearly of the books of the bank by a public accountant, or one or more auditors appointed by the trustees and managers, but 'not out of their own body;' (4) a book containing an extracted list of the depositors' balances made up every year to the 20th November, to be kept open at any time during the hours of public business for the inspection of the depositors; (5) meetings of the trustees and managers half-yearly at least, and the keeping of minutes of their proceedings in a separate book. The trustees and managers were required to transmit weekly returns, showing the amount of the week's transactions, to the National Debt Commissioners. Lastly, the interest payable to depositors —which, together with that payable to the banks, was, until 1828, 3d. per diem, or nearly 5 per cent. —was reduced to £3, 0s. 10d. per annum, that payable to the banks having been previously reduced to £3, 5s. per annum by the Act of 1844.

Post-office Savings-banks were established in 1861 by an act designed to grant additional facilities for depositing small savings at interest, with 'the direct security of the state' for the repayment of the deposits. It empowers the Postmaster-general, with the consent of the Treasury, to authorise 'such of his officers as he shall think fit to receive deposits for remittance to the principal office and to repay the same,' under such regulations as, with the consent of the Treasury, he may prescribe, paying the moneys so received to the National Debt Commissioners. It provides for the transfer of deposits to and from ordinary savings-banks, and fixes the rate of interest on deposits at £2, 10s. per annum. The Act of 1861 was amended in 1863 by one which provided for the transfer of the accounts of minors, and also for the closing, under certain conditions, of trustee banks, and the transfer of their funds to the post-office banks.

Since 1863 six acts relating to savings-banks have been passed, three of which apply to both classes of banks and three to trustee banks only. In 1876 the Savings-bank Barrister Act transferred the powers of settling disputes and certifying rules vested in the barrister appointed by the National Debt Commissioners to the Friendly Societies Central Office. The Savings-bank Act of 1880 reduced the interest payable to the trustees of savings-banks to 3 per cent., and that payable to depositors to £2, 15s.—or to within 5s. of that payable to depositors in post-office banks—viz. £2, 10s. per cent. Its most noteworthy provisions, however, were those authorising the investment of deposits in post-office and trustee banks in government stock, to the amount of £100 in any one year, and to a total amount of £300. Regulations issued under this act in 1881 were amended by those of 1888, which fixed the minimum amount of stock purchasable at *one* shilling. The act thus doubled the original limits of investment, which now amount to £130 in one year instead of £30, provided the £100 be for investment in stock, and to a total of £300 plus £200 deposit. The Savings-bank Act of 1887, while extending the powers of the Postmaster-general to make regulations, conferred a similar power on the Treasury as respects trustee savings-banks, and three important sets of regulations have been issued under it. In the same year the failure of the Cardiff Savings-bank, through a deficiency of £37,000 in the funds due to the frauds of the actuary, led to the passing of the Trustee Savings-bank Act, 1887. Similar failures, chiefly caused by the negligence of trustees in controlling the work of the paid officers of banks, have been of frequent occurrence, one of the earliest being that of the Mildenhall Bank (Suffolk) in 1825. Between 1842 and 1857 there were twenty-three in England and four in Ireland, the loss to the depositors in some cases being very heavy, while in others it was made good by the trustees, and since 1857 there have been fourteen cases of defalcations by paid officials, eleven of which resulted in the closing of the bank. Prior to 1828 the trustees and managers appear to have been personally liable for any deficiency unless they protected themselves by their rules. The Act of 1863 has now provided that no trustee or manager of any bank in the United Kingdom shall be personally liable except (1) for moneys actually received by him on account of or for the use of the bank, and not disposed of as directed by the rules; (2) for neglect or omission in complying with the regulations prescribed by the act as to the maintenance of checks, the audit and examination of accounts, the holding of meetings and keeping minutes of proceedings; (3) for neglect or omission in taking security from officers as required by the act. The 50 and 51 Vict. chap. 47 empowers the Treasury, if satisfied, on the representation either of the depositors or of the National Debt Commissioners, to appoint a commissioner to hold a local inquiry with regard to any trustee bank and to report thereon; while it also provides for the winding-up of trustee banks as 'unregistered associations' under the Companies Acts. The Savings-bank Act, 1891, takes a further step in the same direction by providing for the appointment of an Inspection Committee of Trustee Savings-banks, charged with the duty of ascertaining, by means of inspectors, whether the banks are duly complying with the law, and are keeping their expenditure within due limits. If the committee, on the report of any inspector, are of opinion that a bank has made default in either of these respects, they are to report the matter to the National Debt Commissioners, who may, in their discretion, either close the account of the trustees, or report to the Treasury, with a view of an inspection being made of its affairs under the Act of 1887.

Progress of the System.—The first trustee savings-bank in the United Kingdom was established in 1799. By the end of 1817, when legislation on the subject first began, upwards of 135 were in existence, of which 122 were in England, 4 in Wales, 5 in Ireland, and 4 in Scotland. The establishment of the post-office system in 1861 almost immediately caused a decrease in the business of the older institutions, and by the end of 1869, 145 of the 638 trustee banks open in 1860 had been closed, and capital amounting to £1,816,335 transferred to the post-office banks, the number of which has risen from 2535 in 1862 to 9681 in 1890. The average of the deposits in each seems to show that the latter class of banks benefit a lower social stratum than the former.

In 1829, after the passing of the Act of 1828, the number of savings-bank accounts in the United Kingdom was 409,714, amounting to £14,314,192. In 1845, after the passing of the Act of 1844, it rose to 1,062,930, amounting to £36,748,868; and at the introduction of the post-office system was 1,585,778, amounting to £41,259,145. At the close of 1890 the total number of depositors in the trustee and post-office savings-banks combined was 6,363,096, and the total amount due to them amounted to £111,248,862.

The following table shows the progress of the system:

	1840.		1860.

The percentage of depositors to total population throughout the United Kingdom was 2·9 in 1840; 4 in 1850; 5·4 in 1860; 8·1 in 1870; 10·5 in 1880; and in 1890 it was 19·1 in England and Wales, 13·5 in Scotland, and 5·2 in Ireland.

The total amounts due to depositors in trustee banks and post-office banks was as follows:

	In Trustee Banks	In Post-office Banks	Total Amount.	Average per Depositor.					
	£	£	£	£	s	d.	£	s.	d.
1862	40,563,139	1,698,221	42,261,360	26	0	8	9	10	3
1872	39,680,652	19,318,339	58,998,991	27	16	11	13	7	10
1882	44,612,580	39,037,821	83,650,401	28	14	7	13	13	1
1890	43,614,055	67,634,807	111,248,862	28	7	11	14	0	3

The amount of stock standing to the credit of depositors in savings-banks was as follows:

	Trustee Banks.	Post office Banks	Total.
1881	£124,667	£738,968	£863,635
1885	650,356	2,452,252	3,102,608
1890	1,280,069	4,680,168	5,960,237

In 1880 there were 1080 penny banks established in schools, and in 1890, 2498 such banks.

The Government Annuity and Insurance System.—The government insurance system, though in itself distinct, has by recent legislation become so closely connected with the savings-banks system that it cannot be left out of consideration in treating of the latter. Its foundations were laid in 1833 by the 3 and 4 Will. IV. chap. 14 (extended to Scotland in 1835), which allowed the purchase of annuities, immediate or deferred, through the medium of savings-banks or of societies authorised to be established for the purpose in parishes where there were no savings-banks, and the system was further developed in 1853 by the 16 and 17 Vict. chap. 45, and in 1864 by the 27 and 28 Vict. chap. 43. The latter act is embodied in the Government Annuities Act, 1882, the one now governing the subject. Under these statutes a 'savings-bank annuity' may be of any amount not exceeding £100 a year, and may be granted to any person not under five years of age, while a 'savings-bank insurance' may be granted for not exceeding £100 to any person between the ages of fourteen and sixty-five, or for not exceeding £5 to a person not under eight years. 'Annuity and insurance regulations' under the acts are made by the National Debt Commissioners as respects trustee, and by the Postmaster-general as respects post-office savings-banks.

Taken in conjunction with the Savings-bank Act, 1880, these acts extend the limits of investment in any one year to £230—viz. £30 ordinary deposit, £100 for investment in stock, and £100 for an annuity or insurance; and to a total of £200 ordinary deposit, £300 stock, £100 insurance, and an annuity of £100.

In the United States the 'Philadelphia Savings Fund Society,' founded in 1816, received a state charter in 1819: and between 1817 and 1846 twelve states had granted such charters to savings-banks within their bounds, especially the New England states; fifty years later there were 684 in the United States. These banks do not belong to any connected national system, each being regulated by the legislature of its own state, but on the whole they closely resemble one another in their main features. Before 1870 there were very few failures of savings-banks; but in the seven years that followed no less than twenty-nine failed in the state of New York alone, not by reason of fraud, but mainly on account of commercial depression, the panic of 1873, and injudicious investments. In 1874 the constitution of the New York state was modified so as to prevent the legislature from sanctioning any savings-bank that did not strictly conform to rigorous conditions, fixing the duties and responsibilities of trustees, prescribing the rate of interest (never to exceed 5 per cent. until a surplus of 15 per cent. of deposits as security has been accumulated), and specifying the stocks in which such banks may invest. These regulations have been adopted by other states. Most of the states have endeavoured, ineffectually, to prevent the savings-banks from becoming rivals to other banks, so as to reserve their privileges for the poorer classes. The following table shows the progress of savings-banks in the United States:

	Banks	Depositors	Total Deposits
1825..........	15	16,931	$2,537,082
1845..........	70	145,206	24,506,677
1875..........	771	2,359,864	924,037,304
1885	684	3,158,950	1,141,530,578
1890..........		4,258,023	1,521,814,506

New York, 1878); Scratchley's *Practical Treatise* (2d ed. 1863); *The Law relating to Trustees and Post-office Savings-banks*, by the present writer (1878-84); the reports of the Select Committees on Savings-banks of 1857 and of 1889; the annual reports and returns; also the articles BANKING, CO-OPERATION, FRIENDLY SOCIETIES, SCHULZE-DELITZSCH, &c.

Savona, a seaport of Northern Italy, on the Gulf of Genoa, by rail 26 miles S. by W. of the city of that name and 91 SSE. of Turin. A handsome modern town embowered in orange-groves, it has a Renaissance cathedral (1589-1604), with the tomb of Pope Sixtus IV.; a castle (1542), now used as a prison, in which Mazzini was confined in 1830-31; the Della Rovere Palace, a picture-gallery, a marine institute, &c. The industries embrace ironworks, potteries, glass-works, tanneries, and brick-yards. Coal, wheat, and iron are imported, and chestnut staves and pottery exported. A total of 642,000 tons (510,000 British) enters every year. Pop. 24,481. The poet Chiabrera was born here. The history of Savona has been a long struggle against its successful rival Genoa, who in the 16th century filled up its harbour; it was only opened again in 1815.

Savonarola, GIROLAMO (JEROME), religious and political reformer, was born of a noble family at Ferrara, September 21, 1452. He was educated at home, and at a very early age became deeply versed in the philosophy of the schools; but his disposition was from the first tinged with religious asceticism, and in 1474 he formally withdrew from secular affairs, and entered the Dominican order at Bologna. Having completed his novitiate and the studies of the order, he seems to have made his first public appearance as a preacher in 1482, at Florence, where he had entered the celebrated convent of his order, San Marco, and where he preached the Lent in that year. His first trial, however, was a failure; his voice was harsh and unmusical, and his simple, devout earnestness failed to interest his hearers, so that, after a time, the course of lectures was entirely deserted. Some time afterwards Savonarola was sent to a convent of his order at Brescia, where his zeal began to attract notice, and the disadvantages of manner and address ceased to be felt under the influence of his sterling genius and irresistible enthusiasm. In 1489 he was once more recalled to the convent of San Marco at Florence. His second appearance in the pulpit of San Marco was a complete success. The great subject of his declamation was the sinfulness and apostasy of the time; and in his denunciation of the vices and crimes of his age he took as his theme what has been the topic of enthusiasts in almost every age, the mystical visions of the Apocalypse. These he applied with terrible directness to the actual evils with which, as with a moral deluge, the age was inundated; and for his half-expositions, half-prophetical outpourings his followers claimed for him the character of an inspired prophet. Under the rule of the great head of the Medici family, Lorenzo the Magnificent, art, literature, and philosophy had all followed the common direction of that elegant but semi-pagan revival which the scholars of the 15th century had inaugurated; and the whole spirit of the social as well as intellectual movement of which Florence, under the Medici, was the centre was utterly at variance with the lofty Christian spirituality and severe asceticism in which Savonarola placed the very first conditions of the restoration of true religion and morality. His preaching, therefore, in its spirit, as well as in its direct allusions, was no less antagonistic to the established system of the government than to the worldly and irreligious manners of the age; the visions and predictions ascribed to him had quite as much of political applicability as of religious significance; and thus, to the aristocratic adherents of the Medici, Savonarola early became an object of suspicion, if not of antipathy and dread. It is said by Pico de Mirandola that he refused to grant absolution to Lorenzo when the latter lay dying in 1492 as the Magnificent declined to accede to the demands made by his confessor.

Up to this time, however, Savonarola's relations with the church were, if not of harmony, at least not of antagonism; and when, in the year 1493, a reform of the Dominican order in Tuscany was proposed under his auspices, it was approved by the pope, and Savonarola was named the first vicar-general. About this date, however, his preaching had assumed a directly political character, and the predictions and denunciations which formed the staple of many of his discourses pointed plainly to a political revolution in Florence and in Italy as the divinely ordained means for the regeneration of religion and morality. In one of his discourses he pointed plainly to the advent of the French under Charles VIII.; and when this prediction was fulfilled by the triumphant appearance of the French expedition, Savonarola was one of a deputation of Florentines sent to welcome Charles VIII. as the saviour of Italy, and to invite him to Florence. Very soon, however, the French were compelled to leave Florence, and a republic was established, of which Savonarola became, although without political functions, the guiding and animating spirit, his party, who were popularly called *Piagnoni*, or 'Weepers,' from the penitential character which they professed, being completely in the ascendant. It was during this brief tenure of influence that Savonarola displayed to the fullest extent both the extraordinary powers of his genius and the full extravagance of the theories to which his enthusiastic asceticism impelled him. The republic of Florence was to be the model of a Christian commonwealth, of which God Himself was the chief ruler, and His Gospel the sovereign law; and thus the most stringent enactments were made for the repression of vice, and of all the sinful follies by which it is fomented and maintained. All the haunts of debauchery were suppressed; gambling in all its forms was prohibited; the vanities of dress were restrained by sumptuary enactments; and, under the impulse of the popular enthusiasm which the enthusiasm of the prophet engendered, women flocked in troops to the public square to fling down their costliest ornaments, and his followers made in the piazza an immense 'bonfire of vanities,' destroying in one hecatomb large numbers of cards, dice, masks, carnival costumes, and probably some books of licentious poetry and indecent pictures. There seems no ground for the charge often made that he and his disciples destroyed in indiscriminating zeal valuable statues and rare manuscripts.

Meanwhile, the extremes of his rigorism; the violence of his denunciations, which did not spare even the pope himself (Alexander VI.); the assumption by him, or attribution to him, of a supernatural gift of prophecy; and the extravagant interpretation of the Scriptures, and especially of the Apocalypse, by which he sought to maintain his views, drew upon him the displeasure of Rome. He was cited, in the year 1495, to answer a charge of heresy at Rome; and, on his failing to appear, he was forbidden to preach; the brief by which the Florentine branch of his order had been made independent was revoked; he was offered a cardinal's hat on condition of his changing his style of preaching—an offer he indignantly refused; and he was again forbidden to preach. Once again Savonarola disregarded this order. But his difficulties at home now began to deepen. The measures of the new republic proved impracticable. The party of the Medici, called 'Arrabbiati' ('Enraged'), began to recover ground. A conspiracy for the recall of the exiled House was formed; and although, for the time, it failed of success, and five of the conspirators were condemned and executed, yet this very rigour served to hasten the reaction. The execution of these conspirators was afterwards laid to the charge of Savonarola, who was said to have been the chief opponent of the proposal to grant them an appeal—a charge for which there seems to be no foundation. But all circumstances seemed now to count against the once all-powerful Savonarola. At the critical point of the struggle of parties came, in 1497, a sentence of excommunication from Rome against Savonarola. Savonarola openly declared the censure invalid, because unjust, and refused to hold himself bound by it. During the plague Savonarola, precluded by the excommunication from administering the sacred offices, devoted himself zealously to ministering to the sick monks. A second 'bonfire of vanities' in

1498 led to riots. In the same year, when the new elections took place, the party opposed to Savonarola, the Arrabbiati, came into power. He was ordered to desist from preaching; and the struggle was brought to a crisis by the counter-denunciations of a preacher of the Franciscan order, long an antagonist of Savonarola, Francesco da Puglia. In the excited state of the popular mind thus produced an appeal was made by both of the contending parties to the interposition of divine providence by the ordeal of fire; and one of Savonarola's disciples agreed to make trial of the dread ordeal along with a Franciscan friar. But at the moment when the trial was to have come off (April 1498) difficulties and debates arose, and nothing was actually done. The result of this was to destroy with the populace the prestige of Savonarola's reputation, and to produce a complete revulsion of public feeling. In the midst of this reaction he was cited before the council, and brought to trial for falsely claiming to have seen visions and uttered real prophecies, for other religious errors, and for political insubordination. He denied the charges; but, put to the torture, he made avowals which he afterwards withdrew. The conclusion was a foregone one; he was declared guilty of heresy and of seditious teaching, and of being an enemy to the peace of the church. The acts of the trial were sent to Rome, where the sentence was confirmed; he, with two disciples of his order, was given up to the secular power; so on May 23, 1498, this extraordinary man and his two companions, brothers Domenico and Silvestro, were strangled, and their bodies burned by the executioner. They died professing their adherence to the Catholic Church, confessed and received absolution, and on the morning of the execution Savonarola administered the last communion to his two companions and himself. There seems no doubt that Savonarola firmly believed in the dogmas of the Roman Catholic Church; and it is only as a moral and religious reformer, and not a theological teacher, that he can in any way be regarded as a forerunner of the Reformation of the 16th century.

His works, mainly sermons, religious essays, theological treatises (of which the chief is *The Triumph of the Cross*), some poems, and a political discourse on the government of Florence, were mainly written in Latin. An edition in 6 vols. appeared at Lyons in 1633–40; and one by Baccini of his Sermons at Florence since 1889. The principal work on him is the Life by Professor Villari (1863, Eng. trans. by Horner; 2d ed., much altered, 1887; Eng. trans. by Linda Villari, 1888). There are also English works by R. Madden (1854) and W. R. Clark (1878); see also Mrs Oliphant's *Makers of Florence*, and George Eliot's *Romola*.

Savory (*Satureja*), a genus of plants of the natural order Labiatæ, nearly allied to Thyme (Thymus). The species are herbaceous and half-shrubby plants, all natives of the south of Europe and the East. The Common Savory, or Summer Savory (*S. hortensis*), is commonly cultivated in kitchen-gardens for flavouring dishes. It is an annual plant, ½ to 1 foot high, with lilac or white flowers, has a strong and agreeable aromatic smell, and an aromatic pungent taste, and is in common use both fresh and dried for flavouring dishes, and especially for flavouring beans. It is stomachic and tonic. Winter Savory (*S. montana*) is used in exactly the same way. It is a half-shrubby plant, with prickly-pointed leaves and larger flowers. Its taste is pungently aromatic. Summer savory is propagated by seed; winter savory by slips and cuttings.

Savoy, formerly a province of the kingdom of Sardinia, was transferred to France in 1860, and divided into the two departments of Savoie and Haute-Savoie. It is an alpine region, having the Graian Alps on the eastern frontier, as the boundary next Piedmont. On that side it runs up to 15,782 feet in Mont Blanc, and to 11,792 in Mont Cenis; thence it falls away gradually to the Rhone (950 feet), which separates it on the west from the French department of Ain. The northern boundary passes through the Lake of Geneva; and on the south-west lies the French department of Isère. The area is 3889 sq. m. (2223 in Savoie and 1666 in Haute-Savoie); the total population (1881) 540,525; (1886) 542,446, of whom 267,428 were in Savoie and 275,018 in Haute-Savoie. The rivers are mostly mountain-torrents, as the Isère, Drance, Arve, and Fier, all tributaries of the Rhone, though the Drance falls into the Lake of Geneva. A large part of the surface is covered with forests (29 per cent.) of pine, fir, larch, beech, oak, elm, ash, hazel, walnut, and chestnut, and with pastures (14 per cent.), on which many cattle, sheep, and goats are kept. The vine is extensively grown, some 7¼ million gallons of wine being produced annually. Only 23 per cent. of the surface is cultivated. Potatoes, oats, rye, and wheat, with hemp, beet-root, tobacco, colza-seed, and maize, are the principal crops; much honey is made; butter and cheese are exported in large quantities; silk-worms are bred; and chestnuts form an article of commerce. Building-stone of various kinds, iron ore, and anthracite are the most valuable of the mineral products. Mineral baths are found at Aix-les-Bains, Evian, Challes, and other places. There is considerable manufacturing industry, especially in the making of cottons, silk stuffs, gauze, woollens, iron, clocks, leather, paper, flour, &c. The peasant women make rough woollen stuffs for home wear. The people are poor, thrifty, and industrious; large numbers leave home every year to fill the lower grades of domestic service in Paris and other large towns; but nearly all return home when they have made a little money. The dept. of Savoie has the four arrondissements of Albertville, Chambéry, Moûtiers, St Jean-de-Maurienne; capital, Chambéry. Haute-Savoie has the four arrondissements of Annecy, Bonneville, St-Julien, Thonon; capital, Annecy.

HOUSE OF SAVOY.—The territory of Savoy formed a part of ancient Gaul. After the decline of the Roman empire it was occupied by the Burgundians (437), and from them passed to the Franks in the next century. Subsequently it formed part of the Burgundian kingdom of Arles, and towards the middle of the 11th century became a fief of the empire. The counts of Maurienne, the ancestors of the Savoy counts and dukes, are sometimes stated to have been descended from Wittekind, last king of the Saxons; it is more probable that they had a local or Provençal origin. The emperor, Conrad II., invested Humbert I. (d. 1048), Count of Maurienne, with the counties of Chablais and Lower Valais. For some centuries the chief features in the history of the house are the successive additions of territory that were made to this early nucleus, until, in the beginning of the 15th century, the dominion of the Savoy rulers extended from Lake Geneva southwards to the Gulf of Genoa, and from the river Saône south-eastwards to Lago Maggiore, and Vercelli and Alessandria in Piedmont. Otto (1048–60) acquired by marriage the marquisate of Susa and the counties of Val d'Aosta and Turin. The province of Bugey and the lordship of Tarantaise were added by the next two counts. Amadeus III. (1103–49) called himself margrave of Turin and Count of Savoy, being the first to use the latter title. Amadeus IV. (1233–53), following the traditions of the family, gave his support to the emperor, Frederick II., against the pope, and was rewarded by being created Duke of Chablais and Aosta. Peter (1263-68) before succeeding to power had spent some time in England, where he built in London the palace afterwards called the Savoy; two of his nieces married Englishmen, King Henry III. and Richard Earl of Cornwall. Amadeus V. (1285–1323), surnamed the Great, extended his territories considerably in the north-west (Geneva, Faucigny, Bresse, &c.), acquired the county of Asti in Piedmont, and was made a prince of the empire. The protectorate over Nice, Ventimiglia, Villafranca, and Barcelonette was acquired by Amadeus VII. (1383-91). The Emperor Sigismund made the eighth Amadeus (1391-1433) Duke of Savoy and of Piedmont (1416), and afterwards invested him with the county of Vercelli. But this prince resigned the title and retired to a monastery. In 1439 the Council of Basel deposed Pope Eugenius IV. and elected Amadeus of Savoy pope in his stead; he took the name of Felix V., but resigned the papal dignity in 1448, and died a cardinal in 1451.

The reign of Charles III. (1504-53) was one long train of misfortunes, occasioned by the fact that he sided with the Emperor Charles V. in his great duel with Francis I. of France: Geneva and Valais put themselves (1533) under the protection of the Swiss Confederation; Berne in 1536 seized Chablais, Gex, and Vaud; and by the treaty of Nice France kept possession of Savoy (which she had seized) and the emperor garrisoned the cities of Piedmont, so that Nice only was left to the duke. Emmanuel Philibert, his son, the next duke (1553-80), obtained great renown as an imperial general in the Netherlands, where he won the great victory of St Quentin (1557); this gained him the recovery of his hereditary dominions (except Pignerol, Savigliano, and Saluzzo) in 1559, 1560, and 1564. Ten years later he received again Pignerol and Savigliano, and subsequently acquired the principality of Oneglia and the county of Tenda. His son, Charles Emmanuel (1580-1630), waged war against Henry IV. and Louis XIII. of France, and was deprived of large slices of territory and several fortresses. The succeeding dukes vacillated between the empire and France. Victor Amadeus II. (1675-1730) was at last saved from the clutches of France by the military genius of the celebrated Prince Eugene of Savoy, a distant cousin, who routed the French before Turin in 1706. By the treaty of Utrecht (1713) the Duke of Savoy gained the principality of Montferrat, the kingdom of Sicily, and the recognition of his claim to the crown of Spain should the Bourbon family become extinct. Seven years later the emperor of Austria forced him to exchange the crown of Sicily for that of Sardinia. Henceforward, for 140 years, the sovereignty was known as the kingdom of Sardinia.

The principal immediate aim of the new kings was to get possession of Milan and its territory—i.e. virtually Lombardy. (Turin had been the capital of Savoy since the reign of Emmanuel Philibert.) Charles Emmanuel III. (1730-73) aided France against Austria in two long wars, and thereby gained accessions of territory on his eastern frontier, but he did not get Milan. Under his son and successor, Victor Amadeus III. (1773-96), Savoy, having put herself at the head of the Italian princes in opposing the French Republic and Napoleon, was along with Nice annexed to France. The next duke, who succeeded whilst the French were masters of his continental territories, took refuge in Sardinia (1798), and in 1802 Piedmont was incorporated with France. Victor Emmanuel I. (1802-21) returned to Turin in 1814, not only receiving back his patrimony, but becoming master also of Genoa. This prince left the government to his wife, an Austrian princess, and his father confessor; their efforts were directed to the extirpation of the elements of liberal sentiment and politics implanted by the French during their occupation. This policy provoked a rising of the liberal-minded in 1821, whereupon the king abdicated in favour of his brother Charles Felix (1821-31), who brought in an Austrian army and continued the oppressive and reactionary policy dictated by Austria. He was the last of the elder branch of the family; and on his death the crown passed to Charles Albert (1831-49), the head of the branch Savoy-Carignano, that had been founded by a younger son of Charles Emmanuel in the 17th century. He abdicated in favour of his son Victor Emmanuel II. during the fever of the revolution of 1848-49. From the time of the French Revolution the Sardinian monarch was one of the most influential potentates in Italy, and from the reign of Charles Felix he was singled out by Italian patriots as the man to effect the future unity of Italy. The history of the monarchy from the accession of Charles Albert has been already sufficiently told under Italy (q.v.).

See Histories of Savoy by Cibrario (Turin, 3 vols. 1840-47), Frézet (3 vols. 1826-28), Bertolotti (2 vols. 1830), St-Genis (3 vols. 1869); and of Piedmont by Bianchi (4 vols. 1877-84) and Ricotti (6 vols. 1861-69). For the Stuart connection with the House of Savoy, see STEWART.

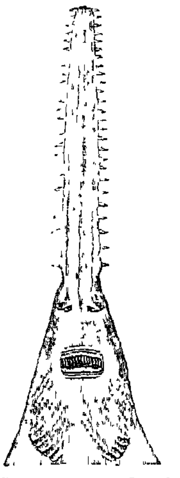
Savoy, a cultivated variety of Cabbage (q.v.), forming a large close head like the true cabbages, but having wrinkled leaves. A number of subvarieties are in cultivation. The mode of cultivation and the uses are the same as those of cabbage. Savoys are much cultivated for winter use; they require a light, rich soil.

Savoy Palace, an ancient palace of London, situated between the Strand and what is now the Thames Embankment, was first built by Peter, Count of Savoy, uncle of Henry III.'s queen, Eleanor of Provence. It was the prison of the captive king John of France after the battle of Poitiers. Then it was the town residence of John of Gaunt, and was burned by the peasants during Wat Tyler's revolt (1381). Henry VII. rebuilt it, and in 1505 endowed it as a 'hospital' or house for one hundred poor people—'rogues and masterless men' they came to be. In its precincts was held in 1661 the Savoy Conference (see PRAYER-BOOK, Vol. VIII. p. 381). 'The Savoy' also included a chapel royal, built in 1515; it was greatly injured by fire in 1864, but was restored at the expense of Queen Victoria. See W. J. Loftie, *Memorials of the Savoy* (1879).

Savu, an island of the East Indies, lies W. of Timor, and is ruled by five Malay rajahs who pay tribute to the Dutch colonial government. Chief products, maize, tobacco, rice, cotton, &c., and horses. Pop. 16,000.

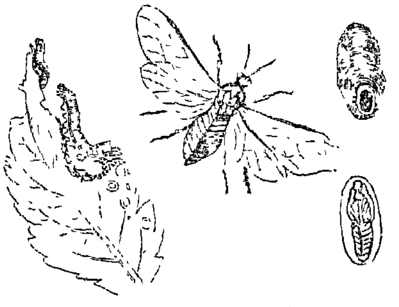
Sawdust. Besides being very useful for such purposes as cleaning dusty floors and stuffing such articles as dolls and pincushions, sawdust is turned to account in other ways. Oxalic Acid (q.v.) is manufactured on a large scale from this 'waste' material. The process consists in first fusing sawdust with a mixture of the hydrates of potassium and sodium in iron pans. The gray or brown powder thus obtained is then treated with water, which leaves the sodium oxalate undissolved. This salt is boiled with milk of lime, the resulting calcium oxalate being then decomposed with sulphuric acid and the filtrate evaporated to yield crystals of oxalic acid. Sawdust is also used in the 'carbonating' stage of the process for the manufacture of soda ash. The substance called *Bois-durci*, of which beautiful ebony-like medallions and other ornaments are made, consists of the fine sawdust of rosewood, ebony, and other woods formed into a paste with blood and pressed into moulds or dies. The furrier finds a use for the sawdust of mahogany and rosewood in dressing his furs, and the small fragments of some woods, such as the pencil cedar, made by saw cuts or the turning tool, yield perfumes. Sawdust sinks in water although the wood from which it is cut floats.

Sawfish (*Pristis*), a genus of cartilaginous fishes distinguished by the prolongation of the snout into a formidable weapon bordered on each side by sharp teeth. Five species of this genus include *P. antiquorum* in the Mediterranean and in many other seas, and *P. pectinatus* off the southern coasts of North America and in the Gulf of Mexico. With its saw, which is sometimes six feet in length, the sawfish slashes or rips up its prey, and its assault is often fatal to large cetaceans. The torn-off pieces of the victim are swallowed by the sawfish, whose true teeth are small and adapted for crushing. The sawfishes are viviparous. The flesh of the sawfish is coarse and almost inedible; the shagreened skin is sometimes used for polishing. Analogous to Pristis, which, although it is somewhat shark-like, belongs to the order of rays, is the genus Pristiophorus, which is ranked among the sharks.



Lower View of Head of Sawfish.

Sawfly, the common name of a number of Hymenopterous insects, injurious to plants. They owe their name to the saw-like ovipositors with which the females drill holes in which to lay their eggs. In one family (Tenthredinidæ) the ovipositor is like a double saw, in the other family (Siricidæ) it is rather comparable to a borer. The adults differ from bees and wasps and other Hymenoptera in having the abdomen attached to the thorax by the whole width of its base instead of by a narrow waist. The larvæ are peculiar in having three pairs of thoracic legs, with which in the Tenthredinidæ a number of abdominal appendages are also associated. They are thus somewhat like caterpillars. Indeed the larva of the Gooseberry and Currant Sawfly (*Nematus ribesii*)—a most destructive pest—is often called a caterpillar. The Corn Sawfly (*Cephus pygmæus*) lays its eggs on the young stalks of corn, which the grubs afterwards destroy. The Turnip Sawfly (*Athalia spinarum*) is a beautiful insect of an orange colour with deeper red shade behind the black head; the destructive larvæ, which frequently ruin the turnip crop, are almost black, and are familiarly known as *Black Jacks* or *Niggers*. The larvæ of the Pine Sawfly (*Lophyrus pini*) are destructive in young fir-woods; and the young of various species of Sirex—e.g. *Sirex gigas*—bore galleries in the wood of various kinds of pine. See Ormerod's *Injurious Insects* (new ed. 1891).



Turnip Sawfly (*Athalia spinarum*) in its various stages of development.

Sawtre, or CHATRYS. See HENRY IV.

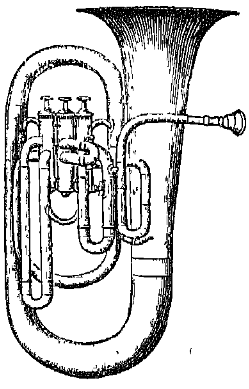
Saxe, *JOHN GODFREY*, American poet, born in Highgate, Vermont, 2d June 1816, was by turns lawyer, journalist, politician, lecturer, and journalist again, and died at Albany, 31st March 1887. His poems, of which there are several volumes, are mostly humorous and satirical, though the more serious and tender touches in which American poets are so facile are not lacking.

Saxe, MAURICE, Marshal, a celebrated soldier of the 18th century, was the natural son of Augustus II. (q.v.), Elector of Saxony and king of Poland, and the Countess Aurora von Konigsmark, and was born at Goslar, 28th October 1696. When only twelve years of age he ran off from home, made his way to Flanders, joined the army of Marlborough, and took part in the capture of Lille and the siege of Tournay. With a boyish love of change he joined the Russo-Polish army before Stralsund (1711), and distinguished himself under his father's own eyes. Then, returning to Dresden, he was induced by his mother to marry the young Countess Löben; but the union did not last long, being dissolved in 1721. In the meantime Maurice had fought against the Turks in Hungary under Prince Eugene, and studied the art of war in France. In 1726 he was elected Duke of Courland, and for a time maintained himself in his new possession against both Russians and Poles, but was compelled to retire to France in 1729. Joining the army on the Rhine, under the Duke of Berwick, he signalised himself at the siege of Philippsburg (1734), and decided the battle of Ettingen by a desperate charge; for these services he was made a lieutenant-general in 1736. On the breaking out of the war of the Austrian succession he was given command of the army which was appointed to invade Bohemia, and took the strongly-fortified city of Prague by storm. The capture of Eger was effected a few days afterwards, and the rest of the campaign showed that his abilities in the field were not inferior to his skill against fortifications. Heretofore known as the Comte de Saxe, he was in 1744 made a marshal of France, and appointed to command the French army in Flanders; and on this occasion he gave decisive proofs of the superiority of his system of tactics by reducing to inaction an enemy much superior in number, and taking from him, almost before his face, various important fortresses. The following year was for him more glorious still: he defeated the Duke of Cumberland in the battle of Fontenoy. In 1746 Maurice by a series of able manœuvres threw back the allies on the right bank of the Meuse, and gained (11th October) the brilliant victory of Raucoux, for which he was rewarded with the title of marshal-general, an honour which had been conferred upon none but Turenne. For the third time, at Laufeldt (2d July 1747), the victor of Culloden suffered complete defeat at the hands of Maurice, and the brilliant capture of Bergen-op-zoom brought the allies to peace. The Dutch, however, were still disposed to hold out, till the capture of Maestricht (1748) destroyed their hopes, and the peace of Aix-la-Chapelle followed. Saxe had previously carried on a correspondence with Frederick the Great of Prussia; he now took occasion to visit him at Berlin, and met with a brilliant reception. He then retired to his estate of Chambord, and died there of dropsy, 30th November 1750. His work on the art of war, entitled *Mes Rêveries*, was published at Paris in 1751. Saxe was a gallant soldier, but no scholar. When the French Academy wanted to make him a member he declined the proffered honour in a sentence whose extraordinary orthography accidentally rebuked, more than the most cutting sarcasm could have done, the sycophancy of the Academy: 'Ils *veule* me *fere* de *la cademie; sela* m'*irct come* une *bage* a un *chas*.' His love for the actress Adrienne Lecouvreur forms the subject of one of Scribe's best-known plays; and from an illegitimate daughter of his George Sand (q.v.) was descended.

His character and genius are well, though not flatteringly, portrayed in Carlyle's *Frederick the Great;* and see also Lives by Karl von Weber (German, 2d ed. 1870); Saint-René Taillandier (French, 1865); and Vitzthum von Eckstadt (French, 1867), with the Duc de Broglie's *Maurice de Saxe et le Marquis d'Argenson* (2 vols. 1891).

Saxe-Coburg, &c. See SAXON DUCHIES.

Saxhorn, the name of a series of brass wind musical instruments invented by Antoine or Adolphe Sax, who was born at Dinant in Belgium in 1814, and settled in Paris in 1842. By means of this and another family of instruments called Saxophones (q.v.) he has greatly influenced military music over the world. The saxhorn consists of a conical tube opening out to a wide bell, is sounded through a cupped mouthpiece, and is provided with valves or pistons on a principle similar to the Cornet (q.v.). Saxhorns are made in several sizes, the principal being the soprano in F, E♭, and D; the contralto in C and B♭; the tenor or althorn in F and E♭; the baritone and euphonium in C and B♭; the bass or bombardon in F and E♭; and the contra-bass or contra-bombardon in B♭. These have all the usual open harmonic notes of their respective tubes (see HARMONICS, HORN, &c.), the pistons providing the intermediate tones and semitones. The series have a very wide compass, stated by the inventor as more than five octaves. They are all more or less like the one (the euphonium) shown in the figure, except the contra-bombardon, which, on account of its size and weight, is usually made circular, so as to go round the shoulders of the performer. Their number and variety supply all the different parts required by a brass band, and in many places very efficient bands are entirely composed of them. From the fact that their fingering is all alike, a performer, having mastered one, can by a little practice play with equal facility on any of the others. This has tended in great measure to supersede the older instruments, which, from their diversity of fingering, had to be studied separately. This result has also been helped by the short-service system in the British army, where, as the maximum time during which the services of the men can be claimed is six years, the simpler the instrument the sooner they can be taught, and consequently the better return for the trouble of teaching them. Their compass, richness, and flexibility of tone render them peculiarly suitable for military music, and their form renders them easy to play either on the march or on horseback. The euphonium and bombardon are, however, the only two which have found a place in the orchestra. See BAND.



Euphonium.

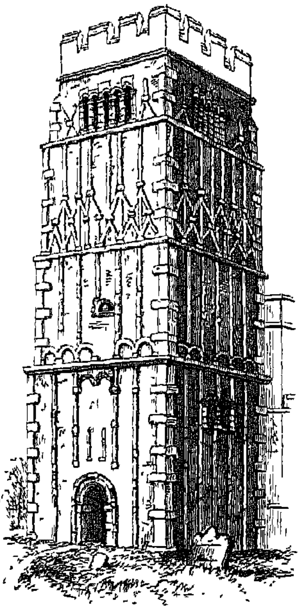
Saxifragaceæ, a natural order of exogenous plants, comprising herbs, shrubs, and trees, so varied in character that botanists are not in agreement respecting its limits. The British genera, of which there are four, all of which are herbs, are very diverse in character, yet they give very little idea of the range of the variation of generic character in the order when they are compared with the ligneous or arborescent exotic genera. They are all, however, distinguished from the genera of the closely allied orders by their regular flowers; four, five, or rarely ten-lobed calyx, more or less adherent to the ovary; petals equal in number to segments of calyx or wanting; stamens also generally equal in number or twice as many, still more rarely indefinite in number; ovary either adherent or inserted in a broad base, either two or four celled, or, if one-celled, having two or more parietal placentas often lobed at the top, with the same number of styles or stigmas as cells or placentas, rarely twice as many; fruit a capsule, with several seeds, usually many to each cell or placenta; the albumen usually copious. The family is spread over nearly the whole world, most numerously in the mountainous regions of the northern hemisphere; they are rare in tropical America, in Peru and Java, and in southern Australia. The prevailing property is astringency. The small grain-like roots of *Saxifraga granulata*, a native of Britain and other temperate countries of Europe, were formerly reputed to be efficacious in calculus. *S. tridactylites*, also a native of Britain, is said to be beneficial in diseases of the liver. But the only species of the numerous herbaceous class having any well-based reputation for medicinal or officinal virtues is the Alum-root (*Heuchera americana*), which is abundantly distributed in rocky and shady places throughout the United States. The root, which is intensely astringent, is employed by the Indians to heal wounds and persistent ulcers, and it is said to form the basis of a powder reputed in America to be a cure for cancer.

Among the arborescent species there are some which produce valuable timber. *Cunonia capensis* is the Red Alder or Rood Els of the Cape of Good Hope. Its timber resembles that of the lime-tree, but is more tough and close-grained, and being also susceptible of a fine polish is valued alike for agricultural purposes and for cabinet-work. *Platylophus trifoliatus* is the White Alder or Wit Els of the same country; it is a larger growing tree than the preceding, the trunk often attaining a diameter of 3 or 4 feet. The wood is white, light, and comparatively soft, and is valued for making boxes, drawers, the more common articles of furniture, picture-frames, and the like. The bark of some of the species of Weinmannia are employed in Peru and in the West India Islands in the tanning of leather, and also for adulterating Peruvian bark. Some of the Australian species yield gum. The Hydrangea, so popular in British gardens and in cottage windows, belongs to this family.

Saxifrage (*Saxifraga*, 'stone-breaker,' because supposed to break stones in the bladder), a genus of plants of the natural order Saxifrageæ or Saxifragaceæ (q.v.). The genus is a numerous one, consisting of annual and perennial herbs, mostly tufted. The species are chiefly mountain or rock plants, and are most abundant in the northern hemisphere. Many species are cultivated in gardens for their pretty flowers and neat habit of growth, being especially valued for ornamenting rockeries. Some thirteen species are natives of Britain, the best known of which is *S. umbrosa*, which, under the popular names London Pride, None-so-pretty, and St Patrick's Cabbage, is a favourite in nearly every cottage garden. The predominant property of the genus is astringency, but it has never been utilised.

Tufted Saxifrage (*Saxifraga cæspitosa*).

Saxo Grammaticus (i.e. Saxo the 'Grammarian' or 'Scholar'), the most celebrated of the early Danish chroniclers, flourished in the end of the 12th century. He was secretary to Archbishop Absalom of Roeskilde, was a Zealander by birth, and is said to have died at Roeskilde in 1208. At the request of the archbishop he wrote a chronicle of the early kings of Denmark, and brought his narrative down to the year 1185. The work is entitled *Gesta Danorum*, or *Historia Danica*. The earlier portions are uncritical, but in regard to times near his own Saxo Grammaticus is a most invaluable authority. According to his own statement, he derived his knowledge of the remoter period of Danish history from old songs, Runic inscriptions, and the historical notices and traditions of the Icelanders. The best editions are by P. E. Muller and Velschow (Copen. 1839–58) and A. Holder (Strasb. 1886). There are good translations from the original Latin into Danish by Vedel (new ed. 1851) and Grundtvig (3 vols. 1818–20). To an English translation in the Folklore Society series by O. Elton of the first nine books (1892) is prefixed a mythological commentary by York Powell.



Tower of Earl's Barton, Northamptonshire.

Saxon Architecture, the style of building used in England before the introduction of the Norman architecture at the Conquest. There are few specimens remaining which can be depended upon as genuine. The Saxons built chiefly in wood, and all their wooden edifices are now lost. It seems probable that a rude and simple style, in which many features resembling Norman work were introduced, was that used by the Saxons in the 11th century. But there are also more ancient structures, still partly preserved, in which more characteristic features exist. Amongst these the towers of Earl's Barton and Barnack, Northamptonshire, a church at Bradford-on-Avon (q.v.), and the crypt at Repton are good examples. The peculiar 'long and short' work of the quoins, the projecting fillets running up the face of the walls and interlacing like woodwork, and the baluster-like shafts between the openings of the upper windows resembling the turned woodwork of the period, are all characteristic of the style. Ancient Roman bricks seem also to have been used in some of the Saxon works, as at the churches of Brixworth, Northamptonshire, and that on the Castle Hill of Dover.

Saxon Duchies, a group of sovereign states in the centre of Germany, lying W. of the kingdom of Saxony, N. of Bavaria, E. of Hesse-Nassau, and S. of the province of Prussian Saxony.

State	Area in sq m	Pop in 1890	Capital
Saxe-Altenburg.	511	170,867	Altenburg.
Saxe-Coburg-Gotha....	755	206,329	Coburg and Gotha
Saxe-Meiningen	958	223,920	Meiningen.
Saxe-Weimar-Eisenach..	1387	326,824	Weimar.

In no one of these states do the territories form a compact mass. Altenburg and Coburg-Gotha each consists of two principal portions, with smaller fragments; Weimar-Eisenach embraces three large divisions; and Meiningen, in addition to a long narrow crescentic piece of territory, has some detached parcels. Except the easternmost part of Altenburg, they are all generally hilly, embracing the Thuringian Highlands and their valleys, and are watered by the tributary streams of the Elbe—the Saale, Unstrut, Ilm, and Elster—and by the Werra. In all the duchies the chief occupations are agriculture and fruit and vegetable growing. Cattle, sheep, and horses are bred with care; poultry are reared in large numbers in Coburg and Meiningen. Various minerals are mined, as iron, coal, and marble in Gotha and Meiningen, lignite, turf, limestone, and sandstone in Altenburg, and kaolin and slates in Meiningen. There is a good deal of industrial activity displayed in all the duchies, especially in the manufacture of glass; and the people of Altenburg make bricks, porcelain, woollens, linen, wooden articles, beer, toys, cottons, chemicals, tobacco-pipes, cloth, machinery, and metal instruments, &c. Education reaches a high level in all the duchies, which maintain in common the university of Jena. The government in each state is framed on the model of a constitutional monarchy. At the head of each is a duke (in Weimar a grand-duke), controlled and assisted by an assembly chosen for three years, and embracing in Altenburg thirty members, in Coburg-Gotha thirty, in Meiningen twenty-four, in Weimar thirty-one members. The representatives are chosen in part directly, in part indirectly. Each state has a ministry (three members in Altenburg, two in Coburg-Gotha, five in Meiningen, and four in Weimar); and each has one vote in the council of the empire. To the imperial parliament Altenburg sends one representative, Coburg-Gotha and Meiningen two each, and Weimar three. The several ducal houses, which have a common ancestor (see SAXONY), are united by family compacts and agreements; the Grand-duke of Weimar ranks as senior, and is the heir to the crown of Saxony in case that royal family dies out.

History.—Saxe-Altenburg was ruled by imperial burgraves from the 12th to the 14th century; in 1485 it became subject to the ruling house of the Saxons, and has continued to be governed by a member of that house ever since. From 1672 to 1825 it was united (for the most part) with Gotha; since then it has formed an independent duchy. Saxe-Coburg has been ruled over by the Saxon house since 1353, as an independent duchy from 1680. In 1826 its duke became duke of Gotha too, but the two duchies were not constitutionally and politically united until 1873. Saxe-Gotha was made an independent duchy in 1641, was united with Altenburg from 1672 to 1825, and after that joined to Coburg. As Ernest II., Duke of Saxe-Coburg-Gotha and brother of Prince Alfred, had no child, the succession passes to the Duke of Edinburgh. Saxe-Meiningen has constituted a separate duchy since 1681. Saxe-Weimar has been under the rule of the Saxon house since 1376. Bernhard (q.v.), a brother of the reigning duke, distinguished himself as a Protestant general in the Thirty Years' War. Duke Karl August (1758-1828) made Weimar (q.v.) the centre of the intellectual and artistic life of Germany by gathering round him Goethe, Schiller, Herder, Wieland, &c., and by encouraging the theatre, the university of Jena, and the fine arts.

Saxons (Lat. *Saxones*, Ger. *Sachsen*), a Germanic people, whose name is usually derived from an old Teutonic word *sahs*, meaning a 'knife,' though some authorities believe it to be another form of *Sassen* = 'the settled people,' are first mentioned by Ptolemy as dwelling in the south of the Cimbrian Peninsula. In the 3d century a 'Saxon League' or 'Confederation,' to which belonged the Cherusci, the Angrivarii, the Chauci, and other tribes, was established on both sides of the estuary of the Elbe and on the islands off the adjacent coast. During the reigns of the emperors Julian and Valentinian they invaded the Roman territory; but their piratical descents on the coasts of Britain and Gaul are far more famous. In 287 Carausius, a Belgic admiral in the Roman service, made himself 'Augustus' in Britain by their help; and about 450 they, in conjunction with the Angles, established themselves permanently in the island and founded the Anglo-Saxon kingdoms. Before the 5th century they had settled along the North Sea coasts from the Elbe to the Loire, a part of what was later Flanders being called the 'Saxon shore.' But these Saxon settlements soon became absorbed in the kingdom of the Franks. In Britain too there was a Saxon shore with its count. In Roman times the coast districts of Britain from Brighton northwards to the Wash were called *Litus Saxonicum*, or Saxon shore. These localities were particularly exposed to the attacks of the Saxons from across the North Sea, and were placed under the authority of a special officer, the Count of the Saxon Shore. At home the Old Saxons enlarged their territory by conquest till it embraced all the lands between the Rhine and Elbe, the North Sea and the Harz Mountains. Along with the Franks they destroyed the kingdom of the Thuringians in 531, and obtained possession of the land between the Harz and the river Unstrut; but this region too was forced to acknowledge the Frankish sovereignty. But the Saxons having thrown off the yoke, wars between the Saxons and the Franks were constant after 719; and the latter after 772 were, under the vigorous leadership of Charlemagne, generally successful, in spite of the determined opposition offered by Wittekind (or Widukind). The desperate resistance of the Saxons was not finally broken until 804, though Wittekind submitted in 785. After the final submission the conquered people accepted Christianity, having before defended their heathen faith in conjunction with their freedom. By the treaty of Verdun (843) the Saxon districts fell to Austrasia, the nucleus of the German empire (see SAXONY). The 'Saxons' of Transylvania (q.v.) are not all of pure Saxon descent; the name is used rather as synonymous with 'German.' See HELIAND and ANGLO-SAXON.

To the Celtic Britons the English or Anglo-Saxon invaders were known only as Saxons, and *Sassenach*, or other Celtic form of the word Saxon, is still the name for Englishmen and their language alike in Wales, the Scottish Highlands, and Ireland. But the 'hated Saxon' as a political war-cry was the coinage of O'Connell.

Saxony, a kingdom of Germany, taking in respect of area the fifth place, but in respect of population the third place, amongst the states of the empire; it is surrounded by Bohemia (on the S.), Silesia (NE. and N.), Prussian Saxony (N. and NW.), and the minor Saxon states (W.). It measures 130 miles from east to west, 90 miles from north to south, and has a total area of 5787 sq. m. (a little smaller than Yorkshire); in shape it roughly resembles a right-angled triangle, the right angle being in the north-west, the hypothenuse in the south, along the Erzgebirge (to 3343 feet). The greater part of the surface is diversified by the spurs (2800 feet) of this mountain-chain, with to the west the outliers (2900 feet) of the Fichtelgebirge and to the east the northern extensions (2600 feet) of the Riesengebirge. The northern districts pass over into the great North German plain. On the whole the surface is therefore elevated (nearly 60 per cent. above 800 feet); in many parts it is studded with isolated peaks of basalt and sandstone (e.g. the fantastic pinnacles of the Saxon Switzerland, skirting the Elbe just above Dresden). It lies almost wholly within the basin of the Elbe, being drained by that river and its tributaries. The climate, owing to the elevation, is somewhat colder and severer than the latitude (50° 10′ to 51° 29′ N.) would indicate. The population grows fast: (1815) 1,178,802; (1840) 1,706,276; (1864) 2,344,094; (1880) 2,972,805; (1890) 3,500,513. Thus it has doubled since 1840. Saxony, whose area is a little more than half that of Belgium (pop. 6,093,798 in 1890), is more densely inhabited, having 605 inhabitants on the square mile to Belgium's 535. By race the majority of the people are Germanised Slavs, close upon 50,000 being Wends, living in Lusatia; the non-Slavonic remainder are descended from ancient immigrants from Franconia and Thuringia. More than 96 per cent. of the population are Lutherans. The capital is Dresden; the largest towns are Leipzig, Dresden, Chemnitz, Plauen, Zwickau, Freiberg, Zittau, Meerane, and Glauchau, in the order named, the first three having each more than 100,000.

Saxony is essentially a mining and manufacturing country; whilst more than 58 per cent. of the population are engaged in the mines and manufactures, less than 20 per cent. depend upon agriculture. The first place amongst the manufactures is taken by the textile industries, which embrace the making of linen, damask, muslin, hosiery, ribbons, cloth and buckskin, flannel, woollen goods, and waxcloth; to these must be added numerous dye-works and factories for printing and stamping textiles. The other branches of industry deal with machinery, pottery, porcelain and glass, chemicals, beer (83 million gallons annually), spirits, lace, paper, straw-plait, tobacco, artificial flowers, pianofortes, hats, toys, watches, books, musical instruments, ornamental wooden articles, &c. These various industries employ close upon 800,000 persons, a large proportion being women. The principal mineral products are coal, argentiferous lead, zinc, iron, and cobalt. Coal is extracted to the annual value of £274,000, the other minerals to £1,713,700. Nearly 30,000 persons are employed in and about the mines, which, however, have decreased since 1860 in number and consequently now employ fewer people. Building-stones, turf, lime, slates, potter's clay, &c. are extracted in considerable quantities. Freiberg is one of the chief centres in Germany for smelting metals, the annual output for all except iron being valued at £850,000. Iron is smelted, cast, and worked by 6800 workmen to the annual value of £993,000. Less than 56 per cent. of the total area is actually cultivated; but 13 per cent. is meadows and 27½ per cent. forests. In spite of the high state of agriculture in Saxony, grain and fat animals are imported annually to the value of £3,300,000, the home produce being insufficient for the people's wants. The crops grown in largest quantity are potatoes, hay, roots and fodder, oats, rye, and beet-root. Fruit-culture, market-gardening, the breeding and fattening of cattle and sheep, and of geese, and bee-keeping are carried on with much zeal and success. Nearly 83 per cent. of the area of the land in cultivation is divided into farms ranging between 2 and 250 acres. A vast amount of trade is done in all kinds of produce, on the Elbe and on the railways (1575 miles in 1890). The well-being of the people advances at a good rate, the savings-banks holding £7·9 per head of the total population in 1888 (£5·3 in 1877), whilst the taxable income increased in sum from £47,975,000 in 1879 to £75,940,000 in 1889. The educational status is very high: amongst the recruits who joined the colours in 1887 there was only 1 in 5000 who could not read and write. Amongst the educational institutions are the university of Leipzig, two famous high schools at Meissen and Grimma, a polytechnique at Dresden, a superior industrial academy at Chemnitz, a mining academy at Freiberg, a forestry school at Tharandt, and numerous inferior mining and technical schools throughout the manufacturing districts. The annual national income and expenditure balances at £5,760,000; the public debt, principally incurred in buying up private railways, amounted in 1890 to £32,394,000. The army, some 33,000 strong, forms the 12th army corps of the imperial forces. The constitution is that of a hereditary constitutional monarchy. The king exercises the supreme executive. There are two legislative chambers. The First Chamber is made up of various *ex-officio* dignitaries of the kingdom, as chief-magistrates, high officers of the church, the princes of the royal family, &c., together with twelve representatives chosen by the landed proprietors, and ten more selected by the king. The Second Chamber consists of eighty representatives, thirty-five elected by the towns and forty-five by the rural districts.

To understand the history of Saxony it is necessary to go back to the Old Saxons (q.v.), who, before their submission to the Franks, had been accustomed to choose a 'duke' to lead them in war. After the division of the Frankish dominion into an eastern and western kingdom, in which division the Saxons and their territory passed to the eastern half or Austrasia, the Saxons were greatly exposed to the attacks of the Northmen on the north-west and of the Slav tribes on the north and north-east, and so they chose them a duke again, one Otto (880–912), who not only defended his people valiantly but extended their supremacy southwards over Thuringia. His son, Henry (912–936), was in 919 chosen king of the eastern or German kingdom, and thus the Saxon chief ruler became the head of all the peoples in the future Germany. Henry reduced the Slav tribes living beyond the Elbe, and so made himself master of all the territories included in the present kingdom of Saxony, the Prussian province of Saxony, the minor Saxon duchies, and more besides. His son, Otto II., king of the Germans, made Count Hermann Billung duke of the Saxons, and the dignity continued in his family down to 1106. The princes of this house, to whom the Saxon people were greatly attached, were the most difficult enemies of the German emperors, who after 1024 were again men of Frankish race. The power of the Saxon dukes was greatly increased under Henry the Proud of Bavaria, who succeeded to the dignity in 1137, and especially under his son Henry the Lion, who conquered Mecklenburg, Hither Pomerania, and Holstein. This prince was deprived of his possessions by the Emperor Frederick I. (1180), who confined the duchy of the Saxons to the territories lying east of the Elbe, and divided those to the west of it between the Archbishop of Cologne and numerous petty bishops and princes. The dignity of duke of the Saxons was given to Bernard of Ascania, son of the prince of Brandenburg. His descendant, Rudolph II. (1356–70), called himself Elector of Saxony. In 1423 the Emperor Sigismund invested Frederick, Landgrave of Meissen and of Thuringia, with the fief of Saxony. This prince, of the House of Wettin, was the ancestor of the reigning royal family in Saxony and of the various dukes of the minor Saxon states. The princes and nobles of the House of Wettin frequently divided and interchanged their possessions in whole or in part, and all the sons of a deceased elector often ruled in common or in conjunction with uncles, so that the history of the house is extremely complicated down to the beginning of the 19th century. But in 1485 a division was made which has in its broad features continued to hold good down to the present day. The family split into two main branches, called, from the two brothers who divided the territories between them, the (elder) Ernestine and the (younger) Albertine lines. The electoral dignity fell to Ernest, who ruled over Thuringia and the western part of modern Saxony. His son, his grandson, and his great-grandson were all zealous supporters of the Reformation, whilst the heads of the Albertine branch, who ruled in the eastern lands (beyond the Elbe), although they were Protestants, supported the pope and the emperor. In 1547 the emperor, after defeating the Elector of Saxony in battle, deprived him of the dignity and of the greater part of his lands; and gave title and lands to his own ally, the head of the younger line, and with that line they remained, the title being exchanged in 1806 for the higher dignity of king. Only the Thuringian territories (see SAXON DUCHIES) remained with the older line.

During the Thirty Years' War the reigning elector, John George I. (1611–56), remained neutral until Tilly invaded his territories; this drove him over to the Protestant side (1631). He made his peace however with the emperor in 1635, receiving Lusatia; but in revenge for this desertion the Swedes wrought terrible havoc in his land and amongst his people ten years long. The Elector Frederick Augustus I. (1694–1733), a vain man, fond of magnificence and eager to make a stir in the world, went over to Roman Catholicism and made an eager canvas for the throne of Poland. He was chosen king as Augustus II. (q.v.); after that the headship of the Protestant states of Germany passed to the Elector of Brandenburg (see PRUSSIA), and the court and dynasty of the Protestant kingdom of Saxony have remained Catholic till the present day. Saxony, in consequence of this alliance with Poland, was drawn into the war against Charles XII. of Sweden, and again suffered greatly from the Swedish armies. In the second Silesian war she sided with Austria, was beaten, and had to pay a million thalers indemnity to Prussia. When the Seven Years' War broke out Frederick the Great refused to recognise the neutrality of Saxony, and, capturing her army, treated her as a conquered province, and forced the elector (Frederick Augustus II.) to take refuge in Poland, to the crown of which country he had been elected in succession to his father. Frederick Augustus III. (1763–1827) bent himself energetically to the task of building up his state again and restoring the prosperity of his subjects, matters in which he was eminently successful. He took little part in the early Napoleonic wars, and in 1806 proclaimed himself king of Saxony as Frederick Augustus I. Then he went over entirely to the side of Napoleon, and sent the Saxon army to fight side by side with the French down to the battle of Leipzig (1813). After the rout of the French in that battle Frederick Augustus was taken prisoner, and his land occupied by the allied Germans and Russians. The congress of Vienna deprived him of a large portion of his territories and subjects, namely 7720 sq. m. out of 13,510, and 864,404 inhabitants out of 2,047,148; these formed part of the new province of Prussian Saxony. This separation of lands that for centuries had been ruled over by the House of Wettin encountered the strongest opposition on the part of the people. In 1832 the old machinery of government, consisting of a secret cabinet and the two chambers of the feudal estates, was abolished to give place to a constitutional system. In May 1849 the Russian Bakunin and other democratic socialists stirred up a rising in Dresden, which resulted in a week's severe barricade fighting in the streets. From 1858 to 1866 the ruler *de facto* of Saxony was Count von Beust (q.v.). In the Austro-Prussian war of 1866 Saxony sided with Austria, but, being along with her ally defeated, she joined the North German Confederation and paid an indemnity of 10 million thalers to Prussia. In the Franco-German war the Saxon army fought of course on the side of Prussia. Since 1871 the country has been peaceful and in a wonderful degree prosperous.

Flathe, 3d ed. 1877); and Daniel, *Handbuch der Geographie* (1881) for geography and statistics. The standard history is Bottiger's (ed. Flathe, 3 vols. 1867–73); but consult also Weisse (7 vols. 1802-12), Meynert (2 vols. 1833-35), Gretschel and Von Bulau (1863), and Kohler (1886).

Saxony, PRUSSIAN, a province of Prussia, formed in 1815 out of districts taken from the kingdom of Saxony, part of the duchy of Magdeburg, the Altmark, the principalities of Halberstadt and Erfurt, and some smaller territories. It lies between Brandenburg, Hanover, Brunswick, Hesse-Cassel, the minor Saxon duchies, and the kingdom of Saxony. The duchy of Anhalt almost divides it into two portions. Area, 9746 sq. m.; pop. (1890) 2,579,852. The greater part of the surface belongs to the North German plain, being watered by the Elbe and its subsidiary streams, the Saale, Mulde, two Elsters, Ilm, &c. The soil, except in the north and on the mountains (Harz and Thüringer Wald) in the south, is extremely fertile, the valley of the Golden Meadow (*Goldene Aue*) being particularly famous. Lignite and salt are extracted to the annual value of 1¾ million pounds sterling. Copper is mined. Wheat, beetroot, flowers, vegetables, hops, &c. are extensively grown. There are important manufactures of cloth, cottons, machinery, oil, small-arms, beer, chemicals, and other articles. Halle is the seat of one of the first universities of Germany. The province sends 20 members to the imperial parliament, and 38 to the Prussian House of Representatives. The capital is Magdeburg; other large towns are Halle, Erfurt, Halberstadt, Aschersleben, Mühlhausen, and Nordhausen.

Saxophone, the name of a family of musical instruments invented by M. Sax (see SAXHORN). They consist of a conical brass tube, sounded by a mouthpiece furnished with a single reed similar to that of the Clarinet (q.v.), and are made in as many different keys as the saxhorn. The contralto and baritone are mostly used in Britain; but in France all the varieties are more or less used. They have twenty holes covered by keys and studs for the first three fingers of each hand, and are all fingered alike. They are greatly valued in military music, but are not much used in the orchestra.

Saxophone.

Say, JEAN BAPTISTE, a French political economist, was born at Lyons, 5th January 1767. Being destined for a commercial career, he passed a part of his youth in England, and on his return to France began his work in a life-insurance office. On the outbreak of the Revolution he made his way to Paris, and worked for Mirabeau on the *Courrier de Provence*, and a year or two later acted as secretary to Clavière, the minister of finance. From 1794 to 1800 he edited a journal called *La Décade*, in which he expounded with great effect the views of Adam Smith. After 18th Brumaire (1799) he was appointed a member of the tribunate, but at the end of a few years he began to express his disapprobation of the arbitrary tendencies of the new consular government, and in 1804 ceased to be a member of a body that had become a mere tool in the hands of Bonaparte. Under the despotism of the empire Say was forced into private life, and betook himself to industrial pursuits. In 1803 he issued the first edition of his principal book, *Traité d'Économie Politique* (8th ed. 1876). In 1814 the French government sent him to England to study the economical condition of that country: he laid down the results of his journey in *De l'Angleterre et des Anglais* (1816). From 1819 he lectured on political economy at the Conservatory of Arts and Trades, and in 1831 was appointed professor of Political Economy at the Collége de France, but died 16th November 1832. A follower of Adam Smith, but an independent and sagacious writer, Say was the first to teach Frenchmen to consider rationally such questions as customs-duties, the currency, public credit, the colonies, and taxation, and to him belongs the credit of having made Adam Smith extensively known on the Continent. Besides the books cited he also wrote *Catéchisme d'Économie Politique* (1815; 6th ed. 1881), *Cours Complet d'Économie Politique* (1828–30)—this merely an expansion of the *Traité*—and *Mélanges et Correspondance* (1833). His principal writings form vols. 9–12 in Guillaumin's *Collection des Économistes*.

Sayce, ARCHIBALD HENRY, philologist, was born at Shirehampton, near Bristol, September 25, 1846, and was educated privately and at Grosvenor College, Bath. He entered Queen's College, Oxford, in 1865, took a classical first-class in 1869, and became fellow, then tutor, of his college. He took orders in 1870, and was appointed in 1876 deputy to Max-Müller in the chair of Comparative Philology at Oxford, which office he resigned in

1890. Professor Sayce joined the Old Testament Revision Company in 1874, was elected a member of numerous home and foreign learned societies, and received the degree of LL.D. from Dublin in 1881, and D.D. from Edinburgh in 1889.

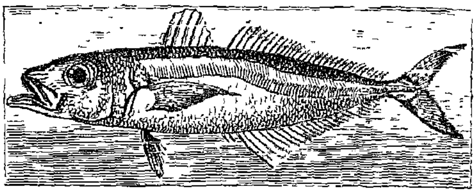
Among his many books the most important are *The Principles of Comparative Philology* (1874), *Introduction to the Science of Language* (2 vols. 1880), *The Ancient Empires of the East* (1884), *Origin and Growth of Religion as illustrated by the Ancient Babylonians* (1887); and admirable short popular works on *Fresh Light from the Ancient Monuments*, *Assyria*, the *Hittites*, and the *Races of the Old Testament* (1891), in 'By-paths of Bible Knowledge.' Besides his *Assyrian Grammar* (1872) and *Lectures on the Assyrian Syllabary* (1875), he has contributed many books and papers on the subject to the learned journals, and he edited George Smith's *History of Babylonia* (1877) and *Chaldean Genesis* (1880). Further works were an edition of Herodotus I.-III. (1883) and an *Introduction to Ezra, Nehemiah* (1885). He began the second series of 'Records of the Past' in 1888; vol. v. 1891.

Scab, in Sheep, like itch in man, or mange in horses or dogs, depends upon the irritation of three varieties of minute acari, some of which burrow in the skin, especially if dirty and scurfy, causing much itching, roughness, and baldness. The parasite readily adheres to hurdles, trees, or other objects against which the affected sheep happen to rub themselves, and hence is apt to be transferred to the skins of sound sheep. Chief amongst the approved remedies are diluted mercurial ointments, tobacco-water, turpentine and oil, and arsenical solutions, such as are used for sheep-dipping. One of the best and simplest applications consists of a pound each of common salt and coarse tobacco, boiled for half an hour, in about a gallon of water; to this are added two drachms of corrosive sublimate; and the mixture diluted until it measures three gallons. For each sheep a pint of this mixture should be carefully applied, from a narrow-necked bottle, along the back, and to any other scurfy itchy parts. A second dressing, after an interval of a week, will generally effect a perfect cure.

Scabies. See Itch.

Scabious (*Scabiosa*), an extensive genus of herbaceous plants, exclusively natives of the eastern hemisphere, of the natural order Dipsaceæ (see Teasel). The flowers are collected in terminal heads, surrounded by a many-leaved involucre, so as to resemble those of the order Compositæ. The Devil's-bit Scabious (*S. succisa*) is a very common autumnal flower in British pastures. The plant possesses great astringency, but no important medicinal virtues, although it was formerly supposed to be of great efficacy in all scaly eruptions, and hence the name scabious, from Lat. *scabies*, 'scab,' 'itch.' The end of the root appears as if abruptly bitten off, and the superstition of the middle ages regarded it as bitten off by the devil, out of envy, because of its usefulness to mankind. The Sweet Scabious (*S. atropurpurea*) is a well-known fragrant garden-flower. It is supposed to be a native of India.

Scad (*Caranx trachurus*, or *Trachurus trachurus*) a fish of the family Carangidæ, sometimes called the *Horse Mackerel*, because of its resemblance to the mackerel, and its comparative coarseness. It is from 12 to 16 inches long, of a dusky olive colour, changing to a resplendent green, waved with a bluish gloss, the head and lower parts silvery, the throat black. It has two dorsal fins, the first short, the second long, and one long ventral fin opposite the second dorsal. There are two small free spines in front of the anal fin. The ordinary scales are very small, but those of the lateral line are large, spiny, and strongly keeled, the keel terminating in a curved spine. The species of Caranx are very numerous, and it is sometimes divided into several genera; but the scad is the only species found on the British coasts. It is common on the south-western coasts of England, but comparatively rare to the north. It sometimes appears in immense shoals, pursuing the fry of herring or similar prey, and the multitudes have sometimes been so great and so crowded together that they could be lifted out of the sea by buckets, and overloaded nets have been torn to pieces. The scad has something of the mackerel flavour. Although not much cared for when fresh, it is often salted, and in that state is esteemed as an article of food in Cornwall and the Scilly Isles. This species has a very wide range: it is rare on the west coast of Norway, but abounds along the coasts of France and Portugal and in the Mediterranean. It is found along all the Atlantic coast of Africa to the Cape of Good Hope, and is also abundant in Australia and New Zealand, and on the west coast of South America.



Scad (*Caranx trachurus*).

Scæ'vola. Caius Mucius, a patriotic Roman who, during the siege by Porsena, tried to stab the Etrurian prince, but by mistake killed his secretary. Porsena ordered his would-be assassin to be burned alive; but when the Roman showed his contempt for pain by thrusting his right hand into a blazing fire and holding it there without flinching, Porsena ordered him to go free. By return courtesy Mucius told Porsena he was but the first of a band of 300 who had sworn to slay their country's enemy; and Porsena, startled by the prospect of having to face in succession a band of such reckless men, was, according to the legend, moved to make peace and depart. Mucius received the name of Scævola ('left-handed') in reference to his loss of the right, and proudly handed this cognomen down to his posterity.

Scafell, a double-peaked mountain in Cumberland, on the Westmorland border, 14½ miles SSW. of Keswick. The loftiest summit in England, it is a chief feature in the scenery of the Lake District (q.v.), in the heart and centre of which it stands. Of its two peaks, the higher, Scafell Pike, attains 3210 feet, the other 3161.

Scagliola, a composition made to imitate the more costly kinds of marble and other ornamental stones; and so successfully that it is often difficult to distinguish between the artificial and the real stone. It consists of finely-ground plaster of Paris mixed with a thin solution of fine glue, and coloured with any of the earthy colours, such as ochres, umber, Sienna earth, Armenian bole, and sometimes chemical colours, such as the chrome yellows, &c. This is spread over the surface intended to represent marble; and whilst still soft pieces of fibrous gypsum, marble, alabaster, and other soft but ornamental stones are pressed into it, and made level with the surface. When the composition is set hard it is rubbed down, and polished with the ordinary stone-polishing materials, which give it a very fine gloss. This kind of work is only adapted for interiors, because scagliola will not bear exposure to damp for any length of time;

but its lightness, and the extreme ease with which it may be applied to walls, pillars, pilasters, and even cornices, render it very useful for the decoration of the better class of dwellings and public buildings.

Scala, Della. See Verona, Scaliger.

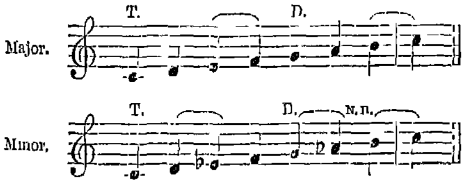
Scala Nova, called by the Turks Kuschadassi, a seaport of Asiatic Turkey, stands at the head of a gulf of the same name, 40 miles S. of Smyrna, and over against Samos, to which it is the nearest mainland port. The ruins of the ancient city of Ephesus (q.v.) are in the vicinity. Liquorice, 'halwa,' tobacco, and raisins are exported to the value of £124,000 a year, and clothing and groceries imported to the value of £40,000. Pop. 9000.

Scala Santa. See Lateran.

Scald-head (Chaucer, *scalled*, 'scabby') is the popular name of Favus (q.v.).

Scalds. See Burns.

Scale (It. *scala*, 'a ladder;' cf. Ger. *Tonleiter*, 'a ladder of sounds') is in Music any regular succession of sounds between one note and its octave which has been established by custom. The perfection of the octave interval (see Harmonics) is the natural reason why it has been chosen as the limit, but the scale itself varies, and has varied at different periods and in different countries. The most important of still existing scales which differ from the modern European are the *pentatonic*—the foundation of Chinese and other Oriental scales, as well as of Scotch and those of Celtic origin—and the Gregorian scales or 'modes' (see Music). The first can easily be illustrated by playing the black notes on a pianoforte, beginning from F♯; 'Auld Lang Syne' will serve as an example of a pentatonic air. The modern scales are *diatonic*—i.e. through the tones or steps ('degrees') of the ladder—and *chromatic*, which, proceeding by uniform degrees, includes all the twelve semitones into which the octave has been divided. Diatonic scales are major or minor according to the disposition of the tones and semitones. They may begin from any note in the octave, and are therefore twenty-four in number—twelve major and twelve minor. The scales of C are given as example. The semitone intervals are marked by brackets, those not so distinguished being tones, save that between A♭ and B in the minor scale, marked N.B., which is a tone and a half. T. indicates the tonic, D. the dominant.



For information about other forms of the minor scale, as well as the abstruse speculations of theorists as to the origin of scales, and philosophic justification of those which have been empirically selected, consult treatises on Harmony (Ouseley, 3d ed. 1883; Prout, 2d ed. 1890); also the scientific treatises of Logier, Helmholtz (*Tonempfindungen*), &c.

Scale Insect. See Coccus.

Scales. Besides the articles which precede and follow, see Balance, Weights and Measures, Degree, Graduation, Thermometer, Fahrenheit, Vernier; also Epidermis, Skin.

Scales, modifications of the skin especially characteristic of fishes and reptiles. Those of lizards and serpents are due to folds of the epidermis, the outer or horny layer of which is in various degrees hardened. So the scales of the pangolin and of the beaver's tail, or those which cover the legs and toes of many birds, are epidermic. On the other hand, the scales of most bony fishes (Teleostei) and of the Dipnoi are developed from the under skin or dermis, and are thus comparable to the little bony plates which occur in the skin of not a few lizards, to the large bony 'scutes' of the crocodilians and many extinct reptiles, and to the armature of the armadillos. A third type of scale is represented by the skin-teeth or 'dermal denticles' of Elasmobranch fishes, for in these, as in the teeth of the mouth, the epidermis forms an external coating of enamel, while the bony core and base are developed from the dermis. To this type the hard scales of some Ganoids (e.g. the sturgeon, bony pike) and a few Teleosteans are also to be referred. Dermal scales are of especial interest, for in a coalescence of these the 'investing bones' of the skull and shoulder-girdle had probably their origin. See Fishes, Skeleton.

Scales, Mathematical. Maps, estate plans, architectural, engineering, and other proportionate drawings are made to scale. An inch, for example, of the scale may represent a foot, yard, mile, or other length of the space to be shown. The first thing to be determined is the *representative fraction*, which shows the ratio between the scale and the object it represents, and should always be given with the scale. If the scale is to be of 1 inch to 8 miles, as there are 506,880 inches in 8 miles the representative fraction will be $\frac{1}{506880}$, which is usually printed on maps 1 : 506880. From this fraction a workable length of scale is easily found.

Fig. 1.—Simple Scale of 1 : 506880.

Suppose a scale showing 20 miles would be convenient to work from; as there are 1,267,200 inches in 20 miles, the proportion would be 506880 : 1 : : 1267200 : 2·5. But this result is usually more readily arrived at by taking the proportion of the original lengths instead of using the representative fraction. Thus, 8 : 20 : : 1 : 2·5. To make the scale, draw a line 2½ inches long. This line represents 20 miles. Bisect it, and each half shows 10 miles. Subdivide the half to the left into ten equal parts, and each of these tenths stands for 1 mile. This is a *simple scale* ready for use, and how it is usually drawn and figured is shown in fig 1.

The *diagonal scale* is a vertical subdivision over the simple one, and is an application of the principle in geometry that the sides about the equal angles of equiangular triangles are proportional. Suppose the further subdivision of miles into furlongs were required. Draw above the simple scale

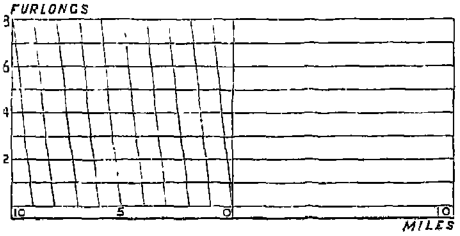


Fig. 2.—Diagonal Scale of 1 : 506880.

eight parallel lines at equal distances from each other (fig. 2). From its ends and point of bisection draw perpendiculars to the eighth of these parallel lines. Subdivide the left half of the eighth line as the same half of the simple scale is subdivided. Join the first subdivision of the uppermost line from its bisection with the point of bisection of the simple scale, and draw lines parallel to this one from the other nine points of subdivision. The space between the bisecting line and the diagonal nearest it on the first parallel shows one furlong, the space above it two, and so upwards according to the geometrical principle stated. Suppose 16 miles 6 furlongs were to be measured. Put the one leg of the divider on the right end of the sixth parallel line and the other where the diagonal line sixth from the centre cuts that parallel, and the length required is found. The diagonal scales on mathematical rules are generally engraved with ten parallel lines, so as to give subdivision of tenths, this being the most generally useful proportion.

The *comparative scale* involves no new principle. It is a scale drawn in a different denomination to the same representative fraction. A scale in leagues comparative to the scale in miles would be three times as long itself and in each of its subdivisions; and if the comparative scale were drawn to the same number of units it might be inconveniently long or short. Thus, a comparative scale showing 20 leagues to the representative fraction given above would be 7·5 inches, which might be too long for working purposes or to be exhibited in print or on the plan. But it is not necessary that the same number of units in the larger or smaller denomination be taken; and the length of scale for a convenient number is easily found by proportion. Thus, in a scale 40 Russian versts are represented by 4·5 inches; draw a comparative scale in English miles. Show 20 miles. Take the verst roundly as 1167 English yards. There are 1760 yards in a mile. In 40 versts there are 46,680 yards; in 20 miles, 35,200 yards. Then 46680 : 35200 : : 4·5 : 3·4. This line 3·4 represents 20 miles to the same representative fraction as the Russian scale of versts, and it can be divided and subdivided like the simple and diagonal scales above.

Scales of Notation, in Arithmetic, have to do with the representation of numbers of any magnitude by means of a few symbols. We ordinarily express numbers in terms of the first nine digit symbols and the symbol known as the cipher—i.e. ten in all. The number 'ten' is then represented by 10, a combination of the 'one' and cipher symbols, and so on in the familiar manner. Mathematically there is no reason why ten should be chosen in preference to any other number as the radix of our common scale of notation. Its convenience arises from the way in which it suits our numeration or naming of numbers. Historically the development of decimal arithmetic—of which our denary scale is the highest phase—is intimately connected with the fact that man has ten fingers. The full significance of the denary scale will be best seen if we take some other number, seven say, as the radix. Our object is now to express all numbers in terms of the cipher and the first six digits only. The number seven itself will be represented by 10, eight by 11, twelve by 15, fourteen by 20, forty-nine, or seven times seven, by 100, and so on. In other words, 49 to radix ten is the same *number* as 100 to radix seven. As another example take the number of days in the year, and let it be expressed in terms of scales whose radices are twelve, ten, seven, and three. Remembering that 365 to radix ten is a concise notation for $3 \times 10^2 + 6 \times 10 + 5$, we must, in order to express it in the duodenary scale, throw it into a simila form with twelve substituted for ten. We fin easily

$$\begin{aligned} 365 &= 30 \times 12 + 5 \\ &= (2 \times 12 + 6) \times 12 + 5 \\ &= 2 \times 12^2 + 6 \times 12 + 5. \end{aligned}$$

Hence 365 to radix ten is the same number as 26 to radix twelve. In the other cases we get

$$\begin{aligned} &365 \text{ to radix } \textit{ten} = 265 \text{ to radix } \textit{twelve} \\ &= 1 \times 7^3 + 0 \times 7^2 + 3 \times 7 + 1, \text{ or } 1031 \text{ to radix } \textit{seven} \\ &= 1 \times 3^5 + 1 \times 3^4 + 1 \times 3^3 + 1 \times 3^2 + 1 \times 3 + 2, \\ &\qquad\qquad \text{or } 111112 \text{ to radix } \textit{three}. \end{aligned}$$

These examples show that the simplicity of having a few symbols is balanced by the disadvantage of having to use long expressions for large numbers. The attempt to work in other than the denary scale is moreover greatly hampered by our lifelong habit of thinking and naming our numbers according to a decimal system.

The fact that there are twelve pence to the shilling and twelve inches to the foot has often suggested the introduction of the duodenary scale. According to this scale twenty-four feet nine inches would be represented symbolically by 20·9. To use this scale we should be compelled to invent two new symbols for what we call ten and eleven. But unless we altered our numeration so as to be in accord with the symbolism, the method would be impracticable. For example, we should have to rename *fourteen* and *twenty-six* so as to bring them into line with their duodenary symbols 12 and 22. At present in all calculations involving shillings and pence or feet and inches we are compelled to *work* partly in the duodenary scale; but the numbers themselves are expressed both symbolically and verbally according to the denary scale and decimal nomenclature. As a matter of history the denary scale is the only one that has ever been used purely; to establish any other would necessitate a complete revolution in modes of thought and habits of language.

Very similar to the mixture of decimals and duodecimals in the examples just given is the method of sexagesimals, which still survives in the subdivision of hours and degrees. There are sixty minutes to the hour (or degree), and sixty seconds to the minute. This method is of great antiquity, and had no doubt an astronomical origin. To the early astronomers it offered special facilities for calculation and for representation of fractions. It was used extensively by Ptolemy and the Alexandrian mathematicians, who employed for symbols the usual Greek numerals as far as the symbol for sixty (see NUMERALS). At its best, however, the sexagesimal notation must have been very cumbersome, even when assisted, as it probably was, by use of the Abacus (q.v.). It is evident that it does not form a pure scale; to do so sixty distinct symbols including the zero would be required. The Alexandrians no doubt borrowed the system from the Chaldeans. In the older Babylonian inscriptions there is found a sexagesimal notation identical, in so far as it is a notation, with that used by Ptolemy and his school. The symbolism is of course quite different, all numbers being represented by appropriate combinations of two cuneiform characters. The numbers up to nine are represented each by the proper number of the simple wedge-shaped character. *Ten* is symbolised by the angle-shaped character, two of which give twenty, three thirty, four forty, and five fifty. *Sixty*, however, is represented by the same simple character as one; five times sixty, or 300, by the same character as five, and so on. The famous tables of Senkereh contain the squares and cubes of all numbers from 1 to 60, expressed in terms of this sexagesimal notation. A few examples will suffice. Thus we find

 given as the square of —i.e. $48 \times 60 + 36 = 2916 = (54)^2$.

We may most simply exhibit the Babylonian method by using heavy figures for the tens and light figures for the units. Thus the above example would be translated **4**8**3**6 = square of **5**4. Others from the table of Senkereh are

$$12153 = \text{cube of } 17$$
$$(1 \times 60^2 + 21 \times 60 + 53 = 4913 = 17^3)$$
$$73 = \text{cube of } 3 \text{ (i.e. thirty)}.$$

This last must mean $7 \times 60^2 + 30 \times 60$, although there is nothing in the notation to show what *place* in the sexagesimal representation is to be occupied by the 3 (or thirty). The example is instructive as showing how far short the Accadians and Assyrians fell of our modern cipher system. It is clear, however, that they were in possession of a sexagesimal scale as true and as complete as the much later Alexandrians. It was used probably only for purposes of calculation; for in simply representing numbers the Assyrians, if not the earlier Accadians, used another scale, in which a special symbol for the hundred was introduced. In this scale, however, the sexagesimal symbolism for 60, 70, 80, and 90 was retained. In the later cuneiform inscriptions of the Persians all trace of the sexagesimal scale is obliterated.

Scaliger (Ital. *Della Scala*, Fr. *De l'Escale*), CÆSAR JULIUS, according to the account given of him by the famous son Joseph Scaliger, was born in 1484 in the castle of Ripa, at the head of the Lago di Garda, in the north of Italy. On the same authority we are told that Julius was the second son of Benedetto della Scala, a descendant of the princely family of Verona of that name, which had been dispossessed of its territory by the republic of Venice. In all probability this genealogy is a pure fiction, as in Julius' letters of naturalisation as a French citizen he is styled simply 'a native of the town of Verona in Italy.' If we may trust his son's further account of him, Julius was bred to the profession of arms along with other noble youths under the immediate supervision of his kinsman the Emperor Maximilian, whom he subsequently served in his wars in different parts of Europe. The son of a fallen house, he was at one time so hopeless of his future that like other noble youths of Italy in similar circumstances he seriously thought of entering the brotherhood of St Francis. With this object he proceeded to the university of Bologna, where he devoted himself mainly to the study of Duns Scotus. His zeal for a monastic life, however, soon cooled, and 'to the last day of his life he would never willingly interchange a word with any Franciscan.' Returning to his former profession of arms, he took service in the French armies then attempting the conquest of Italy, and distinguished himself alike by his marvellous feats of strength and his adventurous courage. Having gained the command of a troop of light horse, he behaved with such gallantry as to win for him the special notice of King Francis himself. Notwithstanding his restless life Scaliger never neglected his studies, and to other attainments he added a knowledge of medicine and Greek. Such is the account of Julius Scaliger up to this point in his life which is given by his son in the epistle entitled 'De Vetustate et Splendore Gentis Scaligeræ et Jul. Cæs. Scaligeri Vita.' An account more likely to be true is that Julius was the son of a sign-painter of Verona, by name Benedetto Bordone, and that he studied at Padua, where he took the degree of doctor of medicine.

It is only from his naturalisation as a French citizen in 1528 that our knowledge of Scaliger is drawn from authentic sources. In that year, on the invitation of the Bishop of Agen, he settled in that town as a physician, and remained there for the rest of his life. Here he married a girl of nineteen, Andiette de Roques Lobejac, by whom he had fifteen children. The best-known circumstance of his later life is his attempt to gain notoriety by an unscrupulous attack on Erasmus, the foremost scholar and man of letters of the age. In ridicule of the Latin stylists of Italy Erasmus had published a satire entitled *Ciceronianus*. Construing this satire as a censure of Cicero himself, Scaliger attacked Erasmus (1531) in an oration which for sheer wantonness of abuse is unparalleled even in that age of unscrupulous controversy. As Erasmus paid no heed to this attack, Scaliger produced a second oration which in brutal scurrility surpassed even his former effort, but before its publication Erasmus was dead. Into all his work, much of which was of undoubted value, Scaliger carried the same coarse and jealous temper. Yet his son Joseph, while frankly admitting his father's faults, which, indeed, were largely his own, claimed for him an essential nobility of character, and an especial hatred of everything that suggested falsehood or hypocrisy. Engaged to the last in his labours as a scholar, Julius died in 1558, under suspicion of decided leanings towards the religious teaching of Calvin.

As a scholar Scaliger's fame has been overshadowed by that of his greater son. His vast attainments, however, and his natural force of mind have been admitted by every generation of scholars. But what Lessing said regarding one of his works (*Poetices libri septem ad Sylvium filium*) is the accepted opinion regarding them all: 'Scaliger's judgments as often show want of sanity and taste as insight and good sense.'

For the Life of Julius Scaliger, see the epistle of his son above referred to; Charles Nisard, *Les Gladiateurs de la République des Lettres* (1860); Bourousse de Laffore, *Étude sur Jules César de Lescale* (Agen, 1860); Magen, *Documents sur Julius Cæsar Scaliger et sa famille* (Agen, 1873). Exclusive of his Latin poems, Scaliger's chief works are *De Causis Linguæ Latinæ libri tredecim; Exotericarum Exercitationum liber quintus decimus de Subtilitate ad Hieronymum Cardanum; Poetices libri septem ad Sylvium; Commentarii in sex libros de causis Plantarum Theophrasti; Animadversiones in Theophrasti Historias plantarum; Aristotelis Historia de Animalibus, J. C. Scaligero interprete, cum ejusdem Commentariis; Commentarii in Hippocratis Librum de Insomniis.*

Scaliger, JOSEPH JUSTUS, the tenth child and third son of the foregoing, was born at Agen, in the district of France then known as Guyenne, in 1540. At the age of eleven he was sent to the Collége de Guyenne at Bordeaux, then, according to Montaigne (himself one of its scholars), the best institution of its kind in France. Owing to the outbreak of one of the many plagues which then devastated that part of the country, in 1555 he returned home, where he remained till his father's death some three years later. Julius Scaliger was too old to give his son methodical instruction; but indirectly the boy profited by his father's attainments. In accordance with the practice of almost all the scholars of the 16th century, the elder Scaliger was an indefatigable writer of Latin verse. Almost daily he was in the habit of dictating from 80 to 200 lines of his own composing, which it was the business of his son to copy. Daily also the boy had to present to his father a Latin theme on any subject which he himself might choose. Thus, without the regular training of other boys, Joseph early acquired that mastery of the mechanism of Latin prose and verse in which he surpassed all the scholars of his time.

Shortly after his father's death Scaliger proceeded to the university of Paris with the special purpose of acquiring the Greek language, with which he had as yet no acquaintance. The teacher whom he sought was Adrian Turnebus, since the death of Budæus the first Greek scholar in Europe. After two months' attendance in the class of Turnebus, Scaliger discovered, to his mortification, that he was too ignorant to profit by it. With the invincible resolution which was the basis of his character, he shut himself up in his own room and set himself to master the elements of the language. His method of procedure and its extraordinary result have a place among the anecdotes of scholarship. With the help of a Latin translation he read through Homer in twenty-one days, making a grammar for himself as he went along. From Homer he proceeded to the other Greek poets, and in four months he had gone through the whole series. Encouraged by his success with Greek, he next attacked Hebrew, but of Hebrew, according to his best biographer, Bernays, he never acquired that mastery which he showed in the case of Latin and Greek. Eventually he boasted that he spoke thirteen languages, ancient and modern. It is to be noted, however, that he acquired these languages, not in the vain spirit of a mere polyglot, but with the aim of a scientific scholar, who realised that the language and literature of one people are indispensable to the thorough understanding of another. Scaliger remained four years at the university of Paris, but of this period of his life only one notable circumstance is related. It was at this time that he adopted the Protestant faith, a change which eventually proved of the first importance in the subsequent direction of his life.

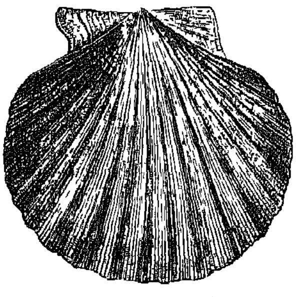
In 1563 he was invited by Louis Chastaigner de la Roche-Pozay to join him in the capacity of travelling companion, and with the family of this noble he was more or less closely connected for the next thirty years. In 1565 he accompanied Roche-Pozay to Italy, of whose scholarship and religion he received the most unfavourable impression. Of England, which they next visited, Scaliger formed an equally unfavourable opinion. Scotland was also included in their tour, but of the Scots he speaks more kindly, specially mentioning the beauty of their ballads. In 1570 he settled at Valence in Dauphiné, where for about two years he studied under the great jurist Cujacius. From 1572 to 1574 he was in Geneva in the capacity of professor in the academy established there by Calvin. Returning to France, he found a home in the family of Roche-Pozay for the next twenty years. It was the period of the Huguenot wars, and Scaliger, like the rest of his countrymen, suffered from the confusions of the time. It was during these years, however, that he produced a series of works which placed him at the head of European scholars. Among them may be mentioned his editions of Catullus, Tibullus, and Propertius, his commentaries on which are equally remarkable for their learning and spirit of vainglorious assumption. But the works which definitively established his reputation were his edition of Manilius in 1579 and his *De Emendatione Temporum* in 1583. By these works he founded the science of modern chronology, an achievement unsurpassed in the history of scholarship. This labour he crowned by his edition of Eusebius in 1606.

In 1593, on an invitation from the Netherlands in the highest degree flattering to his vanity, Scaliger went as successor to Justus Lipsius in the university of Leyden, where he remained for the rest of his life. Though his connection with the university was almost nominal, it is to his example and inspiration that Holland owes her long line of scholars during the 17th and 18th centuries. Scaliger's last years were embittered by controversies which he had himself largely provoked by his indifference to the feelings of others. His chief enemies were the Jesuits, who regarded him as the most formidable foe of their order. In Gaspar Scioppius they found a match for Scaliger himself in the use of trenchant Latin, and one, moreover, who carried the qualities of a hired bravo into the domain of letters. The vulnerable point in Scaliger's coarse nature was his pride in his descent from the family of La Scala. In what is perhaps the most unscrupulous lampoon in literature, Scioppius, in his *Scaliger Hypobolimæus* ('The Supposititious Scaliger'), held the great scholar up to Europe as a baseborn impostor, a profligate, and an atheist. Scaliger wrote a reply; but it was ineffectual against the poisoned weapons of Scioppius. It is generally accepted that the attack of Scioppius hastened Scaliger's death. He still continued his labours, indeed, but his spirit was broken, and he died in 1609, in the arms of his favourite scholar Heinsius.

By his combined knowledge, sagacity, and actual achievement, Scaliger holds the first place among the scholars of all times. 'More than any one before or after him,' says Bernays, 'he approached to a complete conception of the life of antiquity.' To the same effect is the statement of Niebuhr, that 'Scaliger stood on the summit of real and universal knowledge, as no one after him has done.' In his personal character Scaliger was vainglorious, overbearing, and exacting to the verge of absurdity. It was his single-minded devotion to learning, his love of truth, his noble independence of spirit that redeemed a nature essentially coarse and unlovable.

See Jacob Bernays, *Joseph Justus Scaliger* (Berlin, 1855); Charles Nisard, *Juste Lipse, Joseph Scaliger, et Isaac Casaubon* (Paris, 1852); Tamizey de Larroque, *Lettres françaises inédites de Joseph Scaliger* (Agen, 1881); Mark Pattison, *Essays*, edited by Henry Nettleship, M.A. (vol. i. Oxford, 1889). It was Pattison's intention to write a biography of Scaliger; but the fragments that appear among these essays are all that he actually accomplished of his book. A list of Scaliger's works and their various editions is given by Bernays.

Scallop (*Pecten*), a well-known bivalve, one of those with a single muscle closing the shell. The valves are fan-shaped, the left often more or less flat, the right more markedly arched; both are marked with sinuous radiating ridges, to which the name Pecten (Lat., 'a comb') refers. The hinge-line is without teeth, and is extended laterally in two ears. The beautiful colouring of the shells is remarkable even among bivalves. On the margins of the mantle there are hundreds of small sparkling eyes of different degrees of visual efficiency. The small finger-shaped foot is usually marked with bright orange or red colour. The scallops are widely distributed in all seas, at depths of 3 to 40 fathoms. When young they are active and able to swim a little by rapidly opening and closing their valves, but as they grow older they become more sedentary, and are often found thickly covered with acorn-shells, serpula-tubes, and zoophytes. Many species attach themselves by a



Pecten opercularis.

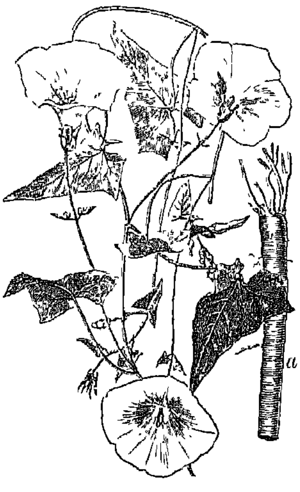
byssus secretion, but often this disappears in adult life. Some of the larger species are often popularly called *clams*, a name shared by other bivalves. *P. Jacobæus*, a native of the Mediterranean, is the Scallop-shell which pilgrims were accustomed to wear in front of their hat in token of having visited the shrine of St James at Compostella. *P. maximus*, found on many parts of the British coasts, is about 6 inches broad. It is sometimes eaten, but is said to be indigestible. About 180 living species are known, and over 400 are recorded as fossils from Carboniferous strata.

Scalp, the term employed to designate the outer covering of the skull or brain-case. Except in the fact that hair in both sexes grows more luxuriantly on the scalp than elsewhere, the skin of the scalp differs so slightly from ordinary Skin (q.v.) that it is unnecessary to enter into any details on this point. But besides the skin the scalp is composed of the expanded tendon of the occipito-frontalis muscle, and of intermediate cellular tissue and blood-vessels. Injuries of the scalp, however slight, must be watched with great caution, for they may be followed by erysipelas, or by inflammation and suppuration under the occipito-frontal muscle, or within the cranium, or by suppuration of the veins of the cranial bones, and general pyæmia that may easily prove fatal If dressed antiseptically at an early stage the risk of such accidents is of course greatly diminished. In the treatment of a wound of this region no part of the scalp, however injured it may be, should be cut or torn away; and, if possible, the use of stitches should be avoided, as plasters and bandages will generally suffice to keep the separated parts in apposition. The patient should be confined to the house (and in severe cases to bed), should be moderately purged, and fed upon non-stimulating but not too low diet. Burns of the scalp are very liable to be followed by erysipelas and diffuse inflammation, but the brain is comparatively seldom affected in these cases. Tumours of the scalp are not uncommon, the most frequent being the cutaneous cysts popularly known as *Wens* (q.v.), and vascular tumours. See HAIR; and for diseases of the scalp, see BALDNESS, and other references given at HAIR.

SCALPING is the act, peculiar to North American Indian warfare, of partly cutting, partly tearing off a piece of the skin of the head, with the hair attached; whether the victim is alive or dead at the time does not affect the operation. The Indians, with whom scalps are the trophies of victory, have always left a long lock or tuft on the scalp as a challenge. Bounties have, in American history, more than once been offered for scalps: in 1724 £100 was offered by Massachusetts for Indian scalps; in 1754, during the French and Indian war, a bounty was offered by the French for British scalps, and £100 by the Colonies for Indian scalps; in 1755 Massachusetts offered £40 for every scalp of a male Indian over twelve years old, and £20 for scalps of women and children; &c.

Scamander, the ancient name of a river in the Troad (see TROY), which was also called Xanthus (Gr., 'yellow') by the gods. As a divinity Scamander took an important part in the Trojan war through its destructive floods. The river rose in Mount Ida and discharged itself into the Hellespont, after being joined by the Simois about two miles from its mouth: the two rivers, however, since the 1st century A.D. have had separate courses. There has been much controversy as to what modern river corresponds to the ancient Scamander; but recent investigators have decided in favour of the Mendereh.

Scammony is a gum-resin of an ashy-gray colour, and rough externally, and having a resinous, splintering fracture. Few drugs are so uniformly adulterated as scammony, which, when pure, contains from 81 to 83 per cent. of resin (the active purgative ingredient), 6 or 8 of gum, with a little starch, sand, fibre, and water. Ordinary adulterants are chalk, flour, guaiacum, resin, and gum tragacanth. Scammony, when pure, is an excellent and trustworthy cathartic of the drastic kind, well adapted for cases of habitual constipation, and as an active purgative for children. The resin of scammony, which is extracted from the crude drug by rectified spirit, possesses the advantage of being always of a nearly uniform strength, and of being almost tasteless. The *Scammony Mixture*, composed of four grains of resin of scammony, triturated with two ounces of milk, until a uniform emulsion is obtained, forms an admirable purgative for young children in doses of half an ounce or more. According to Christison, 'between 7 and 14 grains of resin, in the form of this emulsion, constitute a safe and effectual purgative' for adults. Another popular form for the administration of scammony is the *Compound Powder of Scammony*, composed of scammony, jalap, and ginger, the dose for a child being from 2 to 5 grains, and for an adult from 6 to 12 grains. Scammony is frequently given surreptitiously in the form of biscuit to children troubled with thread-worms.



Scammony (*Convolvulus Scammonia*): *a*, portion of root (Bentley and Trimen).

The plant which produces this valuable drug is *Convolvulus Scammonia* (see CONVOLVULUS), a native of the Levant. It is a perennial, with a thick fleshy tapering root, 3 to 4 feet long, and 3 to 4 inches in diameter, which sends up several smooth slender twining stems, with arrow-head-shaped leaves on long stalks. The root is full of an acrid milky juice, which indeed pervades the whole plant. The scammony plant is not cultivated, but the drug is collected from it where it grows wild. The ordinary mode of collecting scammony is by laying bare the upper part of the root, making incisions, and placing shells or small vessels to receive the juice as it flows, which soon dries and hardens in the air.

Scandalum magnatum, in English law, means slander against the great men of the realm, an offence which consisted in spreading false reports concerning a peer, judge, or other great officer. The statute of 1275 which created this offence was repealed in 1887, and the special forms of action or criminal process formerly in use are superseded by the more general rules of the law relating to Libel (q.v.) and Slander (q.v.). A somewhat similar offence in Scotland is called Leasing-making (q.v.).

Scanderbeg, i.e. Iskander (Alexander) Beg or Bey, the patriot chief of the Albanians, was born in Albania about 1403, but his parents were both of Servian descent. By the Christians he was commonly called George Castriot, though the Servian family name was Branilo. Young George was carried away by the Turks when only seven years of age, and was brought up in the creed of Islam. His personal prowess and skill as a military leader made him a favourite with Sultan Murad (Amurath) II., who gave him the command of a division in the Ottoman armies. But when about forty years of age he took a momentous step, which he had some time been meditating: after the Turks were repulsed by the Hungarian forces at Nissa (Nisch) in 1443, Scanderbeg deserted with three hundred Albanian followers, having first extorted from the sultan's secretary an order to the governor of the mountain fortress of Croya (Ak-hissar) that he was to hand over that stronghold to him (Scanderbeg). From that time the Albanian chief, who now renounced Islam for Christianity, the creed of his fathers and his countrymen, was an unrelenting foe to the Turks; they never beat him but once, and his name grew to be a terror to their soldiery. In less than a month after the capture of Croya the whole of Albania was up in arms, and the Turkish garrisons had been seized or compelled to retire out of the country. Early in the following year the Albanian chiefs unanimously elected Scanderbeg their leader. He collected an army of 15,000 men, and with them nearly annihilated in the defiles a Turkish force of 40,000; and other columns shared the same fate in the succeeding campaign. The years 1446–48 were chiefly occupied with a fierce war against Venice. At length Amurath II. himself took the field (1449) with 150,000 men; but the little hill-fort of Sfetigrad successfully defied him until he had lost 30,000 soldiers, and then it was only taken through treachery. And being after that effectually foiled before the walls of Croya, the sultan withdrew in disgust. These splendid achievements brought to Scanderbeg congratulations, as well as material assistance in stores and volunteers, from the potentates of Italy and Hungary; but none of them sent the brave leader an army, or took up the war with him. The proud Albanian chiefs too began to fall away, mainly because of Scanderbeg's manifest purpose of aggrandising his own family and enlarging its power; some of them even went over to the enemy and led Turkish armies against him. But he nevertheless continued to crush every force that the Turks poured into the mountain fastnesses of Albania, or stationed near its frontiers. At length in 1461 a truce of ten years was concluded between the combatants. Two years later, however, at the instigation of Pope Pius II., who tried in vain to league the Christian princes together against the all-conquering Ottomans, Scanderbeg renewed the war, and again defeated every force that dared to attack him. Even Mohammed II., conqueror of Constantinople, conducted two campaigns in person against the invincible chief, and retired baffled both times, on the first after losing 35,000 men before Croya. Scanderbeg died at Alessio on 17th January 1468, of malarial fever, doubtless also worn out by a quarter of a century's fierce and incessant fighting. He was personally a man of tall stature and commanding appearance, terrible in battle, inflexible in resolution, of wonderful activity, and full of resource, a man whom victory did not demoralise, nor desertion dishearten; nor was natural kindliness wholly destroyed by the savage nature of the strife he was engaged in. There can be no doubt that for a time he broke the force of Moslem irruption, and had he been adequately supported would have inflicted some permanent injury upon the Turkish power. After his death the Albanian opposition speedily collapsed—an incontestable proof of Scanderbeg's genius. See C. Paganel, *Histoire du Scanderbeg* (1855), and the *Edinburgh Review* (October 1881).

Scanderoon, or ALEXANDRETTA (*Iskanderun*, 'Alexander's town'), the port of Aleppo, stands on the east shore of the Gulf of Scanderoon, in the extreme north-east of the Levant, 30 miles N. of Antioch, and 77 NW. of Aleppo. It is a poor and unhealthy place, of some 1500 inhabitants, with a large but neglected harbour. Nevertheless it has a transit trade worth £2,601,600 a year—£1,698,200 being for imports destined for Aleppo and the towns of northern Syria, and £903,400 for exports, chiefly wool, specie, native manufactures, cereals, leather and hides, cattle, butter, &c., galls and yellow berries, pistachio nuts and raisins, liquorice root, copper ore, and silk cocoons. The imports consist principally of manufactured goods (two-thirds of the total), cloth, groceries, indigo, specie, metals, leather and hides, silk, drugs, &c. Britain's share of the whole is 31½ per cent.; next comes Turkey with 19 per cent. Alexandretta was founded by Alexander the Great to commemorate his victory of Issus (333 B.C.). Off here Sir Kenelm Digby defeated a Franco-Venetian squadron (1628); and close by the Egyptian Mehemet Ali defeated the Turkish troops in 1832.

Scandinavia, a large peninsula in the north of Europe, bounded on the N. by the Arctic Ocean, on the W. by that branch of the Atlantic now called the Norwegian Sea, and on the S. and E. by the Baltic Sea and the Gulf of Bothnia. The character of the country, its physical features, industries, &c., are given under NORWAY and SWEDEN. In a historical sense Scandinavia includes Denmark and Iceland, and in a literary sense besides these the intellectual productions of the Swedish race in Finland. For the languages and literatures of Scandinavia, see ICELAND, NORWAY, SWEDEN, DENMARK, and EDDA.

Scandinavian Mythology. The sources to be examined in regard to Scandinavian mythology are many and varied. Throughout the Scandinavian countries are found monumental stones on which runic inscriptions have been written in heathen times. Of these 'runic monuments' no less than three folio volumes have been published by George Stephens, a work of great importance to the student of mythology. From heathen Germany we have a few ancient laws, and a few glossaries containing mythological words. The *Lex Salica*, of which we have a Latin translation, was doubtless originally produced in the German tongue. Then there are formulæ by which the new converts to Christianity renounced the old gods, and in which names of heathen divinities therefore occur. But precious though it be, the amount of mythological information to be gathered from these and similar sources is very small. A richer vein of information is the tolerably well-represented collection of German heroic poems, among which the most important are the Niblung story and Gudrun. The Heliand preserves a number of heathen phrases and figures of speech. The Anglo-Saxon Beowulf poem would be more valuable had not the transcriber conceived it to be his duty to omit the names of the heathen gods occurring in the lay. Iceland is the Mecca to which all must turn who would understand the Odinic religion; Iceland is the Patmos where Scandinavian mythology was recorded. There we find a large mythological literature put in writing after the introduction of Christianity (1000 A.D.), and after the people had adopted the Roman

Copyright 1892 in U.S. by J. B Lippincott Company.

alphabet, but still written in the spirit of the asa-faith, 'naught extenuating and putting down naught in malice.' The most important of the Icelandic documents are the Elder or Poetic Edda and the Younger or Prose Edda. The Heimskringla, completed by Snorre Sturlason about the year 1230, contains much information concerning Scandinavian heathendom, for it gives a very elaborate account of the introduction of Christianity in the north, portraying the conflict between the old and the new religion, and begins with sketches of a number of kings who ruled Norway 140 years before the introduction of Christianity. Hence valuable information may be found in that work not only in regard to the rites and ceremonies prescribed by the Odinic ritual, but also of the morals and habits inculcated and produced by the Odinic code. Several of the Icelandic sagas are also of value in this respect. Cæsar and Tacitus furnish some important data, and next after them come the Christian writers down through the foggy and dark middle ages, who wrote in Latin; but the very small amount of mythological information contained in their books is due in part to their ignorance, but mainly to their hostility to the heathen religion. Among this class of writers Denmark presents a remarkable exception in Saxo Grammaticus, who lived in Denmark in the 12th century. He wrote a *Historia Danica*, and embodied in it an outline of Scandinavian mythology based on old songs. But he presents it as history, assuming Odin, Thor, and the other deities to have been kings and potentates in the north. The first eight books of his history are exclusively mythological. Saxo had a world of valuable light, though he himself saw nothing. Finally the student of Scandinavian mythology must look for fragments of Odinism in the customs, habits, speech, traditions, ballads, folklore tales, and in the usages of the Christian churches throughout Teutondom.

It was Time's morning
When Ymer lived;
There was no sand, no sea,
Nor cooling billows;
Earth there was none,
No lofty heaven;
No spot of living green;
Only a deep profound.

Thus the Elder Edda. The beginning was this: Many ages ere the earth was made there existed two worlds. Far to the north was Niflheim—i.e. the nebulous world, and far to the south was Muspelheim—i.e. the fire world. Between them was Ginungagap, the yawning deep. In the middle of Niflheim lay the spring Hvergelmer, and from it flowed twelve ice-cold streams called the Elivogs (Elivagar), of which Gjol was situated nearest Hel's gate. Muspelheim was so bright and hot that it burned and blazed, and could only be entered by those who had their home there. In the midst of this intense light and burning heat sat Surt, guarding its borders with a flaming sword in his hand. The Elivogs flowed far from their spring-head in Hvergelmer into Ginungagap, and the venom they carried with them hardened as does dross from a furnace, and became ice. Vapours gathered and froze to rime, and thus were formed in the yawning gap many layers of congealed vapour. But the south side of Ginungagap was lighted up by sparks from Muspelheim. Thus, while freezing cold and gathering gloom proceeded from Niflheim, the other side of the gulf was exposed to the dazzling radiance and scorching blasts from Muspelheim, and when the heated blasts met the frozen vapours they melted into drops, and, *by the might of him who sent the heat*, these drops quickened into life and took the form of a giant man. His name was Ymer, and he became the progenitor of all the evil race of giants. At the same time and in the same manner sprang into life a cow, Audhumbla, by whose milk Ymer was nourished. The cow fed herself by licking the salt rime on the rocks, and at the end of the first day she produced by licking the stones a man's hair, on the second evening a head, and on the third evening a perfect man. His name was Bure. He was fair, great, and mighty. He begat a son by name Bor. Bor married the giantess Bestla, and she bore him three sons, Odin, Vile, and Ve (Spirit, Will, and Holiness), and Odin became the father of the gods, who rule heaven and earth. The three brothers, Odin, Vile, and Ve, slew the giant Ymer, and when he fell so much blood flowed that all the race of giants were drowned excepting Bergelmer and his wife, who escaped in a boat and perpetuated their race. The three sons of Bor dragged Ymer's body into Ginungagap, and out of it they made the world: of his flesh the land, of his blood the ocean, of his bones the rocks, of his hair the forests, of his skull the vaulted sky, which they decorated with red hot flakes from Muspelheim to serve as sun, moon, and stars. Ymer's brain they scattered in the air, and made of it the melancholy clouds. Dwarfs quickened like maggots in Ymer's flesh. But there were yet no human beings upon the earth. One day Odin, Hœner, and Loder were walking by the sea, and found two trees, an ash and an elm. They made of them the first man and woman. Odin gave them the breath of life (*ond*), Hœner gave them feeling (*ód*), and Loder gave them blood and the form (image) of the gods (*lá ok lito góda*). The man they called Ask and the woman Embla, and from them are descended the whole human family.

It is worthy of note that the world does not pass from chaos to cosmos. The old Scandinavians took a step farther back into primeval time, and conceived first a *pre-chaotic* state (Muspelheim, Niflheim, and Ginungagap), then a *chaotic* epoch (Ymer, Audhumbla, Bure, Bor, Bestla, Bolthorn, Odin, Vile, and Ve), and finally *cosmos* made from Ymer slain. The gods belonging to the Asgard pantheon and also giants came into being in the chaotic epoch. Odin was born in chaos. But the Scandinavian mythology conceived living and life-giving beings in the pre-chaotic age also. Surt guarded Muspelheim before any creation or birth had taken place. Surt is also the last figure who appears in Ragnarok, where he flings fire and flame over the world, and he is the last one who appears in that terrible act of the drama. The Edda says that Nidhug, a terrible serpent, dwelt in Hvergelmer in Niflheim. Venom flowed with the Elivogs rivers out of Hvergelmer. This points to an evil being in pre-chaotic Niflheim. This dualism in the pre-chaotic epoch is a very interesting point in Scandinavian mythology. The Odinic pantheon has twelve gods to whom divine worship is due, and there are twenty-six goddesses. The twelve gods are Odin, Thor, Balder, Hermod, Tyr, Brage, Heimdal, Hoder, Vidar, Uller, Vale, and Forsete. The asa-god Hœner disappears from the circle of gods, having been given as a hostage to the Vans. To the number of gods must however be added Njord and Frey, who originally were Vans, and also Loke, who was of giant descent, but had entered into foster-brotherhood with Odin himself, and was adopted by the gods. Chief among the goddesses is Odin's wife Frigg; Thor's wife is Sif, Balder's is Nanna, and Brage's is Idun. Freyja is the goddess of love. The gods and goddesses dwell in Asgard, but nearly every one has a separate dwelling. Odin's high-seat is in Hlidskjalf, whence he looks out upon all the nine worlds. He also has a large hall, the famous Valhal, whither he invites all men fallen in battle. Thor lives in Thrudvang, Balder in Breidablik.

Concerning the different gods, and particularly about Thor, Odin, Balder, and Frey, there are a number of myths giving accounts of their exploits.

The most poetical and significant myth is that of the great world-tree, the ash Ygdrasil. It is the tree of existence, the tree of life and knowledge, the tree of grief and fate, the tree of time and space; it is the tree of the universe. This tree has three roots extending into the three principal worlds. The lowest strikes down into Niflheim into the well Hvergelmer, where it is gnawed by the ancient dragon Nidhug and all his reptile brood. The second root stretches into Jotunheim to the fountain of Mimer, where wisdom and wit lie hidden, and of whose waters Odin once purchased a draught, leaving one of his eyes as a pledge with Mimer. The third root is found in Asgard among the gods, near the sacred fountain of Urd the norn of the past, where the gods sit in judgment, riding thither daily over the Bifrost bridge—i.e. the rainbow. At this fountain dwell the three norns Urd *(the Past)*, Verdande *(the Present)*, and Skuld *(the Future)*, and dispense the destinies of men. They weave the web of men's lives. It is a web of golden thread from east to west, from the radiant dawn to the glowing sunset of man's horizon. The woof of this web is fixed in the far north, but the web woven by Urd and Verdande is torn into pieces every evening by Skuld. The branches of Ygdrasil spread over the whole world and aspire above heaven itself. An eagle is perched on the topmost bough, and between his eyes a hawk. A squirrel called Ratatosk runs up and down the tree seeking to cause strife between the eagle and Nidhug. Four stags leap beneath its branches, and feed on its buds. Two swans swim in the Urd fountain, and everything placed therein becomes as white as the film of an egg-shell. The norns draw water from the spring, and with it they sprinkle Ygdrasil in order that the boughs may continue green in spite of the destructive agencies that constantly assail it. Honey-dew falls from Ygdrasil, and is food for the bees. Odin hung nine nights on this tree and offered himself to himself.

In Scandinavian mythology there is a very elaborate development of the evil principle. The dragon Nidhug and his brood originated in Hvergelmer in Niflheim. The giant descendants of Ymer were evil, and they did not all perish in his blood-deluge, for Bergelmer and his household escaped and produced a numerous offspring, with whom Thor and the other gods carried on a constant war. *But the great type or representation of evil is Loke.* He is the instigator of all the misfortunes that have happened both to gods and to men. He is of giant race, but was adopted by the gods, and was already in the dawn of time a foster-brother of Odin. The countenance of Loke is fair, but his disposition is thoroughly bad. Loke frequently accompanies the gods, and they make use of his strength and cunning, and when out of sight he usually plots with the giants for the purpose of bringing ruin upon the gods. He became the father of three terrible children in Jotunheim—i.e. in the home of the giants. These are (1) the Fenriswolf, (2) the Midgard-serpent, and (3) Hel, the goddess of death. The gods knew that these children of Loke were growing up, and would some day cause them great mischief. Therefore they bound the Fenriswolf on a barren island, and put a sword in his open-stretched mouth; but for this the god Tyr had to sacrifice his right hand. They cast the Midgard-serpent into the deep sea, where he encircles the whole earth and bites his own tail. Thor was at one time out fishing with the giant Hymer. He caught the Midgard-serpent on his hook, and would have slain him with his hammer Mjolner had it not been for the giant Hymer, who got frightened and cut the fishing-line just at the moment when Thor had his hammer raised to strike. The third child of Loke, Hel, goddess of death, was thrown into Niflheim, and Odin commanded that all who died of sickness or old age should go to her, while warriors slain in battle were borne on Valkyrian arms to Valhal. Hel's dwelling is called Helheim, and is large and terrible. Her realm in the lower world is divided into nine abodes, one below the other, and it is in the lowest of these that her palace is, called Anguish, her table Famine, her waiters Slowness and *Delay, the threshold Precipice*, and the bed Care. The English word *hell* is of course intimately connected with her name.

Loke caused the greatest sorrow to gods and men when by his cunning he brought about the death of the good Balder. Balder was the favourite of all nature, of the gods and of men. He was the son of Odin and Frigg, and the Edda says that he is the best god and that all mankind are loud in his praises. So fair and dazzling is he in form and feature that rays of light seem to issue from him, and we may form some idea of the beauty of his hair when we know that the whitest of all flowers is called Balder's brow. Balder is the mildest, the wisest, and the most eloquent of the gods; yet such is his nature that the judgment he has pronounced can never be altered. He dwells in the heavenly mansion called Breidablik ('broad-shining splendour'), into which nothing unclean can enter. Balder was tormented by terrible dreams indicating that his life was in danger. He told his dreams to his fellow-gods, who resolved to conjure all things animate and inanimate not to harm him, and accordingly Odin's wife Frigg took an oath from all things that they would do Balder no harm. But still Odin felt anxious, and having saddled his eight-footed horse Sleipner, he rode down to Niflheim, where he waked the vala or seeress, and compelled her to give him information anent the fate of Balder. When it had been made known that all things had taken a solemn oath not to hurt Balder it became a favourite pastime of the gods at their meetings to put him up as a mark and shoot at him. But it sorely vexed Loke to see that Balder was not hurt. So he took on the guise of an old woman, went to Frigg, and asked her if all things had promised to spare Balder. From Frigg he learned that on account of its insignificance she had neglected to exact an oath from the mistletoe. So he straightway went and pulled this up, repaired to the place where the gods were *assembled, and induced the blind god* Hoder to throw the mistletoe at his brother, and do him honour as did the other gods. Loke himself guided Hoder's hand. The twig did not miss its shining mark, and Balder fell dead. The gods were struck speechless with terror. When they had had time to recover their senses Frigg sent Hermod to the goddess Hel to ask her to permit Balder to return to Asgard. Hel said she would release Balder if it was true that he was so universally beloved, and this she would test by observing if all things would weep for him. Messengers were despatched throughout all the world to beseech all things to weep Balder out from Hel's domain. And all things did so with alacrity, men, animals, the earth, stones, trees, and metals, just as we see things weep when they come from the frost into the warm air (a beautiful evidence that Balder is the sun or summer). The messengers were returning confident that their mission had been successful; but on their way home they found a hag crouching on the ground. She called herself Thokk, but she was none other than Loke in disguise. Thokk said she could not weep other than dry tears; and so Hel kept her prey. Now as Loke is physical heat and fire, Thokk's dry tears are the sparks that fly from the burning wood. Soon afterwards Loke was captured and bound with strong cords to the points of rocks in a cave. A serpent was suspended over him in such a manner that the venom fell into Loke's face drop by drop. But Sigyn, Loke's wife, took pity on him. She stands by him, and receives the drops as they fall in a cup, which she empties as often as it is filled. But while she is emptying it venom falls upon Loke's face, which makes him shriek with horror and twist his body about so violently that the whole earth shakes, and thus earthquakes are produced.

But when Balder, the bright and good god, had passed from the happy family circle of the gods to the cold and gloomy abodes of Hel the awful day of doom was impending. It was a fatal thing for the gods and for the world that they united themselves with the giant race. The gods should not have admitted Loke into Asgard. Balder's death was the result, and this hastened the day when the whole world shall be destroyed, when gods and men and giants shall perish in Ragnarok, the twilight of the gods. Increasing corruption and strife in the world are the signs that this great and awful event is impending. Continuous winters rage without any intervening summer now that Balder has been slain; the air is filled with violent storms, snow, and darkness, and these are the signs that Ragnarok is at hand. The sun and moon are swallowed by giants who pursue them in the guise of wolves, and the heavens are stained with blood. The bright stars vanish, the earth trembles in the throes of the earthquake, and the mountains topple down with a tremendous crash. Then all chains and fetters are severed, and the terrible Fenriswolf gets loose. The Midgard-serpent writhes in his giant rage, and seeks land upon the tumultuous waves. The ship Naglfar, which has been built of the nail-parings of dead men, floats upon the waters, carrying the army of frost-giants and mountain-giants over the sea, and having the mighty giant Hrym as its helmsman. Loke too is now freed from his dark cave and strong chains, and comes to the scene as the leader of the hosts of Hel. The Fenriswolf advances and opens his enormous mouth. His lower jaw rests on the earth, and the upper touches the sky. It is only from want of room that he does not open his mouth still wider. Fire flashes from his mouth and nostrils. The Midgard-serpent, placing himself by the side of the Fenriswolf, vomits forth floods of venom that fill the air and waters. In the midst of this confusion, crashing, and devastation the heavens are rent in twain and the sons of Muspel come riding down the opening in brilliant battle-array. And now Surt, the same being that sent the heated blasts from Muspelheim into Ginungagap in the pre-chaotic world, and by whose might the drops of venom sent by Nidhug in Niflheim quickened into the giant Ymer, he who is from everlasting to everlasting, appears on the scene wrapped in flames of fire. His flaming sword outshines the sun. All the hosts here described come riding over the Bifrost bridge, that is the rainbow, which breaks beneath so great a weight. All this vast and glittering array direct their course to the great battlefield called Vigrid, and thus the evil forces on their part are ready for the final struggle.

Meanwhile Heimdal, on the part of the gods, blows his Gjallarhorn to arouse the gods, who assemble without delay. In his embarrassment Odin now for the *third* time in his life goes to the giants for advice. He rides to Mimer, where in his youth he had pawned his eye for knowledge, to consult him as to how he and his warriors are to enter into action. The answer is not recorded, but in the meanwhile the ash Ygdrasil begins to quake and quiver, nor is there anything in heaven or on earth that does not fear and tremble in that awful hour. The gods and all the einherjes (i.e. those fallen in battle and brought to Valhal) don their armour, arm themselves and speedily sally forth to the field of battle, led by Odin, who is easily recognised by his golden helmet, resplendent cuirass, and his flashing spear Gungner. Odin places himself against the Fenriswolf as the foe most worthy of his steel. Thor stands by Odin's side, but can give him no assistance, as he must himself contend with the Midgard-serpent. Frey encounters the mighty Surt himself; but, though terrible blows are exchanged, Frey falls, and the Edda says he owes his defeat to the fact that he did not have that trusty sword which in his passion for a giantess he gave to his servant Skirner, when he sent him to ask for the hand of the charming giantess Gerd. In the last hour the dog Garm, which for ages had been chained in the Gnipa cave, also breaks loose. He is the most terrible monster of all, and he attacks the one-handed Tyr, who had sacrificed his right hand to get the Fenriswolf bound. Garm and Tyr kill each other. Thor gains great renown by dealing the deathblow to the Midgard-serpent with his mighty hammer Mjolner, but he retreats only nine paces before he too falls dead, suffocated by the flood of venom which the expiring serpent vomits forth upon him. The Fenriswolf with his enormous and wide-open mouth swallows Odin; but Vidar, Odin's son, immediately advances to avenge his father. He places his foot upon the wolf's lower jaw, the other he seizes with his hand, and thus tears and rends him till he dies. Vidar is able to do this, for he wears a shoe, for which materials have been gathered in all ages. It is made of scraps of leather cut off from the toes and heels in making patterns for shoes; hence, says the Edda, shoemakers should throw away such pieces if they desire to render assistance to the gods in the final conflict. Loke and Heimdal meet in a duel and become each other's slayers. The conflict is still raging with unabated fury, when the immortal god Surt flings fire and flame over the world. Smoke wreathes up around the ash Ygdrasil; the high flames play against the lurid heavens, and the earth consumed sinks down beneath the watery waste.

After Ragnarok comes a new world. The earth rises a second time from the sea, and is completely clothed in green. Sparkling cascades fall, overarched by rainbows glistening in the sunbeams. The eagle soars on lofty pinion in pursuit of his prey. The gods risen from the dead assemble on the Ida plains and talk over the strange events of the past. The fields unsown yield bountiful harvest, all ills cease, and the gods live in peace. A new sun brighter and more resplendent than the former appears, and there is naught but beauty, plenty, and happiness.

The Scandinavian mythology has two heavens and two hells for humanity, a heaven and hell before Ragnarok, and a heaven and hell after Ragnarok. Before Ragnarok those fallen in battle or by the sword went to Valhal, to become einherjes, who took part with Odin in the first conflict on the plain of Vigrid. Those who died a straw-death (that is, from sickness or old age) went after death to the domain of Hel, and, though the Edda is silent on the subject, they probably fought on the side of Loke. But after Ragnarok there is a heaven called Gimle and a hell called Nastrand. Gimle is a hall more radiant than the sun; it is the uppermost realm, and in it the virtuous shall dwell for ever and enjoy delights without end. Nastrand is a place set apart for the wicked. The word means strand of corpses. It is situated far from the sun, in the lowest region of the universe. It is a large and terrible cave, the doors of which open to the north. This cave is built of serpents wattled together, and the fanged heads of all the serpents turn into the cave, filling it with streams of venom, in which perjurers, murderers, and adulterers have to wade. Bloody hearts hang outside of the hearts of the damned. Their faces are dyed in gore. Strong-envenomed serpent fangs fiercely pierce their hearts; and their hands are riveted together with red-hot stones. Their clothes wrapped in flames are not consumed, and remorseless ravens keep tearing their eyes from their heads. From this terrible cave the damned are, to increase their anguish, washed by the venomous floods into Hvergelmer, that fearful well in Niflheim, where their souls and bodies are subjected to even more terrible pains and woes; torn by countless clusters of serpents, and borne from agony to agony on the whizzing plumage of the primeval Nidhug, the dragon of the uttermost darkness. The Scandinavian mythology appears not to teach eternal punishment. There comes a mighty one to the great judgment, and makes Nidhug sink. In her last vision in Völuspa the vala points to a time when all that is evil shall be dissolved and washed away by the eternal streams of goodness. This is the last vision of the vala:

> There comes the dark
> Dragon flying,
> The shining serpent
> From the Nida-mountains
> In the deep.
> Over the plains he flies:
> Dead bodies he drags
> In his whizzing plumage.
> *Now must Nidhug sink.*

Sophus Bugge has published an elaborate work, *Studier over de nordiske gude, og heltesagns Oprindelse* (German trans. by Professor Bremner, Munich, 1889), in which he attempts to trace the influence of Greek and Roman mythology and of Christianity on Scandinavian mythology. On the other hand, Viktor Rydberg, in his monumental work *Teutonic Mythology* (trans. into English by the present writer, London, 1889), has given an account of the mythology as it existed before it came in contact with and was modified by the Christian religion. The mythological materials in a more or less changed form have been largely augmented by Rydberg, particularly by his subjecting the mythic portions of the *Historia Danica* of Saxo Grammaticus to a most painstaking analysis. He has found the key to Saxo's method of turning myths and traditions into history, and by this discovery he has secured many new and important contributions to Scandinavian mythology. Rydberg shows that the Younger Edda is an unreliable record of the Odinic religion. He has also largely increased our stock of mythological materials by analysing, for the first time, the mythic fragments found in the old Norse literature outside of the Elder Edda.

See Finn Magnusen's *Lexicon Poeticum*, J. Grimm's *Deutsche Mythologie* (Eng. trans. by Stallybrass), Gudbrand Vigfusson's *Corpus Poeticum Boreale*, Laing's *Heimskringla* (new ed. by R. B. Anderson, 1889), N. M. Petersen's *Nordisk Mythologie*, P. A. Munch's *Norröne gude, og Helte-Sagn*, Karl Simrock's *Deutsche Mythologie*, Wilhelm Mannhardt's *Germanische Mythen*, the present writer's *Norse Mythology* (5th ed. 1891). On the last-named work the above article is largely based.

Scansores. See CLIMBERS.

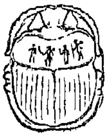
Scapegoat. See AZAZEL.

Scaphoid Bone (Gr. *skaphē*, 'a boat'), a term applied to two somewhat boat-like bones, of which one occurs in the carpus or wrist (see HAND), and the other in the tarsus of the Foot (q.v.).

Scapula. See SHOULDER.

Scapular (Lat *scapula*, 'the shoulder'), a portion of the monastic habit, so called from its being worn upon the shoulders. It consists of a long strip of serge or stuff, the centre of which passes over the head, one flap hanging down in front, the other upon the back. The colour differs for different religious orders or congregations. Besides the scapular worn by the members of religious orders strictly so called, there exists also in the Roman Catholic Church a religious association or confraternity, the members of which, while living in the world and mixing in the ordinary life, wear, under the ordinary garb, two little pieces of cloth, connected by strings passing over the shoulders. The chief duties of this confraternity consist in the recitation of certain prayers, or the observance of certain religious or ascetical exercises in devotion to the Blessed Virgin. This pious association was founded in the first half of the 13th century by an English Carmelite friar named Simon Stock, and was said to have originated in a vision; but this story is now discredited even by Catholics, while they hold that the observance itself is an aid to piety.

Scarabæus (*Ateuchus sacer*), one of the dung-beetles (Coprophaga), well known for the zeal with which they unite in rolling balls of dung to their holes. The dung serves as food, and a beetle having secured a ball seems to gnaw at it continuously—sometimes for a fortnight—until the supply is exhausted. Sometimes an egg is laid in the ball and the parents unite in rolling this to a place of safety, above the level of the annual inundations. The genus is represented by about sixty species in the countries around the Mediterranean. By the Egyptians the scarabæus was venerated during its life, and often embalmed after death! Entomologists have recognised four distinct species sculptured on the Egyptian monuments, and gems of various kinds of stones were often fashioned in their image. Several mystical ideas were associated with the scarabæus: the number of its 'toes,' thirty, symbolised the days of the month; the time it deposited the balls containing the eggs was supposed to refer to the lunar month; the movement of the ball referred to the action of the sun on the earth, and personified that luminary. The scarabæus was supposed to be only of the male sex, hence it signified the self-existent, self-begotten, generation or metamorphosis, and the male or paternal principle of nature. In this sense it appears on the head of the pygmæan deity, Ptah-Socharis Osiris, and in astronomical and sepulchral formulas; and Khepra was a scarab-headed god. The custom of engraving scarab gems passed from Egyptians to Greeks and Etruscans. An engraved scarab of carnelian is figured at GEM.



Engraved Scarab.

See Rev. W. J. Loftie, *An Essay of Scarabs* (1884); and W. M. Flinders Petrie, *Historical Scarabs* (1889).

Scaramouch (Ital. *scaramuccia*, 'skirmish'), a character in the old Italian comedy, originally derived from Spain, representing a military poltroon and braggadocio. He was dressed in a sort of Hispano-Neapolitan costume, including a black *toque* and mantle, and a mask open on the forehead, cheeks, and chin, and always received an inglorious drubbing at the hands of harlequin.

Scarborough, the 'Queen of Watering-places,' in the North Riding of Yorkshire, 54 miles N. of Hull, 21 SSE. of Whitby, 43 NE. of York, and 233 N. of London. Backed by Oliver's Mount (500 feet), it rises like an amphitheatre round a beautiful sandy bay, protected on the north by a castle-crowned headland (300 feet), beyond which is the quieter North Cliff. The South Cliff and the old town (below the Castle) are separated by a picturesque gulley, which is spanned by the Cliff Bridge (1827; 414 feet long, 75 high), and, farther up, by the Ramsdale Valley Bridge (1865). Scarborough (A.S. *Skardeburge*, 'fortified rock') is an old place, for Harold Hardrada ravaged it in 1066, and in 1181 it received a renewal of an earlier charter; and it returned two members to parliament from Edward I.'s time till 1885, when the representation was reduced to one. The castle, now a shattered Norman keep, dates from 1136, but was rebuilt as a royal fortress by Henry II. It was captured by the Earl of Pembroke from Piers Gaveston (1312), by Bruce (1318), by the Earl of Westmorland from the insurgent Lord Stafford (1553), and twice by the parliamentarians (1644–48), besides being unsuccessfully besieged by Aske in the Pilgrimage of Grace (1536). Near it is St Mary's, the church originally of a Cistercian priory (1320). Transition Norman and Early English in style, with later additions, it suffered much during the siege of 1644, and was restored in 1848–50, at a cost of £7000. St Martin's (1862) is a good Early English structure, with windows by Morris. Other buildings are the splendid aquarium (1877), the museum (1828), the market-hall (1853), the huge Grand Hotel (1867), and the Spa (1880), the third on the site, whose two saline and chalybeate springs were discovered about 1620, and which has charming grounds. Scarborough was made a head port in 1840. The tidal harbour, with a lighthouse and a floating-dock, was formed between 1732 and 1850, and is enclosed by three piers, the longest and outermost curving 1380 feet; on the North Sands is a promenade pier 1000 feet long; and here, too, a promenade, nearly 4000 feet long and 24 wide, constructed in 1887–90 at a cost of £50,000, was opened by the Duke of Clarence. The jet manufacture is a specialty. The season lasts from June till the middle of October, when visitors pour in by thousands from every part of the kingdom. Resident pop. (1851) 12,915; (1881) 30,504; (1891) 33,776.

Scarf. See STOLE.

Scarlatina, or SCARLET FEVER, is one of the group of diseases called Exanthemata (q.v.). In addition to the characters common to the group, scarlatina is almost always attended by sore throat, and the rash or eruption, which is of bright scarlet colour, commonly appears as early as the second day after the manifestation of the febrile symptoms, and is followed by very distinct desquamation of the cuticle. The period of incubation (see MEASLES) is very rarely more than a week; sometimes as little as twenty-four hours. Most writers on medicine make three varieties of this disease—viz. *S. simplex*, in which there are the fever and the rash, but only slight throat affection; *S. anginosa*, in which, in addition to the fever and the rash, the throat affection is the most prominent symptom; and *S. maligna*, a name which is applied to certain cases of extreme virulence, in which the system is at once overwhelmed by the force of the disease, or in which the symptoms disclose an extraordinary degree of weakness and want of vital power.

The disease begins with shivering, lassitude, headache, a frequent pulse, a hot dry skin, a flushed face, thirst, loss of appetite, and a furred tongue. Shortly after the appearance of the febrile symptoms the throat begins to feel irritable, and, on examination, is found to be red, and often more or less swollen. This redness becomes diffused over the interior of the mouth and the tongue. The rash on the skin begins in the form of minute red points, which soon become so numerous that the surface appears almost of a uniform red. It first appears on the neck and breast, whence it gradually spreads over the trunk and extremities. The reddened surface is smooth to the touch, and the colour temporarily disappears on pressure of the finger. The eruption, in ordinary cases, is persistent for three or four days, after which it gradually disappears, and is usually gone by the end of the seventh day. The cuticle then begins to scale off in small bran-like scurf, or in flakes of various sizes. Specimens of an almost entire epidermic covering of the hand or foot, forming a natural glove or slipper, are of common occurrence in our pathological museums; but it is comparatively seldom that such perfect moulting takes place. The desquamative process is hardly ever completed till at least five weeks from the commencement of the disease, and may last considerably longer. The fever does not abate on the appearance of the rash, but continues in a more or less decided degree till that has faded; it is often attended by delirium.

Scarlatina anginosa presents in addition to the symptoms above described much more severe affection of the throat, with great pain and swelling. The inflammation is very apt to spread from the throat to the nose and ears: to the latter it is very destructive, life-long deafness often resulting in the case of those who recover from the fever. Sometimes a form of inflammation resembling, if not identical with, diphtheria supervenes; in other cases inflammation and suppuration invade the glands or other tissues in the neck.

Malignant Scarlatina is so terrible a disease that its characteristic symptoms require a brief special notice. The rash comes out late and imperfectly, and sometimes is hardly perceptible; or, having appeared, it may suddenly recede; and sometimes it is intermixed with livid spots. The pulse is feeble, the skin is cold, and there is extreme prostration of strength. In such a case as this death may occur (apparently from blood-poisoning) in a few hours. Other cases rapidly assume a typhus-like character.

Besides the dangers connected with the severity of the fever, and the results of the throat affection, the chief risk arises from inflammation of the kidneys. It is uncertain whether they become affected in all cases; in many there is no evidence that they are. But there are none in which the risk of this complication is absent; and it frequently supervenes in the mildest forms of the disease, if it has been unrecognised, or if due precautions have not been taken. It is essentially similar to catarrhal nephritis arising from other causes (see KIDNEYS), and may arise at any period till desquamation is completed, but most frequently in the second or third week of the disease. Rheumatic fever not unfrequently follows closely upon scarlet fever. Scarlet fever is rare in infancy and after thirty, most common between two and fifteen. But it is very apt to attack persons suffering from wounds and lying-in women exposed to the infection. It is common in Europe, whence it has been introduced into America and Australasia; but is rare in Asia, except Asia Minor, and Africa, except Algiers. In the tropical parts of these continents it is almost unknown; but in tropical America severe epidemics have often occurred.

Like all the exanthemata, scarlet fever occurs in epidemics; and nothing is more remarkable in the history of the disease than the extreme variations in severity in different outbreaks. Sometimes the mortality is almost nil; sometimes as many as 30 and 40 per cent. of those attacked succumb. It is undoubtedly caused by a micro-organism (see GERM THEORY); but the nature of the organism has not yet been conclusively demonstrated. It is very contagious; as, however, the contagium is given off chiefly in the desquamated cuticle it is generally possible, if the patient can be isolated as soon as the disease is recognised, to prevent or greatly to limit its extension to others. On the other hand, the contagium retains its vitality with great persistence, and can be conveyed by letters, clothes, &c. Cases are on record where it has lain dormant in clothes for at least a year. Milk is a frequent vehicle for the disease; and it seems certain that in some epidemics it has acquired its infectious properties not from scarlet fever in man, but from a form of disease affecting milch cows.

Treatment.—No specific is known which can cut short the disease; the feverish state must be treated on general principles, by rest in bed, diluents, &c.; and in simple cases little more is necessary. Severe local symptoms or complications must be met as they arise; bad sore throat by application of Condy's fluid, boracic acid, or some other antiseptic with a brush or as a gargle, by chlorate of potash lozenges, by poultices applied externally, &c. A severe case of scarlatina anginosa will test to the utmost the patience and resource of both nurse and doctor; while scarlatina maligna usually defies all their efforts. In ordinary cases it is of the greatest importance to guard against chills. The patient should be confined to bed for at least a fortnight, and to his room till desquamation is completed. The application of carbolic oil, one to thirty, all over the body, is valuable for neutralising the poison in the skin, and preventing its diffusion; it is moreover generally soothing to the patient. Tonics, especially quinine and iron, are useful during convalescence. Strict isolation during the progress of the case, and careful disinfection afterwards, are of course essential.

In the early stage, before the appearance of the rash, scarlatina may be readily mistaken for several other febrile diseases; after the appearance of the rash the only disease with which it is likely to be confounded is measles, and we must refer to the article on that disease for a notice of the distinctive characters of the two affections. There is no complaint in which the final result is more uncertain than this, and the physician should give a very guarded opinion as to how any special case may terminate.

The popular delusion that *scarlatina* is a mild and diminutive form of *scarlet fever* should always be corrected, as the error, if uncorrected, may do much harm by leading to a disregard of those precautions which are always necessary in this disease.

Scarlatti, ALESSANDRO, composer and teacher of music, was born at Trapani in Sicily in 1659, and is stated to have studied music under Carissimi at Rome. There too, at the court of Queen Christina of Sweden, he produced in 1680 his first opera; he remained in her service, probably, until 1688. After acting as musical director at the court of Naples from 1694 to 1703, he returned to Rome to take up the duties of musical director to the church of Santa Maria Maggiore; but two years later he went back to Naples. There he conducted, one after the other, the three musical conservatoria, and became the founder of the Neapolitan school of musical composition. He died at Naples on 24th October 1725. A man of untiring energy, Scarlatti worked as composer, teacher, director, and player, and wrote a vast number of works, including nearly 120 operas, 200 masses, 10 oratorios, 500 cantatas, and innumerable motets, madrigals, and similar pieces. But, although he was so prolific, he was not a careless composer; on the contrary, he was a master of counterpoint and a fertile inventor of melodies (see OPERA, Vol. VII. p. 608). The most celebrated amongst his pupils were his son, Durante, and Hasse. This son, DOMENICO (1683–1757), early distinguished himself as a composer of church music, and lived successively in Rome, London, Lisbon, Naples, and Madrid. In the history of music he figures as a clever writer of sonatas for the pianoforte, and as the author of various technical improvements in the writing and playing of pianoforte music.

Scarlett, SIR JAMES, BARON ABINGER, an English barrister and judge, was born in Jamaica in 1769, but sent to England to be educated. After graduating at Cambridge, from Trinity College, in 1790, he chose to follow law, and entered at the Inner Temple. His fine personal appearance, backed up by an excellent knowledge of his profession, and by a quiet unassuming manner, soon secured him a large practice, especially as his pleadings began to have an extraordinary weight with the juries. Even whilst he was only a junior the conduct of important cases was sometimes entrusted to him. He took silk in 1816, and from that time held the front rank on the northern circuit and in the law-courts at Westminster. Two years later (1818) he entered parliament as a nominee of Lord Fitzwilliam for Peterborough; this constituency he continued to represent till the end of the reign of George IV. Canning in April 1827 appointed Scarlett Attorney-general, and at the same time he was knighted. He held that office, except for fifteen months, till November 1830. In 1834 Sir James was raised to the bench as Chief Baron of the Court of King's Bench, and took his seat in the House of Lords as Baron Abinger. He died whilst on circuit at Bury St Edmunds, 7th April 1844.

Scarpa, ANTONIO, anatomist (1747–1832), studied at Padua, and from 1783 to 1812 was professor at Pavia. He gained distinction by treatises on the anatomy of the nose, ear, and heart, and on diseases of the eye, aneurisms, and hernia.

Scarpanto (anc. *Carpatho*), a long narrow island in the Mediterranean, belonging to Turkey, midway between Rhodes and Crete. It is 85 sq. m. in area, has steep and difficult coasts, and a bare mountainous surface, rising to 4000 feet. Pop. 5000, all Greeks, and mostly workers in wood.

Scarron, PAUL, the creator of French burlesque, was born at Paris in 1610, son of a counsellor of Parlement, of good family and fortune. His mother having died early, his father married again, and not happily for the children. The stepmother's dislike of Paul's epigrams forced him at fifteen to leave the house, but at seventeen he returned to Paris, became an *abbé*, and gave himself up to a life of pleasure. About 1634 he paid a long visit to Italy, and soon after his return began to suffer from that terrible malady which racked him with tortures, and ultimately left him completely paralysed in his limbs. A mythical story used to be told how that he had first caught his disease, hiding in a swamp from the populace of Mans scandalised at an *abbé* appearing tarred and feathered at the carnival; but, as he had been seized with his disease half-a-dozen years before he obtained a prebend in Mans (1643), it is much more likely he owed it to the excessive debaucheries of his youth. After trying one physician after another, and spending about three years of decorous comfort at Mans, he gave up all hope of remedy, and returned to Paris to depend upon letters for a living. From this time he began to pour forth endless complimentary epistles in verse, sonnets, madrigals, songs of drinking and of eating, and satires; in 1644 published *Typhon, ou la Gigantomachie*, a long jocose poem in five cantos describing the war of the Giants against the Gods; and next year made a still greater hit with his laughable metrical comedy, *Jodelet, ou le Maître Valet*, followed quickly by *Les Trois Dorothées, ou Jodelet souffleté* and *Les Boutades du Capitan Matamore et ses Comédies*—the last apparently never represented. The plots of these Scarron owed to the Spanish, and similarly the idea of his *Virgile Travesti* he borrowed from the Italian poet J. B. Lalli's *Eneide Travestita*. The first part of this famous work of Scarron's appeared in 1648; the whole included only eight of Virgil's books, and of these the first and fourth were translated into English, in all their coarseness and vigour, by a kindred spirit, Charles Cotton. In 1648 appeared also the popular comedy, *L'Héritier Ridicule*, which, it is said, the young king Louis XIV. liked so much that he had it performed twice in one day. During the struggle of the Fronde countless satires appeared against Mazarin, and one of the bitterest of these, entitled *La Mazarinade*, was ascribed to Scarron. On the cardinal's return to Paris in triumph the facile poet addressed him in terms of unmeasured flattery—'Jule, autrefois l'objet de l'injuste satire.' But he did not recover his pensions, although the famous Surintendant Fouquet made good the loss to the poor poet. Scarron was a consummate beggar, but he always did it like a humorist and without spleen or meanness. The exceptional sufferings of this 'living epitome of human misery' extenuate his ceaseless applications for relief, and the facility with which he accepted everything, money, books, a carriage, pies, poultry, puppies. His importunities were so jocular that they never estranged him from his friends, and he never lost his own kindness of heart, for we find him troubling his powerful friends for their good offices on behalf of others, as well as sheltering within his house two nuns thrown on the world through the bankruptcy of their convent—with one of these, Céleste Palaiseau, in earlier days he had been in love.

In 1651 appeared the first part of his famous work *Le Roman Comique* (2d part, 1657), intended as a reaction against the euphuistic and interminable novels of Mlle. de Scudéry and Honoré d'Urfé, then at the height of popular favour. It describes the adventures of a troop of strolling players in the provinces, and, loose and ill-constructed as it is, has the one surpassing excellence of the creative faculty, of bringing before us real men and women. It inspired Gautier's not altogether superior *Capitaine Fracasse*; but more important still, gave the impulse out of which sprang the masterpieces of Le Sage, Defoe, Fielding, and Smollett. The third part, which bears the title of 'Suite d'Offray,' was not the work of Scarron. All three were translated into English by Tom Brown, Savage, and others, and an abridgment by Goldsmith was published posthumously. Other works of Scarron's that deserve mention are the comedies, *Don Japhet d'Arménie* and *La Précaution Inutile*; his *Nouvelles Tragi-comiques*, from one of which (*Les Hypocrites*) Molière took the idea of Tartufe; and the poem, *Relation des Parques et des Poëtes sur la Mort de Voiture*, prefaced by a characteristically gay description of his own appearance and condition. Few men have had his sufferings, and fewer still his courage—'I hate no man, and could wish all the world had the same feelings for me; I am as blithe as a bird when I have money—and should be much more so were I in health; I am merry enough in company, and am quite happy when I am alone; I bear all my ills pretty patiently.'

The income he derived from his publisher—his 'Marquisat de Quinet'—his pensions, and the fruits of his dedications and his importunities enabled him to enjoy good living and to receive in the Hôtel d'Impecuniosité the visits of the greatest figures of the day in the world of fashion as well as letters. About 1650 he became filled with a desire to visit the islands of America, and actually journeyed as far as Tours in October—'I take my leave of burlesque verse, of comedies and comical romances,' wrote the brave-hearted cripple, 'to go to a happy climate, where there are no affected coxcombs, no canting rascals, no inquisition, no rheumatism to cripple any one, nor no confounded wars to starve me.' But this craze brought him to the strangest adventure of his life. One day a friend brought to his house a beautiful but penniless young girl of fifteen, Françoise d'Aubigné, who had been brought up at Martinique, and whose character remains one of the enigmas of history. The poet was enchanted with her, and in 1652 married her to save her from a convent. In the marriage contract, with characteristic buffoonery, he recognises her as bringing him a dowry of four louis, two large and very expressive eyes, a fine bosom, a pair of beautiful hands, and plenty of intelligence; while he on his part brought her immortality. 'The names of kings' wives die with them,' said he, 'that of the wife of Scarron will live for ever'—a strange prophecy, strangely to be fulfilled in the history of Madame de Maintenon. For eight years she waited on her poor husband with pious care, managed admirably his dubious finances, and brought an unknown decorum and refinement into his Bohemian household. Even his writings henceforward lose their grossness under that gentle influence; although indeed this can hardly be said of the earliest after the marriage, *Don Japhet*, which is prefaced by a dedication to the king, a masterpiece of begging without humiliation—'Sire, I will endeavour to persuade your Majesty it would not be very wrong to assist me a little, for if you did assist me a little I would be more jovial than I am; and if I were more jovial than I am I would write lively comedies; if I wrote lively comedies your Majesty would be amused by them; and if you were amused the money bestowed on me would not be lost. All this leads to such an inevitable conclusion that I imagine I should be convinced by it if I were a great king instead of being what I am, a poor wretched creature.' Death came at last to relieve the sufferer in October 1660, but he saw it come with anguish; his greatest sorrow, to leave his poor young wife behind in destitution. For a heart beat warmly in that feeble and distorted frame, and in his dying words we feel a penetrating pathos hardly hidden under an effort of irony: 'If there be a hell I have nothing to fear from it, having endured it in this world.' The eight verses of his own epitaph irresistibly touch the heart. Dead, he could lay aside the mask, and confess all that he had borne in silence—'Passer-by, tread lightly here, take care not to awake him, for it is the first night that poor Scarron sleeps.'

There are editions by Bruzen de la Martinière (10 vols. 1737) and by Baume (2 vols. 1877); of the *Roman Comique*, by Victor Fournel (1857) and A. France (1881). See Christian's *Étude* (1841); Morillot, *Scarron et le genre burlesque* (1888); André Le Breton, *Le Roman au Dix-Septième Siècle* (1890); an excellent article by Van Laun in the *Gent. Mag.* for April 1885; and Jusserand's introduction to a new edition of Tom Brown's translation of *The Comical Works of Scarron* (1892).

Scattery Island, an islet in the Shannon's estuary, 3 miles SW. of Kilrush, containing a fort, fragments of several small churches, and an ancient round tower 87 feet high. It was a sacred place in early Christianity—St Senan's retreat in the

6th century. At the southern extremity of the island stands a lighthouse, whose light, 50 feet above water, is visible 10 miles

Scawfell. See SCAFELL.

Scepticism (Gr. *skeptomai.* 'I consider') strictly denotes that condition in which the mind is before it has arrived at conclusive opinions—when it is still in the act of reflecting, examining, or pondering subjects of thought. Scepticism is therefore the opposite of dogmatism. The notion of 'disbelief' is quite a secondary meaning of the term. Among the Greeks a *skeptikos*, 'sceptic,' was a thoughtful, inquiring person. But inasmuch as the mass of men rush to conclusions with haste, and assert them with far more positiveness than their knowledge warrants, the discerning few of clearer vision are often brought into collision with popular beliefs—more especially in religion, the sphere in which popular beliefs are most numerous, most positive, and most inconsiderate—and are compelled, by the shock given to their reason, to 'doubt,' it may be to 'disbelieve' what is believed and affirmed by the multitude. Thus it is that in common parlance a sceptic has come to mean an infidel, and scepticism infidelity. But the field of thought in which scepticism properly so called exercised itself is not religion but philosophy. In philosophy too the word acquired a meaning different from doubt, or the negation of dogmatism; there was a distinct tendency on the part of those called sceptics to avoid coming to a conclusion one way or another. Philosophical sceptics in all ages and countries have not so much used doubt, like Descartes, as a philosophical instrument; they seem generally to have denied or at least doubted the trustworthiness of the senses as vehicles of absolute truth, and so have destroyed the very possibility of speculation. Pyrrho (q.v.) was the head of the first great school of professed sceptics; the Second Academy under Arcesilaus, and the Third under Carneades, were less thoroughly sceptical. The teaching of the Sophists (q.v.) was also sceptical in temper and tendency. In modern times David Hume represented advanced scepticism in philosophy (as well as in theology); and Kant's opposing philosophy, or a large part of it, has been made the foundation of sceptical systems. The doctrine of the Relativity of Knowledge (q.v.) taught by Hamilton and Mansel may easily be pushed to a highly sceptical extreme. Comte's positivism is in the metaphysical sphere even dogmatically sceptical; in Secularism (q.v.) there is a scepticism of indifference towards all theological and religious doctrine; while Agnosticism (q.v.) may fairly be described as combining most of the characteristic features of philosophical and theological scepticism.

See the articles referred to above; the histories of philosophy; Green's *Introduction* to Hume's works; Balfour's *Defence of Philosophic Doubt;* and Rev. J. Owen's *Evenings with the Sceptics* (2 vols. 1881).

Sceptre (Gr. *skēptron*, 'staff'), originally a staff or walking-stick, hence in course of time also a weapon of assault and of defence. At a very early period the privilege of carrying an ornamental sceptre came to be connected with the idea of authority and station. Both in the Old Testament and in Homer the most solemn oaths are sworn by the sceptre, and Homer speaks of the sceptre as an attribute of kings, princes, and leaders of tribes. The sceptre was frequently an ivory truncheon pierced with gold or silver studs. The sceptre of the kings of Rome, apparently derived from Etruria, and afterwards borne by consuls, victorious generals, and emperors, was of ivory and surmounted by an eagle. The sceptre, which has varied much in form, has kept its place as a symbol of royal authority through the middle ages and down to the present time. The English Sceptre Royal, surmounted by a cross, is 2 feet 9 inches in length, and is of gold, richly adorned with precious stones. This is placed in the sovereign's hand at coronation. St Edward's staff, carried before the sovereigns at coronation, is of beaten gold, 4 feet 7½ inches long, with a foot or pike of steel and the orb and cross at the top. There are also in the English regalia a king's sceptre with the dove, a queen's sceptre with the cross, the queen's ivory rod (the sceptre of the consort of James II.), and another found in 1814, presumably that of Mary, consort of William III. See REGALIA.

Schadow, a family of Berlin artists, of whom three must be named. (1) JOHANN GOTTFRIED SCHADOW, a sculptor, was born in Berlin on 20th May 1764, received his best training in Rome (1785 to 1788), and was, on his return home, appointed sculptor to the Prussian court, and in 1805 rector (in 1816 director) of the Academy of Arts. He died at Berlin on 27th January 1850. Among his most important works were the quadriga on the Brandenburg gate in Berlin, statues of Frederick the Great for Stettin, Blücher for Rostock, Luther for Wittenberg, numerous busts of great Germans, and monumental tombs to General Tauentzien and Von Arnim. He wrote some books dealing with his art. See his *Briefe und Aufsatze* (1864).—(2) RUDOLF, son of the preceding, born in Rome on 9th July 1786, died there on 31st January 1822, was trained as a sculptor by his father, and, following the example of his brother (see below), renounced Protestantism for Roman Catholicism. His best works were a Spinning-girl, Achilles and Penthesilea, John the Baptist, and Virgin and Child.—(3) FRIEDRICH WILHELM SCHADOW-GODENHAUS, second son of the first-named above, was a painter, one of the 'Nazarite' school, to which belonged Overbeck (q.v.), Schnorr, and Veit. Born in Berlin on 6th September 1789, he proceeded to Rome in 1810, studied there the works of the old masters, came under the influence of Cornelius, Overbeck, and their associates, went over to Roman Catholicism (1814), and executed two frescoes for Bartholdy's villa at Rome. In 1819 he was called to be professor of Painting at the Berlin Academy of Arts, and in 1826 was appointed to succeed Cornelius as the head of the Dusseldorf school. He gathered round him enthusiastic pupils; indeed his gifts as a teacher were superior to his talents as a painter, although his 'Mignon,' the 'Wise and Foolish Virgins,' 'Heavenly and Earthly Love,' 'Heaven,' 'Purgatory,' and 'Hell' are admirable in their way. In 1859 he resigned the directorship of the Düsseldorf Academy, and on 19th March 1862 died in that town. He wrote *Über den Einfluss des Christenthums auf die bildende Kunst* (Düsseldorf, 1843) and an art romance, *Der Moderne Vasari* (1854). See Hübner, *Schadow und seine Schule* (1869).

Schafarik (*Szafarzik*), PAUL JOSEPH, Slavonic philologist and archæologist (1795–1861). See BOHEMIA (LITERATURE).

Schaff, PHILIP, a learned Presbyterian theologian, was born at Coire in Switzerland, January 1, 1819, studied at Tubingen, Halle, and Berlin, and was already a *privat-docent* in the last university, when in 1843 he was called, on the recommendation of Neander, Tholuck, and Julius Müller, to be professor in the theological seminary at Mercersburg, Pennsylvania, of the United States German Reformed Church. Here he lectured for twenty years; and during the war he lectured at Andover, Hartford, and New York. In 1869 he was called to be professor in the Union Theological Seminary, New York, and lectured there successively on Christian Symbolics, Hebrew, and Sacred Literature. One of the founders of the American branch of the Evangelical Alliance, he went as a delegate to its General Conferences at Basel in 1879 and Copenhagen in 1884. He attended as delegate also the meetings in London in 1875, out of which grew the Alliance of the Reformed Churches, the first General Council of which met at Edinburgh in 1877, the second at Philadelphia in 1880. He was president of the American Old Testament Revision Committee.

Of his many books the most important are a *History of the Christian Church*, in its enlarged form, 1-1530 A.D. (5 vols. New York; 10 Edin.; 1882-88); *The Creeds of Christendom* (3 vols. 1877); *The Person of Christ* (1865); a *Bible Dictionary* (Phila. 1880); *Popular Commentary on the New Testament*, to which he himself contributed 'Matthew' and 'Galatians' (4 vols. 1878-83); and an enlarged edition of Lange's *Commentary on the Old and New Testaments* (25 vols. 1864-80). Besides these he edited the 'Philosophical and Theological Library,' including Ueberweg's *Hist. of Philos.*, Van Oosterzee's *Christian Dogmatics*, &c.; *The Religious Encyclopædia*, based on Herzog (3 vols. 1884), and (with Rev. S. M. Jackson) the supplementary *Encyclopædia of Living Divines* (1887); and 'A Select Library of the Nicene and Post-Nicene Fathers' (25 vols. New York, 1st series, 3 vols. 1886-89; 2d series, vols. i. and ii. 1890-91).

Schaffhausen, the most northern canton of Switzerland, is bounded on all sides but the south by the duchy of Baden. Area, 114 sq. m.; pop. (1870) 37,721; (1888) 37,876, of whom about 34,000 are Protestants. The chief river is the Rhine, which forms the southern boundary, and within the basin of which the canton is wholly included. The surface is hilly, especially in the north and east; of the many rich valleys that slope southward to the Rhine that of the Klettgau is famous for its fertility and for its wines. Agriculture is the principal branch of industry; grain, potatoes, fruits, hemp, and wine being the chief products. The great council is the governing body; it embraces one representative for every 500 citizens, chosen for four years. The executive is in the hands of a ministry of five persons chosen by the people for four years. The actions of the government are controlled by the optional referendum. The canton is simply the territory belonging to the town, which joined the Swiss confederation in 1501.

SCHAFFHAUSEN, the capital of the above canton, is beautifully situated on the right bank of the Rhine, above the celebrated falls, 31 miles by rail WNW. of Constance. Overlooking the town stands the curious castle of Munoth (1564-90), and this edifice, the cathedral (12th century), the Imthurneum (a concert and lecture hall), a library, and a museum are the chief buildings. The town is remarkable for the antique architecture of its houses. There is a statue to the Swiss historian Johannes von Müller, a native of the place. Pop. (1888) 18,648. The falls of Schaffhausen, about 3 miles below the town, form the grandest waterfall in the whole course of the Rhine (q.v.). They are utilised for the various factories of the place, which turn out iron and other metals, arms, oil, flour, beer, spirits, soap, candles, wool, cotton, and agricultural machines.

Schäffle, ALBERT EDWARD FRIEDRICH, political economist of the historical or evolutionary school, was born 24th February 1831 at Nürtingen in Würtemberg, studied theology at Tübingen, and, after spending some time on the editorial staff of a newspaper, became professor of Political Economy at Tübingen in 1861, and in 1868 at Vienna. He had sat in the Würtemberg diet, and in 1871 was for a short time Austrian minister of commerce. In that year he returned to Stuttgart, devoting himself to literary labours. His chief works are *Die Nationalökonomie* (1861; 3d ed. with a new title, *Das Gesellschaftliche System der Menschlichen Wirtschaft*, 1873), *Kapitalismus und Sozialismus* (1870), *Quintessenz des Sozialismus* (1874; 8th ed. 1885; Eng. trans. 1889), *Grundsatze der Steuerpolitik* (1880)—besides the work cited at POLITICAL ECONOMY.

Schall, JOHANN ADAM VON, a Jesuit missionary to China, was born at Cologne in 1591, entered the Jesuit order in Rome in 1611, and was sent out partly in consequence of his knowledge of mathematics and astronomy to China in 1622. His fame as a scholar led to his being invited to the imperial court at Pekin, where he was entrusted with the reformation of the calendar and the direction of the public mathematical school. The Emperor Shun-che, the founder of the Manchu dynasty (1644), showed him great honour and respect. Through this favour Schall obtained an edict for the building of Catholic churches and for the liberty of Christian preaching throughout the empire; and in the space of fourteen years the Jesuit missionaries are said to have made 100,000 converts. On the death of this emperor, however, a change took place; the edict was revoked, and Schall was thrown into prison and sentenced to death. He was afterwards liberated; but he was again imprisoned, and, at the end of a long incarceration, died August 15, 1669. He had acquired a perfect mastery of the Chinese language, in which he compiled numerous treatises upon scientific and religious subjects. A large MS. collection of his Chinese writings, amounting to 14 volumes in 4to, is preserved in the Vatican Library. In Latin he wrote a work *On the History of the Jesuit Missions in China* (Vienna, 1655).

See Mailly's *Histoire Générale de la Chine*, and Huc's *Le Christianisme en Chine*.

Schamyl. See SHAMYL.

Scharnhorst, GERHARD JOHANN DAVID VON, the organiser of the Prussian army, was born on 12th November 1756, at Bordenau, the son of a Hanoverian farmer. At twenty he entered the army of Hanover, and he took part in the campaigns in Flanders of the years 1793-95. In 1801 he transferred his services to Prussia and was appointed director of the training-school for Prussian officers. Five years later he was wounded at Auerstädt and taken prisoner at Lübeck, but released in time to be present at the battle of Eylau. In 1807 he began the great work of his life: he was put at the head of the commission for reorganising the armies of Prussia. He reformed the army, introduced the short-service (Krümper) system, created a better spirit amongst both officers and men, and so converted what had been a mercenary force into a national army. It was principally by means of this new weapon that Germany was able to crush the great Napoleon at Leipzig six years later (1813). But before that event took place Scharnhorst was dead; he was wounded at Grossgörschen on 2d May 1813, whilst acting as chief of the staff of the Silesian army, and died on 28th June at Prague.

See Life by Lehmann (2 vols. Leip. 1886-87) and Klippel (3 vols. Leip. 1869-71)—the former rather an account of his public work than a biography—and the *Erinnerungen* of Von Boyen (1891).

Scharwenka, XAVER, pianoforte player and musical composer, was born at Samter near Posen on 6th January 1850, and was trained as a musician at Posen and Berlin. On the conclusion of his studies he began to teach in Kullak's music academy in Berlin; but since 1873 he has devoted himself to composing and concerts. In 1881 he started a music school in Berlin. His compositions, embracing trios, quartetts, sonatas, concertos, 'studies,' and some famous Polish dance tunes, belong to the modern school.

Schässburg. See SEGESVAR.

Schaumburg-Lippe, a sovereign German principality, lying between Westphalia and Hanover. Area, 131 sq. m.; pop. (1890) 39,183. Agriculture is the chief occupation, though some coal is extracted. The people are mostly Lutherans. The prince governs with the help of an assembly of fifteen members, ten of whom are elected by the towns and the country districts, the rest by the prince, the nobility, and the clergy and educated classes. The state sends one deputy to the German Reichstag. Capital, Buckeburg (pop. 5088). The principality was founded by a member of the Lippe (q.v.) family, as the countship of Schaumburg, in 1640. The head of this branch of the family assumed the princely title in 1807.

Scheele, CARL WILHELM, chemist, was born on 19th December 1742, at Stralsund in Pomerania, then belonging to Sweden, and was apprenticed to a chemist at Gothenburg, and was afterwards chemist's assistant at Malmö, Stockholm, Upsala, and Köping (at the western end of Lake Mälar), and died at Köping, 19th May 1786. His whole life was devoted, with the absorbing passion of the lover of science and of nature, to chemical experiment and investigation. And, although his apparatus was very primitive and his means limited, he made a great number of discoveries of the utmost importance for the advance of chemistry. He discovered hydrofluoric, tartaric, benzoic, arsenious, molybdic, lactic, citric, malic, oxalic, gallic, and other acids. Chlorine, baryta, oxygen (1777), glycerine (1783), and sulphuretted hydrogen gas were all separated by him independently. He obtained the salts of manganese, and showed how manganese colours glass. The green pigment called Scheele's green, the arsenite of copper, derives its name from the chemist who first described it (see GREEN PIGMENTS), as does also the mineral scheelite or tungsten. He demonstrated in 1777 that the atmosphere consists chiefly of two gases, one, empyreal or fire-air (i.e. oxygen), supporting combustion, the other preventing it. This discovery of oxygen was made independently of Priestley's discovery three years before. In 1783 Scheele described prussic acid, which he proved to be the determining cause of the colouring matter in Prussian blue. He was a worker of wonderful accuracy, perseverance, and genius, and worked both analytically and synthetically. His papers were published in English by T. Beddoes (Lond. 1786), there being corresponding Latin, German, French, &c. editions; and in 1892 Baron Nordenskiöld published a number of his unedited letters and papers.

Scheffel, JOSEPH VIKTOR VON, German poet, was born at Carlsruhe on 16th February 1826, and was educated, at Heidelberg, Munich, and Berlin, to follow the law. But he always had a dislike to this pursuit, and after five years' work at it he gave it up. His interest was fixed upon the life of early and mediæval Germany, and his inclination towards literature was irresistible. As soon as he had shaken off the trammels of routine work, he hurried away to Italy and began to write. His first book, which he never surpassed, was *Der Trompeter von Säkkingen, ein Sang vom Oberrhein* (1854), a tale in verse of the time of the Thirty Years' War, steeped in the spirit of German romance, but as fresh in feeling as a May morning, and lightened with sly, genial humour; not the least charming features of the book are its many songs and the humorous reflections of Hiddigeigei the Tom-cat. Its popularity is attested by the fact that the 190th edition appeared in 1891, or at the rate of more than five editions a year since it was first published. Scheffel's second book, a prose story of the 10th century, *Ekkehard* (1857), telling how the young monk of St Gall fell in love with the Duchess of Swabia whilst teaching her to read Virgil, also enjoys extraordinary popularity: the 120th edition was published in 1891. Ten years after *Ekkehard* appeared Scheffel sent out *Gaudeamus* (1867; 54th ed. 1891), a collection of songs and ballads, which are known to all German students, and sung everywhere throughout the Fatherland. Yet, curiously enough, Scheffel himself had no ear for music, and is said never to have been present at a concert in his life. His remaining books include two romances—*Hugideo* (1884), a tale of the 5th century, and *Juniperus* (1868), placed in the end of the 12th century, the era of the crusades and the heyday of chivalry—three collections of poems—*Frau Aventiure, Lieder aus Heinrich von Ofterdingens Zeit* (1863; 15th ed. 1883); *Bergpsalmen* (1870; 4th ed. 1883), the visions of St Wolfgang, bishop of Ratisbon, seen in the solitude of his hermit's hut on the Salzburg Alps; and *Waldeinsamkeit* (1880), a dozen pictures of landscape-painting in words—and three or four short collections of posthumous *Gedichte* (1887-91). After his return from Italy Scheffel settled down in his native town, and died there on 9th April 1886.

See Life by J. Prölss (1887), by Ruhemann (1886), and Pilz (1887); also the *Erinnerungen* by Zernin (1886).

Scheffer, ARY, a painter, was the son of a German painter settled at Dordrecht in Holland, and was born there on 12th February 1795, studied under Guérin in Paris, and began his artistic career as a painter of genre pictures. But the Romanticism of the early 19th century captivated his fancy; he produced numerous pieces illustrative of Goethe's, Byron's, and Dante's works, such as 'Margaret at the Well,' 'Faust in his Study,' 'Mignon and her Father,' the 'Soldiers of Missolonghi,' the 'Suliote Women,' 'Francesca da Rimini,' 'Dante and Beatrice in Heaven,' and many others. Shortly after 1835 he turned to religious subjects, and painted (but did not always then exhibit) 'Christus Remunerator,' 'Christus Consolator,' 'The Temptation of Christ,' 'St Augustine and Monica,' &c. His best portraits were of the Duchess de Broglie, Prince Talleyrand, Queen Amélie, Liszt, Madame Viardot, Madame Guizot, La Fayette, Béranger, and Lamartine. He died at Argenteuil, near Paris, 15th June 1858. The pure and lofty expression he gives to his creations is a conspicuous feature of his work, which has been accused of sentimentality, and is inferior to that of many contemporaries in technique and execution. See *Memoir* by Mrs Grote (1860).

Scheldt (Lat. *Scaldis*, Fr. *Escaut*), a river that rises in the French dept. of Aisne, flows north past Cambrai and Valenciennes, and, entering Belgium, passes Tournai, Oudenarde, Ghent, Dendermonde, and Antwerp, having received among other tributaries the Lys, Dender, and Rupel. Arrived opposite the island of South Beveland, it divides into two arms. The left or southern, called the Wester Scheldt, flows south of the islands of Beveland and Walcheren, and meets the North Sea at Flushing; the northern or right arm, called the Ooster Scheldt, passes to the north of the same two islands. The river is navigable to Cambrai, 211 miles from its mouth and 56 from its source. From the middle of the 17th to the end of the 18th century the Dutch monopolised the navigation of the lower Scheldt and levied tolls upon all foreign vessels sailing on its waters. When Belgium was separated from Holland in 1831 the rights passed to the former, though they were vainly disputed by the latter. Belgium in 1863 finally renounced her rights for an indemnity of three-quarters of a million sterling paid by the foreign nations using the Scheldt, Great Britain contributing £175,650.

Schellenberg, a village 9 miles S. of Salzburg, near the south-east border of Bavaria, was the scene of the first engagement in the war of the Spanish succession in which the English took part. Marlborough's army of 40,000 men drove an Austrian corps of 12,000 from the fortified heights above the village, after a short, fierce fight, on 4th July 1704.

Schelling, FRIEDRICH WILHELM JOSEPH (afterwards *von* Schelling), was born at Leonberg in Würtemberg, 27th January 1775; studied theology and philosophy at Tübingen; then (1796) science and mathematics at Leipzig; began his career as a teacher of philosophy in the university of Jena in 1798 as successor to Fichte, from which time he was, with Fichte and Hegel, one of the pioneers of post-Kantian speculative thought. In 1803 he married Carolina (1763-1809), the divorced wife of A. W. von Schlegel (q.v.). From 1803 to 1808 he was professor at Wurzburg; then until 1820 secretary of the Royal Academy of Arts at Munich; again professor at Erlangen until 1827, when he returned to Munich to the new university there; and was finally called in 1841 by Frederick-William IV. to Berlin amid great expectation of results from his long-promised final, positive philosophy. He died at the baths of Ragaz in Switzerland, 20th August 1854.

Schelling's significance consists not in his being the founder of a philosophical system, but in his having by the force of his genius and prolonged fervid activity lived into and through the speculative questions of his day, condensing them into profound intuitions and thoughts which not only excited others to systematic thinking, but entered into the philosophical development as landmarks of speculation. His manifold productions may be grouped around the leading ideas of three distinct periods, the first of which extends from 1797 to 1800, when Schelling was under the influence chiefly of Fichte, and embraces the so-called 'Philosophy of Nature' and 'Transcendental Philosophy;' the second culminates in the 'Philosophy of Identity,' and falls between 1801 and 1803, Schelling's lights being then Spinoza and Boehme; the third and least valuable of the three represents the growth of what Schelling called his Positive (in opposition to the previous Critical or Negative) Philosophy, and may be traced as far back as 1809, when *The Inquiry into the Nature of Human Freedom* appeared. Schelling began as an adherent of Fichte's principle of the Ego as the supreme principle of philosophy: the Ego alone cannot be explained by anything outside itself; it posits itself and is conditioned only by itself—i.e. in it *form* and *matter* coincide; such are the ideas of his first production, *On the Possibility of any Form of Philosophy* (1795). In the next work, *On the Ego as Principle of Philosophy*, Schelling seems to make the transition to the Absolute Ego as the ground of the opposition between the Ego and Non-Ego, and thus arrives at the pantheism characteristic of the idealism of Fichte and Hegel. In the *Letters on Dogmatism and Criticism* (1796-98) he sets at naught Kant's arguments for the limitation of knowledge to phenomena, in laying claim to a 'secret wonderful faculty which dwells in us all' of beholding the transcendental ground of all reality, which he calls 'Intellectual Intuition'—a conception to be associated with the Reason or faculty of ideas of Spinoza and Kant and Plato, and with the intuition of the mystics. This notable doctrine, though resting on some basis of psychological experience (such, for example, as the 'Consensus Gentium' talked of in theistic proof or the 'Faith' of Jacobi), is apt to be either vague or presumptuous; the former as it hardly admits of exact definition, and the latter as it is apt to look like a claim to a private view of truth which may not be enjoyed by everybody.

In the *Philosophy of Nature* writings, and in *The World-Soul* (1797-99), we find Schelling supplementing the Fichtian doctrine of the Ego or Absolute Ego, by showing that the whole of Nature may be regarded as an embodiment of a process by which Spirit tends to rise to a consciousness of itself—that in fact we may supplement Subjective Idealism by an Objective Idealism in which Nature is seen to be the other pole of Spirit, slumbering or petrified intelligence. We might therefore say: 'I is everything, because everything is I.' Because of this affinity with Spirit that Nature has we may, thought Schelling, construct a 'Philosophy of Nature'—i.e. we can say what Nature is prior to actual empirical research—and we find him trying to explain Nature by a logical manipulation of such opposites as Self and Not-Self, attraction and repulsion, and such principles as polarity, excitability, light, &c. The *System of Transcendental Idealism* (1800), one of the most important of Schelling's works, speaks of the two fundamental and complementary sciences, Transcendental Philosophy and Speculative Physics, which together constitute the whole of knowledge; the one starts with the Subjective and shows how the Objective belongs thereto, while the other shows how the Objective must become Subjective. Schelling about this time edited two journals, the one for *Speculative Physics*, and the other (with Hegel) the *Critical Journal of Philosophy*, which not only contain some important articles of his own, but express at a stage of white heat the movement of thought which can only be said to culminate in the stupendous system of Hegel. It is easy to see in the *Transcendental Idealism* the germs of the 'Philosophy of Identity.' If either Spirit or Nature conduct us to the unity which Philosophy seeks, the metaphysical ground of Being may be viewed as a supra-sensuous Identity that is above all difference: the Absolute as the unity of the Ideal and the Real is higher than either Spirit in itself or Nature in itself, and Spirit Philosophy and Nature Philosophy merge in Identity Philosophy, the theory of the One which is above dualism and multiplicity. Following Spinoza, Schelling teaches (*Method of Academical Study*, 1803; *Bruno*, 1803, &c.) that it is only the imagination and the reflecting Understanding which cause us to separate things or conceive them separately; Reason beholds all things in their totality or oneness; the Absolute is not only the unity of all contradictions, but the unity of unity and itself unendingness. We here see the roots of the Dialectic or Logic of Hegel, who, however, is careful to avoid, as the grave of thought, a mere formal identity (i.e. to say that the Absolute is that which is one with itself is to say practically nothing about it) and to set forth a unity which is concrete (i.e. a unity in which all variety persists and is not lost). Schelling differs though from Spinoza in keeping the process of development strongly to the fore as indeed the truth of the world ('In the beginning was the *Act*,' in Goethe's words), a most valuable side of his philosophy, linking it through disciples of his with the tremendous development of the historic method in the 19th century; and again in tending to make *Spirit* the chief factor in the world process. In the Identity Philosophy Schelling repeats a good deal of the Natural Philosophy, and the weakest part of his system (only possible in the infancy of science) is his partly rational and partly fantastical and merely verbal construction of nature in the so-called *a priori* way.

The fact that Schelling could never describe to himself his Absolute save in the most formal way left his mind open to the influence of mystical speculation; he could never think exactly to himself how the finite arose out of its dark, infinite background, a question with which he occupied himself in the *Investigations into the Essence of Human Freedom*. In the latter treatise what he chiefly does is to translate into language of Reason such truths of Revelation as that of the Trinity, under which God the Father is seen to go out of Himself to the creation of a world; in some such way by an eternal act before all time man made himself what he is, and ever asserts his freedom until by another eternal act he unites himself to God, and thus brings the world back to God and becomes its Redeemer. The promised Positive Philosophy which was to advance beyond merely negative or critical philosophy came to be simply the philosophy of Mythology and Revelation. What Schelling objected to in the philosophy of Hegel was its attempt to extract all out of the Idea or Reason; there must be thought be something like Will, or Tendency, or Process to account for the illogical and finite aspect of some things, a fact which turned his mind to Nature as the fore-court to Spirit, and connects his philosophy with the strange system of Schopenhauer, which is a pantheism of the Will, as Hegel's philosophy may be called a pantheism of the Idea, and Schelling's of the Spirit. It was in keeping with the mystical character of Schelling's mind that he should look forward to a Johannine church of the future rising over the ruins of Petrinism and Paulinism.

A full account of Schelling will be found in any of the larger histories of Philosophy, such as those of Erdmann (Eng. trans. by Hough, 3 vols. 1889) and Kuno Fischer. Morell, in his *History of Modern Philosophy*, is largely influenced throughout by Schelling, and gives, of course, an account of him. See also Watson's *Schelling's Transcendental Idealism* (Grigg's Classics, Chicago, 1883); A. Seth's *Kant to Hegel*; Frantz, *Schellings Positive Philosophie*; Hartmann, *Studien u. Aufsätze*; D. Marheineke, *Criticism of Schelling's Philosophy of Revelation* (1843); Pfleiderer, *Philosophy of Religion*, vol. ii.; works on Schelling by Noack (1859), H. Becker (1875); and the biographical *Aus Schellings Leben: in Briefen*, ed. by Plitt (3 vols. 1870).

Schemnitz (Magyar *Selmeczbánya*), the oldest and most famous mining town of Hungary, stands in a narrow mountain gorge, 65 miles N. by W. of Pesth. Together with its suburbs it has 15,265 inhabitants, mostly Slovaks. The academy for mining and forestry, embracing collections of minerals and a chemical laboratory, is the principal building; there are also two castles and a pilgrimage church. A highly-esteemed tobacco-pipe is manufactured here and exported to America. The mines have been worked since Roman times, and produce gold and silver, copper and lead. The families of the miners make lace. Tobacco and violin strings are also made. Two-thirds of the mines are state property.

Schenectady, a city and county-seat of New York, on the Erie Canal and the south bank of the Mohawk River, 17 miles by rail NW. of Albany. It is the seat of Union College (1795; since 1873, in virtue of the affiliation to it of law and medical schools at Albany, Union University), and contains machinery and locomotive works, stove-foundries, woollen and flour mills, broom-factories, &c. Schenectady was settled by the Dutch in 1661. In 1690 the place was burned and sixty of the inhabitants massacred and ninety carried off by the French and Indians. Pop. (1890) 19,902.

Schenkel, DANIEL, a learned and aggressive German theologian, born in Switzerland, at Dagerlen in Zurich, December 21, 1813. He studied at Basel and Gottingen, and had been successively *privat-docent* at Basel and pastor at Schaffhausen, when in 1849 he became professor of Theology at Basel. In 1851, through the influence of Ullmann and Umbreit, he was called to Heidelberg, where he died, May 19, 1885, shortly after retiring from his chair. Here also he had been both university preacher and Kirchenrath. In his youth almost orthodox and a vigorous antagonist of Swiss radicalism, he became a prominent leader of the famous Protestantenverein, a champion of ecclesiastical liberalism and of the rights of the laity. From 1860 to 1872 he edited in its interest the *Allgemeine Kirchliche Zeitschrift*, and with a yet wider propagandist aim he associated with himself a group of its liberal theologians in the preparation of a great *Bibel-Lexikon* (5 vols. 1869–75). His most important scientific work was *Das Wesen des Protestantismus aus den Quellen des Reformationszeitalters beleuchtet* (3 vols. 1846–51), in which he explains Protestantism as a task to be progressively realised rather than a system of doctrine or of church government. Its aim is more than to give a comprehensive scheme of dogma to the church and a key for the interpretation of divine revelation to the individual Christian conscience—it is to create a community of believers whose fellowship rests on the re-establishment of humanity through Jesus Christ. Further, in *Der Unionsberuf des evangelischen Protestantismus* (1855) he pointed out the substantial identity that underlay the differences between the Lutheran and the Reformed Confessions. His *Christliche Dogmatik* (2 vols. 1858–59) follows Schleiermacher in making conscience the spring of religion, the intellectual and the moral elements involved being but different aspects of its essence. In his famous book, *Das Charakterbild Jesu* (1864), he essayed a task for which his powers were inadequate. He attempts to construct the human character of Jesus in relation to his consciousness of the Messianic idea, and entirely eliminates the supernatural, the only miracles admitted—those of healing—being reduced to mere psychological cures. His Jesus is merely a sublimated modern radical reformer, and one over-addicted to rhetoric besides.

Other books of this voluminous writer were *Die Kirchliche Frage und ihre Prot. Lösung* (1862); *Die Grundlehren d. Christenthums aus dem Bewusstsein d. Glaubens* (1877); a Life of Schleiermacher (1868); *Christentum und Kirche* (1867); and *Das Christusbild der Apostel u. der Nachapostolischen Zeit* (1879).

Scherer, EDMOND-HENRI-ADOLPHE, a distinguished French critic, was born in Paris in 1815. His father was of Swiss extraction, and his mother was the daughter of a London banker settled in Paris. After receiving the elements of his education in Paris, he was sent to England to reside with a dissenting minister, the Rev. Thomas Loader of Monmouth. During his two years' residence Scherer acquired a knowledge of the English language, which he turned to excellent account in his subsequent career as a literary critic. At this time also he became so deeply influenced by religious feelings that it was his strong desire at once to begin theological studies with a view to entering the church. By the desire of his parents, however, he returned to Paris, and during the next three years he completed his studies in literature and law. In 1836 he went to Strasburg, where he qualified himself for the ministry of the Protestant Church. Discovering that preaching was not his true function, he accepted the professorship of Exegesis in the Oratory at Geneva (1845). In Geneva he was closely associated with Vinet in his advocacy of a severance between church and state, expounding his views in *La Reformation au XIX*^{me} *Siècle*, a journal of which Scherer himself was editor. Gradually, however, he drifted away from his early faith, and in 1850 he was finally expelled from the church. For the next ten years he still lived in Geneva, mainly occupied in religious controversy. In 1860 he left Geneva for Paris, where he at once found ample scope for his powers in literary and political criticism. Besides being a regular contributor to *Le Temps*, he also acted as French correspondent to the *Daily News*, and sent occasional communications to different American papers. In 1871 he was elected representative for the department of Oise-et-Marne, and attained considerable distinction as a practical politician. He died in Paris, 16th March 1889.

By the solidity and extent of his knowledge, his severely logical method, and the range of subjects he has treated Scherer takes a high place among modern literary critics. His distinctive character as a critic lies in his combination of the qualities of the trained thinker and scholar with a keen susceptibility to the most diverse products of creative effort. His defects appear in a certain lack of elasticity and flexibility, partly due to his early training and partly to a naturally rigorous cast of mind, which disposes him to undue severity where he cannot sympathise.

See *Edmond Scherer*, par Octave Gréard of the French Academy (1890), and the Introduction by Mr Saintsbury to Scherer's *Essays on English Literature* (1891). Scherer's chief works are *Mélanges de Critique Religieuse*, *De l'État actuel de l'Église Reformée en France*; *Alexandre Vinet et ses Écrits*; *Études Critiques sur la Littérature Contemporaine* (9 vols.); *Mélange d'Histoire Religieuse*; *Melchior Grimm*.

Scherr, JOHANNES, historian, novelist, and writer of humorous prose and verse, was born 3d October 1817, at Rechberg in Swabia, studied at Zurich and Tübingen, and became a schoolmaster at Stuttgart. In 1844 he came to be known in act and writing as a strong democrat, and in 1848 was a member of the Würtemberg diet. In 1849 he fled to Switzerland, where in 1860 he obtained a post as lecturer in the Zurich Polytechnic. He died 21st November 1886. He wrote a universal history of literature, and histories of religion, of English literature, of German manners and customs, a whole series of romances and novels, and various miscellaneous works in prose and verse. He was vehement and one-sided in polemics; and his lively wit and caustic humour, though they give vivacity to a very characteristic and original style, are extravagant and overstrained.

Scherzo (Ital., 'jest,' 'sport'), in Music, a term applied to a passage or movement of a lively and sportive character, forming part of a musical composition of some length, as a symphony, quartett, or sonata.

Scheveningen, a fishing-village and seaside resort in South Holland, is situated on the North Sea, about two miles NW. of the Hague. Pop. 7980. It is visited by the aristocracy of Holland for sea-bathing, there being an excellent 'bath-house,' numerous villas, and hotels, and, during the season, all the gaieties and amusements of a fashionable watering-place. A range of sandhills protects the village from the sea. The road from the Hague to Scheveningen passes beneath an avenue of fine trees and wooded banks, with a tramway for passengers and goods. Off Scheveningen the Dutch fleet was defeated, and its admiral Tromp killed, by the British under Monk on 8th–10th August 1653.

Schiedam, a town in South Holland, 2¼ miles W. of Rotterdam, and close to the Maas. It is known the world over as the place where Hollands gin is made, in some 300 distilleries. Large numbers of pigs and cattle are fed on the refuse grain in the surrounding country. There is a large shipping trade, some shipbuilding, and cooperages, malt-kilns, &c. Pop. (1870) 18,854; (1890) 25,260.

Schichallion. See PERTHSHIRE, and MASKELYNE.

Schiller, JOHANN CHRISTOPH FRIEDRICH, German poet and dramatist, was the son of an army surgeon, a man of deep religious feeling and strict conscientiousness. His mother was a woman of gentle disposition, true humility and piety, and some poetic feeling. Fritz was born at Marbach on Neckar on 10th November 1759, and inherited the distinguishing traits of both his parents. He was brought up amid the vine-clad hills of Marbach, beneath the ancestral castle and monastery of the Hohenstaufens at Lorch, and at Ludwigsburg, the Versailles of the Dukes of Würtemberg. Besides learning Latin and Greek at the grammar-school of Ludwigsburg, Schiller was carefully educated, especially in religious matters, by his father, whose ambition it was to make him a pastor. But destiny in the person of Duke Carl Eugen decreed otherwise. This Würtembergian imitator of the 'Grand Monarch,' who set up to be the father of his people, established in 1773 a school at his castle of the Solitude, near Ludwigsburg, for the purpose of training army officers and servants for the public service. Captain Schiller, who was at that date superintendent of the ducal forests and gardens around the Solitude, was given to understand that the duke wished to enrol his clever son Fritz amongst the first pupils of his new institution. Accordingly the boy turned to law instead of to theology; and at the ducal school (moved to Stuttgart in 1775) was kept under a rigid discipline, partly military, partly monastic. About 1776 Schiller, tired of law, which he never liked, threw it up for medicine, which he liked very little better. It was not long after this that, principally through reading Klopstock's *Messias*, he became conscious of his own poetic powers. From the first he conceived a decided fancy for tragedy; and now, instead of studying medicine, he spent most of his time in reading and writing poetry and tragedies, although both occupations were strictly forbidden by the duke. In philosophy also he took a more than ordinary interest, and this taste remained with him to the end of his days. The duke was very proud of his clever *protégé*, and on 14th December 1779, in the presence of Goethe and Duke Carl August of Weimar, was delighted to bestow upon him three medals for excellence in his medical studies; for Schiller had at last worked hard to qualify himself for leaving the Carl's School, and so becoming master of himself.

Exactly one year after Goethe's visit Schiller left school, and was appointed surgeon to a Würtemberg regiment. One month later (13th January 1782) his play *Die Rauber*, begun in 1777, was put on the stage at Mannheim. People took their seats at noon, five hours before the performance began, and the piece made a tremendous sensation—being full of the revolutionary sentiments with which the air was charged previous to the outbreak of the French Revolution. Young Schiller had breathed the spirit of such 'storm and stress' productions as Goethe's *Gotz*, and the ideas of the eccentric C. F. D. Schubart; moreover, he had drunk deeply at the wells of Plutarch's hero-worship and Rousseau's overwrought sentimentalism. The play itself, however, in spite of the gravest faults—gross crudities, improbabilities, exaggerated and unreal sentiment, inflated and bombastic diction—literally throbbed with energy and passion, and contained many passages of remarkable tragic force. Schiller himself was present at the performance; but because he quitted Stuttgart a second time without his ducal leave Carl Eugen had the aspiring dramatist arrested, and on his release forbade him both to write plays and to leave Wurtemberg. This treatment Schiller's pride, as writer and as man, would not brook; so on the night of 22d September he fled from the capital in disguise, and under an assumed name (Dr Ritter). He lay concealed at Mannheim and at Oggersheim, and latterly on Frau von Wolzogen's estate of Bauerbach near Meiningen. In that quiet retreat he finished two more plays, *Die Verschworung des Fiesco zu Genua* and *Kabale und Liebe*. The structural idea of the former, Schiller's first historical play, printed in 1783, is that of nearly all his historical works, a revolt against some constituted authority that has degenerated into tyranny and become an enemy of freedom. The latter (1783) is a protest, dramatically a more successful work than *Fiesco*, against the tyrannies of social convenience, involving an attack upon the court life of the typical German ruler of the epoch.

On 1st September Schiller was appointed dramatist to the Mannheim theatre, and thought he had reached his port. But at the end of the year the engagement was not renewed; neither intendant, nor dramatist, nor actors were satisfied one with another. Thus Schiller was again thrown on his own resources; and from the time he left Stuttgart until he settled in Weimar he was always in debt and always struggling with narrow means. One of his plans of self-support was the issue of a sort of theatrical journal, *Die Rheinische Thalia*, begun in November 1784, and written almost entirely by his own hand. In this journal were first printed most of his *Don Carlos*, many of his best poems (e.g. *An die Freude*), and the stories *Verbrecher aus Verlorener Ehre* and *Der Geisterseher*. In 1785 he resolved to depart from Mannheim, and to accept a warm invitation from a circle of admirers in Leipzig, which included, he found, Göschen the publisher (grandfather of the English statesman) and Korner, father of the poet.

Schiller had not been without his love affairs: he had known the pangs of jealousy in connection with Frau von Wolzogen's daughter, he had paid suit to Margareta Schwann, the publisher's daughter in Mannheim, and he had been half fascinated by Charlotte von Kalb, perhaps the most remarkable woman of her generation in Germany. At Dresden, where Körner was living, Schiller found the rest he so much needed, rest from emotional excitement and rest from pecuniary worries. And this rest, which he owed in great part to Körner's generosity, he turned to good account. He finished *Don Carlos* (1787), which may be called his first mature play, in that the enthusiasm is more chastened, the language more sober and disciplined, the plot better elaborated, and the knowledge much riper. Nevertheless it suffers artistically from its excessive length, from its inherent lack of unity, and more especially from the shifting of the interest from Carlos to the Marquis Posa. The play was written in blank verse, as being more appropriate to the dignity of the subject; and besides embodying Schiller's ideas of a perfect political society, it presents a most noble type of the true friend of man in Posa. From the day he first saw Körner he shared with him nearly all his thoughts, and continued to do so after he left Dresden and became intimate with Wilhelm von Humboldt and Goethe. Amongst the finest fruits of his discussions with Korner and his circle are the poems *An die Freude* and *Die Kunstler*. Under the stimulus of the same society he went back to his old love philosophy, and at the same time began to study history in a serious and systematic way. After two years in Dresden something of the old restlessness took possession of him again, caused in part by another unhappy love affair (with Henriette von Arnim), and he thought to allay it by a visit to Weimar and elsewhere. But of Weimar and its court circles the truth-loving poet soon grew tired—Goethe and Duke Carl August were both absent at the time. Nevertheless he stayed on awhile, finding society in Charlotte von Kalb, in Herder, and certain of the professors at Jena near by. One of these, Reinhold (Wieland's son-in-law), brought Kant to his notice; and Schiller steeped himself in the thoughts of the Konigsberg recluse with his usual ardour, though he greatly modified Kant's system ere he adapted it for his own use. About the same time he met his future wife, Charlotte von Lengefeld; and, getting some hints of a possible chair at Jena, he resolutely bent his mind to the writing of a work of more practical value, and began his history of the revolt of the Netherlands. In the end of 1788 he was appointed to a professorship at Jena, and, being further granted a small pension by the Duke of Saxe-Weimar, he married Lotte von Lengefeld. In order to meet the responsibilities entailed by these changes Schiller worked terribly hard, so hard in fact that he eventually broke down his health. Besides lecturing, he wrote a number of minor papers and the greater work, the history of the Thirty Years' War. These productions are not of course the outcome of a prolonged or exhaustive course of special studies; but they rank high amongst German historical writings by virtue of their great merits of style, the warm human interest the writer has breathed into them, and the broad philosophic ideas that form their life and substance.

Towards the end of the year 1792 Schiller was agreeably surprised by the offer, brought about chiefly by his admirer, the Danish poet Baggesen, of a free gift of 3000 gulden from the Duke of Augustenburg and his friend Count Schimmelmann. The first use the now invalid poet made of his freedom was to finish the Thirty Years' War, and his next to pay a visit to his old father and mother, whom he had not seen for eleven years. In the year of this visit (1793) he began the *Briefe über die aesthetische Erziehung des Menschen*, letters of noble and weighty import concerning the function of art as the supreme educative agent. At this period, in the irony of circumstances, it came into the heads of the French revolutionists to nominate Schiller (M. Gille) an honorary member of the republic, a distinction which, although himself a man of democratic sentiments, he spurned with horror on learning of the execution of the king. The diploma of citizenship took five years to reach him (1798).

The year 1794 is in some respects the most important in the whole course of Schiller's life: he made the acquaintance of Fichte, he formed an intimacy with Wilhelm von Humboldt, and began his wonderful friendship with Goethe. He was introduced to the great poet at his future mother-in-law's house in the summer of 1788; but for a while they were both distant and reserved, and it was only in the course of a chance conversation at Jena in the summer of 1794 that they discovered common ground of sympathy. The ice once broken, however, they soon drew together; the dreamer and idealist and the man of universal human interests had both worked their way from entirely opposite starting-points to pretty nearly the same conclusions. Both regarded art as the crowning-stone of human culture, as in fact the best practical religion, and both thought and wrote in the spirit of that conviction. The year 1794 is marked in Schiller's career by two other events: he composed the essay *Ueber Naive und Sentimentale Dichtung*, in which the respective characters of ancient (classic) and modern poetry were for the first time clearly defined and discriminated; and he started the magazine *Die Horen*, which died after a precarious existence of three years. But it gave birth to the much more celebrated *Xenien* (1797), a collection of satirical epigrams, written by Schiller and Goethe conjointly, and aimed at all who, in their estimation, did not pay fit and proper reverence to Art, and its object Beauty. Schiller's intercourse with Goethe had reawakened his poetic instincts, and he once more began to write poems, at first pieces of a reflective and lyric character, principally for his annual *Die Musenalmanach* (another bread-winning project), such as *Die Macht des Gesanges*, *Die Ideale*, *Würde der Frauen*, *Der Spaziergang*, and so forth, and later, mostly in his garden-house at Jena during the years 1797 and 1798, the matchless ballads (*Kraniche des Ibykus*, *Der Handschuh*, *Der Taucher*, *Ritter Toggenburg*, &c.) that in the estimation of many constitute his principal contribution to literature, and that certainly make him the favourite beyond all other poets of the German people. And, under the same stimulus, he went back to the drama, and spent many a long night on the finishing of *Wallenstein* (1798-99), in spite of the fact that every hour's writing cost him several hours' suffering. This play (embracing the trilogy *Wallenstein's Lager*, *Die Piccolomini*, and *Wallenstein's Tod*), which Carlyle declares to have been 'the greatest dramatic work of which the 18th century can boast,' is in every way a remarkable advance on *Don Carlos*. It is built on a wider and truer estimate of human nature, displays a juster conception of the limits and possibilities of dramatic composition, and attains a happier, loftier harmony of the poetic and dramatic ideals; and, especially on account of the magnitude and masterly arrangement of the action, the character of Wallenstein, and the pathetic love-story of Max Piccolomini and Thekla, ranks as one of the greatest, if not the very greatest, of all plays in German literature.

In 1799 Schiller settled in Weimar—he had never lectured since 1793—in order to be nearer the theatre and close to Goethe, whom he zealously supported in his efforts to elevate the German stage into an influential engine of culture. In quick succession he finished *Maria Stuart* (1800), *Die Jungfrau von Orleans* (1801), *Die Braut von Messina* (1803), and *Wilhelm Tell* (1804). The first named, whilst not exactly answering the expectations of the English reader, is nevertheless an admirable drama. Mary, the heroine, is represented as an erring, but repentant and lovable woman, whose character shines out all the more beautiful from contrast with her cold and selfish cousin, Elizabeth; and the play contains several fine passages, descriptive and dramatic. *Die Jungfrau* is artistically one of Schiller's most successful performances; Joan of Arc, the principal character, is drawn as a lovely and innocent maiden inspired with the spirit of the prophetess—a deeply religious and ideally beautiful conception well carried out. *Die Braut von Messina* was confessedly an experiment, and, it is universally admitted, an unsuccessful experiment, at combining the ancient and the modern ideals of dramatic excellence, more especially by the introduction of the chorus as the principal supporter of the action. *Tell*, however, is a noble piece of work, in spite of some technical defects (principally the lack of a central character and of a progressive concentration of the dramatic interest). All the *dramatis personæ* are thoroughly human and are cleverly put before us, and there are many fine descriptions of Swiss landscapes; but the finest thing of all is the unquenchable spirit of freedom that pulses in every line. This was the last drama Schiller lived to finish, though he left others in various stages of completion, *Warbeck* and *Demetrius* being the most advanced. His health, long enfeebled, finally and suddenly broke down; he died on the 9th May 1805, still a comparatively young man, in the prime of his intellectual activity.

Schiller's life was one long struggle against pecuniary difficulties, greatly aggravated at times by the most uncongenial surroundings, and latterly by ill-health. Yet through all he remained true to himself and to his high calling. He pressed ever strenuously forward along the path of knowledge and self-culture, and his literary career is an advance from crude elemental strength to finished and matured art. Personally, in spite of the drawbacks and hindrances of his outward situation, his character and conduct were of the noblest: he made it his constant end, deliberately chosen, to try and carry out in his own daily life the loftiest ideals he believed in, and strove to 'live like a man whom the world would be sorry to lose.' The key to his speculative ideas, especially with respect to art, is contained in the high and reverential regard he paid to moral beauty. That is the chief corner-stone of his æsthetic creed and of his principles of action. He had an enthusiastic admiration for what is noble and grand and magnificent, and this passion enters into the structure and substance of nearly all his writings. Two other great qualities ring through his works, an incorruptible love of truth and a lofty spirit of freedom. His poetic strength lay in a peculiar blending of moral and intellectual force. As a lyric poet he can hardly be accounted as of the first rank: he lacked not only the spontaneity but also the immediate insight and sympathy with the actual world, and the living men and women in it, that in so eminent a degree distinguished his greater friend and contemporary Goethe. As a dramatist, however, he undoubtedly stands first of the Germans, and must justly take a high rank amongst the dramatic writers of the world.

The standard editions of his works are those by Gödeke (17 vols. Stutt. 1868-76), Kurz (9 vols. Hildburghausen, 1868-69), and Boxberger (8 vols. Berlin, 1882). All preceding lives of Schiller have been superseded by Minor's (4 vols. Berlin, 1890 *et seq.*). See also the longer works of Weltrich (Stutt. 1885 *et seq.*) and O. Brahm (Berlin, 1888 *et seq.*). Of the earlier biographies the best were those by Hoffmeister and Viehoff (5 vols. Stutt. 1875), Palleske (2 vols. 12th ed. Stutt. 1886), Düntzer (Leip. 1881), Scherr (4th ed. Leip. 1865), Caroline von Wolzogen (5th ed. Stutt. 1876), Schwab (3d ed. Stutt. 1859), and Hepp (Leip. 1885). Schiller's *Briefe* (2 vols. 1846) and his Correspondence with Goethe (2 vols. 4th ed. 1881), Körner (4 vols. 2d ed. 1874), W. von Humboldt (2d ed. 1876), Lotte (his wife) and her sister (3d ed. 1879), and others contain abundance of biographical matter. There are biographies in English by Carlyle (Lond. 1825), Bulwer-Lytton (Edin. 1844), J. Sime (Edin. 1882, 'Foreign Classics for English Readers'), and H. W. Nevinson (Lond. 1889, 'Great Writers' series), and English translations of Palleske (Lond. 1860) and Düntzer (Lond. 1883). Various English writers have published translations of Schiller's works in whole or in part; the versions of poems by Bulwer-Lytton (1844), Merivale (1844), Bowring (1851), and Lord Lytton (Lond. 1887), and of the dramas Coleridge's *Piccolomini* and *Wallenstein's Death* deserve special mention. The Schiller museum was united with the Goethe museum (*Archiv*) at Weimar in June 1889.

Schilling, Johannes, German sculptor, was born at Mittweida in Saxony, on 23d June 1828, and was trained in Dresden and Berlin. In 1853 he went to Italy, having won a three years' travelling scholarship. In 1868 he was elected a professor of the Academy of Fine Art in Dresden, where he had been settled since his return from Italy. His first great work was the four groups of the Seasons for Dresden; for that city he also executed monuments of Rietschel the sculptor and King John of Saxony, and the colossal Dionysus and Ariadne in bronze for the Royal theatre. His masterpiece is the national monument of Germania on the Niederwald (q.v.), commemorative of the war of 1870–71. Besides numbers of frescoes and similar ornamental works, he has also turned out monuments of Schiller (for Vienna) and the Emperor Maximilian (for Trieste), and a war memorial for Hamburg.

Schimmelpenninck, Mary Ann, was born in Staffordshire, 25th November 1788, the daughter of a Quaker manufacturer named Galton. After her marriage in 1805 to Mr Lambert Schimmelpenninck, she lived at or near Bristol; in 1818 joined the Moravian body; and, having suffered from paralysis since 1837, died at Clifton in August 1856. Her nine works, published between 1813 and 1860, include two on Port Royal, a *Theory of Beauty*, *Sacred Musings*, and an *Autobiography*.

Schinkel, Karl Friedrich, a German architect, was born at Neuruppin in Brandenburg, March 13, 1781, and studied the principles of drawing and design at Berlin. In May 1811 he was elected a member of, and in 1820 a professor at, the Berlin Royal Academy. He died October 9, 1841. The designs to which he chiefly owes his reputation are those of the Museum, the Royal Guard-house, the Memorial of the War of Liberation, the New Theatre, the New Potsdam Gate, the Observatory, the Artillery and Engineers' School, all in Berlin, the Casino in Potsdam, another at Glienicke near Potsdam, and a great number of castles, country-houses, churches, and public buildings. His designs are classic in feeling, noble, harmonious, and dignified. He also excelled as a painter, and as a designer of monuments and of furniture. His designs and sketches were published in *Sammlung architektonischer Entwürfe* (174 plates, 1857–58), *Werke der höheren Baukunst* (25 plates, 1873), *Grundlage der praktischen Baukunst* (2 vols. 1835), and *Sammlung von Möbelentwürfen* (16 plates, 1852). See Life by Kugler (1842), by Quast (1866), and by Dohme (1882).

Schinus, a genus of trees and shrubs of the natural order Anacardiaceæ, natives of South America. The leaves so abound in a resinous or turpentine-like fluid that upon the least swelling of the other portions of the leaf by moisture it is discharged from the sacs which contain it. Thus they fill the air with fragrance after rain, or if thrown into water start and jump about as if alive, discharging jets of this peculiar fluid. A sort of honey and also a kind of vinegar is made by the Peruvians of the fruit of *Schinus molli* (Peruvian mastic), and they also make a vinous drink from it by boiling. A resinous gum exudes from the stem which is of the nature of mastic. The fresh bark of *S. aroeiri* is employed by the Brazilians to coat newly-made ropes with, to which it gives a very durable dark-brown covering. It is said to be dangerous to sleep under its shade, causing painful swellings. The same phenomenon is exhibited by the leaves of some species of the kindred genus Duvaua, of which specimens are occasionally to be seen in our greenhouses. The leaves and twigs when bruised have a very strong odour of turpentine.

Schipka. See Shipka.

Schipperke (Flemish, 'little skipper'), the name of a breed of dogs that has recently become familiar at dog shows, belonging to the same group as the Eskimo and Pomeranian dog, but with almost no tail. They are favourites of the Belgian bargees, and from them have derived their name.

Schism, ecclesiastical division in a church or separation from a church; as also the tendency to promote such division. The Great Schism or Greek Schism is the separation of the Greek Church (q.v.) from the Latin: the temporary Western Schism is dealt with at Antipope, Pope.

Schist (Gr. *schistos*, 'split') is a term properly applied to crystalline rocks with a foliated structure (see Foliation), as mica-schist, hornblende-schist, &c. Indurated clay-rocks with a fissile structure are sometimes erroneously described as schists. For the schistose rocks, see Petrography and Geology.

Schizomycetes ('fission-fungi'), a botanical term for Bacteria. It refers to their commonest mode of reproduction—by transverse division. The term Schizophyte is also synonymous with Bacteria. The advantage of the term Schizomycetes is its harmony with similar terms—Saccharomycetes, Zygomycetes, Ascomycetes, &c.—applied to other sets of fungoid plants. See Bacteria.

Schlagintweit, the name of five brothers who all distinguished themselves as travellers or as writers on sciences allied to geography. Three of them—Hermann von Schlagintweit, born at Munich on 13th May 1826; Adolf, born at Munich 9th January 1829; and Robert, born on 27th October 1833—worked for the most part in company, and in the same departments of inquiry. Hermann and Adolf first made themselves known as investigators of the physical geography of the Alps, through two books—*Untersuchungen über die physikalische Geographie der Alpen* (1850) and a continuation, *Neue Untersuchungen* (1854). Shortly after the publication of the last named Wilhelm von Humboldt got them, along with Robert, recommended to the British East India Company, who sent them out to India to make observations on terrestrial magnetism, to measure mountain altitudes, and carry on meteorological and geognostic investigations. They spent nearly two years and a half in executing their commission, and in the course of it traversed great part of the Deccan, and crossed the main chains of the Himalayas, and penetrated into Tibet. Hermann also made his way alone into Sikkim and Assam, and then in company with Robert explored parts of Ladakh, and crossed, the first of all Europeans, the Kuen-Lun Mountains, for which feat Hermann was in later years nicknamed 'Sakünlünski.' Adolf in the meantime examined the geological structure of the Nilgiris in the south, explored parts of Balti in western Tibet, and in the summer of 1857 crossed the Karakorum and Kuen-Lun Mountains and reached Yarkand; there, however, he was seized by Yakub Beg, emir of East Turkestan, and put to death on 26th August. Hermann on his return to Europe settled down to private life, and gave his energies chiefly to the publication of scientific papers. He died at Munich on 19th January 1882. Robert was in 1863 appointed professor of Geography at Giessen, where he died on 6th June 1885. The Schlagintweits' travels in India are recorded in their *Results of a Scientific Mission to India and High Asia* (4 vols. Leip. 1860–66). During two long journeys through the United States in 1869 and 1880, Robert gathered materials for works on the Pacific railways (1870, 1884, 1886), California (1871), the Mormons (1877), &c.

A fourth brother, EDUARD, born on 23d March 1831, took part in the Spanish invasion of Morocco of 1859-60 and wrote an account of it. He was killed in the battle of Kissingen, fighting in the Bavarian army, on 10th July 1866. EMIL, the fifth brother, born 7th July 1835, chose law for his calling, and the study of Tibetan and Indian languages for his amusement during leisure hours. He has written *Buddhism in Tibet* (Lond. 1860), *Die Könige von Tibet* (Munich, 1865), *Die Gottesurteile der Inder* (1866), and other books.

Schlangenbad, one of the best-known spas of Germany, in the Rheingau district, stands in a beautiful wooded valley of the Taunus Mountains, 5 miles W. of Wiesbaden. The water of the baths (82°-90° F.) is of the character called 'indifferent,' is used for the most part externally, in baths, and is helpful in nervous diseases, for women's complaints, and for purifying the skin. Pop. 403. Visitors in the season, 2000. The place gets its name from a species of harmless snake (*Coluber flavescens*) which is found there.

Schlegel, AUGUST WILHELM VON, German critic, poet, and translator, was born at Hanover on 8th September 1767, and began to study theology at Göttingen, but, like his younger brother Friedrich (see below), soon turned to literature, writing poems for two magazines edited by the poet Bürger, and later for Schiller's *Horen*, and contributing to the *Gottinger Gelehrte Anzeigen* and other periodicals. In 1795 he settled in Jena, and in 1796 married a widow lady, Caroline Böhmer (1763-1809), the clever, restless daughter of Professor Michaelis, who separated from him in 1803, and at once married Schelling. In 1798 Schlegel was appointed professor of Literature and Fine Art in that university; and the years 1801-4 he spent in Berlin, lecturing on the subjects he had taught at Jena. The greater part of the following fourteen years he lived in the house of Madame de Staël at Coppet on the Lake of Geneva; the chief incidents that mark this period of his life were the delivery of *Lectures on Dramatic Art and Literature* (Eng. trans. 1815) at Vienna in 1808, and his officiating as secretary to the Crown-prince of Sweden during the war of liberation (1813-14). In 1818 he was appointed professor of Literature in the university of Bonn, a post he filled down to his death there on 12th May 1845. He had already, years before going to Bonn, done what has proved to be his best work: gifted with considerable feeling for poetic form and much fine taste, he translated into German verse most of the works of Shakespeare, and followed up the success he thereby achieved by publishing admirable translations of Dante, Calderon, Cervantes, Camoens, and other foreign masters of literature. The translation of Shakespeare, afterwards revised and continued by Tieck, is still the classic German version. Along with his brother Friedrich he enjoyed great influence throughout Germany as one of the most active leaders of the Romantic movement, his critical papers in *Das Athenaeum* and in the volume of *Charakteristiken und Kritiken* (1801) being greatly valued in their day. In Bonn he devoted his attention principally to Indian studies, and issued editions of the *Bhagavad-Gita* and the *Ramayana*. Heine attended his lectures at Bonn, and learned from him many of the secrets of poetic workmanship; for A. W. Schlegel's own poems, lifeless and cold as they are, show no little finish as to form. Heine's picture of the vain old dictator of letters coming to lecture to his class is worth quoting: 'He wore kid gloves and was dressed after the latest Paris fashion; he still had about him the perfume of elegant society and *eau de mille fleurs;* he was the *beau-idéal* of elegance and politeness, and when he spoke of the English Lord of the Treasury he always began with the words "My friend." Beside him stood his servant, dressed in the grand livery of the noble house of Schlegel; his business was to snuff the wax candles in the silver candlesticks that stood, along with a glass of sugared water, on the desk before him, the "genius of the age."' His inordinate self-esteem, and the unwarranted influence he enjoyed, led him to pass severe censure upon the literary work of men like Schiller, Wieland, and Kotzebue, and involved him in unseemly polemics. Apart from this feature, his judgment as a critic in matters of pure literary taste makes his lectures still worthy of consideration, especially the set already named and another series, *Ueber Theorie und Geschichte der bildenden Künste*, delivered at Berlin in 1827. His writings were published in three separate collections—*Sämmtliche Werke* (12 vols. Leip. 1846-47), *Œuvres écrites en Français* (3 vols. 1846), and *Opuscula quæ Latine scripta reliquit* (1848).

See the books quoted under FRIEDRICH SCHLEGEL; the letters of his first wife, edited by Waitz under the title *Karoline* (3 vols. 1871-82); and Mrs Alfred Sidgwick's *Caroline Schlegel and her Friends* (1889).

Schlegel, FRIEDRICH VON, German critic and writer, was born at Hanover on 10th March 1772. After receiving a classical education at Göttingen and Leipzig, he took to his pen for a livelihood. He abducted the wife of the Jewish merchant Veit (a daughter of Moses Mendelssohn and mother of Veit the religious painter), thus putting into practice views as to free love which he had enounced in a notorious romance, *Lucinde*. He then joined his brother August Wilhelm at Jena, and along with him wrote and edited the journal *Das Athenaeum*, in which they laid down the characteristic principles or features of Romanticism. His zeal for these principles was so strong that he has ever been accounted the head of the Romantic School (q.v.). With him too Friedrich wrote *Charakteristiken und Kritiken* (1801), a set of longer critical essays, which gave a real stimulus to good work in German literature and contain some of both brothers' best writing. Friedrich Schlegel at length sought relief for his romantic yearnings, and refuge from the harsh realities of actual life, by becoming a faithful son of the Roman Catholic Church. From 1808 down to his death, which occurred during a lecture-tour at Dresden on 11th January 1829, he was employed in the public service of Austria. It was he who penned the proclamations of that empire against Napoleon in 1809. The best known of his books, at least in Britain, are lectures on the *Philosophy of History*, first delivered at Vienna in 1827 (Eng. trans. 1835), and *History of Literature*, delivered at Vienna in 1814 (Eng. trans. 1859); both are clever, but one-sided, the Roman Catholic tendencies of the writer being too strongly pronounced. There are also English versions of his *Philosophy of Life* (1847) and *Lectures on Modern History* (1849). The book the Germans esteem most highly of his is *Ueber Sprache und Weisheit der Indier* (1808), which was a pioneer for the study of Sanskrit in Europe. The best edition of his *Sämmtliche Werke* is Feuchterleben's (15 vols. Vienna, 1846).

See his *Briefe an A. W. Schlegel* (1889); Haym, *Die Romantische Schule* (Berlin, 1869); and G. Brandes, *Den Romantiske Skole i Tydskland* (Copenhagen, 1873).

Schleicher, AUGUST, philologist, was born at Meiningen, on 19th February 1821, studied at Leipzig, Tübingen, and Bonn, and began to lecture on comparative philology at the last-named university in 1846. Four years later he was called to the chair of Slavonic Languages at Prague.

From 1857 to 1868 he lived at Jena as an honorary professor; and there he died on 6th December 1868. With him the comparative study of the Indo-Germanic languages took a decided step forward. In his *Kompendium der vergleichenden Grammatik der Indogermanischen Sprachen* (1861; 4th ed. 1876; Eng. trans. 1874–77) he showed clearly the relations of the members of the group, not only one to another, but of each to the original parent language, which he made a gallant attempt to reconstruct, and laid down the phonetic laws that had governed their respective developments. Schleicher did first-rate service also in advancing the scientific study of the Slavonic family of tongues and the Lithuanian language; for instance, in the *Handbuch der litauischen Sprache* (1857). Further labours were embodied in *Die Sprachen Europas* (1850), *Die Deutsche Sprache* (1860; 5th ed. 1888), *Indogermanische Chrestomathie* (1869), and *Litauische Marchen und Lieder* (1857). His views as to the study of language, which he wished to treat as a purely natural science, have been hotly contested by Max-Muller. There is a Memoir by Lefmann (1870).

Schleiden, MATTHIAS JAKOB, botanist, was born at Hamburg, 5th April 1804, studied law at Heidelberg, practised at Hamburg as advocate, but in 1833 went to Göttingen and devoted himself to the study of physiology and botany. In 1839 he was called to the chair of Botany at Jena, and in 1863 at Dorpat. In 1866 he retired, and died at Frankfort, 23d June 1881. He contributed greatly to establish the cell-theory (see CELL); and of his numerous works, including two collections of poems, books on materialism, the sense of sight, the age of man, a Life of Linnæus, &c., the most important is his *Grundzuge der wissenschaftlichen Botanik* (1842–43; Eng. trans. *Principles of Scientific Botany*, 1849). See BOTANY, Vol. II. p. 352.

Schleiermacher, FRIEDRICH ERNST DANIEL, the greatest German theologian since Luther, was the founder of that modern theology which seeks to understand Christianity without doing despite to the reasonable convictions of the human mind. What marked him out as reformer was first and foremost his mental constitution, in which a profoundly religious temperament was happily blended with an acute intelligence, and an unhesitating independence of thought and feeling with an exceptional susceptibility to the most various impressions from without. Then he was fortunate in having his various gifts developed by the course of his education and the experiences of his life.

He was born on the 21st November 1768 at Breslau, the son of an army chaplain belonging to the Reformed confession. The pious atmosphere of his home awakened vivid religious feelings in the boy, which attained fuller growth at the Moravian educational institutes of Niesky and Barby, where he studied from 1783 till 1787. But deep as was the impression made upon him by the godliness of social life amongst the brethren, the narrow and rigid dogmatic form of religion as taught by them was simply intolerable to the eager mind of Schleiermacher, already leavened by the wisdom of classical antiquity; and he felt that he could no longer profess this faith without a lie against his own nature. There was a painful conflict of opinion between him and his rigorously orthodox father ere the son forsook the theological seminary of Barby to study philosophy and theology at Halle. Of the philosophers it was mainly Plato, Spinoza, and Leibnitz, and afterwards also Kant, Fichte, and Schelling, who made a permanent impression on him and moulded his mental development. A powerful influence was also exerted from 1797 onwards by the intimacy into which, now a preacher in Berlin, he was drawn with the devotees, both male and female, of Romanticism (q.v.). He thoroughly sympathised with that cultus of personal feeling and that contempt for mere intellectual *Aufklarung* which the romanticists carried to an extreme; but he was saved from falling into the speculative and practical excesses of the romanticists by the anchor which his character had found in personal piety, and by the scientific prudence and breadth that came of his constant study of philosophy, ancient and modern. To this first sojourn in Berlin belong the earliest of those publications which made Schleiermacher known to the learned world: the *Reden uber Religion* (1799; new ed. 1879), the *Monologen* (1800; 7th ed. 1868), and the ethical work, the *Grundlinien einer Kritik der bisherigen Sittenlehre* (1803). In these he expounded in scientific form that hostility to the traditional moral philosophy and the Kantian ethic of the categorical imperative to which he had already (1801) given audacious expression in the 'Confidential Letters on Schlegel's *Lucinde*,' where he attempted a defence of the notorious romance of his friend Friedrich Schlegel. A more valuable undertaking was the translation of Plato, which the two friends set about jointly, but which was ultimately carried through in 1804–10 by Schleiermacher alone. This work, epoch-making for the comprehension of Plato's philosophy, was in great part the fruit of the involuntary idleness imposed upon the translator by Napoleon, when in 1806 he closed the university of Halle, at which since 1804 Schleiermacher had been extra-ordinary professor. Returning to Berlin, he entered into close relations with Stein and Humboldt, with the philosopher Fichte, and with other patriots; and he took an active share in all the efforts which were being made to bring about the moral regeneration and the political restoration of the German Fatherland, especially of Prussia. One scheme with this aim was the establishment of the new Frederick-William university of Berlin, in which Schleiermacher took part; and in the theological faculty of this university he became professor in 1810. The fame of his academic lectures on all branches of theology and philosophy attracted yearly increasing crowds of enthusiastic students; and as preacher at the *Dreifaltigkeitskirche* he exercised a profound religious influence by his sermons, both on hearers and readers. Equally influential were his labours in the sphere of church politics; he was the soul of the movement which led to the union in 1817 of the Lutheran and Reformed Churches in Prussia; and it was not his fault that his far-sighted proposals for the preparation of a new constitution and forms of ritual suited to the wants of the united church were not adopted. His resolute bearing in these controversies was the more to his honour, inasmuch as it made him so unpopular with the government that for years he ran the risk of losing his university chair.

Yet all these public labours—some of them trying and ungrateful—could not prevent the indefatigable scholar from devoting concentrated energy to the advancement of learning. The outcome of these studies was on the one hand short essays on ethical problems and on points connected with ancient philosophy which were published in the transactions of the Berlin Academy; and on the other the theological works *Die Weihnachtsfeier* (1806; Eng. trans. *Christmas Eve*, 1889); a critical treatise on the first epistle to Timothy (1807); *Kurze Darstellung des theologischen Studiums* (1811); and finally his most important work, *Der Christliche Glaube nach den Grundsatzen der Evangelischen Kirche im Zusammenhang dargestellt* (1821; 2d ed. 1831; 5th ed. 1861). He died 12th February 1834; and after his death friends published several other works from his manuscripts or from notes of his lectures taken by students. Of these the most important are *Die Christliche Sitte* (1843), *Leben Jesu*, Sermons, a work on Dialectic, and a sketch of a system of Ethics. A collection of letters, of great importance for understanding Schleiermacher's very singular personality, was edited by Dilthey in four volumes (1860–64; partly trans. by Frederica Rowan, 1860). Dilthey began a biography, of which only the first volume has appeared (1870). A multitude of larger and smaller books and articles dealing with the man and his work appeared on occasion of the centenary of his birth, 1868. In 1825 Thirlwall published a translation of his *Essay on St Luke*; his *Introduction to Plato's Dialogues* was translated into English by Dobson in 1836; and a volume of *Selected Sermons* was issued in England in 1890.

Schleiermacher has been for theology what Kant was for philosophy. Kant submitted the theoretical and practical reason to a critical analysis, in order to distinguish the primordial and perennial laws of thought and will from the ever-changing sensations which supply the materials of experience. In like manner Schleiermacher undertook a critical analysis of religion, in order to discover what in it was the original essence and what were the derivative forms. Dogma, he taught, is not religion, but a statement about religion which is the product of reflection; religion itself is feeling, the immediate sense of our dependence on the divine source of all things, on God. But devout feeling, though the inmost part of individual life, is not itself merely individual; the individual man is conditioned by the community he belongs to, and the mode in which that community experiences the religious emotion, in a manner common to its members, rests on and is conditioned by the historical and fundamental fact of the establishment of the community. In this fact we may recognise a 'revelation,' inasmuch as a creative religious personality communicates to others its own peculiar religious feeling, its consciousness of God. Every historical religion rests in this sense on a revelation, on the communication of the original religious life of creative personalities, such as could not be thought out *a priori* or deduced from universal truths. This is especially true of Christianity, which is peculiarly a *positive* religion, one to be realised through experience, inasmuch as it has for its very centre the relation to the historical person of Jesus Christ as the redeemer; and by this fact all statements of doctrine as to God and the world and mankind must be regulated. The Christian church recognises that it has received 'Redemption'—liberation and strengthening of the consciousness of God heretofore trammelled by nature—as the influence of the person of Christ, and that it continues to receive the same by means of the spirit of the church, which has proceeded from Christ. From this experience the church is led upwards to its cause in the person of Christ, and for that reason believes in the typical perfection of Christ; this distinguishes Christ from all other men, yet without abrogating his true humanity. Similarly our faith in Christ rests only on that quickening of the pious disposition which we experience through and from him, and which in a sense is common to us with him. But this faith is independent of all historical reports of miraculous events that took place in him or by him. It is not because of the Bible and its miracles that we believe in Christ; it is because of Christ, whose influence we experience in our consciousness of redemption, that we believe in the Bible. That is, we ascribe to the Bible a normative dignity, as containing a substantially true picture of Christ; while it must not, however, prevent us from submitting its story in detail to the same critical tests as we apply to all historical traditions whatsoever. Schleiermacher did *not* expressly deny all miracle; but he laid down the general principle that it is not to the advantage of piety to hold, in the case of any single events, that their connection with the order of nature is interrupted by their dependence upon God. His general conception of the relation of God to the world, of the mutual correspondence of the infinite with the many finite causes (which approximates very closely to Spinoza's view), excludes the possibility of miracles in the fully supernaturalistic sense of the word. In this reference Schleiermacher has avoided and superseded alike supra-naturalism and rationalism, by emphasising Christian experience, and insisting on the historical character of the Christian religion *in the person and influence of Christ*. He has interpenetrated theology with philosophical idealism by taking as its basis the human self-consciousness. On the other hand, he set philosophy free from the unhistorical individualism and rationalism which had clung to it even in Kant's hands by widening the religious and ethical consciousness into the social consciousness of the community; in the common consciousness of ethical beings he discovered reason historically developing itself, and saw in the individual reason no more than the special form of manifestation, the organ which is but its servant. By means of his dogmatics and his ethics Schleiermacher has done more than any other thinker to solve the great problem of this age—the reconciliation of the individual with the community, of private conscience with the claims of historical tradition.

See, besides books referred to above, the article RELIGION in this work; Lichtenberger, *History of German Theology in the Nineteenth Century* (1873; Eng. trans. by Hastie); and *The Development of Theology since Kant* (1890), and *The Philosophy of Religion* (Eng. trans. 1886–88), by the present writer.

Schleswig. See SLESWICK.

Schlettstadt, a town of Lower Alsace, on the left bank of the Ill, 27 miles by rail SSW. of Strasburg. It manufactures wire-gauze. In the 13th century it was made a free imperial town, and in the 16th was chosen by Agricola as the seat of a higher school that greatly helped to foster humanistic studies; Erasmus was a pupil. In 1634 the town became French; it was fortified by Vauban in 1676. The Germans, after capturing the town in 1870, razed the fortifications. Here Martin Bucer (q.v.), the Reformer, was born. Pop. (1875) 9094; (1885) 9172.

Schliemann, HEINRICH, the excavator of the sites of Troy and Mycenæ, was a native of Mecklenburg-Schwerin, born at Neubuckow on 6th January 1822. Whilst working in a merchant's office and afterwards trading on his own account in St Petersburg, he acquired a knowledge of the principal languages of modern Europe and of ancient Greek. Having in the meantime become possessed of a large fortune, he began in 1870 to explore and excavate at his own cost the ruin-heaps of Hissarlik in the Troad (Asia Minor), and continued the work for twelve years. Schliemann maintained that it was the site of ancient Troy (q.v.). For carrying off, contrary to his agreement with the Turkish government, *all* the spoils he unearthed, he was compelled, through a judgment of the Greek courts, to pay the Ottoman Porte the sum of £2000. But he retained possession of his collections, and in 1882 presented them to the German nation; they are now preserved in the Ethnological Museum at Berlin. In 1876 Schliemann commenced, in like manner, to excavate the site of ancient Mycenæ in Greece;

and there he discovered invaluable treasures (now in the Polytechnic at Athens), and exposed buildings of great antiquity and interest (see MYCENÆ). He also carried on explorations in the island of Ithaca (1869 and 1878), at Orchomenus (1881–82), and at Tiryns (1884–85). The results of his labours are described in the monographs on *Mykenæ* (1877; Eng. trans. 1877); *Ilios*, with an autobiography of the author, and notes, &c. by Professors Virchow and Max-Müller (1880; Eng. trans. 1880); *Orchomenos* (1881); *Troja* (1883; Eng. trans. 1883); *Tiryns* (1886; Eng. trans. 1886); and *Bericht uber die Ausgrabungen im Troja im Jahre 1890* (1891). He wrote also *Ithaka, der Peloponnes, und Troja* (1869); *Trojanische Alterthumer* (1874); and *Reise in der Troas* (1881). Schliemann died at Naples on 27th December 1890, and was buried at Athens. See Dr Schuchardt's *Schliemann's Ausgrabungen* (1890; Eng. trans. 1891), and his own *Selbstbiographie* (1891).

Schlosser, FRIEDRICH CHRISTOPH, a German historian, born at Jever in Oldenburg, 17th November 1776, was educated at Göttingen, and, after spending many years as a private tutor and academic teacher, was (1819) called to Heidelberg as professor of History, and died there, September 23, 1861. His principal writings are *Geschichte der bildersturmenden Kaiser* (1812); *Weltgeschichte* (9 vols. 1817–24); *Geschichte des 18 Jahrh.* (1823; 5th ed. 8 vols. 1864–66; Eng. trans. 1843–52); *Geschichte der Alten Welt und ihrer Cultur* (1826–34); *Weltgeschichte fur das Deutsche Volk* (18 vols. 1844–56; 4th ed. 19 vols. 1884–88); and *Studien uber Dante* (1855). Schlosser's ideal of the historian's art was ethical: he wrote neither from the literary standpoint, nor yet from the critical, but from the moral. Yet he is not uncritical; for he exercised the critical intelligence of a widely-read historian with a stern love of truth. His books have had great influence with the middle classes of Germany. There are German Lives of him by Gervinus (1861), Weber (1876), Erdmannsdörffer (1876), and O. Lorenz (1878).

Schlüsselburg, a town and prison-fortress of Russia, the fortress being on a rocky islet in the Neva where it issues from Lake Ladoga, and the town (pop. 5542) on the right bank of the river. Here the dethroned Czar Ivan VI. was murdered by authority, after twenty-three years' imprisonment in this and other fortresses.

Schmalkalden, an old town of Hesse-Nassau, Prussia, stands 19 miles SW. of Gotha, is surrounded with double walls, contains a castle, a town-house in which the historic 'articles' were signed, and carries on iron-mining and hardware manufactures. Pop. 6729. It is the birthplace of Karl Wilhelm (1815–73), composer of the 'Wacht am Rhein.'

LEAGUE OF SCHMALKALD, a defensive alliance concluded at Schmalkalden on 4th April 1531 between nine Protestant princes and eleven imperial cities, with whom other princes and imperial cities subsequently made common cause. The Elector of Saxony and the Landgrave of Hesse were appointed chiefs of the league. The object of this formidable alliance, which included nearly all the Protestant states from Denmark to Switzerland, was the common defence of the religion and political freedom of the Protestants against the Emperor Charles V. and the Catholic states. The confederation was consolidated by the *Articles of Schmalkald*, drawn up by Luther at Wittenberg in 1536. A conflict was of course inevitable. In the war of Schmalkald that ensued (1546) when the emperor got leisure to turn his attention to the matter the strength of the Protestants was crippled and dissipated by jealousies, but especially by the defection of Duke Maurice of Saxony, so that in the battle of Mühlberg (24th April 1547) the Elector of Saxony (the head of the elder branch of the Saxon house, Duke Maurice being the head of the younger branch), Philip of Hesse, and other Protestant chiefs were taken prisoners and their army routed. This caused the league to break up. The Protestant cause was, however, revived five years later by Duke Maurice, who had in the meantime been made Elector instead of his unfortunate kinsman, and who in 1552 returned to his old allegiance to Luther's teaching.

Schmitz, LEONHARD, was born in 1807, and educated at the Gymnasium of Aix-la-Chapelle and at the new university of Bonn, where he was profoundly influenced by Niebuhr, Welcker, and Brandis. His marriage to an English lady in 1837 drew him to England, and here with Dr W. Smith he completed the translation (vol. iii. 1842) of Niebuhr's history which Hare and Thirlwall had begun (vols. i.–ii. 1828–32). His translations of Niebuhr's *Lectures on the History of Rome* (1834; 2d ed. 3 vols. 1849–50), *Lectures on Ancient History* (3 vols. 1852), and *Lectures on Ancient Ethnography and Geography* (2 vols. 1853) followed; and later, from his own pen, excellent manuals of the *History of Greece*, and of *Rome*, *Ancient History*, *Ancient Geography*, and *Mediæval History*. He edited the *Classical Museum* for some years, and was a large contributor to the *Penny Cyclopædia* and Dr W. Smith's *Dictionaries of Greek and Roman Antiquities*, of *Biography and Mythology*, and of *Geography*. He translated Zumpt's *Latin Grammar*, and edited a popular series of Latin class-books for W. & R. Chambers. In 1846 he became Rector of the Edinburgh High School, and in 1866 head of the International College at Isleworth, which post he resigned in 1874. He acted for some years as classical examiner to London University, was injured by a street accident in 1889, but recovered, only to be carried off by influenza, 28th May 1890.

Schneeberg, a mining-town of west Saxony, 20 miles SW. of Chemnitz, producing silver (though not in its former great abundance), cobalt, tin, and iron. Dolls, lace, chemicals, &c. are manufactured, and embroidery is carried on. Pop. 7949.

Schneekoppe, the highest point (5260 feet) of the Riesengebirge (q.v.).

Schnitzer, EDUARD, better known as EMIN PASHA, was born of Jewish parents at Neisse in Silesia, on the 28th of March 1840, and was educated at the Gymnasium of Neisse until 1858, when he commenced the study of medicine at the university of Breslau; and he graduated at Berlin in 1864. Soon after, he proceeded to Turkey with the view of settling there in practice, and had till 1873 an appointment at Scutari on the staff of Hakki Pasha. During this appointment Schnitzer gained an intimate acquaintance with Armenia, Syria, and Arabia, and it was during this period of his life that he adopted the name of Emin and the habits and customs of the Turks. He took the name the better to enable him to identify himself with the people and to disarm their prejudices. After a brief visit to Nissa in 1875, where his studies in natural history were continued, we find him in 1876 entering the Egyptian medical service as Dr Emin Effendi. He proceeded to Khartoum, was sent by Ismail Pasha, the governor-general, to the Equator, and appointed by Gordon Pasha chief medical officer of the Equatorial Province. This appointment he held until 1878, being employed, however, by Gordon Pasha, who greatly appreciated his talents, in various diplomatic missions and tours of inspection. In 1878 Gordon Pasha appointed Emin Effendi governor of the Equatorial Province, which position he held until the arrival of Mr

Stanley's expedition in 1889. In 1879 he was raised to the rank of Bey, in 1887 to that of Pasha.

An extraordinary linguist, Emin acquired, besides French, English, Italian, Turkish, and Arabic, a knowledge of several Slavonic languages, as well as many central African dialects. He was known as a skilful medical man, and his ability as a governor and an administrator is witnessed to by the fact that he for years, cut off from all communication with the outside world, single-handed maintained his position at the farthest outpost of civilisation. It is true that after the expedition sent to his relief arrived his troops revolted; but this is to be explained by the fact that his ignorant men were disappointed at the sorry spectacle which the expedition presented after its heroic march to their assistance. Emin gained a wonderful insight into the habits and customs of the people amongst whom he has lived, and probably no one has added more to our anthropological knowledge of central African tribes than he. For over seven years he carried on meteorological investigations with such success that Lado has become the standard to which all barometrical observations are referred in East Equatorial Africa. With reference to his geographical work, his route surveys extend over more than 4000 miles, and he made a triangulation survey of the country extending from the Victoria and Albert Lakes in the south to Lado in the north, to the river Djur in the north-west, to Mombuttu and the river Welle in the south-west. Between 1878 and 1883 eleven geographical papers of extreme value were published by him in *Petermann's Mittheilungen*. Emin's services to natural history have been very great, for throughout the whole of his residence in central Africa he showed himself an intelligent and painstaking collector. It is impossible to specify the number of examples he has sent to Europe, but one collection sent to the British Museum in 1878 consisted of over 100 mammals, 350 birds belonging to 179 species, many reptiles, batrachians, 380 butterflies belonging to 356 species (15 of which were new to science), besides many beetles, scorpions, and a large number of land and fresh-water shells. The results of his labours in this direction have almost completely elucidated the distribution of the flora and fauna of central Africa. Apart from this work, Emin has made many botanical collections; and his cultivation experiments, carried on for many years, will prove of service in the agricultural development of central Africa. Steadily working at the central African languages, he collected numerous and valuable vocabularies, the most important being of the Waganda, Wanyoro, Wahuma, Madi, Bari, and Mombuttu dialects.

When it is considered that all the work here indicated was performed by a man weighted with the government of a large uncivilised province, and who was for years cut off from all communication with Europe, it will be seen what force of character and energy he possessed. Emin Pasha was no military genius, but he proved himself to be an enlightened ruler and a bitter foe to the slave-dealers, managing to abolish slave-dealing throughout his province. He constantly endeavoured to civilise the people committed to his charge, and in this he succeeded to a very large extent. In December 1889 Emin Pasha arrived at Zanzibar with Mr Stanley. He met with an accident there from which he nearly lost his life, and from whose effects he suffered for three months. Notwithstanding this, and the urgent desire of his friends in Europe for his return home, such was his energy and his love for the country which he had left that he entered the service of the German government, and returned at the head of a large expedition to central Africa. He has been very energetic in extending the German sphere of influence, has made favourable treaties with the Arabs of Tabora, and founded three large German stations on the Victoria Lake, besides establishing a chain of military posts from Mpwapwa to the interior. He has also been engaged in his favourite studies, and has sent numerous large collections of birds, beasts, and reptiles, as well as ethnographical collections, to the museum in Berlin. Emin Pasha was awarded the Patron's Medal of the Royal Geographical Society in 1890.

See *Uganda and the Egyptian Soudan*, by the present writer and the Rev. C. T. Wilson (2 vols. 1882); *Emin Pasha in Central Africa: his Letters and Journals* (trans. by Mrs Felkin, 1888); *Petermann's Mittheilungen* (1878-83); *Scottish Geographical Magazine* (1886-89); *Proceedings of the Zoological Society* (1888); *Journal of the Anthropological Institute* (1888); Stanley, *In Darkest Africa* (1890); and works on their experiences in Equatoria by Parke, Junker, Gessi, Casati (1891), &c.

Schnorr von Carolsfeld, BARON JULIUS, painter, was born at Leipzig on 26th March 1794, and was trained as a painter by his father (likewise an artist) and at the Vienna Academy. In Vienna he became associated with the German school of Cornelius, Overbeck, Schadow, and Veit, who went back for their inspiration to the old masters anterior to the days of Raphael, and in 1818 he followed them to Rome. But though he agreed with them in principle, he avoided their extremes, and was the only one of them who remained a Protestant. For the walls of the Villa Massimi at Rome he executed, as his share of the work, nearly two dozen frescoes from Ariosto's *Roland* (1820-26). The year after the completion of this labour he was called by King Louis of Bavaria to fill the chair of Historical Painting in the Academy of Munich, and was besides commissioned to paint for the king's new palace and other royal apartments a series of frescoes illustrative of the *Nibelungenlied* and of the lives of Charlemagne, Frederick Barbarossa, and Rudolph of Hapsburg. In 1846 he accepted the appointment of professor at the Fine Art Academy in Dresden, coupled with the directorship of the royal picture-gallery. Schnorr's designs for 180 pictures to illustrate the narratives of the Bible (*Bible Pictures*, Lond. 1860) are accounted by many authorities the best things he did. The illustrations for Cotta's great edition of the *Nibelungen Not* were also designed by him; and his skill as a draughtsman and designer are further exhibited in stained-glass windows in St Paul's Cathedral, London, and in Glasgow Cathedral. Amongst his representative easel-pictures may be quoted the 'Marriage at Cana,' 'Jacob and Rachel,' 'Three Christian and Three Heathen Knights of Ariosto,' 'Ruth in Boaz's Wheat-field,' 'Christ Bearing the Cross,' 'Siegfried and Kriemhild,' and 'Luther at Worms.' His best qualities are balance of arrangement, freedom of design, and vivacity, together with many happy inspirations; in fact, he had too many ideas, and did not give himself time to mature them properly. Besides, his work is frequently too decorative in effect, and the figures lack individuality and dignity. Schnorr died in Dresden, 24th May 1872. See *Art Journal* (1865).

Schöffer. See GUTENBERG.

Scholarship, a benefaction, generally the annual proceeds of a bequest permanently invested, paid for the maintenance of a student at a university or at a school. See UNIVERSITY, CAMBRIDGE, OXFORD, ETON, HARROW, &c.

Scholasticism. The term scholasticism specially designates the aims, methods, and products of thought which constitute the main endeavour of the intellectual life of the middle ages. As under the names of its leading representatives special accounts have been given of their distinctive teaching, it will here be sufficient to indicate the conditions from which scholasticism arose, the general course of its history, and the causes that wrought its decay. In the case of no other great development of human thought can we mark with such precision its beginning, process, and end.

It was with the reign of Charlemagne (died 814) that the start was fairly made towards a new civilisation with the Christian religion and theology for its basis, and with a character and aim of its own essentially distinct from the civilisation of antiquity which had died with the ruin of the empire of Rome. In the political confusions that followed the dismemberment of the Carlovingian empire much was lost that had been recently gained, yet the tradition was never again lost of those ideals of a higher culture inaugurated in the schools founded by Charlemagne. In John Scotus Erigena (died 875) we have the first great thinker of the early middle ages. As he drew his inspiration from Plato rather than from Aristotle, however, and as his methods are not those of the schoolmen proper, he does not in strictness belong to the scholastic philosophy. It is by his translation of the writings of the Pseudo-Dionysius, a work which exercised the profoundest influence on the religious life of the middle ages, that he holds his place among the thinkers who have determined the development of Christian Europe. In the 10th century the tradition of higher studies was represented by one who, though also not a schoolman, cannot be passed over in any history of the origins of the new civilisation. By his great school at Rheims, Gerbert, afterwards Pope Sylvester II. (died 1003), kept alive in France that intellectual eagerness which it had mainly owed to the genius of Charlemagne, and which eventually justified the saying of the middle ages—'To the Germans the empire, to the Italians the pope, to France studies!'

During the 11th century western Europe grew to a clearer consciousness of the aims it had to follow in the development of the ideas on which the Christian society must be based. Till the year 1000 all endeavour had been paralysed by the belief that with that year God's account with men must close. As the dreaded hour was left behind, however, the sense of relief and gratitude showed itself in a quickened life in every field of human activity. The first crusade (1096) is conclusive proof that the church now confidently reckoned on a renewed term of terrestrial existence, and that it felt the duty of signalising the unexpected respite. In the sphere of thought, also, that movement now began which, in spite of its fatuities and eventual stultification, had for its essential aim the reasoned account of the ideas on which the new order was founded. In this endeavour there were initial conditions which at once determined the nature and direction of men's reasonings and vitiated at the source the value of their results. It is the essential distinction between the schoolmen and the thinkers of antiquity that the former were not left free to question the subject-matter on which their ingenuity was expended. Of all ultimate questions the church provided a solution ready to hand and beyond appeal. The liberty to choose or reject that solution would have nullified the very principle of the church's existence. Moreover, the intellectual life of the middle ages directly proceeded from the organisation of the church, and individual thinkers were but the organs of its doctrine and tradition. The mediæval university was as essentially a religious institution as a monastery or a cathedral, and its members held their place solely on condition of their acceptance of the church's standard of faith. But it was exclusively in the universities that intellectual life was then possible. With their thought thus fettered in its fundamental process, a natural development, following every indication of truth to its legitimate conclusion, could not be looked for in the schoolmen. The most daring conclusion they could reach was to question whether the teaching of the church could be made good to the mind by any process of merely human reasoning. Uniformity of method, and futile distinctions or petrifying routine, were thus the inevitable outcome of the mediæval philosophy.

According to the statement of Victor Cousin, now generally accepted as true, the fundamental problem of scholasticism had its first suggestion in a remark of Porphyry (died 304) regarding the difficulty of settling the question whether *genera* and *species* have a real objective existence or are merely abstractions of the mind. Put in as simple language as its nature admits, the problem is this: Is there or is there not an objective reality corresponding to our general notion, say of *man, horse, flower*, &c.? Those who answered the question in the affirmative came to be known as *realists*, their opponents as *nominalists*. Trifling as the question may appear in itself, for the schoolmen it lay at the root of every attempt to render account to human reason of divinely revealed truth. An abstract question assumed vital importance when the disputants saw behind it the doctrines of the Trinity, the Incarnation, the Immaculate Conception, and the nature and existence of angels. It was especially in its bearing on the doctrine of the Trinity that the question of Nominalism *versus* Realism for more than four centuries exercised the acutest intellects the world has perhaps seen. It was the contention of the Realists that on the principle of Nominalism the doctrine of the Trinity was irrational and inconceivable. Grant, they argued, that our general notions have objective reality, then, just as from the totality of men we have an objective unity in the notion *man*, so from the Divine Trinity of Persons we can conceive a Divine Unity of Substance. On the other hand, if general notions be mere names, the doctrine of the Trinity in Unity is absurd on the face of it. Of the two theories it was Realism which had the approval of the church, and which was associated with the pious feeling of the middle ages. Till its final triumph in William of Ockham Nominalism had to fight for its existence against the main current of the religious and speculative tendency of the mediæval church. The history of scholasticism is in large degree the history of the varying fortunes of these two rival theories and their rival champions.

An event of the first importance divides this history into two periods so distinctly marked that they have come to be known as the periods of the earlier and the later scholasticism. This event was the introduction into the Christian schools through the medium of the Arabian commentators (chiefly Avicenna and Averrhoes) of the writings of Aristotle on natural science, metaphysics, and ethics. Till the beginning of the 13th century Aristotle had been known to the schoolmen only by his writings on logic. From the knowledge of Aristotle's complete work, therefore, they received an impulse which led the way to bolder speculation, and gave birth to questionings that stirred the deepest consciousness of the later middle age. On the one hand, the new Aristotle ministered to the intellectual want of the time in supplying the material it needed to exercise those faculties which had been so assiduously trained by Aristotle's own dialectic. But Aristotle was a pagan, and many points in his teaching ran counter to Christian doctrine. To give him that place in the schools which many now wished would be a standing menace to the authority of the church. From the first appearance of the new writings, therefore, Rome steadily set its face against the 'Grecian Doctor,' and in a succession of anathemas forbade certain parts of his writings to be used in the universities. In the relation of thinkers to Aristotle we have thus the distinction between the earlier and the later scholasticism. Of the first period the great names are Roscellinus, Anselm, William of Champeaux, Abelard, and Peter Lombard; of the second, Albertus Magnus, Alexander of Hales, Thomas Aquinas, Duns Scotus, William of Ockham, and Jean Gerson.

The name of Anselm (1033-1109) is chiefly remembered in connection with his attempt to prove the existence of God from the innate idea which he supposed to be common to all mankind. His place in the line of the schoolmen, however, is not due to this argument, famous as it is in the history of thought. It was in his controversy with his contemporary Roscellinus (born near Soissons about 1050) on the burning question of universals that he entered the peculiar domain of scholasticism. Though not the first to renew the old controversy, Roscellinus, by the notoriety which he gave to it, may be regarded as the founder of the scholastic philosophy. With a skill and success that alarmed the authorities of the church he argued for the theory of Nominalism, Anselm taking up the contrary position with equal subtlety and persistence. It proves the importance assigned to the question at issue that in 1092 a council held at Soissons condemned the teaching of Roscellinus as implicitly involving the negation of the doctrine of the Trinity. As Roscellinus was the founder of Nominalism, William of Champeaux (1070-1122), the head of a famous school of logic in Paris, was the founder of Realism. It was in refuting his teaching that his pupil Abelard (1079-1142) gained the first triumphs of his extraordinary career. In Abelard we have the boldest thinker and one of the most striking figures in the history of the middle ages. His celebrated pamphlet *Sic et Non* was a manifesto of rationalism, which sent a shudder through the conservatism of the time. Selecting 158 points of Christian doctrine he arrayed the opinions of the most revered authorities on each. Presented in this startling fashion, the opinions of St Paul, Augustine, Gregory, Jerome, Athanasius, and others were seen to be so essentially self-contradictory that no doctrine was left on which an intelligent believer could rest. On the main question of the schools he rejected the orthodox Realism, and adopted an eclectic theory which was neither Realism nor Nominalism, but a middle position between each. A thinker like Abelard striking at the very root of the Christian tradition could not in the reason of things be tolerated by the church; and by a great assembly at Sens in 1140, and afterwards at Rome, his writings were ordered to be burned and himself prohibited from teaching. But the spirit of Abelard was never completely exorcised during the subsequent centuries, and he has always been regarded as the brilliant precursor of the modern time. By his 'Four Books of Sentences' (i.e. right rules) Peter Lombard (c. 1100-60), a pupil of Abelard, came to hold a place in the history of scholasticism hardly second to any other thinker. The object of his book was to be the antidote of *Sic et Non*; and in a different spirit from Abelard the Lombard brought together the opinions of the Latin fathers Augustine, Ambrose, and Hilary, as also of Cassiodorus. To each article he annexed a series of 'Distinctions,' in which he sought to define more precisely the doctrine under consideration. Though conceived in a spirit of orthodoxy, the 'Sentences' did not escape the leaven of Abelard's scepticism. Regarded with suspicion on its first appearance, it yet became the great text-book of the universities to the close of the middle ages, and was itself made the subject of interminable commentaries by subsequent schoolmen.

In the second period of scholasticism larger interests and more various problems quickened the speculations of the successive thinkers. During the 13th and 14th centuries the rivalries of the two mendicant orders, the Dominicans and the Franciscans, divided the schools, and introduced a polemical element into philosophical discussion unknown in a similar degree to the earlier period. Generally the Franciscans, as the body of democratic origin, counted in their ranks the bolder thinkers among the schoolmen. Thus, Roger Bacon, Duns Scotus, William of Ockham were Franciscans, Albertus Magnus and Thomas Aquinas Dominicans. The new Aristotle was the battle-ground of the two rival camps of thinkers, and specially the Aristotelian doctrine of the soul. As that doctrine had been expounded by the Arabian commentator Averrhoes, it involved the negation of the Christian doctrine of the resurrection and of the immortality of the soul. It is mainly by their attitude towards Averrhoes that we distinguish the different tendencies of the schoolmen of the 13th and 14th centuries.

An eclectic in his view of universals, Albertus Magnus (1193-1280) accepted Aristotle through the commentator Avicenna in preference to Averrhoes. The task of the later schoolmen was to harmonise the newly-received teaching of Aristotle with the doctrines of the church, and Albert was the first to bring together the materials for the furthering of this end. To effect this harmony was the life's endeavour of the most constructive mind of all the schoolmen, Thomas Aquinas (c. 1226-74). In his *Summa Theologiæ* Aquinas sought to supply a complete repertory of human thought on all subjects touching religion and philosophy, the fundamental principle of his work being that as faith and reason have two distinct spheres, neither can conflict with the other. On the subject of universals he was an eclectic like his master Albertus. Even Aquinas did not escape the charge of heresy, and through the efforts of the Franciscans his teaching on the nature of the soul was formally condemned by the church. Eventually, however, he came to hold the first place as the oracle of divine and human wisdom, so that a pope could say of him that 'the articles of Thomas were so many miracles.' What Aquinas was to the Dominicans Duns Scotus (c. 1265-1308) was to the Franciscans. Roger Bacon (c. 1214-94), also a Franciscan, holds a place apart from the other thinkers of the middle ages by his contempt for the studies of the schoolmen. The introduction into the western schools of what is known as the Byzantine logic by Petrus Hispanus (1226-77) is a turning-point in the history of the scholastic philosophy. Through its influence logic in the teaching of Duns Scotus and William of Ockham assumed an importance which had the most disastrous results on the entire scholastic system. With an acumen which gained for him the title of 'The Subtle Doctor,' Duns applied the new logic to the main position of Aquinas that reason and revelation are two distinct sources of knowledge, and sought to prove that there is, in truth, no knowledge apart from the Christian teaching. On the question of universals he shows all his subtlety, but his position is virtually that of Aquinas himself. It was in the hands of William of Ockham (c. 1270-1349), a pupil of Duns Scotus, that the scholastic philosophy assumed a form which speedily led to its disintegration. By his triumphant demonstration of the theory of Nominalism scholasticism ceased to have a reason for its existence, and the foundation was laid for that method of experiment and induction which was the outcome of the long travail of the schools of the middle ages. With Ockham closes the line of the great schoolmen; and of the thinkers who followed him Jean Gerson (1363-1429) alone deserves to be mentioned as one of the representative figures of the later scholasticism. In certain of the great universities, indeed, the scholastic methods continued to prevail long after a better way had been opened up for the freer development of the human spirit. In the university of Paris scholasticism held its place into the 17th century; and in Spain, till comparatively recent years, it was still the only philosophy that could be learned by her students. By the close of the 15th century, however, scholasticism was dead as a vital phase of human thought. In itself it was an exhausted movement, and the revival of antiquity and the religious reformation of the 16th century supplied a fresh stream of ideas, which opened up a larger scope of the possible development of humanity.

It was natural that the humanists and the reformers should do their utmost to discredit the system from which they were seeking to emancipate their contemporaries; and so effectually did they do their work that not till within recent years has scholasticism been thought worthy of a serious attempt to understand it. At present the tendency is to recognise in it for its own time and place a perfectly rational system, yielding healthy exercise to the best minds of the middle ages. The ridicule of the humanists is seen to be true only of its later phases. While, therefore, from the very conditions of its origin and growth, scholasticism was debarred from that free and direct questioning of things which is the distinctive characteristic of ancient and modern times, it nevertheless, as in Dante and Thomas Aquinas, produced certain types of thought and feeling which could have sprung from no other system, and for the absence of which the world would have been emphatically the poorer.

See Hauréau, *Histoire de la Philosophie Scolastique*; Milman, *History of Latin Christianity*; Hampden, *Scholastic Philosophy* (Bampton Lecture, 1848); Cousin, *Ouvrages inédits d'Abélard*; Prantl, *Geschichte der Logik im Abendlande*; Jourdain, *Recherches Critiques sur l'Âge et l'Origine des Traductions Latines d'Aristote* (1843); Renan, *Averroes et l'Averroisme*; also, the various histories of philosophy by Lewes, Schwegler, Ueberweg, and others.

Scholiasts, ancient grammarians, for the most part anonymous and known only by their short annotations written on the margins of the MSS. of the ancient classics, Greek and Roman. These remarks concern the language more frequently than the substance, and are sometimes feeble and pedantic, but often tend to elucidate the text or even critically amend it. The earliest scholiasts were those of the Alexandrian School (q.v.); many are as late as the Byzantine period. A Gloss (q.v.) was one of the merely verbal scholia.

Scholten, JAN HENDRIK, the chief of the modern school of Dutch critical theologians, was born at Vleuter near Utrecht, August 17, 1811. He studied at Utrecht, and became in 1840 professor of Theology at Franeker, in 1843 extraordinary, and in 1845 ordinary professor at Leyden, where he died 10th April 1885, four years after his retirement. His writings were either in Dutch or Latin, but French and German translations carried them far beyond their country. The chief were *Principles of the Theology of the Reformed Church* (2 vols. 1848-50), *Historical and Critical Introduction to the New Testament* (1853), *A Critical Study of the Gospel of John* (1864), *The Oldest Witnesses to the Writings of the New Testament* (1866), *The Oldest Gospel* (1868), and *The Pauline Gospel* (1870). The school of which he was the most conspicuous leader eliminates the supernatural element from Christianity, evolving the religion from the religious consciousness of Jesus.

Scholten gave an interesting sketch of his own religious development in his *Afscheidsrede bij het Neerleggen van het Hoogleerarsambt* (1881). See also Kuenen's *Levensbericht*, with a complete list of his writings (1885).

Schomberg, FREDERICK HERMANN, DUKE OF, was born in 1618 of an ancient house taking its name from its castle of Schönburg on the Rhine, and fought against the Imperialists in the Thirty Years' War. Entering the French service in 1650, he conducted a successful campaign in Spain, was naturalised in France, and, though a Protestant, obtained a marshal's baton in 1675. On the revocation of the Edict of Nantes in 1685, after some unimportant work done for the House of Brandenburg and the Elector Palatine, he accepted the post of second in command under the Prince of Orange in the English expedition. The new king made him K.G., duke, and master of the ordnance, and gave him command of the army in Ireland in 1689. Wintering in Ulster, he joined William III. in 1690, and fought and fell in the battle of the Boyne (1st July). His son Meinhart commanded the right wing, and was made Duke of Leinster. But in the war of the Spanish succession he was recalled as inefficient for his command, and died childless in 1709, the title dying with him. The fourth Marquis of Lothian married a granddaughter of the first Duke of Schomberg.

Schomburgk, SIR ROBERT HERMANN, a traveller, was born at Freiburg in Prussian Saxony, June 5, 1804. He was trained for the mercantile profession, and went out to the United States in 1829, but in the following year he removed to Anegada, one of the Virgin Isles. Having surveyed the island and laid a report before the Royal Geographical Society, he was charged by that body to lead an exploring expedition to British Guiana in 1835. This enterprise, which was surrounded with formidable difficulties, he satisfactorily achieved, and from time to time laid the results of his investigations before the society, in whose *Journal* they were regularly published. It was during this exploration, and while he was ascending the Berbice River, that he discovered, January 1, 1837, the magnificent aquatic plant, the *Victoria regia* (q.v.). On his return to England in 1839 he published *Travels and Researches in British Guiana in 1835-39* (Lond. 1840). In 1840 he returned to Guiana under the auspices of the British government, to survey the colony; and on his return, after the completion of his labours, he received the honour of knighthood. Sir Robert's *Description of British Guiana* and his brother Richard's *Reisen in Britisch-Guiana, 1840-44* (Leip. 1847-48) embody the results of this expedition. In 1847 the former published an excellent and elaborate *History of Barbadoes*, and in the following year departed for San Domingo, whither he had been accredited as British consul and representative. In this new sphere he continued to pursue his geographical and scientific researches, the results of which he communicated to the Geographical Society till 1853. In 1857 he was appointed British representative to the Siamese court, but returned to Europe ill in 1864, and died 11th March 1865 at Schöneberg near Berlin.

Schönbein, CHRISTIAN FRIEDRICH, chemist, was born at Metzingen in Würtemberg, 18th October 1799, studied natural science at Tübingen and Erlangen, and visited England in 1826, and after that Paris. In 1828 he was called to a chair in the university of Basel. In 1839 he discovered *Ozone* (q.v.), and invented *Gun-cotton* (q.v.) in 1845, obtaining from it by dissolution in ether the material called Collodion (q.v.). In his later years he confined himself chiefly to experiments with oxygen. Of his works the chief are *Das Verhalten des Eisens zum Sauerstoff* (Basel, 1837), *Beitrage zur physikalischen Chemie* (1844), *Ueber die Erzeugung des Ozons* (1844), *Ueber die Verbrennung der Korper in atmospharischer Luft* (1845). He died at Baden-Baden, 29th August 1868. See Life by Hagenbach (Basel, 1869).

Schönbrunn, a royal palace in the outskirts of Vienna, the summer residence of the imperial family, was built by Maria Theresa in 1744, and has attached to it a zoological and a botanical garden. The treaty of Vienna was signed within its walls.

Schönebeck, a town of Prussia, 9 miles by rail south of Magdeburg, on the left bank of the Elbe. Here some 65,000 tons of salt are made annually, and there are a variety of manufactures —machinery, chemicals, percussion caps, starch, varnish, &c. Pop. 13,319.

Schönlein, Johann Lukas, professor of medicine, was born at Bamberg on 30th November 1793, studied medicine at Landshut, Würzburg, Jena, and Göttingen, and began to lecture at Würzburg in 1819. In the following year he was appointed professor of Clinics and Therapeutics there; in 1833 he removed to a similar chair at Zurich; and in 1839 he was called to Berlin to be professor of Pathology and Therapeutics, and to preside over the clinical instruction given in the Charité hospital. He retired in 1859, and died at Bamberg on 23d January 1864. His principal merit is that he introduced into Germany the exact methods of study which were in vogue in England and France, and thus founded what was called the Natural History School of Würzburg (see Medicine, Vol. VII. p. 119). His theoretical teaching, which was summed up in a systematic classification of diseases, was of less value, comparatively speaking. See Life by Rothlauf (Bamberg, 1874).

Schoolcraft, Henry Rowe, American ethnologist, was born in New York state, March 28, 1793, studied at Union College, and in 1817-18 visited the mining region west of the Mississippi, afterwards publishing a *Journal* (1819; revised 1853). He also published a narrative of General Cass's exploring expedition to Lake Superior and the Upper Mississippi (1820), of which he was geologist. In 1822 he became Indian agent for the tribes about the lakes, and in 1823 he married the granddaughter of an Ojibway chief, who had been educated in Europe. From 1828 to 1832 he was an active member of the legislature of Michigan territory, and founded its Historical Society, and the Algic Society of Detroit. In 1832 he commanded an expedition which discovered the sources of the Mississippi (*Narrative*, 1834). While superintendent and disbursing agent for the Indians, he negotiated treaties by which the government acquired lands to the extent of 16,000,000 acres. In 1845 he collected the statistics of the Six Nations (*Notes on the Iroquois*, &c. 1848). In 1847 congress authorised him to gather, collate, and edit all accessible information relating to the Indians. The result is to be found in his *Historical and Statistical Information respecting the History, Condition, and Prospects of the Indian Tribes of the United States* (5 vols. 1851-55, published by congress at a cost of nearly $30,000 per vol., with over 300 illustrations; a sixth was added by Schoolcraft in 1857). His numerous other works include many poems, a Life of Cass, *Algic Researches* (1839), *The Red Race of America* (1847), *Thirty Years with the Indian Tribes* (1851), *The Indian in his Wigwam*, &c. He died 10th December 1864.

School Inspectors. After annual government grants for education were commenced in 1846 (see Education), H.M. Inspectors of schools were appointed. Inspection was intended to be a means of co-operation between the government and the clergymen, local committees, and trustees of schools, for the improvement and extension of education; it was not intended as a means of exercising control, but of affording assistance; not for the restraint, but encouragement of local efforts. The inspector was instructed to communicate with those who had up to that time interested themselves in education with a view to such co-operation. He was also instructed to visit, when conveniently able to do so, any schools not aided by public grants whose school committees or promoters desired such visits. The general duties of the inspector were gradually divided into three distinct heads: (1) Furnishing information to enable the committee of Council to determine the propriety of granting funds in aid of erecting new schools. (2) Inspecting and reporting on the method and matter of instruction in schools aided by public grants. (3) Furnishing information when required by the committee of Council respecting the state of education in particular districts. These instructions, with such additions as the fuller development of the system required, continue to describe generally the relation between the committee of Council, inspectors, school managers, and teachers, with the single exception that, on the passing of the Education Acts of England in 1870 and of Scotland in 1872, religious teaching was removed from inspectorial supervision. As the various religious bodies both in England and Scotland had hitherto taken by far the keenest interest in education, before any inspector was appointed his name was submitted for approval to the authorities of the church over whose schools he was to have supervision. Up to the passing of the Acts of 1870 and 1872 there were five classes of inspectors for the schools respectively of the Church of England, of bodies not connected with that church, of the Church of Scotland, of the Free Church, and of the Roman Catholic Church. Now every inspector visits every aided school in his district irrespective of denomination; and since the passing of these acts the churches are not consulted about the appointments.

As grants were steadily increasing, and there was considerable doubt as to the efficiency both of instruction and inspection, Mr Lowe (Lord Sherbrooke) introduced in 1862 the Revised Code, the leading feature of which was individual examination and payment by results. The passing of the English Education Act in 1870 and of the Scotch Act in 1872, and the codes framed upon them, introduced most important changes; but the fundamental principle of payment by results, which had been operative for about ten years in England, was retained, and for the first time applied to Scotland. In 1885 the administrative functions of the English and Scotch departments were separated; and the latter has now a committee of Council and secretary of its own; but the Lord President of the Council is the head of both departments. Provision has from time to time been made to prevent the examination becoming a mechanical recording of results, and by the Codes of 1890 (England) and 1891 (Scotland) a more elastic method of examination was applied both to higher and lower standards. The English and Scotch Codes are on similar lines, and differ only in unimportant details. The fixed grant on average attendance was much enlarged, and the variable grant depending on examination correspondingly reduced, enough, however, being left to differentiate fair, good, and excellent work. The basis of this variable grant also is average attendance. The minimum number of attendances hitherto qualifying for examination was removed, and thus the temptation to neglect those whose attendance fell below that minimum.

There are four classes of officers engaged in inspection—chief inspectors, district inspectors, sub-inspectors, and assistants. In England there are twelve chief inspectors, two being almost wholly occupied with the training colleges. In Scotland there are three, one of whom combines ordinary inspection with supervision of the training colleges. The chief inspector, besides having a district of his own, has a general supervision over the other districts in his division, and is appealed to in cases of difficulty. Each chief has an annual divisional conference with his colleagues, the object of which is to compare experiences and, as far as possible, secure uniformity of test and standard. Assistants are chosen by the department from the ranks of eminent elementary teachers, and from them sub-inspectors are appointed. The English staff consists of 107 inspectors, 45 sub-inspectors, and 152 assistants; the Scotch staff, of 25 inspectors, 4 sub-inspectors, and 21 assistants. Of the 25 school inspectors, 5 are Oxford, 4 Cambridge graduates; almost the whole of the others and a number of the sub-inspectors and assistants are graduates of Scotch universities. Inspectors are appointed by a minute of the committee of Council, and must be not more than thirty-five years of age. Applications with testimonials are made to the Right Honourable the Lords of the Committee of Council on Education. Those appointed are at first placed alongside of a chief inspector, with the result that they obtain considerable experience of the work before being placed in independent charge of a district. They are, as a rule, selected on the ground of academical distinction, and all but very few have had considerable experience as teachers. In Ireland only, candidates for the inspectorship have to pass an examination in the theory and practice of education, and of school management, besides spending a period of probation under a chief inspector.

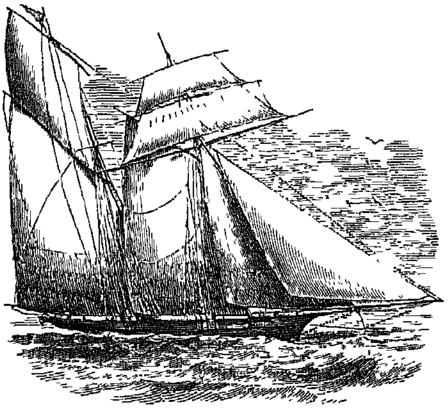
In the United States inspectors are known as superintendents of schools, whose duty includes both inspection (in regard to the discipline and methods of the school) and examination (of the pupils, to ascertain the amount and kind of progress made). On the continent of Europe generally inspectors are drawn from the ranks of elementary teachers, and have less to do with examination of the pupils' attainments than with seeing that the law is obeyed, the school programme carried out, and the teachers perform their work properly.

Schools. See Education, Army (Vol. I. p. 439), Military Schools; Art (Vol. I. p. 456); the articles on the nine great English public schools; and for the Schoolmen, Scholasticism.

Schools, Brothers of Christian, a religious congregation in the Roman Catholic Church, established for the religious and secular education of the poor. It originated in France in the end of the 17th century, and was organised by a charitable ecclesiastic, the Abbé de la Salle, canon of the church of Rheims (1651–1719), who in 1684 resigned his canonry, sold his possessions for the poor, and drew up rules for his brotherhood of teachers—all lay brothers and subject to one general head. Teaching was made gratuitous for day-scholars, but boarders and day-boarders paid fees. Learning Latin was not obligatory on the poor; after the catechism the basis of the teaching was reading and writing the mother-tongue. On this ground it has been claimed for the canon of Rheims that he was really the founder of organised primary schools and primary education. The brothers devote themselves by a vow to the profession of teaching for life, and are trained in normal schools of their own. They wear a special ecclesiastical costume, and work always in pairs, and, though laymen, are bound by the usual vows of poverty, chastity, and obedience. In 1725 Benedict XIII. issued a bull recognising them as a religious congregation. It still continues to flourish in France (in spite of the secularisation of public schools), as also in Belgium, Italy, southern Germany, Great Britain, North America, and Africa. Their system of education has received the highest testimonies, and they still form one of the most flourishing of all the lay orders in the Catholic Church. The brothers have over 2000 schools, with some 325,000 scholars—more than two-thirds of them in France and her colonies, and the most part receiving gratuitous education.

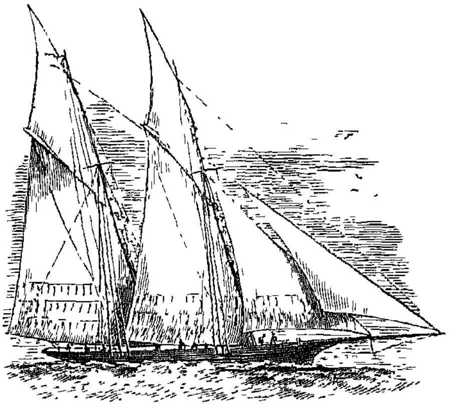
The *Institute of Irish Christian Brothers* was founded at Waterford in 1802 by Ed. Ignatius Rice, merchant. Branches of the order were soon established in Dublin, Cork, and other towns, especially in the south of Ireland. The institute was formally approved as a congregation by Pius VII. in 1820, and since then has received many favours from succeeding pontiffs. It is governed by a superior-general, who resides at the head house in Marino, Dublin. For a time the Brothers accepted a government grant under the National Board of Education, established in 1832, but soon withdrew from this connection on account of the separation of religious and secular teaching insisted on by the National Board as a fundamental condition of receiving any share of the grant at its disposal; and since then the Brothers' primary schools have been supported by the voluntary contributions of the people. Their system of teaching has met with the warm approval of successive royal commissions appointed to inquire into the state of primary education in Ireland. There are some 700 Brothers, with 40,000 pupils. Besides primary schools, the Brothers conduct institutions for the deaf and dumb, industrial schools, orphanages, high schools, and colleges; they have also extensive establishments in India, Australia, New Zealand, Gibraltar, and Newfoundland.

Schooner is a swift, sharply-built vessel, carrying usually two masts, though occasionally a greater number, and commonly is of small size.



Topsail Schooner.

There are two classes of schooners—the 'fore-and-aft schooner,' or schooner proper, and the 'topsail schooner.' In the former both foremast and mainmast are rigged like the mainmast of a cutter, with fore-and-aft Sails (q.v.). In the latter the foremast carries a square topsail and a square topgallantsail. Topsail schooners, though carrying no square foresail, have a squaresail for running free which sets from the deck. On a wind the former rig has a great advantage, as the schooner can sail up within 4½ or even 4 points of the wind; but before the wind the square topsail gives the advantage to the topsail schooner; and as the latter can on occasion strike her squaresails, and set a fore-and-aft topsail in their place, she has usually the preference. No sailing-vessel is faster than a schooner of fine build when she carries ample canvas; hence it is a favourite form for the larger class of Yachts (q.v.), and before the introduction of steam despatch-vessels was employed much in the packet service. Schooners are still employed to a great extent in the merchant service for running small cargoes, and especially those of perishable goods, as fish or fresh fruit. They are easily managed by a small crew, but, from the sharpness of their build, have no great amount of stowage.



Fore-and-aft Rigged Schooner.

Schopenhauer, Arthur, the founder of systematic modern Pessimism (q.v.), was born at Danzig, 22d February 1788. His father was a banker; his mother, Johanna Trosiener (1770 1838), wrote twenty-four volumes of novels and novelettes, and on her husband's death settled in 1806 at Weimar, where she saw much of Goethe. Schopenhauer, after resigning the business career for which his father had trained him by travel and residence in foreign countries (France, England), acquired a classical education at the schools of Gotha and Weimar; and having after his father's death inherited a patrimony of £150 a year, entered the university of Göttingen in 1809, heard later Fichte and Schleiermacher, and devoted much attention to physical and medical science in Berlin. He graduated at Jena with his first work, *On the Fourfold Root of the Principle of Sufficient Reason*, a treatise in which he seeks to classify the principles which determine respectively the provinces of Physics, Logic, Mathematics, and Ethics. Schopenhauer's philosophy, although not devoid of elements of objective value, is a perfect expression of his most unique personality, and cannot be fully understood save in connection with his character. He inherited from his father an unbreakable energy of character (some friends of his youth called him a *Jupiter Tonans*) and cosmopolitan, freethinking sympathies, and from his mother a brilliant polish of mind and facility of literary expression. His mind was not formed by years of patient acquisition but by the society of his seniors and by a congeries of vivid sights and experiences of travel, and retained to the end its habit of seizing at a conclusion through the force of intuition or apprehension rather than of reasoning. Inner discord was the keynote of his life in that in him the subjective and the objective, feeling and reason, were in perpetual conflict; he believed the tendency of life to be to separate more and more the heart and the head. His disposition was heavy and severe, dark, mistrustful and suspicious, preventing him from entering into permanent trustful relations with men or women: his mother desired him to live apart from her after the death of her husband, and he could hardly think seriously of marriage as he saw only in woman a wayward, mindless animal—ugly too he said—existing solely for the propagation of the species, an end which perpetuated the woe of the world. Lastly he believed that he had brought to the birth a philosophy which made himself the successor of Socrates, since whose time nothing had been done in philosophy save Kant's undoing of the mass of traditionary error; and he saw himself and his thinking passed over until he was sixty, and what he regarded as fatuous ravings (the Fichte-Schelling-Hegel philosophy) praised as the highest wisdom, so that he was tempted to believe there was a conspiracy of professors of philosophy against him and his truth. The cardinal articles of his philosophical creed, which he seized as it were by intuition early in life, were: first, Idealism (Idealism is of course more likely to lead to Pessimism than Realism, as it believes the world to be illusory)—Subjective Idealism—i.e. that the world is my idea, a mere phantasmagoria of my brain, and therefore in itself nothing; secondly, that the way of knowledge or speculation to the centre of things, to the 'thing-in-itself,' was demolished for ever by the immortal criticism of Kant (it simply galled him to fury to hear Schelling talking of *knowing* God by '*Intellectual* Intuition'); and thirdly, that there was accessible to the mind, to the intuition of genius, the contemplation of the Platonic ideas—that is, the ideas of Art, the only knowledge not subservient to the Will and to the needs of practical life.

His own contribution to the sum of human knowledge, as he thought, was the truth that Will, the active side of our nature, or Impulse, was the key to the one thing we did know directly and from the inside—i.e. the self (all else of course we know from without and through the self), and therefore the key to the understanding of all things from the atom up through plants and animals to the starry systems. His philosophy thus is, as he puts it, that the world is through and through Will, and also (but secondarily) through and through Idea: Will is the creative, the primary, while Idea is the secondary, the receptive factor in things—a mere offshoot from the brain. There is thus a pronounced Materialistic side to Schopenhauer's philosophy which is inconsistent with his Idealism; he always taught too the descent of man from some lower form of life—the basis of his theory that what animals wanted from man was not compassion but justice and equality, although of course as a metaphysician he deprecates a natural as opposed to a philosophical explanation of the world. Time, as he said, is only in us a form of our thought; and Schopenhauer had no sense for history. His chief book, *The World as Will and Idea* (1819), expounds in four books the Logic, the Metaphysic, the Æsthetic, and the Ethic of his view; it teaches a pantheism of the Will (Panthelismus), and defends the extension of the word Will as blind irresistible energy or impulse (it is essential to remember the irrationality of the Will in Schopenhauer) to include all processes from attraction and gravitation to motivation, which last is simply 'causality seen from within.' He collected in the *Will in Nature* what he deemed the scientific confirmations of his doctrine. The first meed of praise which fell to him was the crowning by the Norwegian Academy in 1839 of his prize essay on the *Freedom of the Will*, in which he defends the phenomenal necessity or determinism of the Will and its supra-sensible freedom. His ethical theory rests on sympathy, the treatment of self and others as not two or many but as one and the same, as both the manifestation of the All-Will which rises to a feeling of hunger in the stomach, gnawing in the teeth, thinking in the brain, &c. Sympathy, however, is only a 'civic virtue;' the highest virtue is asceticism, the denial of the Will to live, in which the Intellect through contemplation of the idea of Art frees itself from desire and willing and pierces the 'Veil of Mâyâ' (Illusion) which hides from us the supra-sensible, and the Will is reduced to its original state of quiescence or potency. Remove the Will from life and there is no more: 'before us there is certainly Nothing.' Schopenhauer preferred Buddhism and Mysticism and Anchoretic Christianity to the reigning forms of religion and to Rationalistic Theism. He gave out his occasional papers in the *Parerga and Paralipomena* (1851), which more than the other works express the man himself, illustrate the eloquence of his pen, and perhaps have led people to his shrine who know next to nothing of his strict theory. In an appendix to *The World as Will and Idea* he criticises the Kantian theory of knowledge as laying too much weight on the Reflective or Indirect Method as opposed to the Intuitive or Direct. His essay on *Seeing and Colours* (1816) contains practically Goethe's theory of colours; Goethe had been pleased to get Schopenhauer's help in his optical researches, and had predicted for Schopenhauer a hearing in the world. From Weimar and university circles Schopenhauer had gone to Dresden (1814-18) for the writing of *The World as Will and Idea;* thence he had gone to Italy; his unsuccessful attempt as lecturer in Berlin University was made in 1820. Of two lawsuits one concerning money matters was settled in his favour through his own legal acumen; the other ended in his having to pay £9 a year to a seamstress as compensation for injuries received by her when the irate philosopher ejected her with violence from his rooms as an intruder. After renewed travel and residence in the south he finally in 1831 left Berlin for Frankfort-on-the-Main, where he chose to live as an isolated thinker until his death there, 21st September 1860. Frauenstädt, his literary executor, was the chief of his 'evangelists' and 'apostles'—as he called the most enthusiastic of his admirers.

The complete works, edited by Frauenstädt, appeared in 6 vols. in 1876. There is an English translation of *The World as Will and Idea*, by Haldane and Kemp (1883-86), and of the *Fourfold Root* and *Will in Nature* (1888); and a volume of *Selected Essays*, by E. B. Bax, appeared in 1891. Mr Saunders in his Schopenhauer series has translated somewhat from the *Parerga*, &c. The first magazine article on Schopenhauer which drew attention to him abroad was in the *Westminster Review* (vol. iii. new series, 1853, pp. 388-407). The best Life is by Gwinner (Leip. 1862; new ed. 1878). Frauenstädt writes on Schopenhauer's life and philosophy in an introduction in vol. i. of the *Works*. See also his *Letters on the Philosophy of Schopenhauer* (Leip. 1854), &c. Miss Zimmern's Life (1876) and that of Professor Wallace (1890) are both very good. See also the large histories of philosophy—Kuno Fischer, Erdmann, Zeller, Hartmann (*Studien u., Aufsätze*, i., and elsewhere). There is a bibliography at the end of Professor Wallace's book; see also W. L. Hertslet, *Schopenhauer-Register* (1891), and the article PESSIMISM for references.

Schorl-rock, a compound of quartz and schorl or black Tourmaline (q.v.). It may be fine or coarse grained. Sometimes it consists principally of quartz with prisms of schorl scattered irregularly through it; at other times it may be so fine grained as to form a blackish-gray mass in which the naked eye cannot distinguish the separate ingredients. The rock occurs associated with granite and the crystalline schists.

Schottische (a Frenchified form of the German word for *Scottish*), a somewhat fanciful name given to a slow modern dance in $\frac{2}{4}$ time.

Schouvaloff, COUNT PETER ANDREIEVITCH, Russian ambassador, was born at St Petersburg on 15th July 1827, became head of a department in the ministry of the Interior in 1862, and in 1866 head of the secret police; in 1873 he was sent on a secret mission to London, when he arranged the marriage between the Duke of Edinburgh and the only daughter of the Emperor Alexander II. In 1878 he was one of the representatives of Russia at the Congress of Berlin. He died 22d March 1889.—His brother, COUNT PAUL, born in 1830, entered the army and took part in the defence of Sebastopol and in the battle of Inkermann. As head of a department in the ministry of the Interior he helped to organise the liberation of the Russian serfs (1861). In 1878 he held a divisional command in the battle of Philippopolis, which the Russians won against Suleiman Pasha. In 1885 he was appointed ambassador to Germany.

Schouwen, an island of Holland, in the province of Zealand, with an area of 62 sq. m. and a pop. of 24,000, who grow madder, refine salt, and salt fish. Chief town, Zierikzee.

Schrader, EBERHARD, a learned Assyriologist, was born at Brunswick, January 5, 1836, studied at Göttingen, where his bent to oriental studies was confirmed by Ewald, and became ordinary professor of Theology at Zurich in 1863, Giessen in 1870, and Jena in 1873. In 1875 he obeyed a call from Berlin to the chair of Oriental Languages, with a seat in the Academy of Sciences.

His earliest books were devoted to Old Testament criticism—*Studien zur Kritik und Erklärung der biblischen Urgeschichte* (1863), and a fresh edition—the eighth—of De Wette's *Einleitung* (1869). Turning next to Assyriology, he quickly placed himself at the head of German scholars by an unrivalled combination of wide erudition and critical sagacity. His books are *Die Assyrisch-Babylonischen Keilinschriften* (1872); *Die Keilinschriften und das Alte Testament* (1872; 2d ed. 1883; Eng. trans. 2 vols. 1885-86); *Die Hollenfahrt der Istar* (1874); *Keilinschriften und Geschichtsforschung* (1878), in which he combats in masterly fashion the attack of the historian Gutschmid on the method and result of work in the cuneiform inscriptions; and *Zur Frage nach dem Ursprung der Babylon. Kultur* (1884). There is a translation by Mr F. B. Jevons of his important *Prehistoric Antiquities of the Aryan Peoples* (1890).

Schreiner, OLIVE, a gifted South African authoress, daughter of a Lutheran clergyman at Capetown, who startled the conventional English world of letters in 1883 by '*The Story of an African Farm:* a Novel. By Ralph Iron.' As a series of half-finished pictures of rough life on a Boer farm, and of the spiritual problems that rend an inquiring soul, the book shows exceptional power and promise. The simple yet forcible style, the penetrating pathos, and the feeling of intense personality underlying the book arrested even the readers of the circulating library. Her next book, *Dreams* (1890), was a group of noble spiritual allegories, of which one had already appeared in the earlier work.

Schrevelius, CORNELIUS, a Dutch scholar, was born at Haarlem in 1615. In 1642 he succeeded his father as rector of the university of

Leyden, and died 11th September 1664. He was a laborious and erudite man, but possessed little critical discernment. His most notable performance was a *Lexicon Græco-Latinum et Latino-Græcum* (Leyden, 1654), of which there have been innumerable editions. He also executed between 1648 and 1665 many *variorum* editions of the classics—Juvenal, Hesiod, Terence, Virgil, Horace, Homer, Martial, Lucan, Cicero, Ovid, and Claudian.

Schubart, Christian Daniel, poet, was born 13th April 1739 at Sontheim in Swabia, and studied theology, afterwards becoming schoolmaster and organist, first at Geisslingen and then at Ludwigsburg. But he wrote satirical poems and spoke unadvisedly, lost his post, and then led a wandering life in various cities and countries, giving poetical readings and piano performances. He got into difficulty in Austrian territory at Ulm, was enticed back to Wurtemberg by the prince, whom he had greatly irritated by a stinging epigram, was carried to the fortress-prison of Hohen-Asperg (1777), and there pined for ten years. Then he was set free by intervention of the Prussian court, and straightway appointed court musician and theatre-director at Stuttgart to the same prince who had kept him all these years in prison. But he was utterly broken in health, and died 10th October 1791. His poetry is very unequal in value; he was an effective satirist of abuses in church and state, and some of his patriotic pieces, odes and hymns, have real poetic worth; but he is chiefly remembered for his tragic fate, and for the influence his work exercised on Schiller. His *Gesammelte Schriften* (including essays and newspaper articles) fill 8 volumes.

See the autobiographical *Schubarts Leben* (1793), and monographs on the man by D. F. Strauss (1849), Hauff (1885), and Nägele (1888).

Schubert, Franz Peter, the celebrated composer, was born in Vienna on January 31, 1797. His father, who came of a Moravian peasant stock, had settled some years previously as a schoolmaster in a district of the city called the Lichtenthal; his mother before her marriage had been a cook. Their two elder sons, Ignaz and Ferdinand, adopted the father's calling. Franz's musical gifts very early declared themselves. At first he was taught the violin by his father, and the pianoforte by his brother Ignaz; but he very soon outstripped their powers of instruction. His training was therefore entrusted to Holzer, organist of the parish church, whose raptures over the boy's talents were a poor substitute for the conscientious care which they demanded. Before he was eleven years of age young Schubert was leading soprano in the Lichtenthal choir, whence he was soon transferred to the Konvikt or choristers' school of the Court-chapel. Franz at once took his place as one of the violin-players in the school band, where he soon became leader. The constant practice thus afforded him was doubtless an inestimable advantage, though it must always be regretted that his theoretical training was practically left to take care of itself; for Ruzicka, the music-master at the Konvikt, seems to have taken much the same line with Schubert as Holzer had done before him. The circumstances of the school were not favourable to study. The boys were allowed to go hungry, and in winter without fire, so that even practice was carried on under difficulties. But Schubert's thirst for composition triumphed over all such obstacles, and in its endeavour to be satisfied interfered seriously with his progress in the ordinary curriculum. He made many friends at this time, for his schoolfellows were all proud of his gifts and were delighted to take part in the performance of his compositions; while in Spaun, one of the senior choristers, he found a benefactor who kept him supplied with music-paper, a luxury beyond the reach of his own very slender resources. During the five years thus spent Schubert tried his hand at almost every kind of composition, the work which marks the completion of this period being a symphony in D (October 28, 1813).

On his departure from the Konvikt he became an under-teacher in his father's school in order to avoid the conscription. Even at this early date he wrote some of his most enduring compositions. Of these may be mentioned that immortal song the *Erl King*, truly marvellous as the work of a youth of eighteen, and the Mass in F, first performed by the Lichtenthal choir under the direction of the composer. Among those who congratulated him on this occasion was Salieri, under whose guidance his more recent studies had been made. Schubert's delivery from the drudgery of his father's school was brought about by Franz von Schober, a young man of his own age, who had met with some of his songs, and who, on coming to the university of Vienna, lost no time in finding out the composer. As soon as he became aware of Schubert's anomalous position, he proposed that he should share his lodging and be free to devote himself entirely to his art. Franz fell in with the arrangement, which, however, was put an end to by the interference of Schober's brother after a few months, when Schubert was doubtless laid under a similar obligation to other friends; for, with the exception of £4 paid to him for a cantata written for a Herr Watteroth, his work as yet had brought him in nothing. His short residence with Schober was marked by an event which had a lasting influence on his career—his acquaintance with Vogl, the eminent singer and actor, who very soon appreciated his genius, and became his firm and most valued friend. Vogl's fine literary taste enabled him to curb that omnivorous instinct of Schubert's which impelled him to lavish his treasures of melody on words altogether unworthy of them. To him also Schubert owed the recognition (inadequate as it was) of his talents by the Viennese, for Vogl constantly sang his songs at the houses of people of influence in the first instance, and eventually in public.

In 1818 Schubert became teacher of music in the family of Count Johann Esterhazy at his country seat at Zelész, in Hungary, where he passed several months, finding in the beauty of his surroundings a new stimulus to composition. The end of the year, however, saw him back in Vienna and installed in lodgings with the poet Mayrhofer. The two would often work together in the same room, the one writing verses which the other as rapidly set to music. On February 28, 1819, Schubert was first brought before the public as a composer by the performance of one of his songs, the *Schäfers Klagelied*, at a concert in Vienna. In the summer he made an extended tour with Vogl, and found time to compose, during a halt at Steyr, his well-known pianoforte quintett (op. 114). His comic operetta, the *Zwillingsbrüder*, finished 19th January 1819, was produced at the Kärnthnerthor theatre on June 14, 1820, and two months later came the first performance of the *Zauberharfe* at the Theater-an-der-Wien. His appearance in print was delayed until April 1821, when his old schoolfellow Leopold Sonnleither and another friend named Gymnich had the *Erl King* engraved at their own cost. But as Schubert's songs began to be heard more frequently the enthusiasm with which they were received at length overcame the hesitation of publishers in accepting his MSS. As many as twenty songs were issued in eight months, but unfortunately no permanent pecuniary benefit was secured to the composer. In 1822 Schubert completed his opera *Alfonso und Estrella*, the libretto of which was furnished by Schober. It was rehearsed at Gratz, but was not brought to performance during the composer's lifetime. Liszt produced it at Weimar in 1854; but it did not meet with any real success until March 1881, when with a new libretto and considerable curtailment it was produced at Carlsruhe. To 1822 belong also the two movements of the unfinished symphony in B minor, in which for the first time in his orchestral writings Schubert displays a complete individuality. His first acquaintance with Weber and his formal introduction to Beethoven are also noteworthy among the events of this year.

During 1823 Schubert devoted much attention to dramatic music, writing with great rapidity the three-act opera of *Fierabras;* but to himself these labours resulted only in intense disappointment and depression, although we owe to his efforts in this direction the beautiful *Rosamunde* music, the orchestral parts of which were discovered at Vienna in 1867 by Sir George Grove in a cupboard where they had remained untouched for forty-four years. A second long stay with the Esterhazys at Zelész restored Schubert from his state of extreme dejection, the visit being marked by the composition of many important works, including some pianoforte duets written for his two pupils, the daughters of Count Esterhazy. Of these the best known is probably the *Divertissement à la Hongroise,* inspired by Hungarian airs which Schubert heard sung by a servant as he passed the door of the kitchen. The summer of 1825 was devoted to a pleasant tour with Vogl, the two friends delighting every one with their performance of Schubert's new songs from Walter Scott's *Lady of the Lake,* to which he referred when he wrote 'The way in which Vogl sings and I accompany, so that for the moment we appear to be one, is something quite new and unexpected to these good people.' And yet the seven songs which proved so successful were sold on his return to Vienna for the paltry sum of £20!

The compositions of 1826 included a quartett in D minor and the pianoforte sonata in G, usually known as the Fantasia. One of Schubert's happiest inspirations, the song *Hark! Hark! the lark,* came suddenly upon him as he sat in a beer-garden one Sunday afternoon in July; his other Shakespearian songs, *Who is Sylvia?* and the 'drinking song' in *Antony and Cleopatra,* being also attributable to this date. In the autumn he missed a probable appointment as director of the music at the Court Theatre of Vienna through his refusal to alter certain pieces which he had composed as a test of his fitness for the post. Some months later Schubert's songs were brought under the notice of Beethoven. They were put into his hands during his last illness by his devoted attendant Schindler, who had Schubert's welfare much at heart. The perusal of them was a revelation to him, and drew from him the exclamation: 'Truly Schubert has the divine fire!' A recurrence of his malady prevented his acquaintance with Schubert's other works, but he often spoke of him and foretold the stir which he was destined to make in the musical world. During these days Schubert twice visited the man whom of all others he admired, and, when the end had come, was one of the torch-bearers at Beethoven's funeral.

In 1827 Schubert was elected a member of the representative body of the Musical Society of Vienna, an honour which he greatly appreciated, while his prospects were further brightened by advantageous proposals from foreign publishers, the best possible proof of his growing reputation. He was thus spurred on to surpass his former achievements in the composition of his noblest symphony (No. 9 in C), begun in March 1828, and if possible more characteristic of him than the earlier one in B minor. His rate of production during this his last year was truly prodigious, for besides the symphony he wrote his Mass in E flat, the oratorio *Miriam's War-song,* the string quintett in C, and three pianoforte sonatas. He also composed several songs, the words of which his friend Schindler had found among Beethoven's papers. One of these, *Die Taubenpost,* is dated October 1828, and is probably the last piece written by Schubert. He gave his first and, as it proved, his only concert in the hall of the Musik-Verein at Vienna on the evening of March 26. The venture was extremely successful, so that for the time being the needy composer was placed beyond want, although he had to abandon his usual summer excursion on account of his poverty, which must indeed have been extreme, since he was driven to dispose of some of his finest songs for a few pence apiece.

At the end of August he took up his abode with his brother Ferdinand in a new house in the suburb of Neue Wieden, but the change seems to have had a bad effect upon his already weak state of health. He recovered sufficiently to join some friends in a short walking tour; but his illness soon returned, bringing with it complete loss of appetite. Yet he was as active as ever, both in body and in mind. He walked much, and talked of his plans for a proposed new opera, *Graf von Gleichen.* He was able to go to hear Beethoven's quartett in C sharp minor, which greatly moved him, and to attend the first performance of a Requiem composed by Ferdinand Schubert. At the same time a study of Handel's scores caused him to reflect upon his own deficiencies in counterpoint, and to determine to remedy them by a course of lessons with Sechter, the best-known authority on the subject. The dates of the lessons were fixed and the text-book chosen. But Schubert's time for work was now over. On November 11 he wrote to Schober telling him that for eleven days he had taken neither food nor drink, and asking for some of Cooper's novels to read. A few days later he became delirious and was found to be suffering from an attack of typhus fever, to which he succumbed on Wednesday, November 19, 1828, in the thirty-second year of his age. In accordance with his latest wish his remains were buried near Beethoven's grave in the cemetery of Währung; they were reinterred in the central cemetery of Vienna on September 23, 1888.

Among composers Schubert is remarkable for the apparently ceaseless impulse to compose which possessed him; and, as a consequence, for the vast and, considering the shortness of his life, almost incredible quantity of music with which he has enriched the world. He is still more renowned for the absolute spontaneity of his writings and for the poetic spirit with which he has imbued them. But his special and peculiar eminence lies in the department of song-writing, in which he reached the highest limit of excellence, the earliest of his lyrical productions affording perfectly mature examples of artistic musical form applied to song. In other branches of composition the deficiencies of his theoretical training are often evident, but here his instincts were never at fault. There were occasions when the torrent of inspiration rushed upon him with irresistible force. At such times the recitation or perusal of a poem seemed to touch some hidden spring in him, and in a few moments he had wedded it to music in such perfect accord with the words that the finest poems of the greatest poets were by this means not so much enhanced as transcended. His usual custom, however, was to write steadily for a long time every morning; and he would sometimes compose six or seven songs in his best manner in less than as many hours. But the lyrical spirit was by no means confined to his songs; it found its way into his instrumental works, which reveal a wonderful prodigality of ideas, although comparatively little learning is displayed in turning them to account. In his orchestral writings Schubert is celebrated for extraordinary delicacy in his method of instrumentation, especially in his treatment of the wood-wind; and this is the more remarkable from the fact of his never having heard the effect of his very finest passages—for some of his noblest pieces were not performed until long after his death. He rarely altered anything he had written, and could never understand the immense pains taken by Beethoven in perfecting his scores. Schubert wrote as one impelled by imperious necessity to relieve his mind of ideas, which in his case were sometimes forgotten as soon as they were committed to paper—a fact which will be the more readily appreciated when it is remembered that, although his years were fewer than those of any other master of the first rank, he composed more than 500 songs, ten symphonies (including two left unfinished), six masses, a host of sonatas and other works for the pianoforte, a number of string quartetts (those in A minor and D minor being especially fine), as well as several operas, cantatas, and overtures. Schubert's personal character was extremely modest and retiring; hence perhaps, to some extent, his failure to obtain any permanent appointment by which he might have been delivered from that sadly precarious mode of existence which doubtless hastened his end. His sweetness and amiability of disposition endeared him to every one, while he was generous to a fault. The insignificance of his appearance gave no token of the genius it concealed; his friend Lachner describes him as 'looking like a cabman.'

For an exhaustive account of Schubert's life, together with a complete list of his works, see the article by Sir George Grove in his *Dictionary of Music.* There are Lives by Kreissle von Hellborn (1866) and Reissmann (1873); see also the *Beiträge* by Max Friedlander (1883).

Schultz, HERMANN, theologian, born at Lüchow in Hanover, December 30, 1836, studied at Göttingen and Erlangen, and became professor at Basel in 1864, at Strasburg in 1872, Heidelberg in 1874, and Göttingen in 1876. There also he became university preacher and consistorial councillor.

His writings include *Die Voraussetzungen der Christlichen Lehre von der Unsterblichkeit* (1861); *Alttestamentliche Theologie* (1869; 4th ed. 1889; Eng. trans. 1892), a work masterly in its religious insight; *Die Lehre von der Gottheit Christi* (1881), in which he applies Ritschl's method to the central question of Christianity, the Divinity being apprehended neither from the metaphysical nor eschatological point of view, but as the expression of the experience of the Christian community, a human personal life having become the expression of an eternal divine life through a moral rather than a natural miracle; a volume of sermons (1882); *Lehre vom Heiligen Abendmal* (1886); and *Grundriss d. prakt. Theologie* (1889); *Grundriss d. Evangel. Dogmatik* (1890).

Schulze-Delitzsch, HERMANN, founder of the people's banks of Germany, was born on 29th August 1808, at Delitzsch, a small town of Prussian Saxony. He was educated to follow the law, at Leipzig and at Halle, and entered the public service of Prussia; but in 1841 he settled down in his native town as patrimonial judge (a kind of estate manager discharging also judicial and administrative functions), and thenceforward devoted his life to the better economic education of the small farmers and operatives amongst whom he lived. When the National Assembly was called together in Berlin in 1848 Schulze-Delitzsch, who represented his native town, was chosen chairman of a commission to inquire into the distress prevailing amongst the labouring and artisan classes; and two years later, for protesting that it was unjust to tax the people when their representatives were not allowed to deliberate together, he was tried on a charge of treason, but was acquitted. On his return to Delitzsch he started the first people's bank. In these institutions the subscribers, all contributors of small sums, received credit and dividends in proportion of their savings; the joint credit of the association was used for borrowing money; and the banks were managed by a board of the subscribers. By 1859 there were already more than two hundred of these banks in the central districts of Germany; and in that same year, at a congress which met at Halle, these were united under one organisation, with Schulze-Delitzsch as manager. The system was introduced with great success into Austria, Italy, Belgium, and Russia; and when its deviser and founder died, on 29th April 1883, at Potsdam, there were in Germany alone 3500 branches, having twelve million members, with a share capital of £10,000,000 and deposits to more than twice that sum. In 1861 he again took his seat in parliament, joining the Progressist party and labouring for constitutional reform. When Lassalle began to agitate for state loans to productive associations he found Schulze-Delitzsch, a firm believer in self-help, writing and speaking in opposition to him. 'He who preaches to the people self-help, self-responsibility, self-reliance as the condition of their economic independence and political freedom must in the first place practise these principles in his own life,' such was the social creed he lived by. And when the members of his party wished to make him a gift of £7000 in recognition of his disinterested labours in behalf of social reform, they could only prevail upon him to accept £1000 for himself; the rest he set aside for the payment of men who should promote the cause of social reform. An account of his system of people's banks is contained in *Vorschuss- und Kredit-Vereine als Volksbanken* (5th ed. 1876); besides this he wrote *Die Entwickelung des Genossenschaftswesens* (1870) and other books on co-operation. See Life by Bernstein (Berlin, 1879), and a paper by John Rae in *Good Words* (1885).

Schumann, ROBERT, the great apostle of the Romantic school in music, was born at Zwickau in Saxony, 8th June 1810. His father was a man of a distinctly artistic turn of mind, and until his death in 1826 Robert had every encouragement to indulge any taste he had for music. No very decided manifestation, however, was apparent until Schumann's mother and guardian had to face a most unwelcome desire on the part of the young man, who should have been pursuing his law studies. His mother was sorely troubled, and sought advice from Frederick Wieck, the eminent pianoforte teacher. His answer favoured Schumann's ardent ambition, and at the age of twenty-one, after a desultory course of law and philosophy, a good deal of observant travel in Germany, Switzerland, and Italy, and a thorough course of Jean Paul Richter, Schumann began to qualify himself for his great mission, and settled down in Leipzig as an ardent student of music under Wieck. In his haste to become perfect in his art he defeated his own ends; for, not content with arduous practising, he had recourse to mechanical means for improving the power of his hands—one of them so violent that he permanently disabled the third finger of his right hand. He turned perforce to composition, and his misfortune has proved our gain. In 1832 Clara Wieck, his teacher's daughter, who though only thirteen years of age was already an accomplished pianist, made a deep impression on Schumann, which later developed into a still deeper and a mutual feeling.

In 1833 his first important pianoforte compositions were published (*Toccata*, &c.), and in the following year his overflowing energy conceived the idea of a new musical paper, and inspired three friends with the same enthusiasm for art criticism as he had himself. As editor of this *Neue Zeitschrift fur Musik* for more than ten years he contributed many essays, some very fantastic, some of inestimable value, and all showing strong imaginative and poetical powers. His critiques on young composers are particularly interesting for their keen critical acumen, their frank admission and fearless proclamation of any good quality in any artist however young or unknown, and their generous encouragement of all earnest workers. For an account of Schumann's charming idea of an imaginary society, the *Davidsbündler*, reference must be made to a more detailed notice of his life.

From the year 1836 his genius for composing asserted itself more and more, and it is very interesting to notice how it seems to have turned deliberately and methodically from one branch of composition to another. His greatest pianoforte works were written between 1836 and 1839 (*Fantasia*, *Noveletten*, *Kinderscenen*, *Kreisleriana*, *Humoreske*, *Faschingschwank*, &c.). The reception of these works was on the whole very encouraging, and against the neglect of some authorities, and the adverse criticism of others, Schumann had the support of such as Liszt and Moscheles.

In 1835 Mendelssohn came to Leipzig filled with the energy and enthusiasm which in a few years raised Leipzig to the dignity of the most important musical centre in Germany. Schumann with ready and generous appreciation at once fell down and worshipped. 'I look up to Mendelssohn as to a high mountain peak,' he wrote. He accepted a professorship in the new Conservatorium, but he was eminently unfitted for such work, and in a short time he resigned the appointment. In 1836 a visit to Vienna yielded important though indirect results. Interested as he was in Franz Schubert's writings, he made thorough investigations for possible MSS., and was rewarded with the score of the C major symphony, which he forwarded to Mendelssohn in Leipzig, and it was performed there for the first time eight years after the composer's death. At length in 1840, in spite of Wieck's opposition, he married his daughter Clara Josephine (born 13th September 1819). And as the time of trial had inspired some of his most tender works, notably many songs, so the perfect happiness of the next few years gave his compositions an impulse to a richer, fuller style, characterised by more repose. In the following year he turned his attention to instrumental work, and rapidly produced three symphonies and the romantic concerto in A minor. Chamber music next claimed his attention, and the three beautiful quartetts prepared the way for what is probably the most widely popular, as it is one of the most perfect of all Schumann's concert pieces—the *Quintett* for pianoforte and strings. The pianoforte *Quartett* belongs to the same year (1842). In 1843, the last year of his residence in Leipzig, he produced two important choral works, *Paradise and the Peri*, which met with great success, and scenes from *Faust*. But the insidious disease which had been working in his brain since early youth, and which bereft him of reason before his death, first broke out now in unmistakable symptoms, and in order to comply with medical advice he left the exciting musical life of Leipzig and settled in Dresden. For more than two years the state of his health gave his friends great anxiety, but in 1847 the clouds lifted—only, alas, to gather for the last dark years. From 1848 to 1850 works of all kinds appeared in rapid succession—*Genoveva* (his only opera), incidental music to Byron's *Manfred*, songs, and much instrumental solo and concerted music.

In 1850 Schumann was invited to succeed Dr Hiller as musical director in Düsseldorf—a post for which he was as unfitted as he had proved for the professorship in Leipzig. He had none of the qualities so necessary in a conductor—concentration of attention, prompt decision, resource; and an eyewitness of the circumstance assured the present writer that on one occasion Schumann in a fit of absent-mindedness went on beating time after the piece had concluded!

Much desultory work, some remarkably fine, some only grand fragments, some never attaining beyond ambitious design, belongs to the years in Düsseldorf (1850-54); but it became ever more and more evident that he must retire from his post as a conductor, and this, naturally enough, he could not be induced to consider necessary. Hence arose ill-feeling and unpleasantness. In 1851 his former ailment broke out anew, and his eccentricity gradually grew more marked. He was subject to most curious delusions, and devoted himself largely to the art of table-turning and spiritualism. One famous delusion was that the spirits of Schubert and Mendelssohn visited him; and once he jumped up during the night to note down a theme given him, as he imagined, by Schubert—the unfinished Variations on which were his last work. In February 1854, during an attack of extreme depression, he threw himself into the Rhine, but was rescued by boatmen. Insanity had asserted its sway, and Schumann spent the last two years of his life in a private asylum near Bonn, where he died in his wife's arms, July 29, 1856, aged only forty-six.

The characteristics of Schumann's compositions are great originality and fertility in subjects and themes, freshness, force, and piquancy in rhythm, and a wealth and resource in harmony which places him among composers not far from Bach himself. Those works which are cast in certain forms, as sonatas, symphonies, &c., do not always follow the recognised canon, but the exuberance of what is generally self-contained and restrained fancy maintains such unflagging vivacity and interest that the analytical faculty is often quite disarmed. Among writers of songs and ballads he is second to none. The extreme originality and unconventionality of his work account for a tardy appreciation, but he has won a secure place now among the great composers. His talented and devoted wife laboured incessantly to obtain a hearing for his pianoforte compositions, and she lived to see her labours crowned with success. After his death she taught at the Frankfort Conservatoire, and played in the chief cities of Europe—her visit to London in 1886 was a splendid success.

Other biographies and criticisms will be found in Wasielewski's *Robert Schumann* (Dresden, 1858; 3d ed. Bonn, 1880; Eng. trans. 1878), the work of an intimate friend and a long recognised authority; Dr Spitta's admirable article in Grove's *Dictionary of Music*; Reissman's *Life and Works of Robert Schumann* (Eng. trans. 1886); Pohl's 'Reminiscences' (*Deutsche Revue*, vol. iv. Berlin, 1878); Fétis, in the *Biographie Universelle* (a singularly unappreciative estimate); *Life of Schubert told in his Letters* (trans. from the German by May Herbert, 2 vols. 1890); innumerable notices and criticisms in periodicals (such as E. Prout, in the *Monthly Musical Record*, 1871-72; J. Bennet, in the *Musical Times*, 1879); but the Life (1892) by Professor Niecks of Edinburgh, who has had access to the best authorities, must henceforth rank as the standard authority.

Schürer, Emil, a learned biblical scholar, was born at Augsburg, 2d May 1844, studied at Erlangen, Berlin, and Heidelberg, became first *privatdocent*, and next professor extra-ordinary at Leipzig, and in 1878 was called to a chair at Giessen. He edited the well-known *Theologische Literaturzeitung* from its commencement in 1876 until his association with Harnack in 1881.

His books are *Schleiermacher's Religionsbegriff* (1868); *De Controversiis paschalibus* (1869); and the *Lehrbuch der Neutest. Zeitgeschichte* (1874), re-issued in its second edition (2 vols. 1886-87) under the title *Geschichte des Jüdischen Volkes*. This splendid work has been translated into English (5 vols. 1886-90).

Schurz, Carl, born near Cologne, 2d March 1829, entered Bonn University in 1846, joined Kinkel (q.v.) in the revolutionary movement of 1848-49, and the next year returned from Switzerland and effected his master's escape. In 1852 he passed to the United States, where he speedily engaged in politics, lectured, practised law, and as major-general of volunteers took part in several battles during the civil war. Journalism next engaged his attention till in 1869 he was elected to the United States senate. In 1877 he was made Secretary of the Interior, and from 1880 to 1884 he was once again an editor. In 1887 he published a Life of Henry Clay.

Schuyler, Philip John, a leader of the American Revolution, was born at Albany, 22d November 1733, raised a company and fought at Lake George in 1755, and rendered other services during the French and Indian War. He was a member of the colonial assembly from 1768, and was a delegate to the Continental congress of 1775, which appointed him one of the first four major-generals. Washington gave him the northern department of New York, and he was preparing to invade Canada when ill-health compelled him to hand the command over to General Montgomery. He still retained a general direction of affairs from Albany, but jealousies and complaints, especially from Gates, rendered his work both hard and disagreeable, and in 1779, after a congressional committee had acquitted him honourably of all charges, he resigned. He would not again accept a command, although he remained one of Washington's closest friends and advisers. Besides acting as commissioner for Indian affairs, and making treaties with the Six Nations, he sat in congress from 1777 to 1781, and was a state senator for thirteen years between 1780 and 1797, a United States senator in 1789-91 and 1797-98, and surveyor-general of the state from 1782. With Hamilton (who married a daughter) and John Jay he shared the leadership of the Federal party in New York; and he aided in preparing the state's code of laws. He died at Albany, 18th November 1804. See the Life by B. J. Lossing (enlarged ed. 2 vols. 1872), and G. W. Schuyler's *Philip Schuyler and his Family* (2 vols. New York, 1888).

Schuylkill (pron. *Skoolkill*), a river of Pennsylvania, which rises in the coal region, near Pottsville, and, flowing 130 miles south-east, past Reading and Norristown, empties into the river Delaware at the southern limit of Philadelphia. This city is built on both sides of the Schuylkill, and draws its water-supply from it. Coal-barges ascend the river by dams and locks.

Schwalbach, or Langenschwalbach, a spa of Germany, 8 miles W. by N. of Wiesbaden, has eight springs impregnated with iron and carbonic acid gas, the water of which is efficacious in female complaints, poor blood, and muscular weakness. Pop. 2658, increased to about 7000 in the season.

Schwann, Theodor, naturalist and founder of the cell-theory, was born 7th December 1810, at Neuss in Rhenish Prussia, studied at Bonn, Würzburg and Berlin, and became assistant to Johannes Müller. In 1838 he became professor of Anatomy at Louvain, in 1848 at Liége, where he also lectured on physiology. He died at Cologne, 14th January 1882. He made many discoveries on the digestion, muscular structure, contractility of the arteries, and the nervous system; but his chief contributions to science, practically establishing the cell-theory, are found in his classic *Microscopic Investigations on the Accordance in the Structure of Plants and Animals* (1839; Eng. trans. 1847), the main ideas of which are explained at Cell, Vol. III. p. 46.

Schwanthaler, Ludwig Michael, a German sculptor, was born on 26th August 1802, at Munich, the descendant of an old family of Tyrolese sculptors, and was trained in the Munich Academy of Art and in his father's workshop. After a visit to Rome he set up a studio at Munich, and, being brought under the notice of King Louis, was charged to execute for the Glyptothek several bas-reliefs and figures. In 1832 he revisited Rome, for the purpose of preparing models for the national monument of Valhalla and the Pinakothek. On his return to Munich (1834) he began his bas-reliefs and sculptures for the Königsbau. In 1835 he was appointed professor at the Munich Academy. The number of his works is singularly great, while their excellence places him in the first rank of German sculptors. Yet, spite of his power of design, he is somewhat conventional in his conception: and his influence on art has not been all for good. The multitude of his commissions is responsible for a good deal of work being left to his assistants, and for the lack of careful finish such work shows. Among his remaining efforts may be mentioned two groups for the gable ends of the Valhalla, the colossal statue of Bavaria, 60 feet high, that stands in front of the Temple of Fame, statues of Goethe, Jean Paul Richter, and Mozart, of Venus, Diana, Apollo, Bacchus, &c., and many others, both groups and single figures. He died on 28th November 1848, leaving his models to the nation. See *Art Journal* (1880).

Schwarz, Berthold. See Gunpowder, Vol. V. p. 470.

Schwarz, Christian Friedrich, a German missionary in India, was born at Sonnenburg, in Brandenburg, 8th October 1726. He studied at Halle, and, having resolved to become a missionary, obtained ordination at Copenhagen, with the view of joining the Danish mission at Tranquebar, where he arrived in 1750. His career is a beautiful example of what may be accomplished when piety, integrity, good sense, and a charity that knows how to prevent the virtue of zeal from lapsing into fanaticism are united harmoniously in a man. After labouring sixteen years at Tranquebar he went to Trichinopoly, where he founded a church and school, and also acted as chaplain to the garrison. In 1769 he gained the friendship of the Rajah of Tanjore, and removed to his capital in 1778; there he died on 13th February 1798. He was highly successful in making converts to Christianity, and gained the esteem and confidence of the native rulers, including Hyder Ali, of Mysore, who, when he was arranging terms of peace with the Madras government, demanded that Schwarz should act as their agent—'him, and no other one,' said the sultan, 'will I receive and trust.' The Rajah of Tanjore, before he died, appointed Schwarz tutor and guardian of his young son, who turned out one of the most accomplished sovereigns of India. See the Life of Schwarz by H. N. Pearson (1855).

Schwarzburg, an old princely family of Germany, which traces its descent from a Thuringian count, Günther, whom St Boniface converted to Christianity. The first to adopt the title of Schwarzburg was Count Sizzo IV., early in the 12th century. Count Günther XXXIX., who introduced the reformation into his states, was the common ancestor of the two existing lines of the Schwarzburg family: his son Johann Gunther founded the line of Schwarzburg-Sondershausen, and Albert that of Schwarzburg-Rudolstadt.

SCHWARZBURG-RUDOLSTADT, a sovereign principality of the German empire, consists of the upper lordship (283 sq. m. and 79 per cent. of the pop.) in the Thuringer Wald, surrounded by the Saxon duchies of Weimar, Altenburg, and Meiningen, and the lower lordship (80 sq. m. and 21 per cent. of the pop.), lying 40 miles to the north in Prussian Saxony. Pop. 85,863. Both divisions are mountainous; in the lower lordship stands the Kyffhauser (1545 feet), under which, according to the legend, Frederick Barbarossa sleeps. In the lower lordship agriculture is the mainstay of the people; in the upper manufacturing industry (porcelain, glass, machinery, mathematical instruments, &c.), mining, forestry, and grazing. Education stands at a high level. The constitution is in principle that of a constitutional monarchy, the head of the state being the prince. The national assembly consists of sixteen members, elected every three years. Capital, Rudolstadt.

SCHWARZBURG-SONDERSHAUSEN, a sovereign principality of Germany, consists of the lower lordship (200 sq. m. and 51½ per cent. of pop.) in Prussian Saxony and two separate portions constituting the upper lordship (132 sq. m. and 48½ per cent. of pop.) in the Thuringer Wald, surrounded by the Saxon duchies of Gotha, Weimar, and Meiningen. Pop. 75,510. The occupations are the same as for Schwarzburg-Rudolstadt, and distributed in the same way. The government is in the hands of the prince and an assembly of fifteen members, ten elected by the people, five nominated by the prince. Capital, Sondershausen.

Schwarzenberg, a princely family of Germany, the head of which was raised (1429) by the Emperor Sigismund to the dignity of Baron of the Empire. Three of this family have acquired a European reputation. ADAM, Count of Schwarzenberg, who was born in 1584, became (1619) prime-minister and adviser of George William, Elector of Brandenburg. He was all-powerful during the Thirty Years' War, and brought down terrible calamities on Brandenburg by his obstinate refusal to join the Protestant union and his firm adherence to a policy of neutrality. He died 14th March 1641, shortly after the death of his master.—KARL PHILIPP, Prince of Schwarzenberg, won distinction as an Austrian field-marshal during the Napoleonic wars. He was born at Vienna, 15th April 1771, and first served against the Turks. In the war against the French republic he fought with especial honour at the battles of Cateau-Cambrésis (1794), Würzburg (1796), and Hohenlinden (1800), and reached the grade of lieutenant field-marshal. He was under the orders of Mack in the campaign of 1805; and, when he saw that Ulm was lost, he cut his way through the French army and retired to Eger. He was ambassador at the Russian court in 1808 by the express wish of the Emperor Alexander, fought at Wagram in 1809, and conducted the negotiations for the marriage between Napoleon and Maria Louisa. In this capacity and as ambassador at Paris he so far gained the esteem of Napoleon that the latter expressly demanded him as general-in-chief of the Austrian contingent which was sent to aid France in the invasion of Russia in 1812. Schwarzenberg passed the Bug and achieved some slight successes, but was driven into the 'duchy of Warsaw,' where, acting on secret instructions from Napoleon, he took up a position at Pultusk and remained inactive. In the following year he was appointed to the command of the Austrian army of observation in Bohemia; and, when Austria joined the allied powers, he became generalissimo of the united armies, and won the great battles of Dresden and Leipzig. The year after (1814) he marched into France and captured Paris. He died of apoplexy at Leipzig, 15th October 1820. Although a bold and skilful leader of cavalry, he was a pedant. His memoirs were edited by Prokesch-Osten (Vienna, new ed. 1861).—His nephew, FELIX LUDWIG JOHANN FRIEDRICH, born October 2, 1800, was sent on a diplomatic mission to London in 1826, but became involved with Lady Ellenborough in a divorce case, was ambassador at Naples in 1846, distinguished himself in the Italian campaign of 1848, was placed at the head of affairs at Vienna, called in the aid of the Russians against Hungary, and pursued a bold absolutist policy, his object being to make Austria supreme amongst the German states. He died at Vienna, April 5, 1852. See Life by Berger (Leip. 1853).

Schwarzwald. See BLACK FOREST.

Schwatka, FREDERICK, Arctic explorer, was born at Galena, Illinois, 29th September 1849, graduated at West Point in 1871, and served as a lieutenant of cavalry on the frontier till 1877, meanwhile being also admitted to the Nebraska bar and taking a medical degree in New York. In 1878–80 he commanded an expedition to King William's Land which discovered and buried the skeletons of several of Sir John Franklin's party, and gathered information which filled up all gaps in the narratives of Rae and M'Clintock, besides performing a notable sledge-journey of 3251 miles. After exploring the course of the Yukon in Alaska, in 1884 he resigned his commission. In 1886 he commanded the *New York Times* Alaskan expedition, and ascended Mount St Elias to a height of 7200 feet; and in 1891 he led another party to Alaska which opened up some 700 miles of new country in the same quarter. In 1889 he had led an expedition, for the journal *America*, into Chihuahua, in Northern Mexico. He has published *Along Alaska's Great River* (1885), *Nimrod in the North* (1885), *The Children of the Cold* (1886). See also *Schwatka's Search*, by W. H. Gilder (1881).

Schwedt, a town of Prussia, in the province of Brandenburg, on the Oder, 28 miles SSW. of Stettin, with wood-sawing, lime-burning, and tobacco industries. It was the residence of the margraves of Brandenburg from 1689 to 1788, and was entirely rebuilt after a fire in 1684. Pop. 9756.

Schwegler, ALBERT, theologian and philosopher, born at Michelbach in Würtemberg, 10th February 1819. He studied theology at Tübingen, and was profoundly influenced by the writings of Hegel, Strauss, and especially Baur. His striking treatise on Montanism (1841) and many contributions to Zeller's *Theologische Jahrbücher* brought him into collision with the church authorities in Würtemberg, and caused him to abandon the clerical calling. In 1843 he started the *Jahrbucher der Gegenwart*, and habilitated as *privat-docent* in philosophy and classical philology at Tübingen, where in 1848 he became extra-ordinary professor of Classical Philology, later ordinary professor of History, and died 5th January 1857.

His other theological works were *Das Nachapostolische Zeitalter* (2 vols. 1846)—a hastily written and uncritical exaggeration of the Baur hypothesis, Christianity being represented as a mere outgrowth of Ebionitism—and editions of the Clementine homilies (1847) and the Church History of Eusebius (2 vols. 1852). More valuable was his contribution to the history of philosophy: a translation with commentary of Aristotle's *Metaphysics* (4 vols. 1847-48); the *Geschichte der Philosophie* (1848; Eng. trans. by Dr Hutchison Stirling, 1872), a masterly sketch; and the posthumous *Geschichte der Griech. Philosophie* (ed. by Kostlin, 1859), in which he broke away from his earlier Hegelianism. He left unfinished a *Rom. Geschichte* (3 vols. 1853-58; 2d ed. 1867-72; continued by Clason, vols. iv. and v. 1873-76).

Schweidnitz, a town of Prussian Silesia, 36 miles by rail SW. of Breslau. Woollen and linen goods, agricultural implements, gloves, needles, pottery, and numerous other articles are manufactured. The beer has been celebrated since the 16th century. Considerable quantities of flax and beetroot are grown in the neighbourhood. Between 1641 and 1807 Schweidnitz was besieged and taken six times, the last time by the French, after which the defences were in great part destroyed. Pop. (1890) 24,780.

Schweinfurt, an ancient and long an imperial free city in the north-west of Bavaria, on the Main, 28 miles NE. of Wurzburg by rail. It contains a beautiful market-place, in which important cattle and wool markets are held. Wine-growing, sugar-refining, and manufactures of chemicals, paper, bells, dyeing materials, as white-lead, ultramarine, Schweinfurt green, &c., and numerous other articles are carried on. Pop. 12,502. Ruckert, the poet, was born here; and a monument was erected in 1890.

Schweinfurth, Georg August, a German traveller in Africa, was born in Riga, 29th December 1836. He studied at Heidelberg, Munich, and Berlin, making botany his specialty. In 1864 he made a journey through the valley of the Nile, and along the coasts of the Red Sea as far as Abyssinia. In 1869, by the aid of a grant from the Humboldt Society of Berlin, he again started for Khartoum, whence he made his way into the interior in the company of ivory-traders, passed through the regions inhabited by the Bongo, Dinka, Niam-Niam, Madi, and Monbuttu peoples, and discovered the Welle. He returned in 1871, and in 1874 published his travels, an English translation, *The Heart of Africa*, appearing the same year. At the request of the Khedive he founded in 1872 the Egyptian Geographical Society, and was nominated president of the same. Between 1874 and 1883 he explored various districts of Egypt, especially their botany. In 1880 he was appointed director of all the Egyptian museums, collections, &c. in Cairo; but returned to Europe for good in 1888. He has published *Artes Africanæ* (Leip. and Lond. 1875) and numerous papers in the journals, *Petermann's Mitteilungen*, *Zeitschrift fur Erdkunde*, *Globus*, &c.

Schwenkfeld, Caspar von, founder of a Protestant sect, was born of noble family in 1490 at Ossig near Liegnitz in Lower Silesia, studied two years at Cologne and elsewhere, and, before retiring into private life in 1521 to a constant study of the Scriptures, served at various courts with Duke Charles of Münsterberg, and as aulic counsellor with Duke Frederick II. of Liegnitz. He became acquainted with the views of John Huss, from his youth up had been a student of Tauler, and was permanently won over to the Reformation by the noble courage of Luther at Worms. About 1525 he openly declared for Luther, and went to Wittenberg to converse with him, but found his views widely divergent on baptism and the eucharist. Still further, he found himself unable to accept any confessions of faith except such as followed closely the letter of Scripture, and in his profound conviction that the new movement should proceed *from within* outwardly, and not *from without* inwardly, he disagreed with the Lutherans in their policy of linking the Reformed Church with the state, instead of waiting passively for the direct guidance of the Holy Spirit, the sole fountain of sanctification. Schwenkfeld did not himself partake of the Lord's Supper, although he did not forbid it to others, for he held that there could be no right participation without the exclusion of unbelievers, and that the true Lord's Supper is kept through faith inwardly in the soul as often as a man receives *divine sweetness in Christ*. He did not approve of infant baptism, yet without admitting the Baptist view of the importance of the baptism of adults. His views coincide with those of George Fox in the doctrine of the Inward Light, the Immediate Revelation, and the inability of mere outward bodily acts, such as partaking of the Lord's Supper or baptism, to give the inward and spiritual reality and power of the Lord's 'body' and 'blood,' or that of the spiritual 'washing of regeneration.' Schwenkfeld's views in that intolerant time brought him the hatred of Lutherans and Catholics alike. The influence of the Emperor Ferdinand forced the Duke of Liegnitz to banish him in 1529, and he thereafter travelled to Ulm, Augsburg, Nuremberg, and Strasburg, everywhere gaining disciples. Luther fiercely denounced him, and many untrue charges were brought against him by others, but all the violence of his antagonists the much-enduring man received with saintly patience. He died at Ulm, 10th December 1561. Schwenkfeld wrote ninety distinct works, most of which were burned, if not answered, by both Protestants and Catholics. One of the most important was his *Bekandtniss und Rechenschaft von den Hauptpunkten des Christlichen Glaubens* (1547). By means of personal teaching and his books a group of earnest disciples more than 4000 strong was formed all over Germany, but mostly in Swabia and Silesia, who separated themselves under the name of Confessors, or Followers of the Glory of Christ. They were persecuted in Silesia in his lifetime, and many emigrated to Holland, some to England. The Jesuit mission established in Silesia in 1719 persecuted the remnant still further, and some joined the Protestant churches, some fled to Saxony, where they were protected by Count Zinzendorf. In 1734 forty families emigrated to England, and finally thence to Pennsylvania, where, as Schwenkfeldians, they have maintained a distinct existence to this day, and in 1890 numbered 306 members, with six churches.

See H. W. Erdkam, *Geschichte der Protestantischen Sekten im Zeitalter der Reformation* (Hamburg, 1848); Kadelbach, *Geschichte Schwenkfelds und der Schwenkfeldianer* (Lauban, 1861); and Robert Barclay, *The Inner Life of the Religious Societies of the Commonwealth* (Lond. 1876).

Schwerin, capital of the grand-duchy of Mecklenburg-Schwerin, is agreeably situated on the west shore of the Lake of Schwerin (14 miles in length and 3 broad), with smaller lakes behind it. It is surrounded with suburbs and contains the grand-duke's castle (1845-58), a Renaissance structure; the cathedral (1365-1430), with interesting monuments and stained glass; an arsenal; a museum and picture-gallery; and manufactures of lacquered wares, machinery, cloth, &c. Pop. (1890) 33,730.

Schwyz, a canton of Switzerland, touches in the north the Lake of Zurich, and in the west the Lakes of Zug and Lucerne. Area, 350 sq. m.; pop. (1888) 50,396, nearly all Roman Catholics. The surface is mountainous, rising to 7494 feet, and in Kinzigkulm on the border to 9052 feet. Cattle-breeding and the keeping of swine, goats, and sheep are the principal occupations, though cotton and silk are both spun and woven, and much fruit is grown, Schwyz *kirschenwasser* being in great demand. The celebrated monastery of Einsiedeln (q.v.) attracts large numbers of pilgrims, and the Rigi (q.v.) vast numbers of tourists in the summer. Schwyz, one of the three original cantons of the Swiss Confederation, and also one of the Four Forest Cantons, has supplied the name to the whole country of which it forms a part. The people govern themselves through a grand council, consisting of one representative for every 600 citizens, and an executive of seven members chosen by the council from its own body; all these rulers are elected for four years. Schwyz, the capital, is picturesquely situated 26 miles by rail east of Lucerne. Here on 1st August 1891 was held the sixth centenary of the League of Brunnen and the seventh of the founding of Bern. Pop. 6624.

Sciacca (anc. *Thermæ Selinuntinæ*), a seaport on the south coast of Sicily, stands on a bold cliff 30 miles NW. of Girgenti, has a fine 11th-century cathedral, the ruined castles of the Lunas and the Perollos (between whom there existed a terrible feud), hot sulphurous and saline springs, and half-way up the adjacent mountain San Calogero caves that have been used as steam baths since Phœnician times. Off the coast very productive coral banks were discovered in 1875–80. Agathocles, tyrant of Syracuse, was a native. Pop. 20,709.

Sciatica is the term given to neuralgia of the great sciatic nerve, the largest in the body, which passes down the back of the thigh. It is characterised by irregular pains about the hip, especially between the great trochanter of the thigh-bone and the bony process on which the body rests when sitting, spreading into neighbouring parts, and running down the back of the thigh to the leg and foot; or the pains may occupy only isolated parts, as the knee-joint, the calf of the leg, or the sole of the foot. It generally differs from the most typical forms of Neuralgia (q.v.) in that the pain, though subject to severe exacerbations, is constantly present. The nerve usually becomes very tender to touch, either at isolated points or throughout; and, in severe and prolonged cases, diminution of sensation in the area of distribution of the nerve, and wasting of the muscles of the limb, are apt to occur. It is sometimes dependent on a gouty condition of the system; but more frequently than other forms of neuralgia can be traced to some definite exposure to cold or wet. It is often a very obstinate disease: the treatment must be conducted on the same lines as that of other forms of neuralgia. Here Acupuncture (q.v.) is specially valuable. In intractable cases *nerve-stretching*—i.e. cutting down upon the trunk of the nerve, and forcibly pulling upon it—has often been successful where all other measures have failed to cure. The same result may sometimes be obtained by forcibly bending the thigh up towards the abdomen.

Scicli, a town in the south-east corner of Sicily, 36 miles SW. of Syracuse, with some cloth-weaving and cheese-making. Near by are the remains of the ancient *Casmenæ*. Pop. 11,842.

Science, in its widest significance, is the correlation of all knowledge. To know a truth in its relation to other truths is to know it scientifically. For example, the recognition that the alternation of day and night depends upon the apparent daily motion of the sun is a distinct scientific achievement, being one of those elementary scientific truths which have been the possession of thinking minds from time immemorial. By generalisation from everyday experiences like that just mentioned, and from the historic or traditional experiences of the race, man has been led to the belief that natural events follow each other in an orderly and connected way. To investigate this orderly connection is the aim of all science; and in pursuing this aim the human mind consciously or unconsciously takes for granted the Law of Continuity, which postulates that in their development and interactions the phenomena of nature follow an intelligible plan which never has failed and which never can fail. In assuming intelligibility in nature science rests of necessity upon the fundamental laws of thought. To express it otherwise, the end of science is the rational interpretation of the facts of existence as disclosed to us by our faculties and senses.

In all scientific inquiry the first step is to scrutinise the evidence of the senses, whose indications are always imperfect and often misleading. History shows again and again that the supposed scientific beliefs of one age are at variance with the scientific facts of a later age. In every such case it will be found that the earlier and false science has laid too great stress on the apparent, and has from insufficient knowledge failed in apprehending the real. In the history of Astronomy, the most self-contained and in itself the most developed of the physical sciences, we find many familiar illustrations of this. None is more striking perhaps than the recognition of the earth's diurnal rotation as the reality which produces the appearance of the daily motion of sun, moon, and stars. At first a heresy, then a rational hypothesis commanding assent from all thinking minds, the earth's axial rotation is now a demonstrable fact.

Experiment is the great method of scientific inquiry. In it we arbitrarily interfere with the circumstances of a phenomenon, or produce an entirely new phenomenon by an appropriate combination of causes. Contrasted with Experiment is Observation, in which we simply watch and record the events as they occur in nature. But even in Astronomy, emphatically an observational science, experiment plays an important part. The dynamical knowledge which Newton developed into the cosmic law of gravitation was founded on experiment; and every time the astronomer points his telescope to a celestial object he experiments by arbitrarily interfering with the course of the rays of light. Meteorology again, which twenty years ago could hardly be called a science, has made great strides in these days by appealing to laboratory experiments for the elucidation of its phenomena. Likewise in Biology very little true scientific progress was made until experiment was appealed to. Till then Botany and Zoology were simply lists of plants and animals, classified according to characteristics or according to distribution on the earth's surface. The gardener and breeder led the way in a form of experimenting which Darwin made scientific; while such branches of the subject as Embryology and Bacteriology are as truly experimental as Chemistry itself. In studying the laws alike of inorganic and of organic nature the experimenter must be careful not to destroy the phenomenon that is to be studied. This consideration makes the biological problem particularly difficult of attack.

In the psychical group of sciences the method of experimenting still awaits development. The complexity of the problems presented, and the manner in which they affect the welfare and happiness of humanity, render social and political experimenting excessively hazardous and of doubtful morality. History, however, affords many instructive examples of attempted reforms which were largely tentative. From these and from the general study of customs and rites as they have been in the past and are now, the economist, the ethnologist, the moralist, or the theologian can accumulate his own materials for the upbuilding of his appropriate science. Such sciences are of necessity essentially observational.

It is obvious from what has gone before that sciences may be grouped, or science partitioned, on a broad and intelligible principle. There are the Physical Sciences, which have to do with inorganic nature—that is, with the laws and properties of Matter, Energy, and Ether. Then there are the Biological Sciences, which consider the laws of Life. And finally, there are the Psychical Sciences, which deal with the phenomena of Mind. The influence of Life upon the Matter and Energy of the Universe, profound though it is, in no way renders nugatory the great principles that hold in inorganic nature. These principles are the Conservation of Matter and the Conservation of Energy, Ether being the medium through which and by which Energy is transmitted and transformed. The great principle of biology, which enters along with these physical principles as a factor in organic nature, is the law of Biogenesis, or Life from Life. In the higher mental sphere of activities these three great principles still hold, however much mind may interfere in what would otherwise have been the natural progress of events in the lower spheres of activity. So far no broad psychic principle comparable to the physical and biological principles has been discovered, or even imagined to be discoverable. It must ever be remembered, however, that this broad gradation in the sciences is itself a psychic phenomenon.

Numerous attempts have been made to give a detailed classification of the sciences, so as to bring out the natural relation of the one to the other. Such classifications may have a historic interest, inasmuch as they must have been largely conditioned by the extent of knowledge or degree of ignorance of the classifier. They may also have a philosophic value as affording a glimpse into the nature of the human mind. But it is extremely doubtful if they have in any appreciable way assisted in the progress of science itself. One of the most celebrated is the classification due to Comte, who first explicitly drew the distinction between Abstract and Concrete sciences, or what might better be termed Fundamental and Derivative sciences (see POSITIVISM). The distinction is most simply expressed by saying that a derivative science requires for its elucidation no peculiar principle or law of nature, but involves only those principles which are already discussed under the fundamental sciences. The truth is that a derivative science is a special or limited branch of science in general, separated out for purposes more or less concrete or practical; and it is impossible logically to mark off such special sciences as a group from other branches of science, which, though no more abstract and no less special, are still treated as included in the fundamental sciences. The mistake which Comte himself made in classifying Astronomy in his group of abstract sciences along with Mathematics, Physics, Chemistry, Biology, and Sociology is an illustration in point. Comte's scheme has been severely criticised by Herbert Spencer, who suggests a threefold grouping into Abstract, Abstract-Concrete, and Concrete Sciences. The second group is essentially what we have called above Physical Science, including Physics and Chemistry as ordinarily understood. Mr Spencer considers it as dealing with the laws of 'Force' in the abstract, or as exhibited by matter. Biology appears for the first time in the third or Concrete group as exhibiting certain 'laws of redistribution of matter and motion actually going on.' But surely there is a fundamental science of Biology dealing with the laws of vital 'Force,' and having to Botany and Zoology the same kind of relation which Physics and Chemistry have to Astronomy and Geology. The whole fallacy of the position lies in making 'Force,' even with its vague Spencerian sense, one of the central props of the argument. Force is apparent, not real, unless we take it in the sense of Energy; but this will not apply to Mr Spencer's classification. From the present outlook of science the existences of the universe are five—namely, Ether, Matter, Energy, Life, and Mind. The first three are inseparable agents in the simplest phenomenon that occurs in nature. They may ultimately be reduced to two or conceivably to one.

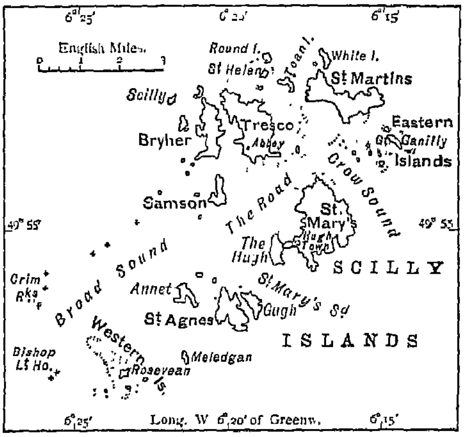
Science and Art. See KENSINGTON.

Scientific Frontier, a term used by Lord Beaconsfield at the Guildhall banquet of 9th November 1878, when speaking of the boundaries between India and Afghanistan. He stated that at that time the frontier in question was 'a haphazard frontier,' but that steps were being taken to make it 'a scientific frontier,' by which he meant a frontier that would admit of being occupied and defended according to the requirements of the science of strategy.

Scilla. See SQUILL.

Scilly Islands, a Cornish group, lie about 27 miles WSW. of Land's End. They occupy, as a group, about 30 sq. m. of sea-room, and consist of six large islands—St Mary's (1528 acres; pop. 1290), Tresco (697 acres; pop. 328), St Martin's (515 acres; pop. 175), St Agnes (313 acres; pop. 148), Bryher (269 acres; pop. 103), and Samson (78 acres, uninhabited)—and some thirty



small ones, besides innumerable rocks and ledges, of which about a hundred are named. They are composed entirely of a coarse type of granite, a continuation of that running through Devon and Cornwall. Tin is found, but in such minute quantities that to justify the identification of these islands with the *Cassiterides* (q.v.) or 'Tin Islands' of the ancients the west end of Cornwall would almost require to be included as the all-important member of the group. The idea of a land of Lyonesse between the islands and the mainland submerged within historic times is now abandoned. The present name 'Scilly' belongs strictly to a small, very inaccessible, double, rocky island in the north-west of the group, and is most probably derived from Cornish *Silya*, or *Sillis*, 'a conger eel.'

Athelstan conquered the islands in 938, and established monks upon Tresco, the ruins of whose abbey still remain. Olaf Trygvason (995–1000), who forced Christianity upon Norway and introduced it into Iceland, is said to have been converted by a hermit upon one of the islands. They were handed over to the wealthy abbey of Tavistock by Henry I., but reverted to the crown upon the dissolution of the monasteries in 1539. In 1568 Queen Elizabeth leased them to Sir Francis Godolphin, who built the Star Castle on St Mary's—over the doorway stands 'E. R. 1593.' They remained in his family for more than 250 years—hence the hamlet of 'Dolphin' town upon Tresco. They sheltered Prince Charles in 1645 before he fled to Jersey (Clarendon here began his History), and Cromwell's Tower on Tresco was set up by the parliamentary forces. In 1834 they were leased to Mr Augustus John Smith, a radical reformer although somewhat of an autocrat, and the best friend the islanders have ever had. He made Tresco his home for thirty-eight years, and his tropical gardens there are unique in northern Europe. He built churches and schools, suppressed smuggling, encouraged agriculture, and forbade overcrowded holdings. He was succeeded as 'lord proprietor' in 1872 by his nephew, T. A. Dorrien Smith.

The climate is mild, but necessarily damp, and the weather is changeable and frequently stormy; but the temperature is extremely equable, averaging 58° F. in summer and 45° F. in winter. The leading natural features of the scenery are the fantastically weathered rocks and rock-basins and the bold coast-lines. There are remains of cromlechs and stone circles; and a perfect kistvaen (containing human bones showing traces of fire action) was opened upon Samson in 1862. Tresco Abbey and its gardens are considered the leading objects of interest for the tourist. No part of the islands is more than 160 feet above sea-level. The highest points are the 'Telegraph' on St Mary's, and St Martin's Head, which has had a daymark since 1683. There has been a lighthouse on St Agnes since 1680, on Bishop Rock since 1858, and on Round Island since 1887; there are also lights on the Wolf, the Seven Stones (floating), and the Longships off Land's End. Hugh Town on St Mary's, the only town on the islands, with plain, substantial and uninteresting houses (mostly two-storied), has a church (resident chaplain, with curates on Tresco, St Martin's, and St Agnes), two chapels, two comfortable hotels, banks, shops, schools, telegraph (since 1870), and Jubilee Hall. It has also a pier (erected by Mr A. J. Smith), a coastguard station, and a lifeboat. There is good anchorage in the roadstead. Many of the islands, especially Annet, abound with sea-fowl.

Wrecks used to be very numerous and were a fruitful source of wealth. One of the most famous was that of three ships of Sir Cloudesley Shovel's fleet in 1707, when 2000 men, including the admiral, were drowned. The Scillonians also lived by pilotage, but steam and more lighthouses now help vessels to avoid the islands. Smuggling was formerly largely indulged in. In the early years of the 19th century, before the days of iron ships, there were three shipbuilding-yards on St Mary's. Kelp-making, introduced in 1684, has been given up. Nowadays most of the young men emigrate and are found doing well in all parts of the world. Farming is practised, and early potatoes and broccoli are exported; but the principal industry now is the cultivation of narcissus and other lilies—100 tons of flowers being shipped in a single spring. There is a steamer to Penzance three times a week all the year round. In May and June, during the mackerel-fishing, there is one steamer (often two) daily with cargoes of sometimes over 100,000 fish. The fishing-boats, however, belong to Penzance and the east coast. Politically the islands belong to the St Ives division of Cornwall.

See Borlase's *Observations* (1756), White's *A Week in the Isles of Scilly* (1850), Tonkin's *Guide* (Penzance, 1887), and Besant's *Armorel of Lyonesse* (1890).

Scimitar, an oriental sabre. See SWORD.

Scinde. See SIND, SINDHIA.

Scink. See SKINK.

Scintillation, or twinkling of the stars, is a familiar phenomenon to all who have directed their attention to the firmament above us. Under ordinary atmospheric conditions this flickering is possessed only by the so-called fixed stars (see STARS). A planet shines steadily and by this mark can readily be picked out. When near the horizon, however, planets have been observed to scintillate slightly; while stars at low altitudes invariably twinkle more vigorously than stars overhead. This at once points to the atmosphere as an important factor, since the phenomenon is more pronounced when the light has to traverse a greater depth of air. Again, when viewed through sufficiently large telescopes stars cease twinkling altogether. The action of the telescope is to concentrate upon the eye a much larger pencil of rays than could naturally enter it. Instead of one slender ray the eye receives the integral effect of a great number of rays, whose individual features are lost in the general average. In the case of a planet, again, the rays which fall upon the retina converge from all parts of a disc of sensible size; and in the integral effect of this pencil the individual features of the component rays are lost. But a star is so far distant as to be virtually a point of light. In this case we have an excessively slender ray infinitely narrow compared even to the small pencil of light that comes to us from a planet. The vicissitudes of refraction which a star-ray experiences in passing through the infinitely irregular variations of density, temperature, and humidity in our atmosphere characterise its integral effect on our retina, and the result is twinkling. The exquisite chromatic effects that accompany the twinkling of a bright star like Sirius are fully accounted for in terms of this general explanation. It is possible indeed by separating the images of a star produced in the two eyes to observe two different scintillations at one and the same time. Scintillation may thus be said to depend on three factors: (1) The vast distance even of the nearest stars reducing the largest of them to mere points of light; (2) the ever-changing variableness in condition of the atmosphere through which the light must come to us; (3) the smallness of aperture of our eye, which receives an almost ideal single ray of light.

Scio. See CHIOS.

Scioppius (Latinised form of *Schoppe*), KASPAR, a classical scholar and controversialist, was born at Neumark in the Palatinate, 27th May 1576, and studied at Heidelberg, Altdorf, and Ingolstadt. Whilst on a visit to Rome in 1598 he abjured Protestantism and became a Roman Catholic. Henceforth his career is a series of fierce onslaughts on his former co-religionists, on the old Latin writers, and on all who enjoyed a reputation in the world. He was honoured with the title of a count of Spain, and was made a pensioner of the Vatican. Amongst the first to feel his venom was Scaliger (q.v.), against whom in 1606 he launched *Scaliger Hypobolimæus*. Sent in 1608 by the court of Rome to the diet of Ratisbon for the purpose of observing the religious condition of Germany, he published numerous pamphlets against the Protestants, recommending the Catholic powers to use every means for their extermination. Shortly afterwards he fired off several venomous libels against James I. of England. For this the servants of Lord Digby, ambassador in Madrid, gave him a sound cudgelling in that city in 1614. Scioppius fled from Spain to Ingolstadt, where he issued his *Legatus Latro* (1615) against the ambassador. In 1618 he went to Milan, where he resided for the next twelve years, devoting himself partly to philological studies and partly to theological warfare. He died at Padua, 19th November 1649, the reviler of all respectable parties, loved by none, but also feared by none. Scioppius was a prodigious scholar, and might have rivalled Scaliger himself in reputation, as he did in learning, had it not been for the infirmities of his temper and judgment. His most important work is *Grammatica Philosophica* (1628); next in value come *Verisimilium Libri Quatuor* (1596), *Suspectæ Lectiones* (1597), *De Arte Critica* (1597), *Observationes Linguæ Latinæ* (1609), *Paradoxa Literaria* (1628), and *De Scholarum et Studiorum Ratione* (1636).

Scioto, a beautiful river of Ohio, rises in the north-west portion of the state, and flows east and then south, past Columbus and Chillicothe, to its junction at Portsmouth with the river Ohio. It is nearly 300 miles long, and from its mouth to Columbus feeds the Ohio and Erie Canal.

Scipio, PUBLIUS CORNELIUS, surnamed AFRICANUS MAJOR, one of the most famous soldiers of ancient Rome, was born in 237 B.C. He took part in the disastrous battle of the Ticinus (218), where he saved his father's life, and later at the Trebia and the fatal field of Cannæ. In 212 he was elected ædile, though not yet of legal age, and in 210 was specially selected by acclamation of the people as a general extraordinary for Spain. His noble beauty and personal charm proved irresistible, but in this gracious and self-reliant youth of twenty-seven the people had found a hero and the state a saviour. His arrival gave a new turn to the war. By a bold and sudden march he captured *Nova Carthago*, the stronghold of the Carthaginians, and his courtesy soon won over many of the native chiefs. He checked Hasdrubal, but failed to prevent him from crossing the Pyrenees to the assistance of Hannibal. In 207 he won a decisive victory over the other Hasdrubal (son of Gisgo) and Mago, which gave him the whole of Spain. Soon after he returned to Rome, where he was elected consul (205) though he had not yet filled the office of prætor. His favourite plan to transfer the war to Africa was opposed by a party in the senate; but the popular enthusiasm for the name of Scipio proved too strong, and in 204 he sailed from Lilybæum, in Sicily, with 30,000 men, and landed on the coast near Utica. His successes against Syphax and their own armies compelled the Carthaginians to recall Hannibal from Italy—the very object Scipio had laboured to achieve. After some abortive efforts at reconciliation the great struggle between Rome and Carthage, between Scipio and Hannibal, was terminated by the battle fought near Zama, 19th October 202, in which the Carthaginian troops were routed with immense slaughter. Hannibal advised his countrymen to abandon what had now become a hopeless and ruinous contest, and his advice was taken. The noble magnanimity of Scipio's character made submission the more easy; and peace was concluded in the following year, when the conqueror returned to Rome to enjoy a triumph. The surname of Africanus was conferred on him, and so extravagant was the popular gratitude that it was proposed to make him consul and dictator for life, honours which would have been the destruction of the constitution, but which Scipio was either wise enough or magnanimous enough to refuse. In 190, in order to give him his aid, he served as legate under his brother Lucius in the war with Antiochus, and crushed his power in the great victory of Magnesia. But after their triumphant return a prosecution was raised against Lucius for allowing himself to be bribed by Antiochus, the colour being the too lenient terms he had been granted. Lucius was declared guilty by the senate; his property was confiscated, and he himself would have been thrown into prison had not Africanus forcibly rescued him from the hands of the officers of justice. In 185 Scipio was himself accused by the tribune M. Nævius; but, instead of refuting the charges brought against him, he delivered, on the first day of his trial, a eulogy on his own achievements, and opened the second day by reminding the citizens that it was the anniversary of the battle of Zama, and therefore a time to return thanks to the immortal gods, and to pray for other citizens like himself. The people followed him to the Capitol in a fever of excitement, and the prosecution was at an end. But Scipio felt that popular enthusiasm was uncertain, that the power of the oligarchy was irresistible, that its hatred of him was unappeasable, and that his day was over. He retired to his country-seat at Liternum, in Campania, where he spent the remainder of his life, and where he died about 183. His wife was daughter to the Æmilius Paulus who fell at Cannæ; his daughter was Cornelia, mother of the Gracchi. Scipio Africanus is commonly regarded as the greatest Roman general before Julius Cæsar; and certainly in the brilliancy of his gifts and accomplishments he was unsurpassed; but if his career be strictly examined it will be found that he owed as much to fortune as to genius. No doubt he won splendid successes, and made the most of his great advantages. Yet his fondness for sounding titles and lavish display, his nepotism, his corruption of the public spirit by largesses, and his assumption of personal superiority to the common law were influences distinctly harmful to the state. His beauty, bravery, and courtesy, his proud yet pious belief that the gods favoured him with their inspiration, won him the love and reverence of soldiers and of women; and his magnanimity towards his fallen foe, who flitted about the eastern courts in dreary exile, is a bright feature in his character, and nobly distinguishes him from the cruel-hearted oligarchs of the senate.

Scipio Æmilianus, PUBLIUS CORNELIUS, surnamed AFRICANUS MINOR, born 185 B.C., was a younger son of that Lucius Æmilius Paulus who conquered Macedon, but was adopted by his kinsman, Publius Scipio, son of the great Scipio Africanus. He accompanied his father on his expedition against Macedon, and fought by his side at Pydna (168). In Greece he made the acquaintance of Polybius the historian, who afterwards became one of his most valued friends. In 151 he went to Spain as military tribune under the consul Lucius Lucullus, and two years later began the third and last Punic war, which mainly consisted in the siege of Carthage. Scipio still held the subordinate position of military tribune; but the incapacity of the consuls, M. Manilius and L. Calpurnius Piso, (149-148), and the brilliant manner in which he rectified their blunders, drew all eyes to him. The favourite both of the Roman army and the Roman people, Scipio was at length in 147, when only a candidate for the ædileship, elected consul by an extraordinary decree of the Comitia, and invested with supreme command. Even the aged Cato, who was not liberal with his praise, marked his opinion of the relative worth of the young Scipio and his comrades by quoting the Homeric line, 'He only is a living man; the rest are gliding shades.' The story of the siege of Carthage, the despairing heroism of its inhabitants, the determined resolution, the sleepless vigilance, the incessant labours of Scipio belong to history. The city was finally taken by storm in the spring of 146; and by the orders of the senate it was levelled to the ground, and the ploughshare driven over its site. Scipio, a man of noble and refined soul, steeped from his youth up in the culture of Greece, obeyed the savage command with sorrow, even with horror. As he gazed on the ruin he had wrought, the thought flashed across his mind that some day Rome too might perish, and the words of the *Iliad* rose to his lips: 'The day shall come when sacred Troy shall perish, and Priam and his people shall be slain.'

Scipio, though probably the most accomplished Roman gentleman of his age, was rigorous in his observance of the antique Roman virtues; and when holding the office of censor in 142 he made fruitless efforts to follow in the footsteps of Cato. In 139 he was accused on the charge of *majestas* by the tribune Tiberius Claudius Asellus, but was acquitted, and soon after was sent to Egypt and Asia on a special embassy. Meanwhile affairs had gone badly in Spain. Viriathus, the Lusitanian patriot, had again and again inflicted the most disgraceful defeats on the Roman armies, and his example had roused the hopes of the Celtiberian tribes, who also rushed to war against the common foe. The contest continued with varying success; but the interest centres in the city of Numantia, whose inhabitants displayed amazing courage in the struggle with Rome. For long it seemed as if the Numantines were invincible—one consul after another finding their subjugation too hard a task; but at length in 134 Scipio, re-elected consul, went to Spain, and after a siege of eight months forced the gaunt and famished citizens to surrender, and utterly destroyed their homes. He then returned to Rome, where he took a prominent part in political affairs as one of the leaders of the aristocratic party, and, though one of the more moderate, his popularity with the populace greatly declined. Although a brother-in-law of Tiberius Gracchus, whose sister Sempronia he had married, he disclaimed any sympathy with his political aims; and when he heard of the murder of his kinsman quoted his favourite Homer: 'So perish all who do the like again.' The Latins, whose lands were being seized by the commissioners in their unwise haste to carry out to the full the Sempronian law, appealed to Scipio for protection, and he succeeded (129) in getting the jurisdiction suspended until the consuls should determine what were domain lands and what private property. But his action caused the most furious indignation among the party of reform, and shortly after Scipio was found dead in his bed, doubtless murdered by some unscrupulous member of the Gracchan party. Scipio was neither a rigid aristocrat nor a flatterer of the people. Inferior in splendour of genius to his adoptive grandfather, he surpassed him in purity of character, in simplicity of patriotism, and in liberality of culture. 'The history of Rome,' says Mommsen, 'presents various men of greater genius than Scipio Æmilianus, but none equalling him in moral purity, in the utter absence of political selfishness, in generous love of his country, and none, perhaps, to whom destiny has assigned a more tragic part. . . . It was his lot to fight for his country on many a battlefield and to return home uninjured, that he might perish there by the hand of an assassin; but in his quiet chamber he no less died for Rome than if he had fallen beneath the walls of Carthage.'

Scire Facias, a writ for enforcing judgments, decisions about patents, &c., or for annulling them: often contracted, like *fi.fa.*, into *sci.fa.* See WRIT.

Scirpus, a genus of plants of the order Cyperaceæ (q.v.). The plants of this genus are called Club-rushes, and the Common Bulrush (*S. lacustris*) of our ponds and sluggish streams is a familiar example. The rhizomes of *S. dubius* are eaten by the natives of the south of India; as are the tubers of *S. tuberosus* by the Chinese, who cultivate the plant in tanks and ponds. The species of this genus, about 300, are universally diffused, although found chiefly in temperate climates. They date from the Lower Miocene period.

Scirrhus (Gr., 'hard'), a term applied to a kind of Cancer (q.v.).

Scissors. See CUTLERY.

Scitamineæ. See ZINGIBERACEÆ.

Sclerostoma, a genus of nematode worms (see THREAD-WORMS), one of which, *S. duodenale*, is a parasite of the human intestine, and another, *S. syngamus* or *Syngamus trachealis*, is the cause of Gapes (q.v.) in fowls.

Sclerotium is a hard, multicellular tuber-like body formed towards the end of the vegetative season by the close union of the ordinary mycelial filaments of Fungi (q.v.). It represents the dormant or resting stage of the fungus, but is not common to all fungi. At the beginning of the period of growth it sends out filaments or groups of filaments which carry on the active life-history of the individual, and soon the store of nourishment is absorbed from the sclerotium by these filaments. The Ergot of Rye (q.v.) is the sclerotium of the fungus *Claviceps purpurea*.

Scolopendrium. See HART'S-TONGUE.

Scomberidæ. See MACKEREL.

Scone (pronounced *Scoon*), in Perthshire, on the Tay's left bank, 2 miles N. of Perth, was the capital of Pictavia as early as 710, and the coronation place of the Scottish kings from 1153 till 1488, as afterwards in 1651 of Charles II. (see SCOTLAND, p. 239). Fordun vividly describes the semi-Celtic coronation of Alexander III. (1249), who was the last to be seated on the 'Stone of Destiny,' carried off in 1296 by Edward I. An Augustinian abbey, founded by Alexander I. in 1115, was totally demolished by a rabble in 1559; and the subsequent Palace of the Viscounts Stormont, in which the Old Pretender lived for three weeks in 1716, and which was also visited by Prince Charles Edward, has given place to a modern castellated mansion, the seat of their descendant, the Earl of Mansfield. Queen Victoria stayed here in 1842. See Urquhart's *History of Scone* (1884).

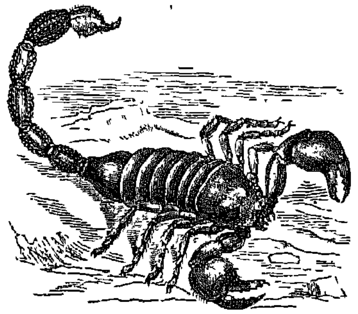
Scopas, an ancient Greek sculptor, founder, along with Praxiteles (q.v.), of the later Attic school, was a native of the island of Paros, and flourished during the first half of the 4th century B.C. One of his earliest works we read about was the temple of Athena Alea at Tegea in Arcadia, on the site of a previous one burned down in 395 B.C.; he superintended both the building of it and the adorning of it with sculpture. Some fifteen years or so later he settled in Athens, where for more than a quarter of a century he laboured at his profession. Towards the end of his life he was associated with Leochares and others in preparing sculpture for the great Mausoleum (q.v.) of Halicarnassus in Asia Minor. A large composition representing Achilles being conveyed to Leuce by Poseidon, Thetis, and the Nereids, preserved for some time in the temple of Neptune at Rome, was accounted one of his greatest masterpieces. Another composite work attributed to him, though doubtfully, was the 'Slaughter of the Children of Niobe.' He excelled also in statues of single gods and goddesses, as the 'Apollo with the Lyre.' See the German monograph by Urlichs (1863).

Score, in Music, compositions for several voices or instruments, or for an orchestra, so written that each part has a separate staff for itself, these staves being placed over each other, bar corresponding to bar. Occasionally, where there is a deficiency of staves for all the parts, or where any of the parts have so little to do that it is not worth while to assign them a separate staff, parts related to or connected with each other, as two flutes, two clarionets, or three trombones, may be written on the same staff together. As a general rule, the highest part should be placed uppermost, then the next lower, and gradually descending. All the parts of a chorus should be placed together.

Scoresby, WILLIAM, an Arctic explorer and savant, was born at Cropton near Whitby, October 5, 1789. He commenced a seafaring life at the age of eleven, by accompanying his father, a whaling captain, to the Greenland seas; and next succeeding his father, he made several voyages to the Spitzbergen and Greenland whaling-grounds. He attended classes at Edinburgh University, carried on investigations in natural history, botany, meteorology, magnetism, &c., and published the results in *An Account of the Arctic Regions* (2 vols. 1820). In 1822 he surveyed 400 miles of the east coast of Greenland. After one more voyage he retired from seafaring life in order to enter the church; and having studied at Cambridge, and been ordained (1825) at Bessingby, laboured faithfully at Liverpool, Exeter, and Bradford. At length failing health compelled him to retire (1849) to Torquay; but he still continued his physical researches. The results of these, as of some earlier inquiries, were published in the transactions of the learned societies, and in *Magnetical Investigations* (2 vols. 1839-52). For the better prosecution of these researches Scoresby made a voyage to the United States in 1847, and to Australia in 1856. He died at Torquay on March 21, 1857. He was elected F.R.S. in 1824, and a corresponding member of the French Institute in 1827. See Life by his nephew (1861).

Scoriæ are the cinders and slags of volcanoes, more or less porous from the expansion of the gases contained in the melted materials. See VOLCANO, IGNEOUS ROCKS.

Scorpion, a name applicable to any member of the family Scorpionidæ, included along with spiders, mites, &c. in the heterogeneous class Arachnida. Among the common genera are Scorpio, Androctonus, and Buthus. Altogether there are about 200 species, natives of warm countries in both hemispheres. About thirteen species live in southern Europe. Shy of the light, they lurk during the day under stones and in crevices, but run about actively in the darkness seeking their prey—usually insects or spiders—which they sting and afterwards suck. The form of the body is distinctive: the head and the thorax are united, covered by a cephalo-thoracic shield, and bear a pair of cheliceræ, a pair of large pedipalps, and four pairs of walking legs. On the anterior part of the shield there are several pairs of simple eyes, a pair centrally and several pairs near the margin. The abdomen consists of twelve segments, of which five form the narrow 'tail,' which is curled over the back when the animal runs. On the under surface of the abdomen we see most anteriorly a small double plate covering the genital aperture, then a pair of remarkable comb-like appendages or 'pectines,' probably with tactile functions, and behind these on four successive segments the slit-like apertures of four pairs of respiratory lung-books (so called as the lamellæ are superimposed like the leaves of a book). The tail ends in a sting, containing a paired gland from which poison flows through the perforated sharp point. When the scorpion strikes it suddenly straightens the tail, bringing the point (which is usually upturned) rapidly downwards. It does not seem possible for the scorpion to sting itself, as is often alleged; there has been much controversy on the subject, the old allegation being that a scorpion surrounded by a ring of fire would, recognising its fate, deliberately commit suicide by stinging itself on the head. Of late years many experiments have been made: scorpions evidently suffer much from great heat, and their excited movements may readily have given rise to apparently suicidal designs such as the creature is of course utterly incapable of forming. As poisonous snakes cannot kill themselves or others of their own species by their venom, so scorpions cannot injure by their poison either themselves or other scorpions. See Fayrer, *Thanatophidia of India* (1873); Bourne, in *Proc. Roy. Soc.* (1887).



Common Scorpion (*Scorpio europeus*).

In seizing the prey the scorpion's large pedipalps are of use, and the small cheliceræ may serve to hold the dead body close to the mouth; the pharynx is suctorial, and the food-canal is very narrow, the food being for the most part merely the juices of the victim. The brain is well developed, and there is a ventral nerve-cord with seven ganglia. The lung-books are like those of spiders. In regard to their reproduction the most interesting fact is the parental care of the mother scorpion, who brings forth her young alive, shelters them under her body, or carries them about with her. When alarmed or irritated scorpions show some fierceness, moving their tail threateningly; they are highly sensitive to sound, musical or other. They are universally disliked, and not a little dreaded, being apt to get into houses, and into beds, hiding themselves under pillows, in shoes, boots, &c., so that accidents are very frequent in countries where they abound. The wound which they give is seldom fatal, but even that of the common European scorpions is very painful, and that of some of the largest species—which are six inches long—is much more severe, attended with nausea and constitutional derangement, nor do the effects soon cease. It is of use to press a large key or other tube on the wound, so as to force out part of the poison. The best remedy is ammonia, internally administered, and also applied externally; see Venomous Bites.

Scorpion-grass, an old name for Forget-me-not (q.v.), supposed on the Doctrine of Signatures (q.v.) to be good for scorpion bites.

Scory, John, Bishop of Hereford, was born at Acle in Norfolk, and about 1530 was a friar in a Dominican house at Cambridge. After its dissolution in 1538 he got preferment from his patron, Archbishop Cranmer, to whom he was chaplain until in 1551 he became Bishop of Rochester. He was translated next year to Chichester as successor to the deprived Dr Day, but on Mary's accession he was himself deprived, and, appearing before Bonner, renounced his wife, did penance, and had formal absolution (1554). Still he cannot have felt safe, for he fled abroad, first to Emden, and then to Geneva; and from the Continent addressed an 'Epistle to the faythfull in pryson in England,' exhorting them to continue in patience and hope. Mary dead, he came back to England (1559), and the same year was made Bishop of Hereford, and helped to consecrate Archbishop Parker. We find him in 1579 petitioning Burghley for removal from Hereford ('my present purgatorie') to Norwich, but death only removed him, on 26th June 1585, at his palace of Whitbourne. See vol. i. of Cooper's *Athenæ Cantabrigienses* (1858).

Scorzone'ra (Ital. *scorza*, 'bark;' *nera*, 'black'), a genus of plants of the natural order Compositæ, sub-order Cichoraceæ, having yellow or rarely rose-coloured flowers. The species are numerous, mostly natives of the south of Europe and the East. No species is found in Britain. The Common Scorzonera of kitchen-gardens, *S. hispanica*, a native of the south of Europe, has long been cultivated for its esculent roots. The root is black externally, white within, about the thickness of a man's finger, long, and tapering very gradually, whence the name *Viper's Grass*, sometimes given to the plant, the root being supposed to resemble a viper. It contains a white milky juice, and has a mild, sweetish mucilaginous taste; it is very pleasant when boiled, the outer rind being first scraped off, and the root steeped in water, to abstract part of its bitterness. The leaves are an inferior substitute for mulberry-leaves in feeding silkworms.—Other species of Scorzonera are used in the same way. The roots of *S. deliciosa*, a native of Parma, are preserved with sugar; those of *S. tuberosa* are a favourite food of the Kalmucks.

Scot, Michael. See Scott.

Scot, Reginald, a writer ever to be held in honour as an early disbeliever in the reality of witchcraft, was a younger son of Sir John Scot of Scotshall near Smeeth in Kent, and was born about 1538. He studied at Hart Hall, Oxford, married in 1568, a second time after 1584, gave himself up to study and to gardening, and perhaps acted as steward to his cousin, Sir Thomas. But little more is known of his life save that he was collector of subsidies for the *lathe* of Shepway in 1586-87, that he himself had property and bore arms, and that he died 9th October 1599. Dr Nicholson finds traces of legal education in his writing. He published *The Hoppe-Garden* in 1574 (3d ed. 1578), and is credited with the introduction of hop-growing into England. His famous work, *The Discoverie of Witchcraft*, appeared in 1584, its deliberate aim to check the persecution of witches. The work is marked by humanity and strong sense, great boldness and power of logic, and is an admirable exposure of the childish absurdities which formed the basis of the witchcraft cases, and of the absurd manner in which the evidence was collected by the inquisitors and witch-finders. The healthy rationalism and openness of mind of the writer were more than two centuries before their time in England, and naturally excited the antipathy of a self-conceited fool like King James, who wrote his *Dæmonology* (1597) 'chiefly against the damnable opinions of Wierus and Scot, the latter of whom is not ashamed in public print to deny there can be such a thing as witchcraft.' The king's answer was pitiful, but he had the advantage of being able to burn Scot's book by the hands of the common hangman. Scot's work should have been complete as an antidote to 'Sprenger's fables and Bodin's bables, which reach not so far to the extolling of witches' omnipotencie as to the derogating of God's glorie;' but, besides the feeble effort of the royal Solomon, answers and refutations continued to be written by Gifford, Perkins, Meric Casaubon, Cotta, and many eminent divines, and, with such few exceptions as the writers Webster, Wagstaffe, Ady, and others, witchcraft kept its hold upon the minds even of great men down to and beyond Glanvill, Sir Thomas Browne, Richard Baxter, and even John Wesley. One great merit of Scot's book to the modern student is its richness as a collection of forms of incantations and the processes of sorcery, for its rational and liberal-minded author had the fairness to quote his antagonists honestly before pulverising them with his logic. The full title of the book best explains its scope and aim: 'The discoverie of witchcraft, wherein the lewde dealing of witches and witchmongers is notablie detected, the knaverie of conjurors, the impietie of inchantors, the follie of soothsayers, the impudent falsehood of cousenors, the infidelitie of atheists, the pestilent practices of Pythonists, the curiositie of figure-casters, the vanitie of dreamers, the beggarlie art of Alcumystrie, the abhomination of idolatrie, the horrible art of poisoning, the vertue and power of naturall magike, and all the conveiances of Legierdemaine and juggling are deciphered: and many other things opened, which have long lien hidden, howbeit verie necessarie to be knowne'—'for the undeceiving of Judges, Justices, and Juries, and for the preservation of poor, aged, deformed, ignorant people; frequently taken, arraigned, condemned, and executed for Witches, when according to a right understanding, and a good conscience, Physick, Food, and necessaries should be administered to them' was added in the 1651 title-page, besides other changes. This second edition was in quarto; the third, in 1665, was in folio, and contained, from an unknown and less rational pen, nine fresh chapters, commencing the fifteenth book, and a second book of the 'Discourse on Devils and Spirits' appended to the first and second issues. The next edition in time was the limited reprint of 1886, admirably edited, with an Introduction, by Brinsley Nicholson, M.D. See also Conjuring.

Scot and Lot. The old legal phrase *Scot* (A.S. *sceat*, 'pay') *and Lot* embraced all parochial assessments for the poor, the church, lighting, cleansing, and watching. Previously to the Reform Act the right of voting for members of parliament and for municipal officers was, in various English boroughs, exclusively vested in payers of Scot and Lot.

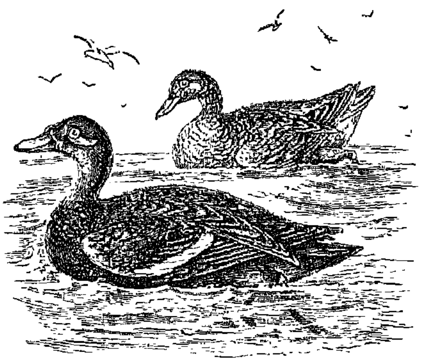
Scoter (*Œdemia*), a genus of oceanic ducks, represented on British coasts by the Common Scoter (*Œ. nigra*), the larger Velvet Scoter (*Œ. fusca*), and occasionally by the North American Surf Scoter (*Œ. perspicillata*). In North America *Œ. americana* is widely distributed. The Common Black Scoter is about the size of the common duck. The whole plumage of the male is deep black; that of the female is dark brown. They are abundant in winter on many parts of the British coast, but most migrate in spring to northern Scandinavia, Russia, and Siberia. They usually nest by inland fresh-water lakes. They feed on molluscs. The flesh is oily, and has a fishy taste, but, being therefore permitted to Roman Catholics during Lent, is in great request in some countries.



Velvet Scoter (*Œdemia fusca*).

Scotists. See DUNS SCOTUS, SCHOLASTICISM.

Scotland, the northern part of Great Britain, is washed on the W. and N. by the Atlantic, on the E. by the North Sea, and on the S. is parted from England by the Solway Firth and the (largely artificial) line described in the article BORDERS. Its length, from Cape Wrath to the Mull of Galloway, is 274 sq. m.; its breadth varies between 24 and 146 miles; and its total area is 19,777,490 acres or 30,902 sq. m., of which 631 sq. m. are water and 485 foreshore. The geology, physical geography, meteorology, &c. have already been sketched at GREAT BRITAIN; still, here we may recapitulate the outstanding features of Scotland for purposes of comparison and of reference to innumerable articles scattered throughout this work. Of 787 islands, belonging mostly to the Hebrides, Orkneys, or Shetland, sixty-two exceed 3 sq. m. in area, and of these the largest are Long Island (Lewis and Harris, 859 sq. m.), Skye (643), the Mainland of Shetland (378), Mull (347), Islay (246), Pomona (207), Arran (168), Jura (143), and North Uist (136). Of twenty-six rivers flowing direct to the sea the chief are the Tweed (97 miles long), Forth (75), Tay (93), Dee (87), Don (82), Deveron (62), Spey (96), Clyde (106), and Nith (71); and of these the Forth, Tay, and Clyde expand into important estuaries. There is also the Moray Firth; and indeed the whole coast is so intersected by arms of the sea that few places are more than 40 miles inland. Fresh-water lakes are numerous—Lochs Lomond (27 sq. m.), Ness (19), Awe (16), Shin, Maree, Tay, Earn, Leven, Katrine, &c. The division of Scotland into Highlands and Lowlands, which puzzles strangers, who cannot understand how Wick comes to be Lowland and Inveraray Highland, has been explained at HIGHLANDS. In the Lowlands the highest points are Merrick (2764 feet) in Kirkcudbrightshire, and Broad Law (2723) in Peeblesshire; in the Highlands there are no fewer than 184 summits that exceed 3000 feet above sea-level—among them Ben Nevis (4406), Ben Macdhui (4296), Ben Lawers (4004), Ben Cruachan (3689), Ben Wyvis (3429), and Ben Lomond (3192). See CHEVIOTS, OCHILS, GRAMPIANS, &c.

In the whole of Scotland the percentage of cultivated area is only 24·2—in Fife as high as 74·8, in Sutherland as low as 2·4. Woods cover less than 1400 sq. m.; and there are 1800 acres of orchards, nearly 5300 of market-gardens, and 1400 of nursery grounds. Between 1857 and 1890 the number of horses increased from 185,406 to 189,727, of cattle from 381,053 to 1,185,876, of sheep from 5,683,168 to 7,361,461, and of pigs from 140,354 to 159,674. In 1890 the value of the total mineral output was £10,705,780, including £8,382,957 for 24,278,589 tons of coal (in 1854 only 7,448,000 tons), £534,265 for 998,835 tons of iron ore, and £599,633 for 2,180,483 tons of oil shale. No very reliable figures are published for the manufactures, which are noticed under the various towns (Glasgow, Dundee, Greenock, Aberdeen, Edinburgh, Dunfermline, Hawick, Galashiels, &c.); but in 1890 there were in all Scotland 747 textile factories, with 2,413,735 spindles, 71,471 power-looms, and 154,591 hands. In shipbuilding, during a period of five years, there was a minimum output of 203 vessels of 112,072 tons in 1886, a maximum of 264 of 209,718 in 1890; whilst during that same period foreign and colonial imports ranged between £27,919,943 and £36,771,016, the exports between £18,248,094 and £24,749,907, and the customs between £1,650,950 and £1,789,260. In 1890 at the twenty-seven head ports there entered 53,212 sailing and steam vessels of 14,651,134 tons, and cleared 53,819 of 12,080,812. The length of the railways has grown from 1243 miles in 1857 to 2700 in 1874, and 3118 in 1890.

The gradual growth of the total population has been as follows: (1801) 1,608,420; (1821) 2,091,521; (1841) 2,620,184; (1861) 3,062,294; (1881) 3,735,573; (1891) 4,033,103, of whom 1,951,461 were males, 2,081,642 females, and 231,602 Gaelic-speaking, and of whom 1,589,874 belonged to the nine principal towns, 1,308,821 to the other towns, 1,008,464 to the mainland rural districts, and 125,944 to the insular rural districts. Those nine principal towns are Glasgow (pop. in 1891 of 565,714, or 792,728 with suburbs), Edinburgh (261,261), Dundee (155,640), Aberdeen (121,905), Leith (69,696), Paisley (66,427), Greenock (63,498), Perth (30,760), Kilmarnock (27,959); and the other towns with more than 10,000 inhabitants are Coatbridge (29,996), Kirkcaldy (27,151), Hamilton (24,863), Ayr (24,800), Arbroath (22,960), Dunfermline (22,365), Inverness (19,214), Hawick (19,204), Airdrie (19,135), Motherwell (18,662), Dumfries (17,804), Falkirk (17,307), Galashiels (17,249), Dumbarton (16,908), Stirling (16,895), Wishaw (14,869), Port Glasgow (14,624), Rutherglen (13,361), Montrose (13,048), Forfar (12,844), Peterhead (12,195), Alloa (10,711), and Pollokshaws (10,228).

The officers of state for Scotland are the Secretary for Scotland, the Lord Keeper of the Privy Seal, the Lord Clerk Register, the Lord Advocate, and the Lord Justice-clerk. The duties of the first, appointed under an Act of 1885 (amended 1887), were transferred to him from the Home Secretary, and relate to education, sanitation, manufactures, prisons, &c. For the government of Scotland reference may be made to the articles PARLIAMENT, BOROUGH, and COUNTY, a system similar to that described in the last-named article having been extended to North Britain by the Local Government (Scotland) Act, 1889, with some differences —e.g. that in Scottish county councils there are no aldermen. Under that act a good many changes have been made in the county boundaries, detached portions of Nairn, Perth, Selkirk, &c. being annexed to the counties surrounding them; whilst Orkney and Shetland, united for parliamentary purposes, were dissevered. There thus are thirty-three counties, whose area and population are shown in the following table:

Counties.	Area in statute acres.	Population. 1801	Population. 1891.
Aberdeen	1,262,097	121,065	281,331
Argyll	2,134,274	81,277	75,945
Ayr	735,262	84,297	224,222
Banff	413,791	37,216	64,167
Berwick	297,161	30,206	32,398
Bute	143,997	11,791	18,408
Caithness	448,867	22,609	37,161
Clackmannan	31,876	10,858	28,438
Dumbarton	172,677	20,710	94,511
Dumfries	705,946	54,597	74,308
Edinburgh	234,926	122,597	444,055
Elgin	312,346	27,760	43,448
Fife	328,427	93,743	187,320
Forfar	569,851	99,053	277,788
Haddington	179,142	29,986	37,491
Inverness	2,767,078	72,672	88,362
Kincardine	248,195	26,349	35,647
Kinross	49,812	6,725	6,280
Kirkcudbright	610,343	29,211	39,979
Lanark	568,868	147,692	1,045,787
Linlithgow	81,113	17,844	52,789
Nairn	127,906	8,322	10,019
Orkney	240,640	24,445	30,438
Peebles	227,869	8,735	14,760
Perth	1,664,690	125,583	126,128
Renfrew	162,428	78,501	290,790
Ross and Cromarty	1,861,572	56,318	77,751
Roxburgh	428,464	33,721	53,726
Selkirk	166,524	5,388	27,349
Shetland	352,876	22,379	28,711
Stirling	298,579	50,825	125,604
Sutherland	1,359,846	23,117	21,940
Wigtown	327,906	22,918	36,048

CIVIL HISTORY.—An account has been given under the article PICTS of the early inhabitants of the country which has long been known by the name of Scotland, but which by the Romans was called Caledonia (q.v.). The original Scotia or Scotland was Ireland, and the Scoti or Scots, at their first appearance in authentic history, were the people of Ireland (q.v.). The Scots were a Celtic race, and their original seat in Northern Britain was in Argyll, which they acquired by colonisation or conquest before the end of the 5th century; and thence they spread themselves along the western coast from the Firth of Clyde to the modern Ross. The name of Scotland seems first to have been given to the united kingdom of the Picts and Scots in the 10th century. It was then sometimes styled, by way of distinction, *Scotia Nova* (New Scotland), and it was a considerable time afterwards before the name of Scotland was applied to it, to the exclusion of Ireland. This interchange of names was a fruitful source of dispute between Irish and Scottish writers in the 16th and 17th centuries.

The first prince of the British Scots mentioned in our authentic annals was Fergus, son of Erc, who crossed over to Britain about 495 or 498. His nation had been converted to Christianity by St Patrick, and Fergus himself is said to have received the blessing of the saint in his early years. His great-grandson, Conal, was king of the British Scots when Columba (q.v.) began the conversion of the Northern Picts; and by that prince, according to the best authorities, Iona was given for the use of the mission. Conal was succeeded by his nephew, Aidan, who was inaugurated as sovereign by St Columba in the island of Iona—a ceremony which Scottish writers, misled by the great French antiquary Martène, long believed to be the first example of the benediction of kings. Aidan was a powerful prince, and more than once successfully invaded the English border, but in 603, towards the end of his reign, he received a severe defeat from the Northumbrian sovereign Ethelfrid at Dægsastane (probably Dawstone in Liddesdale).

The history of Aidan's successors is obscure and uninteresting, except to the professed students of our early history. Their kingdom was overshadowed by the more powerful monarchy of the Picts, with which, as well as with its neighbours in the south—the Britons of Cumbria—it was engaged in almost unceasing conflict. The Scots were for a time under some sort of subjection to the English of Northumbria, but recovered their independence on the defeat and death of King Ecgfrid in battle with the Picts at Nechtansmere (Dunnichen, Forfarshire) in 685. In the middle of the 9th century, by a revolution, the exact nature of which has never been ascertained, the Scots acquired a predominance in Northern Britain. Kenneth Macalpin, the lineal descendant of Fergus and Aidan, succeeded his father as king of the Scots in 836. The Pictish kingdom was weakened by civil dissension and a disputed claim to the crown. Kenneth laid claim to it as the true heir in the female line, and was acknowledged king of Alban in 843.

King Kenneth transferred his residence to Forteviot in Stratherne, which had been the Pictish capital, fixing soon afterwards the ecclesiastical metropolis of the united kingdom at Dunkeld, whence in 908 it was translated to Abernethy. The Picts and Scots, each speaking a dialect of the Celtic tongue, gradually coalesced into one people, whose territory extended from the Firths of Forth and Clyde to the northern extremity of Britain. The crown descended to a line of princes of the family of Kenneth, whose rule gave a unity and comparative tranquillity to the Scots of Britain which those of Ireland, at no time really united under one prince, never possessed. The first interruption to the descent of the crown in the line of Kenneth was the reign of a usurper named Grig, round whose name, amplified to Gregory by the writers of a later age, a cloud of legendary fiction gathered. The old family was restored on his expulsion in 893.

The reign of Constantine, son of Aodh, who succeeded in 904, was a remarkable one. In his time it is probable that the seat of the ecclesiastical primacy was transferred from Abernethy to St Andrews, and that the regal residence was fixed at Scone. At the latter place, in the sixth year of his reign, the chronicles mention that Constantine the king, Kellach the bishop, and the Scots swore to observe the laws and discipline of the faith and the rights of the churches and the gospels. This seems to indicate the meeting of some sort of council, civil or ecclesiastical, or more probably a combination of both, according to the form prevalent at this period both among the Celtic and the Teutonic nations. Even before the establishment of the kingdom of the Picts and Scots in the person of Kenneth, Northern Britain had experienced the attacks of a new enemy, the Scandinavian invaders, generally spoken of under the name of Danes. Constantine resisted them bravely, but towards the end of his reign he entered into an alliance with them in opposition to the English. In 937 a powerful army, composed of Scots and Picts, Britons and Danes, disembarked on the Humber, and was encountered at Brunanburh (q.v.) by Athelstan, *king of England. A battle was fought there, the* first of a series of unfortunate combats by Scottish princes on English ground. The confederate army was defeated, and, though Constantine escaped, his son was amongst the slain. Weary of strife, the king soon afterwards retired to the Culdee monastery at St Andrews, of which he became abbot, and there died in 953.

During the reign of Malcolm, the first of that name, and the successor of Constantine, a portion of the Cumbrian kingdom, including the modern Cumberland and part of Westmorland, which had been wrested from the Britons by Edmund, king of England, was bestowed by that prince on the Scottish sovereign. This grant was the foundation of that claim of homage made by the English kings on the Scottish sovereigns, which afterwards became the cause or the pretext for the great struggle between the two nations. The northern kingdom was still further increased in the reign of Kenneth, son of Malcolm, by the acquisition of Lothian, and of Northern Cumbria, or Strathclyde. The former province, previously a part of the Northumbrian kingdom, and entirely English in its population, was bestowed on Kenneth by Edgar, king of England. The Cumbrian kingdom, which had at one time extended along the west coast from the Firth of Clyde to the border of Wales, had been weakened by the loss of its southern territories; it was inhabited by a Celtic people speaking Cymric or Welsh, and now fell under the dominion of the Scottish king, though its inhabitants long retained their own speech and a peculiar system of laws (see **Bretts and Scots**). The last addition to Scotland in the south took place under Malcolm II., son of Kenneth, who acquired the Merse and Teviotdale from the Earl of Northumbria, and thus advanced his kingdom on the eastern border to the Tweed. The reign of Malcolm II. extended from 1003 to 1033. The kings who immediately followed are better known to the general readers than any of their predecessors, Shakespeare having made their names familiar to every one. Malcolm's successor was his grandson, Duncan, whose brief reign was followed by that of Macbeth (q.v.). The latter was a vigorous and prudent ruler, munificent to the church, and famous as the only Scottish king who made a pilgrimage to Rome. But, although by marriage he was connected with the royal line, he was unable to secure the affection of his subjects. Malcolm, the eldest son of Duncan, assisted by his kinsman, Siward, Earl of Northumbria, invaded Scotland. The usurper was defeated and slain at Lumphanan, in Mar, in 1057, and Malcolm was acknowledged as king.

The long reign of Malcolm Canmore was the commencement of a great social and political revolution in Scotland. His residence in England, and still more his marriage with the English Princess Margaret, the sister of Edgar Atheling, led to the introduction of English customs, the English language, and an English population into the northern and western districts of the kingdom. The influx of English colonists was increased by the tyranny of William the Conqueror and his Norman followers. All received a ready welcome from the Scottish king, whose object it was to assimilate the condition of the Scots in every respect to that of their fellow-subjects in Lothian; and what his stern, though generous, character might have failed to accomplish was brought about by the winning gentleness and Christian graces of his English queen.

Malcolm fell in battle before Alnwick Castle in the year 1093, and Margaret survived only a few days. It seemed as if the work of their reign was about to be utterly overthrown. The Celtic people of Scotland, attached to their old customs, *and disregarding the claims of Malcolm's children,* raised his brother, Donald Bane, to the throne. The success, however, of this attempt to restore a barbarism which the better part of the nation had outgrown was of brief duration; Donald was dethroned, and Edgar, the eldest surviving son of Malcolm and Margaret, was acknowledged as king. The very name of the new sovereign marked the ascendency of English influence. That influence, and all the beneficial effects with which it was attended, continued to increase during the reigns of Edgar and his brother and successor, Alexander I. The change went steadily on under the wise and beneficent rule of David (q.v.), the youngest son of Malcolm. His reign, which extended from 1124 to 1153, was devoted to the task of ameliorating the condition of his subjects, and never was such a work more nobly accomplished. David was in every respect the model of a Christian king. Pious, generous, and humane, he was at the same time active and just, conforming himself to the principles of religion and the rules of the church with all the devotion of his mother, but never forgetting that to him, not to the clergy, God had committed the government of his kingdom. He was all that Alfred was to England, and more than St Louis was to France. Had he reigned over a more powerful nation his name would have been one of the best known among those of the princes of Christendom. At the time of David's accession Scotland was still but partially civilised, and it depended in a great measure on the character of its ruler whether it was to advance or recede. It received a permanent stamp from the government of David. The Celtic people were improved morally, socially, and ecclesiastically, and all along the eastern coast were planted Norman, English, and Flemish colonies, which gradually penetrated into the inland districts, and established the language and manners of that Teutonic race which forms the population of *the greater part of Scotland. David* encouraged and secured the new institutions by introducing a system of written law, which gradually superseded the old Celtic traditionary usages, the first genuine collections of Scottish legislation belonging to his reign. David was as great a reformer in the church as in the state. The ecclesiastical system prevalent in Scotland almost up to his time differed in some points from that established in England and on the Continent, bearing a great resemblance to that of Ireland, from which it was indeed derived. David established dioceses, encouraged the erection and endowment of parishes, provided for the maintenance of the clergy by means of tithes, and, displacing the old Celtic monastic bodies, introduced the Benedictine and Augustinian orders.

David, though devoting his energies to the improvement of his subjects in the manner which has been mentioned, did not forget duties of a less agreeable kind. He knew that a Scottish king really held his crown by the tenure of the sword, and none of his fierce ancestors was a more intrepid warrior than the accomplished and saintly David. His skill and courage were shown, though without success, at the Battle of the Standard. As the representative through his mother of the ancient kings of England, he had many friends in that country; and had the Scottish army been successful the history of the two kingdoms might in some respects have been different. As it was, he contented himself with maintaining the cause of his sister's child, the Empress Matilda, against King Stephen.

David's grandson and successor, Malcolm IV. (1153-65), and his brother, William the Lion (1165-1214) pursued the policy of their grandfather with equal resolution, though sometimes with less success. They were embarrassed by their connection with the English King Henry II., who took advantage of his superior power and ability to impose unwise and unjust restraints on the independence of the Scottish sovereigns and their kingdom—a policy which laid the foundation of the unhappy national strife of after years. This was averted for a time by the concessions of Richard I. in 1189. 'For more than a century,' says Lord Hailes, 'there was no national quarrel, no national war between the two kingdoms—a blessed period.' That period was well employed by the next two kings, Alexander II. and Alexander III., the son and grandson of William the Lion, to consolidate the institutions of their kingdom, and extend and confirm what had been begun by David. Alexander III. was one of the ablest and best of the Scottish kings. By a treaty with the king of Norway he added to his kingdom Man and the other islands of the Western Sea, held by the Norwegians. His sudden death in 1286 was one of the greatest calamities with which Scotland could have been afflicted. It closed a period of prosperity—a course of improvement—which the kingdom did not again enjoy for fully 400 years.

On the death of the infant granddaughter and heiress of Alexander III. in 1290 the succession to the crown was disputed. The question between the two chief claimants, Baliol and Bruce (q.v.), was not free from doubt according to the customs of the time; and Edward I. (q.v.) of England, to whom the decision was referred, appears at first to have acted with good faith. But this great king, who had already subdued Wales, was now bent on uniting the British Islands under one sceptre; and in the pursuit of that object he sacrificed humanity, honour, and justice. The results were most deplorable. The national spirit of the Scots was finally roused, and after a long struggle under Wallace and Bruce, in 1314 they secured their independence on the field of Bannockburn (q.v.). The battle of freedom was won; but it was at the expense of tranquillity and civilisation. The border counties were continually wasted by the English; the central provinces were the scene of frequent warfare among the chief nobles; and the highland districts became more and more the seat of barbarism, the Celtic tribes re-acquiring something of their old ascendency, just as they did in Ireland in the troubled times which followed the invasion of Edward Bruce. The strong arm of King Robert might have repressed these disorders had his life been longer spared after the treaty of Northampton; but his death in 1329 and the accession of an infant son again plunged the country into all the miseries of foreign and civil war. When that son, David II., grew up to manhood he proved in every respect unworthy of his great father. The reigns of this prince and his successors Robert II. and Robert III., the two first princes of the House of Stewart, may be regarded as the most wretched period of Scottish history. In the year 1411 the kingdom would have become absolutely barbarous if the invasion of the Lord of the Isles had not been repulsed at Harlaw (q.v.) by the skill of the Earl of Mar and the bravery of the lowland knights and burgesses.

A happier time began to dawn with the release of James I. in 1424 from his English captivity. The events of the following period are better known, and a brief notice of the most important will be sufficient. Reference may be made for details to the accounts of the particular kings. The vigorous rule of James I. had restored a tranquillity to which his kingdom had long been unaccustomed; but strife and discord were again brought back on his assassination. One of the most calamitous features of the time was a long series of minorities. James himself had succeeded to the crown when a child and a captive; James II., James III., James IV., James V., Mary, and James VI. all succeeded while under age, and all except James IV. when little more than infants. The courage and ability shown by almost all the Stewart princes were insufficient to repair the mischiefs done by others in the beginning of their reigns, and to abate the great curse of the country—the unlimited power and constant feuds of the nobles. The last addition to the Scottish kingdom was made in the reign of James III., when the islands of Orkney and Shetland were made over to him as the dowry of his queen, Margaret of Denmark. The marriage in 1503 of James IV. with Margaret of England was far more important in its ultimate results, and brought about in the reign of his great-grandson that peaceful union with England which the death of the Maid of Norway had prevented in the 13th century. Many good laws were enacted during the reigns of the Jameses; but the wisdom of the Scottish legislature was more shown in framing them than the vigour of the government in enforcing them. Among the most important improvements of the period was the establishment of universities—the first of which, that of St Andrews, was founded during the minority of James I.—and the institution of the College of Justice in the reign of James V.

During the reign of the fifth James religious discord added another element to the evils with which Scotland was afflicted. The practical corruptions of the church were greater than they were almost in any other country in Europe, and one of the consequences was that the principles of the Reformation were pushed further than elsewhere. The first great ecclesiastical struggle had hardly ceased, by the overthrow of the Roman Catholic system, when the strife began anew in the Reformed Communion in the shape of a contest between Episcopacy and Presbyterianism, the former being supported by the sovereign, the latter by the common people, the nobles throwing their weight into either scale as it suited their policy at the time. James VI. struggled hard to establish an absolute supremacy, both in church and state, in opposition to a powerful party, which admitted no royal authority whatever in the former and very little in the latter. After his accession to the English crown he was apparently successful in carrying out his designs, but during the reign of his son, Charles I., the contest again broke out with increased bitterness. The nobility, whose rapacity had been checked by the sovereign, joined the popular party. The opponents of the crown bound themselves together, first by the National Covenant, and afterwards, in alliance with the English Puritans, by the Solemn League and Covenant. Their efforts were completely successful, but their success led to the utter overthrow of the monarchy by Cromwell. See MONTROSE.

The restoration of Charles II. was welcomed by all classes, wearied as they were of a foreign and military rule, but especially by the nobles and gentry, who had learned by bitter experience that the humiliation of the sovereign was necessarily followed by the degradation of their order. Had the government of Charles II. and James VII. been reasonably just and moderate it could hardly have failed in securing general support; but it was more oppressive and corrupt than any which Scotland had experienced since the regencies in the minority of James VI. The natural result was the revolution which seated William and Mary on the throne: the rising under Dundee (see GRAHAM, JOHN) was crushed at Killiecrankie.

The parliament of Scotland, which met for the last time in 1706, was originally composed, like the English parliament, of three classes—the ecclesiastics (consisting of bishops, abbots, and priors), the barons, and the burgesses. The spiritual lords during the establishment of Episcopacy after the Reformation were composed of bishops only. When Presbyterianism was established at the time of the Covenant, and when it was formally ratified by law at the Revolution, the ecclesiastical estate ceased to have any place in parliament. The barons, or immediate vassals of the crown, at first sat in their own right, whether holding peerages or not; but afterwards the peers alone sat, the others sending their representatives. The burgesses were the representatives of the burghs. All the three estates sat to the very last in one house, the sovereign presiding in person, or through a commissioner named by him.

Hardly had the majority of the nation been successful in the Revolution settlement when many of them began to repent of what they had done, and Jacobitism became more popular than royalist principles had ever been when the House of Stewart was on the throne. The discontent was greatly increased by the fears entertained of English influence. Ancient jealousies had been revived and intensified by the collapse of the Darien Scheme (q.v.). The state of matters grew so threatening after the accession of Queen Anne that the ruling English statesmen became satisfied that nothing short of an incorporating union between the two kingdoms could avert the danger of a disputed succession to the throne and of a civil war. Supported by some of the ablest and most influential persons in Scotland, they were successful in carrying through their design, though it was opposed by a majority of the Scottish people, under such leaders as Fletcher (q.v.). The Act of Union was formally ratified by the parliament of Scotland on the 16th of January 1707. It subsequently received the royal assent, and came into operation on the 1st of May of the same year. The union continued to be unpopular in Scotland for many years, an unpopularity increased by the corrupt means freely used to carry it through. Suspicions were cherished that the national life would pass away with the national separateness, and that the independence of the Scottish church and the distinctness of the national system of jurisprudence would inevitably suffer. There were agitations and petitions for the repeal of the union and the restoration of the national parliament. But the discontent gradually died down; not that the malcontents were silenced by argument but by the logic of facts. The association with the larger and wealthier kingdom of the south opened a vastly wider field to the enterprise for which in all departments of life the 'præfervidum ingenium Scotorum' had already been noted; and the rapid growth of prosperity by the extension of old and the establishment of new industries helped to bring about a sense of well-being and content. The peaceful acquiescence of the great majority of the nation in the union was brought out at the time of the Jacobite rebellions of 1715 and 1745 (see JACOBITES); the Porteous Mob (q.v.) was a temporary ebullition of a discontent only partly political. It became patent to all that the consequences of the union were beneficial to both countries; yet Scotland and England are in many respects two countries still, and a Scot abroad, asked if he is an Englishman, will seldom give an affirmative answer.

Scotland and Scotsmen have taken a prominent part in the public affairs and intellectual life of the United Kingdom, in its warfare and colonial expansion; the literature of Scotland blossomed luxuriantly (see below) after the union; Reid and Dugald Stewart founded a school of philosophy (see SCOTTISH PHILOSOPHY), as Jeffrey and Cockburn did a school of criticism; and in the 18th century the 'Modern Athens' was more conspicuously a centre of literary and intellectual culture than at any former period. A long series of scientific worthies connects the days of Napier of Merchiston with those of Lord Kelvin (Sir William Thomson) and Professor Tait—including in mathematics, physics, and chemistry the Gregories, Simson, Black, Brewster, J. D. Forbes, Clerk-Maxwell, and Macquorn Rankine; in engineering and steam navigation, Watt, Rennie, Telford, Symington, Henry Bell, Fairbairn, and the Stevensons; in geology, almost all the greatest British names—Hutton, Playfair, Hall, Murchison, and Lyell; in zoology, Edward Forbes and Wyville Thomson; Brown the great botanist; and in medicine and surgery, the dynasties of Gregories, Cullens, Monros, Hunters, and Bells, Simpson, Liston, and Syme. Paterson and Law, founders of the Bank of England and the Bank of France, were Scotsmen. Erskine and Campbell sat on the woolsack of England, Sir Alexander Cockburn was Lord Chief-justice. Of painters, Jameson, Allan, Nasmyth, Thomson, Raeburn, Wilkie, Dyce, David Scott, Phillip, and MacCulloch may be named, with the brothers Adam, architects. Amongst soldiers have been Marshal Keith, Marshal Stair, Abercromby, Moore, Heathfield, Lynedoch, and Lord Clyde; amongst sailors, Camperdown and Dundonald; and there have never failed Scottish travellers and explorers from the days of Bruce 'the Abyssinian' to those of Livingstone and Joseph Thomson.

The 'Scot abroad' was always a familiar phenomenon equally in French universities and in French, Austrian, Swedish, and Russian armies; and Scotsmen have not since then become a race of stay-at-homes. From a paper in the *Scottish Geographical Magazine* for 1885 it appears that, apart from the incalculable numbers of persons of Scottish descent in the south, there were then in England and Wales upwards of 253,000 persons of Scottish birth. Sir Charles Dilke has said (in *Greater Britain*), 'In British settlements from Canada to Ceylon, from Dunedin to Bombay, for every Englishman you meet who has worked himself up to wealth from small beginnings without external aid, you find ten Scotsmen.' Yet the comparative numbers of Scotsmen in the colonies are not so great as this statement suggests; in the various Australian colonies they vary from a fifth to a seventh of the total number of colonists born in the United Kingdom; in New Zealand about one-third; in

Canada settlers of Scottish descent are to those of English descent as 70 to 100; in the United States the Scottish born are not a fourth of the English born citizens. Eminent English statesmen like Mr Gladstone have been of purely Scotch descent. Sweden has its *Hamiltons*, Germany *Douglases*; the great philosopher Kant, the Russian poet Lermontoff, the Norwegian composer Grieg bear Scottish names more or less modified.

See the 'Historians of Scotland' series (10 vols. 1871–80), comprising the chronicles of Fordun and Wyntoun, the lives of SS. Ninian, Kentigern, and Columba, the *Critical Essay on the Ancient Inhabitants of Scotland*, by Father Innes (q.v.), &c.; the *History* of Bede, the Irish Annals, and especially Skene's *Celtic Scotland* (3 vols. 1876–8); new ed. 1886). For the period down to the Reformation may be added the Chronicles of Melrose and Lanercost, Leslie's and Buchanan's Histories, E. W. Robertson's *Scotland under her Early Kings* (2 vols. 1862), and the Acts of the Scottish Parliament. For the period from the Reformation to the Union—Knox's, Calderwood's, Spottiswoode's, and Robertson's Histories, Baillie's Letters, Wodrow's and Burnet's Histories, the Acts of Parliament, and the State Papers. The Scotch Records publications include *The Exchequer Rolls of Scotland*, *Accounts of Lord High Treasurer*, *Register of Privy-council*, *Documents illustrating Scottish History.* Well-known works are Pinkerton's *Inquiry*, Hailes's *Annals*, and the more modern general histories by Tytler, Laing, Hill Burton, with smaller works by Mackenzie and Macarthur. See also Chambers's *Domestic Annals*; the works of Cosmo Innes; Hill Burton's *Scot Abroad*; Mackintosh's *History of Civilisation in Scotland* (1878–84), his *Scotland from the Earliest Times to the Present Century* (1890); and the Duke of Argyll's *Scotland as it was and as it is* (1887); besides works on special periods. Additional references may be found by consulting articles in this work, such as GOWRIE CONSPIRACY, JACOBITES, &c., and the lives of the kings and other great personages of Scottish history. For the royal arms of Scotland, see HERALDRY, Vol. V. p. 669.

ECCLESIASTICAL HISTORY.—Christianity in Scotland dates from the 4th century, but its beginnings are obscure. What we know centres mainly round the lives of the great Celtic missionaries, Ninian, Kentigern, and Columba, and may be traced in the articles on them, as also in those on Adamnan, on Cuthbert, on the Culdees, and on the Picts. The connection of St Palladius, 'chief apostle of the Scottish nation,' with Scotland seems mythical; he is said to have been sent 'in Scotiam' in 430 by Pope Celestine; but the 'Scotia' here meant was certainly Ireland, and Skene doubts if Palladius was ever in Scotland till after his death, when St Ternan brought his relics to Fordoun in Kincardineshire. The doctrines of the ancient Scottish Church were the same as those of the rest of Western Christendom. In ritual there were some points of difference, but so slight that the most important related to the time of observing the Easter festival. In these points also the Scots gradually conformed to the usage of the Roman and English Churches. In one point, however, there continued for several centuries to be a marked distinction between the Scots and Irish on the one hand and the churches of England and the Continent on the other. This was in reference to ecclesiastical government. The Scots recognised the same orders of the ministry, bishops, priests, and deacons, as other Christians did; and like them they held that ordination could be given only by bishops. But they acknowledged no such supremacy of jurisdiction in the episcopal order as was held by other churches. In Scotland there were neither dioceses nor parishes; but there were numerous monasteries in which the abbots, whether bishops or priests, bore the chief rule, all being in subordination to the successor of St Columba, the presbyter-abbot of Iona, who in virtue of that office was primate of the Picts and Scots.

When Iona was desolated by the Northmen the primacy seems to have been transferred in the middle of the 9th century to the Abbots of Dunkeld, then to the Bishops of Abernethy, and finally to the Bishops of St Andrews, who became known as *Episcopi Scotorum*, the bishops of the Scots. Slowly at first, but gradually, an assimilation to the English and continental usages began, a change rendered more easy by the Scottish dominion being extended over Lothian, in which the ecclesiastical system was the same as that of England. A great impulse was given in the same direction by the marriage of Malcolm III., king of the Scots, with Margaret the sister of Edgar Atheling. The king and queen used their utmost efforts to introduce the English usages in ecclesiastical as in other matters; and Margaret herself held repeated conferences for that purpose with the chief Scottish ecclesiastics, at which her husband acted as interpreter. The principal points in which she attempted to bring about a reform were the commencement of the Lent fast, the superstitious infrequency of receiving the communion, and the lax observance of Sunday and of the scriptural and canonical restrictions on marriage between relations.

The reform begun by Malcolm and Margaret was fully carried out by their youngest son, David I. These improvements were completed by his successors, and before the end of the 12th century the ecclesiastical system of Scotland differed in no important point from that of the rest of Europe. Some Scottish writers have lamented the change, as being one from purity of belief and practice to superstition and immorality. This is undoubtedly a mistake. The Celtic Church had become very corrupt, and the clergy were inferior both in learning and morals to their brethren in the south. King David was a reformer in the best sense of the word, and it does not detract from the character of his reformation that as time went on the Scottish Church became involved in those superstitions with which the rest of Christendom was overspread.

The ritual of the Scottish mediæval church was almost the same as that of England, the Salisbury Missal and Breviary being the models of the Liturgies and Office Books used in Scotland. The external system of the church—cathedral, parochial, and monastic—was also in almost every point identical. The chief monastic orders were the Benedictine and its most important branches the Clugniac and Cistercian, the canons regular of St Augustine, and the Reformed Premonstratensian canons. The Clugniacs and Cistercians were in strict subordination to the mother-houses of their orders at Clugny and Citeaux. In the 13th century the Dominican, Franciscan, and Carmelite friars were introduced into Scotland. The chapters of all the Scottish cathedrals, except those of St Andrews and Whithorn, were composed of secular canons—the chief dignitaries being a dean, archdeacon, chancellor, precentor, and treasurer. The prior and canons regular of the Augustinian monastery at St Andrews formed the chapter of that see, and the prior and Premonstratensian canons of Whithorn formed the chapter of the cathedral of Galloway. There were twelve dioceses in the Scottish Church, to which Orkney was added on the transference of those islands to the Scottish sovereign in the 15th century. The twelve dioceses were Caithness, Ross, Moray, Aberdeen, Brechin, Dunkeld, Dunblane, St Andrews, Argyll, the Isles, Glasgow, and Galloway. The larger of these dioceses were divided, like the English dioceses, into rural deaneries. The single point in which the mediæval church down to the 15th century differed from that of England and other churches of the west was in its having no metropolitan. St Andrews, and next to it Glasgow, had a certain precedence; the bishops of the former see, and failing them the bishops of the latter, having the privilege of crowning and anointing the sovereign. But they had no jurisdiction over the other sees, nor did their bishops bear the style of archbishop. This led to claims on the part of the Archbishops of York to metropolitan authority in Scotland, which had no foundation except in regard to the southern portion of the diocese of St Andrews and the see of Galloway, the bishops of which were for several centuries suffragans of York. The court of Rome found it convenient, for the sake of its own privileges, to encourage this anomalous system; but to provide for the meetings of the Scottish bishops in provincial council a bull of Pope Honorius III. in 1225 authorised them to meet in synod. In virtue of this bull the bishops, abbots, priors, and other chief ecclesiastics, with representatives of the capitular, collegiate, and conventual bodies, assembled annually in provincial synod, sitting in one house under the presidency of a conservator chosen by and from the bishops. The chief government of the church under the pope thus devolved on these synods and their elective presidents. This continued until the erection of St Andrews into an archiepiscopal and metropolitan see, in virtue of a bull of Pope Sixtus IV. in 1472. By this bull all the Scottish sees were made suffragans to that of St Andrews, whose bishops were now to be styled archbishops.

In 1492 Glasgow was raised to the dignity of a metropolitan see by a bull of Pope Innocent VIII., and the bishops of Dunkeld, Dunblane, Galloway, and Argyll were made suffragans to its archbishop, an arrangement which was soon afterwards altered to some extent—Dunkeld and Dunblane being reannexed to St Andrews, and Glasgow having for its suffragan sees those of Galloway, Argyll, and the Isles. This last arrangement continued till the Reformation, and afterwards during the establishment of Episcopacy—the two Scottish archbishops occupying towards each other precisely the same position as the Archbishops of Canterbury and York, and being sometimes involved in the same unseemly broils, in regard to jurisdiction and precedence, which long existed between the English metropolitans.

The ignorance and immorality of the clergy were far worse than they were in England, or perhaps anywhere in Europe, except in the Scandinavian churches. The desire for reformation which led to the proceedings of Huss and Wyclif produced similar effects in the Scottish kingdom. As early as the year 1406 or 1407 James Resby, an English priest and a disciple of Wyclif, was burned at Perth; and in 1433 Paul Crawar, a Bohemian Hussite, was burned at St Andrews. The opinions of Wyclif continued to be privately taught, particularly in the south-western counties, where his followers were known by the name of the Lollards (q.v.) of Kyle. In the following century the intercourse with the Continent was frequent and close, and the effects of Luther's preaching and writings were soon felt in Scotland. In the year 1525 the importation of Lutheran books and the propagation of the Reformer's tenets were forbidden by an act of the Scottish parliament; and in February 1528 Patrick Hamilton, abbot of Ferne, was burned at St Andrews for teaching and publishing Lutheran doctrines. The piety of Hamilton and the patience with which he bore his sufferings induced others to follow his teaching and example. Several persons, both ecclesiastics and laymen, were subsequently burned, and many more fled to England or the Continent.

The persecution, though encouraged or permitted by the bishops, was disapproved of by some ecclesiastics of learning and influence, who were desirous of effecting a reform in the church without breaking off from communion with the hierarchy. The efforts of this school were unsuccessful, and the Scottish nation was gradually divided into two parties—one of which, headed by the bishops and supported by the state, was determined to resist all change; and the other, composed of a considerable number of the clergy both regular and secular, of the gentry, and of the burgesses of the large towns, was disposed to carry its reforming principles far beyond what had been done by Luther and Melanchthon. These two parties came into deadly conflict in 1546. On the 28th of February in that year George Wishart, the most eloquent of the Reforming preachers, was condemned to death by an ecclesiastical court—at which Cardinal Beaton, Archbishop of St Andrews, presided—and was burned. On the 28th of May following the cardinal was murdered by Norman Leslie and other adherents of the Reforming party. The struggle continued during the regency of the Earl of Arran and that of Mary of Lorraine, the mother of Mary, the young queen of Scots.

In the year 1559 the Reformers became strong enough to set the regent at defiance. Various circumstances encouraged them to demand freedom for their opinions, particularly the death of Mary of England and the accession of Elizabeth. They were further animated at this time by the return from Geneva of their chief preacher, John Knox. The conflict was to be decided by other than spiritual weapons. The regent and the Reformed party, now known by the name of the Congregation, met in open warfare. The contest was carried on for a twelvemonth, and ended in the triumph of the Congregation. A parliament met at Edinburgh on the 1st of August 1560. The Reforming party had the complete ascendency, and succeeded in passing several acts by which the jurisdiction of the pope was abolished, the mass was proscribed, and a Confession of Faith drawn up by Knox and his associates was ratified, the spiritual lords making a faint resistance.

The new Confession of Faith adhered in all essential articles of belief to the ancient creeds of the church. In regard to the sacraments it differed entirely from the recent teaching of the Western Church; but its language, on the whole, was moderate and conciliatory. In reference to ceremonies and the details of church polity it declared that such things were temporary in their nature, and not appointed for all times and places, and that they ought to be altered when they fostered superstition and ceased to be conducive to edification.

A Book of Discipline was soon afterwards drawn up by the compilers of the Confession, which was generally approved of, but did not receive the sanction of parliament. It followed out in detail the principles laid down in the Confession. In regard to the office-bearers of the church various orders were mentioned, but three were specially of importance—ministers, elders, and deacons. Ministers were to be chosen by each several congregation, but were to be examined and admitted in public by the ministers and elders of the church. No other ceremony, such as imposition of hands, was to be used. The elders and deacons were to be chosen yearly in each congregation, and were not to receive any stipend, because their office was only to be from year to year and because they were not to be debarred from attending to their own private occupations. In order to the better provision for the wants of the time certain persons called superintendents were appointed in particular districts, with power to plant and erect churches and to appoint ministers within the bounds of their jurisdiction.

The chief governing as well as legislative and judicial power in the Reformed Church was entrusted to a General Assembly, which met half-yearly or yearly, and was composed of the superintendents, ministers, and lay commissioners, and which gradually, by the introduction of the system of representation, assumed the form and more than the power of a parliament.

The worship of the Reformed Church was modelled on that established by Calvin at Geneva. It was embodied in a formulary called the Book of Common Order, which for nearly a century continued to be generally used. It contained forms for the ordinary worship both on Sundays and weekdays, and for the administration of the sacraments, and for certain other occasions. The minister was not absolutely restricted to these forms. Except in the singing of Psalms, the people took no direct part in ordinary worship, and there was no distinction of ecclesiastical seasons, all holydays whatever except Sunday being abolished.

The form of church government established at the Reformation did not remain long undisturbed. Some of the most zealous Protestants thought the danger to which the church was exposed from state tyranny and aristocratical oppression could best be met by restoring the bishops to their ancient position both in the church and in the parliament; while others of equal zeal and sincerity saw in this only the commencement of a plan for bringing back all the errors of popery. A scheme of this kind was actually established for some time, and the sees were filled with Protestant bishops set apart for the office by their brethren of the ministry. It was almost immediately attacked by some of the ministers, who soon found a leader in Andrew Melville, a scholar of considerable eminence, who returned to Scotland in 1574, after a residence in Geneva, during which he had ardently embraced the new opinions as to ecclesiastical government maintained by Beza.

The struggle continued for some years, the bishops being encouraged by the sovereign and his advisers, whose support was frequently of little real advantage to them, and Melville receiving the zealous assistance of many of the ministers, and of the great body of the common people, who sympathised with him in his democratic theories of civil and ecclesiastical government. Melville was at last entirely successful. His opinions were embodied in what was called the Second Book of Discipline, which received the formal sanction of the General Assembly in 1581. This formulary differed very much from the First Book. It laid down authoritatively those principles in regard to ecclesiastical authority which the English Puritans were vainly striving to establish in the southern kingdom, and was in reality an attempt to make the civil power subordinate to the ecclesiastical, even in matters secular. It recognised four orders of office-bearers in the church, the Pastor, Minister, or Bishop, the Doctor, the Presbyter or Elder, and the Deacon. These were to be set apart by ordination and the imposition of the hands of the eldership, but no one was to be intruded into any office contrary to the will of the congregation or without the voice of the eldership. Four sorts of church courts, each rising above the other, were sanctioned; first, of particular congregations one or more; second, of a province or what was afterwards called the Provincial Synod; third, of a whole nation; and fourth, of the universal church. What is generally regarded as the most essential feature of the Presbyterian system—the Presbytery—was not yet introduced in its proper form, the lowest court being a combination of what were afterwards known as the Presbytery and the Kirk-session. It was, however, introduced before the year 1592, when the privileges of general and provincial assemblies, presbyteries, and parochial sessions were ratified by parliament, though the Book of Discipline itself did not receive any formal sanction.

King James had agreed to the establishment of Presbyterianism, but personally and as a sovereign he disliked its discipline, and he soon endeavoured to overthrow it. His accession to the crown of England enabled him to do this with more authority. He gradually obtained from the General Assembly a recognition of the civil rights of the bishops, and this led to the restoration of their ecclesiastical privileges. His changes were sanctioned by a General Assembly which met at Glasgow in 1610, and in the course of the same year Episcopacy was restored in reality, as well as in name, by the consecration of three Scottish prelates by four of the English bishops at London.

The king wished to assimilate the Scottish Church as far as possible to that of England, and his next important movement was the establishment of what are called the Five Articles of Perth (see PERTH).

These various changes excited great dissatisfaction in Scotland, particularly in the southern counties, but it gradually abated to a considerable extent, and might have altogether ceased had not further innovations been attempted. It was the wish of James to introduce a prayer book like that of the English Church in place of the Book of Common Order, but he saw the danger with which the proposal was attended, and gave it up or postponed it. His son Charles was as inferior to his father in prudence as he excelled him in conscientiousness and religious zeal. During his first visit to Scotland he added another bishopric—that of Edinburgh—to the dioceses of the Scottish Church. Most unwisely and most improperly he endeavoured by his royal authority to introduce into that church a Book of Canons and a Liturgy framed on the model of those of England. The king had many loyal supporters in all parts of Scotland, and in the north Episcopacy was preferred by the people to Presbyterianism. But the storm of popular indignation which was now roused swept everything before it. The king's opponents banded themselves together by the National Covenant, and at a General Assembly held at Glasgow abolished the Perth Articles and Episcopacy and re-established Presbyterianism. Charles attempted to maintain his claim by the sword, but was unsuccessful, and obliged to ratify in parliament all that had been done by his opponents.

Had the Covenanters been satisfied with the victory which they had won Presbyterianism might have remained the established religion of the Scottish kingdom. But they could not resist the entreaties for aid from the English Puritans, or rather they yielded to the delusion of extending their own discipline over the churches of England and Ireland. They just attempted, in an opposite direction, what James and Charles had failed to accomplish. For a time their policy seemed to triumph. The Solemn League and Covenant of the three kingdoms, after having been approved by the General Assembly in Scotland, was signed by the Assembly of Divines which the parliament had summoned to meet at Westminster and by the parliament itself. The ecclesiastical documents which were afterwards drawn up originated with the Assembly of Divines, but were sanctioned by the Assembly in Scotland. The principal of these were a Directory for Public Worship, a Confession of Faith, and a Larger and Shorter Catechism. The first of these documents was intended to supersede the Book of Common Prayer in England, and indirectly the Book of Common Order in Scotland. It laid down certain general rules in regard to public worship and the administration of the sacraments, but left very much to the discretion of the particular ministers and congregations.

The union between the Scottish and English Puritans was dissolved by the ascendency of the Independents. Scotland, distracted by civil and ecclesiastical dissension, was unable to defend itself against Cromwell. It was conquered and kept thoroughly under subjection by the English army, which forbade the meetings of the General Assembly, but left the other courts and the rest of the church system as they were before. At the Restoration the higher classes generally, who had suffered under the ecclesiastical tyranny of the ministers, were zealous for the re-establishment of Episcopacy. The greater part of the nation, except in the south-western provinces, was indifferent, and the king experienced no difficulty in restoring the bishops to their former rights both in church and state. But Episcopacy alone was restored; there was no attempt to introduce a liturgy, or even to enforce the observance of the Perth Articles. The new primate, Archbishop Sharp, was an able man of good moral character, but ambitious and overbearing, and the Covenanters never forgave his change from Presbyterianism, though he had always belonged to the more moderate of the two parties into which the church was divided. He was almost the only one of the bishops who enjoyed political influence; and, unfortunately for himself and the hierarchy, that influence was generally used to encourage, not to restrain, the severe measures of the government. When the primate was assassinated that severity became a cruel tyranny, and many who had no predilection for any particular ecclesiastical opinions were ready to welcome the change which took place at the Revolution.

When the Scottish Estates met in 1689 to consider what course was to be adopted in the northern kingdom the bishops declined to abandon King James. Whatever might have been the consequences had they taken an opposite course, this resolution was fatal to the Episcopal establishment. William and Mary were called to the throne, and Prelacy was declared to be an insupportable grievance and was abolished. In the following year Presbyterianism was re-established, and the Westminster Confession of Faith was ratified as the national standard of belief, and the right of patrons to nominate to ecclesiastical benefices was taken away. In the end of the same year a General Assembly was held, the first which had been allowed to meet since its dissolution by the order of Cromwell. It was composed as before of ministers and elders from the various presbyteries and of elders from the burghs and universities, and was presided over by a lay commissioner named by the crown and a minister elected by the members as moderator. With the exception of some years in the reign of William, the Assembly has continued to meet annually since the Revolution and to transact business during the periods when it was not in session by a commission named by itself for the purpose. The other chief ecclesiastical events of William's reign were a series of vain attempts on the part of the sovereign to bring about a comprehension of the Episcopal clergy with those of the Establishment and the passing by the Assembly in 1697 of what was called the 'Barrier Act' (q.v.), which guarded against sudden legislation by providing that no permanent act should be passed until it had received the approbation of the majority of the presbyteries.

During the reign of Queen Anne and in the year 1707 England and Scotland were united into one kingdom. A special statute was passed for the security of the Protestant religion and Presbyterian church government in the latter country; providing that these should continue without any alteration in time to come, and confirming the act of William and Mary which ratified the Confession of Faith and settled the Presbyterian form of church government.

In the year 1712 an act was passed by the British parliament which restored to patrons in Scotland their right of presentation to benefices. This statute excited great discontent among the members of the Established Church, and for many years attempts were made to obtain a repeal of it. These attempts were unsuccessful, but its provisions were long practically disregarded. When at length the General Assembly began to act upon it the dissatisfaction increased among those who held the divine right of the people to choose their own ministers. The leader of the discontented party was a minister named Ebenezer Erskine, and he with his adherents in the year 1733 finally separated from the Establishment and formed a communion which took the title of the Associate Presbytery, though its members were popularly known as the Seceders. The Seceders themselves were soon divided by a dispute as to whether it was consistent with principle to take the Burgher's oath of allegiance into two bodies, called the Burgher and Anti-burgher Synods. In the year 1761 another secession from the Establishment took place in connection with the law of patronage; and the separated body assumed the name of the Presbytery of Relief.

There were no further secessions for nearly a century; but the church was divided into two parties, known as the Moderates and Evangelicals, the former of whom were favourable, the latter hostile, to the law of patronage. For many years the Moderates, headed by Dr Robertson the historian and others of his school, and supported by the influence of the government, maintained an ascendency in the General Assembly and throughout the country. In the later years of George III. and during the reign of George IV. this ascendency began to decrease. The political excitement which prevailed in the beginning of the reign of William IV. strongly affected the Scottish Establishment, which from its very constitution is peculiarly liable to be moved by the impulses of popular feeling. The two parties in the General Assembly engaged in a struggle more fierce than any in which they had yet met; and the subject of dispute as before was immediately connected with the law of patronage. Dr Chalmers, the most distinguished minister in Scotland, added the whole weight of his influence to the popular party, and in 1834 an interim act of Assembly was passed, known as the Veto Act, which declared it to be a fundamental law of the church that no pastor should be intruded on any congregation contrary to the will of the people, and laid down certain rules for carrying out this principle. The legality of this act was doubted; and in connection with a presentation to the parish of Auchterarder the presentee, on being rejected by the presbytery in terms of the Veto Act, appealed, with concurrence of the patron, to the Court of Session—the supreme civil court in Scotland. That court decided that the conduct of the presbytery in rejecting the presentee was illegal, and their judgment was affirmed by the House of Lords. Other cases of a similar nature followed, and something like a conflict took place between the civil and ecclesiastical courts, the former enforcing their sentences by civil penalties, the latter suspending and deposing the ministers who obeyed the injunctions of the Court of Session. In the

General Assembly of 1843 the dispute came to a crisis. A large number of ministers and elders of the popular party left the Assembly and met apart in a similar body, of which Dr Chalmers was chosen moderator. They formed themselves into a separate communion under the title of 'The Free Church of Scotland,' and gave up their benefices in the Established Church and all connection whatever with that body. The Free Church carried off about one-half of the members of the Establishment and became a rival communion in most of the parishes. By an act of parliament in 1874 patronage was abolished in the Established Church and the right of choosing the minister transferred to the congregation.

In 1820 the Burgher and Anti-burgher Seceders were united under the name of the Associate Synod of the Secession Church; and in 1847 this Associate Synod and the Relief Synod were united under the name of 'The United Presbyterian Church.' Negotiations for a union of the United Presbyterian Church and the Free Church have led to no practical result; but the desirableness of a union between the three Presbyterian churches is constantly discussed, though the agitation for the disestablishment of the Church of Scotland has embittered the relations between the mother-church and her daughters.

Episcopal Church in Scotland.—It is a common but erroneous opinion that almost all the Episcopal clergy were Jacobites from the time of the accession of William and Mary. The bishops were so (see NONJURORS); but a large number, probably a considerable majority of the clergy, had at first no objection to take the oath of allegiance to the new government. During the reign of Queen Anne the Episcopal clergy were well disposed to the government, knowing the queen's good wishes to their communion. They were frequently harassed by the courts of the Establishment; but all who were willing to take the oaths obtained an ample protection for their worship on the passing of the Toleration Act of 1712. On the death of the queen almost all the clergy and most of the laity were involved directly or indirectly in the attempts to overthrow the Hanoverian dynasty, and it was this which finally made the names of Episcopalian and Jacobite for many years to be convertible terms.

In the meantime the succession of bishops had been kept up by new consecrations, and after some years the dioceses, though diminished in number, were regularly filled. An important change took place in the forms of worship. No longer trammelled by their connection with the state, they adopted liturgical forms similar to those in the English Prayer-book, and in almost all cases identical, except that many of the congregations used an Office for the communion modelled on that of the Scottish Liturgy of King Charles I. The Episcopalians took no such open part in the insurrection of 1745 as they did in that of 1715, but their sympathies were known to be with the House of Stewart; and the government carried through parliament some intolerant acts, which were put in execution with great harshness, and which for many years suppressed all public worship in the Episcopal communion. It was only after the accession of George III. that these statutes ceased to be actively enforced; and it was not till 1792 that the Episcopalians, who from the death of Prince Charles had acknowledged the reigning dynasty, were relieved from the penal laws. The act which gave this relief imposed restrictions on their clergy officiating in England and prohibited their holding benefices in the English Church. In 1804 the bishops and clergy agreed to adopt the Thirty-nine Articles of the Church of England, and in 1863 the Prayer-book was adopted as the authorised service-book of the Episcopal Church, permission being given in certain cases to use the Scottish Communion Office. The restrictions imposed on the Scottish clergy by the Act of 1792 were modified by an act passed in 1840; and in 1864 they were entirely removed, the right being reserved to bishops in England and Ireland to refuse institution to a Scottish clergyman without assigning any reason, on his first presentation to a benefice in England or Ireland, but not after he should have once held such benefice.

The dioceses of the Scottish Episcopal Church are seven in number—viz. Moray, Aberdeen, Brechin, Argyll, St Andrews, Edinburgh, and Glasgow. The bishops are chosen by the clergy of the diocese and by representatives of the lay communicants, a majority of both orders being necessary to a valid election. One of the bishops, under the name of Primus, chosen by the other bishops, presides at all meetings of the bishops, and has certain other privileges, but possesses no metropolitan authority. The highest judicial body is the Episcopal College, composed of all the bishops. The highest legislative body is a General Synod, composed of two houses, the one of the bishops, the other of the deans and the representatives of the clergy. There is also a Church Council, composed of the bishops, clergy, and representatives of the laity, which meets yearly, and is recognised as the organ of the church in matters of finance.

Roman Catholic Church.—The ecclesiastical revolution of 1560 by no means extinguished the Roman Catholic Church. An act of parliament was indeed passed making the saying or hearing of mass a crime punishable by confiscation of goods and imprisonment for the first offence, banishment for the second, and death for the third. Under its provisions Archbishop Hamilton and some few other priests were thrown into prison in 1563. The bishops for the most part were cowed and helpless, and a number of priests fled the country. Nevertheless, many noblemen and a large part of the population, especially in the north, remained faithful at heart to the old religion, and were till the end of the century a formidable political power upon which the partisans of Queen Mary in England, the Guises, and the king of Spain could rely in their projects against the throne of Elizabeth. Missionaries, chiefly Jesuits, came into the country to keep alive as best they could the decaying faith. The sufferings of both priests and people were extreme, yet notwithstanding the bitter hostility displayed by the kirk with whom the coercive power lay, it is notable that only one priest, John Ogilvy the Jesuit, suffered the penalty of death (1615), and this not on the ground of his priestly office, but for language which was, not unnaturally, judged to be treasonable.

The Scottish Roman Catholics suffered also for a long time from the want of any regular ecclesiastical organisation. In 1598 the secular clergy were placed under the jurisdiction of the newly-appointed archpriest of England, George Blackwell, and in like manner continued to be subject to Dr William Bishop, the first vicar-apostolic of England and Scotland, in 1623. It was not until nearly a century after the Reformation (1653) that they were granted a 'prefect' of the mission in the person of William Ballantyne. Meanwhile measures were taken to keep up the supply of missionary priests by the foundation of seminaries abroad. Clement VIII. founded the Scots college at Rome in 1600. In 1612 a seminary originally set up at Tournai, after many wanderings, was finally established at Douai. A college was opened at Madrid in 1633, and subsequently transferred to Valladolid. Another seminary was established at a later period in connection with the Scottish monastery at Ratisbon. During the whole of the 17th and 18th centuries, or until the episcopate of the illustrious convert from Protestantism, Dr William Hay (1769-1811), the fortunes of the Scottish Catholics were at a very low ebb. Bishop Hay founded in 1799 a seminary at Aquhorthies near Inverurie, and provided Catholics with a new literature.

A report made to Rome in 1679 estimated the total number of Catholic *communicants* at 14,000. Of these 12,000 belonged to the Highlands, where, however, there were only 3 or 4 priests. In 1705 there were said to be 160 Catholics in Edinburgh, 5 in Leith, and 12 in Glasgow. Certain districts of the Highlands and Islands named as exclusively Catholic are South Uist and Barra, Canna, Rum and Muck, Knoydart and Morar, Arisaig, Moydart and Glengarry, in which places there were about 4500 Catholics. The district of Braemar contained 500. There were at this time 36 priests on the mission in all Scotland. The number of Catholics in the country about the year 1779 has been estimated at from 20,000 to 30,000, while it is said that not more than twenty of these possessed land worth a hundred a year. A very great increase, chiefly owing to the influx of Irishmen, took place at the beginning of the 19th century. In 1800 Edinburgh and Leith contained 1000 Catholics; in 1829, 14,000. In the latter year there were 25,000 in Glasgow, 1500 in Perth, 1400 at Preshome, 1500 in Glengarry, 1000 in Dumfries, and 3000 in Aberdeen—the whole Catholic population being reckoned about this time at 70,000, including the bishops and 50 priests. In 1890 there were in Scotland 338,643 Catholics (220,000 in Glasgow alone), 332 chapels, and 350 priests.

The first bishop appointed as vicar-apostolic for Scotland was Thomas Nicolson (1695). The vicariate was divided into a Lowland District and Highland District in 1731, and into three districts in 1828. The Hierarchy, consisting of two archbishops, St Andrews and Edinburgh, and Glasgow, and four bishops suffragans of the former, was established by Leo XIII., March 4, 1878. St Mary's College at Blairs, 6 miles south-west of Aberdeen (whither the seminary was removed from Aquhorthies in 1829), has a president and four professors.

The chief original authorities for the ecclesiastical history of Scotland down to the Revolution are the same as those mentioned in the article on the Civil History, to which may be added Theiner's *Vetera Monumenta Hibernorum et Scotorum* and Joseph Robertson's *Concilia Scotiæ* (2 vols., Bannatyne Club, 1866). The chief modern authorities are Cook's *History of the Reformation* and *History of the Church of Scotland;* Principal Lee's Lectures (1860); Principal Cunningham's *Church History of Scotland* (2d ed. 1883); the present writer's *Ecclesiastical History of Scotland* (4 vols. 1861); Scott's *Fasti Ecclesiæ Scoticanæ; The Church of Scotland, Past and Present*, edited by Professor Story (5 vols. 1891). See also Dean Stanley's *Lectures on the History of the Church of Scotland* (2d ed. 1879), with Principal Rainy's Reply (1872); the *St Giles' Lectures* (1881); Bishop Wordsworth's *Discourse* (1881); for the Free Church point of view, M'Crie's *Sketches* (1841), Hetherington's *History* (1841), and Buchanan's *Ten Years' Conflict* (1849); for the Episcopal side, Russell's *Church of Scotland* (1838) and Miss Kinloch's *History* (1888). See W. Forbes-Leith, S.J., *Narratives of Scottish Catholics under Mary Stuart and James VI.* (1885); *The Catholic Church in Scotland*, edited by the Rev. J. F. S. Gordon (Glasgow, 1869); and Dr Bellesheim, *History of the Catholic Church in Scotland*, trans. by F. Hunter-Blair, vols. iii. and iv. (1889-90); and see in this work the articles on CONFESSIONS OF FAITH, COVENANT, PRESBYTERIANISM, ASSEMBLY, ELDER, FREE CHURCH, UNITED PRESBYTERIANS, CAMERONIANS, and those on the great church leaders, Knox, Melville, Henderson, Chalmers, Macleod, Tulloch, &c.

SCOTTISH LANGUAGE.—This name is now applied to the Teutonic speech of Lowland Scotland, especially in its literary form, as the official language of the kingdom in the 15th and 16th centuries, and the vehicle of ballad and lyric poetry down to the present day. As originally used, it meant the Celtic language of the Scoti or Scots of Ireland, and to a comparatively late date it continued to be applied to the same language as spoken by the Celtic people of the Highlands and Western Isles, the 'Saxon' tongue of the Lowlander being then usually distinguished as 'Inglis' or English. All the earlier Scottish writers, Barbour, Wyntoun, Harry the Minstrel, Dunbar, and even Sir David Lyndsay recognised their language as 'Inglis;' Fordun, about 1400, still applied the name *Scottish* to the Celtic, saying of his countrymen: 'For they use two languages, the Scottish and the Teutonic (*Scoticâ et Teutonicâ*); the people speaking the latter occupies the seacoast and lowland districts, the people of Scottish language (*linguæ gens Scoticæ*) inhabit the highlands and isles beyond.' But as the nationality of Scotland, as distinct from England, became more definitely recognised, there were obvious inconveniences in applying the name *Scottish* to the speech of what had become the least important section of the nation, and the Celtic tongue began to be usually spoken of by Lowlanders as Yrische or Ersche; it was natural also that in the struggle with 'oure alde enemeis of Ingland,' the name *Inglis* should become distasteful to patriotic Scots; and, accordingly, in the 16th century, the name 'Scottis,' after having been disused for more than a century, was recalled, and applied to the Lowland tongue as being the official language of Scotland and of the vast majority of Scotsmen. Thus Gavin Douglas in the preface to his translation of *Virgil*, and the author of the *Complaynt of Scotland*, claimed to write in the 'Scottis toung;' and from 1550 onwards this has always meant the Teutonic or Saxon speech of Lowland Scotland, the original *lingua Scotica* of the Highlanders being distinguished as Erse or Scottish Gaelic. The latter is a form, or group of forms, of the common Celtic tongue which is spoken, with many dialectal gradations, from Cape Wrath in Scotland to Cape Clear in Ireland, the Gaelic of Argyll and Islay not differing from the Irish Gaelic of Ulster on the one hand, more than it does from the Scottish Gaelic of Inverness and Skye on the other. The Erse has been a literary language in Ireland from a remote period; its literary career in Scotland is much shorter, beginning with Carswell's Gaelic version of John Knox's Liturgy, printed in 1567, and of little moment before the 19th century. The Gaelic is still extensively spoken in Scotland west and north of a line which runs up the Firth of Clyde and Loch Long, and crosses by Glen Douglas, Rowardennan, Aberfoyle, Callander, Comrie, Dunkeld, Glen Shee, Mount Blair, till it reaches the Dee 6 miles above Balmoral; leaving the Dee 3 miles above Ballater, it continues by the southern watershed of Glen Livet to the Spey and Knock of Moray, Coulmony on the Findhorn, and reaches the Moray Firth about 3 miles west of Nairn. East of this line, as also in the north-east half of Caithness and in the Orkney and Shetland Isles, Gaelic is no longer native; but even to the west of the line a large proportion of the population is bilingual. There has never been any newspaper or journal published in Gaelic, so that the literary standing of the language is very different from that of Welsh.

The Lowland Scotch is a form of the Teutonic or Germanic speech introduced into Britain by the Angles and Saxons in the 5th century. These tribes spoke different dialects, which may be broadly distinguished as *Saxon*, including West

Saxon and Kentish, and *Anglian*, including Mercian and Northumbrian. In the Middle English period these developed into the Southern, Midland, and Northern English dialects respectively. Lowland Scotch forms part of the Northumbrian or Northern English division; modern standard English is a blending of Midland and Southern. Before the Norman Conquest, and for some centuries later, the old Northumbrian was spoken probably with little or no variation from the Humber to the Firth of Forth. But after the division of the Northumbrian territory between England and Scotland, and especially after the final establishment of the independence of Scotland in the beginning of the 14th century, this common speech began to be exposed to diverse influences north and south of the Border. South of the Tweed and Cheviots the Northumbrian sank from the rank of a literary language used by poets, preachers, and chroniclers, to that of a local dialect, or group of patois, overshadowed by the king's English of London, and more and more depressed under its influence. After 1400, or at least after the 15th century, it disappears from the view of the student. But north of the Tweed and Solway the Northumbrian remained the language of a court and a nation; it spread westward and northward over districts formerly occupied by British and Gaelic (or it may be Pictish) populations, from which it sustained modifications phonetic and structural; it received literary culture, and especially contracted alliances with French and Latin on its own account; so as to acquire by the close of the 15th century distinctive and strongly-marked features of its own not found in the cognate dialects in the north of England. From the close of the 14th to the beginning of the 17th century it was the vehicle of an extensive and in many respects brilliant literature, it was the medium of legislation and justice, and fulfilled every function of a national language. But a serious shock to its independent development was given by the Reformation, in consequence of the close relations between the leaders of that movement with the English Protestants, and the use of English books, especially of the English version of the Geneva Bible, printed at Edinburgh in 1576-79. Then followed the accession of James VI. to the crown of England, the transference of the seat of government to London, and the consequent disuse of the 'Scottis toung' by the court and by the nobility, who found it desirable to speak the king's English, and gradually grew ashamed of their Scotch. After this, few works were written in the native tongue, except such as were intended for merely local use. It became obsolete in public legal use at the time of the Commonwealth, and though retained a little longer in the local records of remote burghs and kirk-sessions, it disappeared from these also by 1707. But though it thus became obsolete in official and literary use, so that Scotchmen thenceforth wrote in English tinged more or less with Scotticisms, or words, phrases, and idioms derived from their native speech, it still continued, in several dialectal varieties, to be the vernacular of the people, and after a period of neglect it bloomed forth anew as the vehicle of ballad and lyric poetry, in Lady Wardlaw, Allan Ramsay, Burns, and their numerous fellow-singers. Sir Walter Scott also led the way in its use in prose fiction as the characteristic speech of local characters, a purpose for which it has continued to be effectively used down to the present day by many popular writers. These uses are, however, only *dialectal;* they must be classed with the similar use of Lancashire, Cumberland, Dorset, or Devonshire dialect, by English poets and novelists as the appropriate language of the local muse, and of local *dramatis personæ;* with this difference that Scottish, having been a literary language, has preserved a certain literary status which is wanting to these English dialects. But even this difference tends to disappear; recent writers of Scottish tales have sought to heighten the local truthfulness of their delineations, by giving as close a transcript as possible of the local speech, regardless of the traditional conventionalisms of the 'literary' Scotch.

The Teutonic tongue was probably introduced into the country south of the Forth as early as into any part of England. But few actual specimens of the language in these early times have come down to us; the chief is the Runic inscription still extant on the Ruthwell Cross in Dumfriesshire in the old Northumbrian of about 660; then there are the local names, which, in so far as they are those of the dwellings of men, or of the less conspicuous natural features, are in eastern Lothian, Teviotdale, and lower Tweeddale, as truly Teutonic as in Kent or Essex. Isolated vernacular words and phrases in early Latin charters, and in the Latin texts of the early laws, some of which go back to the reign of David I., testify to the currency of the language in the 11th and 12th centuries. But connected specimens are all of later date, and the earliest of these are, moreover, known only in transcripts much later than their own date. Thus the eight lines of verse beginning:

Quhen Alysander oure kyng wes dede
That Scotland led in luve and le,

though referring to events which followed the year 1289, are preserved for us only by Wyntoun who wrote after 1400. Rude snatches of song relating to the siege of Berwick in 1296 are preserved by Fabyan who wrote about 1500. Even Barbour's *Brus*, written about 1375, is, with the exception of the passages incorporated by Wyntoun, preserved only in MSS. more than a century younger. A charter of 1385 in the 'Red Book of Glen Tully,' and fragments of Scottish acts of 1389 and 1398 are among the earliest contemporary documents. But after 1400 the remains become plentiful.

The Scottish language as thus known to us has been divided into three periods: *Early Scottish*, during which the language did not differ appreciably from the Northern Middle English, extending from the earliest remains down to about 1475; *Middle Scottish*, the national period of the language, from that date to about 1650; *Modern Scotch*, the dialectal period, from 1650 onwards. The distinctive characters of these periods are fully set forth in the Historical Introduction to a treatise on the *Dialect of the Southern Counties of Scotland* (1873), by the present writer. It will be observed that the first is coterminous with the Middle English Period of the English language, as recognised by modern scholars, and that the second is co-extensive with the Early Modern or Tudor and Early Stuart Period of modern English. Barbour and Wyntoun represent the Early Period; Dunbar, Gavin Douglas, Lyndesay, Montgomery, and the fine prose of Bellenden and the *Complaynt of Scotland*, Archbishop Hamilton's Catechism, and the writings of Ninian Winzet, Father Dalrymple, and other Roman Catholics belong to the Middle Period; the poets and novelists of the 18th and 19th centuries, the Modern Period.

The living tongue now exists in numerous dialects and sub-dialects, easily distinguished from each other by differences of pronunciation and vocabulary. The researches of Dr Murray, followed by those of Dr Alexander J. Ellis, have established three main dialects, classed as Southern or Border Scotch (Teviotdale, Dumfriesshire, and Selkirkshire); Central Scotch (Lothian and Fife, Ayrshire and Clydesdale, Galloway, south-east

Perthshire); North-eastern Scotch (Angus, Aberdeen and Moray, Caithness). In the Orkney and Shetland Isles dialects of the Norse survived till a century ago, many traces of which still characterise this fourth or *Insular Scotch* group (see the article Dialect, by Dr A. J. Ellis).

It was long a favourite notion that the Scottish speech contains a much larger Norse element than English; some writers even went to the length of claiming that it was of Scandinavian rather than of Anglo-Saxon origin. This is an entire mistake. There is no record of any Norwegian or Danish conquests and settlements in the east of Scotland, as in the east of England. In England the northern limit of Danish influence is about Durham; the county of Northumberland and the whole Scottish Lowlands, except a small district near the Solway, are entirely void of Danish characteristics. The differences relied upon as evidences of Scandinavian influence in Scotland, are really the differences between a pure Anglian dialect such as that of Scotland, and the largely Saxon dialect which lies at the basis of literary English. Scandinavian words and forms prevail extensively in certain English dialects, as in Yorkshire and Lincolnshire, but fewer of them have passed into Scotch than into literary English.

The greatest work dealing with the Scottish language is Dr Jamieson's *Dictionary* (published 1804, with supplement, 1825; new ed. 1879-87). The author aimed to include both the literary words of the earlier periods and the modern words from all the dialects. For the former he was necessarily hampered by the deficiency of available printed material. For the latter he was dependent on the co-operation of friends in different districts. It is to be wondered that in these circumstances he produced so estimable a work. Its most serious defect was due to his utter ignorance of the subject historically, and his erroneous fancy that Scotch was more intimately related to the tongues of Scandinavia, even to Suio-Gothic, as he called old Swedish, than to northern English. This coloured his whole work, even his definitions. The *New English Dictionary* (vol. i. 1888) of the Philological Society includes all literary Scottish words, either in separate articles or as variants of corresponding English ones. It would still be desirable to make a systematic collection of all living Scottish words, of all the dialects, for which Jamieson's modern words might serve as a basis. How much remains to be done in this way is apparent from the Rev. Walter Gregor's *Glossary of Banffshire* (1866) and Mr T. Edmonston's *Shetland Glossary* (1866), both published by the Philological Society.

Scottish Literature.—A special difficulty presents itself in connection with the literary history of Scotland. Are we to regard as Scottish literature only what is written in the Scottish vernacular in its various developments from Barbour to Burns? Thus regarded, Scottish literature would manifestly be the inadequate expression of the Scottish character and genius. On the other hand, the literature produced by Scotsmen in standard English is for many reasons best treated under the general head of English literature. Nevertheless, a national literature being the expression of the national consciousness only when considered as an organic whole, the survey here attempted will take account of the total contribution made by Scotsmen to the literature of the world.

The literature of Scotland definitely begins with John Barbour (died 1395). A few scraps of verse of questionable authenticity and doubtful authorship hardly justify us in saying that he had any predecessor. Barbour's *Brus* marks an epoch at once in the literature and the political history of the country. As has been said of him, he is the first poet and, at the same time, the first historian of Scotland. In his sober and yet imaginative presentment of his theme—the deeds of the national hero and the establishment of the national independence—Barbour struck that note in Scottish literature so conspicuously manifest in the intense national feeling of Burns and Scott. As the exponent of the same tradition with all the exaggerations of popular feeling, Blind Harry, though he came a century later, may be naturally grouped with Barbour. Of little value as poetry, and grotesque in its perversion of the story he professed to tell, Blind Harry's *Wallace* has its distinct place in the national life of Scotland. 'Next to the Bible,' says its latest editor, 'it was probably the book most frequently found in Scottish households.'

Chaucer may with even greater truth be called the father of Scottish than of English poetry. In England he had predecessors who cannot be altogether disregarded: in Scotland, with the exception of Barbour, who was not great enough to be a source of inspiration, he had none. Moreover, the Scottish poets who looked to him as their master made a far more distinguished succession than his imitators in England. Inspired by the form and the themes of Chaucer, his followers in Scotland in individual effects often surpassed their model, and even suggest the question whether they would not have done better to trust more to their own natural impulse. To the close of the 16th century, however, it was on Chaucer that the poets of Scotland had ever their eyes fixed, and it was by their approximation to his models that they measured their success in their art.

The Scottish line of Chaucerians begins with James I. (died 1437). By his own natural affinities, and by the accident of his personal history, James is the most deeply imbued of them all with the spirit of the English poet. While he was thus so distinctly the vehicle of another's inspiration, every reader of the *King's Quair* feels that in its delicacy of feeling, its sense for the music and subtler shades of language, it is the expression of a mind essentially poetic in its deepest construction of nature and human life. It is in itself a fact of curious interest that the Scotland of James II. and James III. should have produced a poet of the type and of the importance of Robert Henryson. That Henryson achieved the work he did is, in truth, conclusive proof that there was a higher consciousness in the nation than the external history of the time would lead us to infer. The work of Henryson is marked by qualities which have not been conspicuous in poets of his country even greater than himself—pervading artistic feeling and justness of thought and sentiment. In his *Fables*, the *Abbey Walk*, *Robene and Makyne* ('the first English pastoral'), and the *Garmond of Fair Ladies* he exhibits such a range of poetic gifts, and of such an order, as must always ensure to him his own niche among the imaginative writers of British literature. Of a very different type and of far greater natural force is Henryson's younger contemporary William Dunbar. A Chaucerian also, Dunbar is generally acknowledged to have surpassed his master in imaginative intensity and in the blended effects of ghastly humour and daring conception. 'In brilliancy of fancy,' says Scott, 'in force of description, in the power of conveying moral precepts with terseness, and marking lessons of life with conciseness and energy, in quickness of satire, and in poignancy of humour, the Northern Maker may boldly aspire to rival the Bard of Woodstock.' Where Dunbar falls short of the highest order of poets is in that largeness of humanity, in that just and genial survey of life which gives its breadth and serenity to the work of Chaucer, and has assured his supreme place in English literature. From the number of Dunbar's poems it is sufficient to specify *The Thrissil and the Rois*, *The Golden Targe*, *The Dance of the Sevin Deidly Synnis* (one of the memorable efforts of poetic genius), *The Justis* *betwix the Tailzeour and the Sowtar* as those which best exhibit his power. Of Dunbar it has to be added that he is the first Scottish writer in whom are unmistakably present the distinctive traits of the national genius as it has expressed itself in literature. As the translator of the *Æneid*, Gavin Douglas (1475-1522) must always remain an interesting figure; and it is on his translation that his claims as a poet mainly rest. In the opinion of the very latest critics Douglas has rendered his author with a sympathetic insight and frequent felicity of interpretation which have not been surpassed by any subsequent translator. Without natural inspiration, however, he fails when left to his own resources. His *Palice of Honour* and *King Hart* are purely conventional productions, without individual stamp, in the tedious allegorical fashion of the time. Like his three predecessors, Sir David Lyndsay (1490-1555) regarded Chaucer as his great exemplar in poetry, and in his early poem *The Dreme* he is directly inspired by his model. Yet no two minds could be more essentially unlike than Chaucer and Lyndsay. Chaucer's view of life was essentially that of a poet: for Lyndsay the world around him was a sight which he regarded not through the medium of the poetic imagination, but with the direct feeling of one moved to the heart by the strivings and sufferings of his fellow-men. The period in which he lived, also, was more proper to men of his type than to men of the purely poetic temper. By the time he reached manhood the great religious revolution of the 16th century had broken upon western Europe, and was begetting universal discontent with existing conditions, and specially with the clergy of the ancient church, who were mainly responsible for the state to which society had come. With the majority of the men of letters of his time, therefore, Lyndsay found scope for his talent as the critic and censor of the social order around him. By the vigour and effect with which he accomplished this task in such poems as *The Testament of the Papyngo*, *The Satyre of the Thrie Estaitis*, and *The Dialog concerning the Monarchie* he did for Scotland what Erasmus did for Europe, preparing the way for Knox as Erasmus did for Luther. As poet and champion of the people Lyndsay came to hold a place in the hearts of his countrymen from which Burns alone was able to dislodge him.

The very success which the four poets just named achieved in their art is proof of a cultivated opinion which made their development possible. It is but what we should expect, therefore, that these four poets are only the brilliant survivors of a numerous race who were their rivals for poetic distinction. The list of such given by Dunbar in his *Lament for the Makars* leaves us with a lively impression of the intellectual activity of an age which many things might persuade us was one in which the finer play of the human spirit was hardly to be looked for. In this connection reference should also be made to that ballad poetry of which Scotland has produced such splendid specimens in their kind. Though their date and authorship cannot be definitely fixed, it seems unquestionable that many of the best of the ballads belong to the 15th and 16th centuries.

It was in vernacular poetry that the Scottish genius found its highest expression during the period of which we are speaking; but along other lines of expansion there was no lack of well-directed effort. There is conclusive evidence that the intellect of Scotland had already taken that bent which it has kept ever since—that bent for the dialectic treatment of abstract questions which eventually produced Scottish theology and Scottish philosophy. At the close of the 15th century Erasmus notes as a generally recognised fact the affinity of the Scots for abstract thinking, and about the middle of the 16th the younger Scaliger made a similar remark in somewhat different terms. According to Renan, Michael Scott was the first (1230) to introduce the Aristotelian Commentaries of Averrhoes into the western schools—an event of the first importance in the intellectual history of Europe. To Duns Scotus (who according to the best authority, John Major, was undoubtedly a Scotsman) belongs the credit of leading the way by his remorseless logic to the emancipation of men's minds from the scholastic philosophy after it had done its work of discipline on the mind of Europe. The foundation of the three universities of St Andrews (1411), Glasgow (1451), and Aberdeen (1494) is another proof of what has been already said, that in spite of chronic strife and confusion there was a section of the community who had steadily at heart the highest interests of the country.

Like other countries of Europe, Scotland had also during this period its succession of chroniclers of varying degrees of merit. The first of these was John of Fordun, who between 1384 and 1387 wrote his Latin chronicle of the Scottish nation (*Scotichronicon*), afterwards unscrupulously interpolated and continued by Walter Bower (died 1449). With these, though he wrote in vernacular verse, may be mentioned Andrew of Wyntoun, who towards the end of the 14th century composed his *Orygynale Cronycle*, or story of the world from its creation. Of much higher merit as being the product of a time when the Revival of Learning had extended knowledge and raised the level of thought are the Latin histories of Hector Boece (died 1536) and John Major (died 1550). The translation of Boece's history into Scots by John Bellenden is the work of a writer who consciously uses language both with knowledge and skill. An interesting anonymous tract in the Scottish dialect, *The Complaynt of Scotland* (1548), is a curious example of that superfine writing which among the humanists of the time was known as Ciceronianism.

During the latter half of the 16th century the mind and heart of Scotland were engrossed in the task of adjusting its social and political system to the religious settlement accepted by the country in 1560. The time was therefore in the highest degree unfavourable to the growth of imaginative literature. Such productions as the *Gude and Godly Ballades*, interesting as the deepest utterance of the time, show the dominant note even of poetic feeling. When every explanation has been suggested, however, it is a strange fact that Scotland, which during the 15th century had so distinctly the advantage of England in the quality of its poetic literature, for this period can only show against the Elizabethan galaxy such names as Sir Richard Maitland, Alexander Montgomery, Alexander Hume, and King James VI. In vernacular prose the most notable production of the period is John Knox's *History of the Reformation in Scotland*, a work of national importance to his own country, and by the imprint it bears of a commanding personality holding a unique place in its literature. The *History of Scotland* by Bishop Lesley (afterwards translated into Latin), the *Memoirs* of Sir James Melville, and the *Tractates* of Ninian Winzet, though of no special literary excellence, are all the works of men alive to the great questions that moved the world of their time. Of all the Scotsmen of this period, however, the greatest literary genius was George Buchanan, who by the grace of his Latin poetry and his equal skill in prose gained a reputation second to no writer in Europe. In Buchanan's vernacular writings also, the *Admoni-*

tioun and *The Chamæleon*, we have the most skilfully wrought Scottish prose that has come down to us. As a scholar of singular attainments, though of no distinctive literary genius, Andrew Melville may also be mentioned as one among many examples of Scotsmen who profited to the utmost by the new studies of the Revival of Learning.

For the 17th century Scotland has but one distinguished poet to show—William Drummond of Hawthornden (1585-1649). In other departments of literature there were many able workers, but none of whom it can be said that their work is of very high order in its kind. During this century also Scotland was absorbed in questions that lay at the roots of the national life, and till these questions should be finally settled a collective intellectual movement, such as is necessary to a great literature, was a moral impossibility. The union of the crowns and the removal of the court in 1603 had likewise for the time an injurious effect in weakening the national spirit, which in the 15th century had been so potent an inspiration. Thenceforward the Scottish language gradually gave way before the standard English, and it is a significant fact that Scotland produced nothing of literary importance in its own dialect till the appearance of Allan Ramsay's *Gentle Shepherd* in the following century. As regards its achievement in literature during the 17th century, therefore, Scotland may be very briefly disposed of.

With Drummond of Hawthornden may be named as poets Sir William Alexander (Earl of Stirling) and Sir Robert Ayton, though neither produced work that deserves a place in a British anthology. In Drummond, however, we have a poet the distinction of whose character and genius has made him one of the interesting figures in literary history. Poor as was the beginning of the century in poetry, the latter half is poorer still, since it boasts not one name that deserves even a passing mention. As continuing the tradition in Latin poetry so brilliantly initiated by Buchanan may be noted the *Delitiæ Poetarum Scotorum*, a collection of Latin poetry written by Scotsmen. Among its contributors Arthur Johnston merits special mention as the Scotsman of the period who after Drummond gave proof of the finest literary gift. In history the best work was done by David Calderwood and Archbishop Spottiswoode during the first half of the century, and by Sir James Dalrymple and Bishop Burnet in the second half. Against the brilliant list of English divines for this period Scotland can only show as its two best known Samuel Rutherford and Archbishop Leighton—the latter, however, a writer of such fine suggestions that Coleridge could speak of him as a Christianised Plato. As miscellaneous writers holding a place apart Sir Thomas Urquhart, the translator of the first three books of Rabelais, and Robert Barclay (1648-90), author of the *Apology for the Quakers*, close the list of the most distinguished names in Scottish literature during the 17th century.

Far different is the literary record of Scotland for the 18th century. Due proportion guarded, it may be safely said that during this period she was surpassed by no country in Europe in brilliant initiative and in solid contribution in every field of intellectual activity. The mere enumeration of the more important names in each department shows that this statement is no exaggeration.

Of the crowd of poets who wrote in the vernacular two stand out pre-eminently as the representatives of their fellows. In the first half of the century Allan Ramsay in his *Gentle Shepherd* produced a work which, in virtue of its intrinsic quality, and as the only example in its kind, is in its own degree a British classic. Robert Burns, born the year after Ramsay's death, is the greatest natural force in the imaginative literature of the 18th century, and it is the supreme tribute to his genius that his poems have made classic the dialect in which he wrote. Two poets who wrote in English also call for special notice in virtue of the fresh impulse of thought and feeling which they communicated to the poetry not only of Britain but of Europe. In his *Seasons* James Thomson (1700-48) gave expression to certain aspects of man's relation to nature which freshened the sources of English poetry and on the Continent influenced notably, among others, Jean-Jacques Rousseau. As perhaps the first to strike the dominant note of Romanticism James Macpherson (1738-96), the 'translator' of the pseudo-Ossianic poems, is rightly regarded as one of the literary forces of his century. In history David Hume (1711-76) and William Robertson (1721-93), both writing before Gibbon, gave a new character and aim to the treatment of the past, and by their insight, philosophic breadth, and literary skill made an era in the science of human affairs. As has been already said, it is the ruling instinct of the Scottish mind to busy itself with the mysteries that lie at the heart of things, and in the 18th century we have signal illustration of the fact. In the line of philosophic thinkers it is sufficient to name Hume, Reid, and Adam Smith to indicate the far-reaching importance of Scottish thought and speculation during the period we are considering. From Hume's disintegrating scepticism dates an epoch in metaphysical science, the extraordinary development of modern German thought resulting by natural recoil from his main position. As the founder of what is distinctively known as the Scottish philosophy Thomas Reid had in France an even more direct and potent influence than Hume in Germany. Of Adam Smith's *Wealth of Nations* it is enough to say that by the consenting opinion of Europe it is one of the epoch-making books in man's history. As masters in their own department, Smollett and James Boswell likewise deserve to be named even in the most cursory account of British letters.

The time has not yet come when the literary forces of the 19th century can be reckoned with the same precision as in the case of the centuries that preceded it. Of Scotland, however, it may be safely said that the literary succession of the 19th century is not unworthy of its brilliant predecessor; and it may also be added that all the work of the highest order contributed by Scotsmen to the imperial literature bears the unmistakable stamp of its national origin. In the two greatest literary Scotsmen of the century, Scott and Carlyle, the distinctive genius of their country cannot be missed. While the work of Scott has its elements of universal interest, in its initial inspiration, in its recurrent moods it is one in nature with the Scottish soil and the Scottish race. In Carlyle we have in ungovernable force that emotion in the presence of the mystery of things against which, as he has himself told us, Scott likewise had all his life to do battle, and which, as we have seen, may be regarded as the deepest and most constant note of the Scottish character and genius.

In the foregoing sketch only writers of the first importance have necessarily been mentioned; but such names as the following can hardly be left unnoticed in the briefest account of the literature of Scotland. For the 18th century Miss Jean Elliot, Mrs Cockburn, Lady Anne Barnard, John Skinner, and Robert Fergusson as writers of Scottish verse; and John Home, Henry Mackenzie, Lord Hailes, and Dr Adam Ferguson as writers in standard English, may be specially named. In the

19th century there has been no lack of poets in the vernacular—among the best known being Robert Tannahill, James Hogg, Allan Cunningham, William Tennant, William Laidlaw, and William Motherwell. Thomas Campbell, Joanna Baillie, Professor Wilson, and Professor Aytoun, as poets; George Chalmers, Malcolm Laing, John Pinkerton, Dr M'Crie, Patrick Fraser Tytler, Sir Archibald Alison, and John Gibson Lockhart, as biographers and historians; Dugald Stewart, Dr Thomas Brown, Sir James Mackintosh, Sir William Hamilton, and Professor Ferrier, as philosophers; and John Galt, Professor Wilson, John Gibson Lockhart, Miss Ferrier, and Michael Scott, as novelists, represent the main contribution of Scotsmen to English literature, living authors being left out of account.

See the introductions to the different volumes issued by the Scottish Text Society; David Irving, *Lives of the Scottish Poets* and *Lives of Scottish Writers;* Dr John Ross, *Scottish History and Literature to the period of the Reformation* (1884); Chambers, *Cyclopædia of English Literature;* the various histories of English literature; and in this work the articles on the authors named, as well as those on more recent Scottish writers, such as Mrs Oliphant, George Macdonald, William Black, Andrew Lang, and R. L. Stevenson.

Scotland Yard, in Whitehall, being the headquarters of the metropolitan police, is believed to have received its name from a palace there in which kings of Scotland and their ambassadors occasionally lodged. New Scotland Yard, the police headquarters since 1890, is on the Thames Embankment.

Scots Greys. See DRAGOON.

Scots Guards is the name of a well-known regiment of Guards (q.v.) in the British army. But the name has most national interest as that of the Scottish force which served the kings of France. The alliance of the Scots and the French, never, perhaps, very cordial and spontaneous on either side, lasted, nevertheless, for a very long period, and was maintained by common interest and reciprocal benefits, and is still distinctly traceable in the Scottish language, laws, and institutions. This alliance originated and developed in the persistent efforts of the Edwards and their successors to subdue both France and Scotland to the English crown. In no outward fact, however, does this alliance appear more conspicuously and interestingly than in the history of the Scots Guards or Scottish Archers in France, extending over 400 years, from 1418 till 1830. All Scotland and all Europe is familiar with the vivid picture of that theme presented by Walter Scott in *Quentin Durward,* in Le Balafré, in the veteran Lindsay, and in the other living figures of that romance, which is mainly based on fact.

In the distracted, almost hopeless, state to which Henry V. of England reduced France in the time of Charles VI. the Scotch archers, who then began to flock thither in large numbers by way of La Rochelle, the only port at that time not yet in possession of the English, distinguished themselves as the staunchest element in the French forces, as the rallying centre of a new army. From 7000 to 10,000 landed in 1419 under the command of the Earl of Buchan. The great victory of Charles VII. at Baugé on 22d March 1421, celebrated in the French court by a whole month's rejoicings, was the achievement of Scotch valour. In that engagement the Duke of Clarence was unhorsed by Sir John Swinton, and had his death-blow dealt him by the Earl of Buchan, who was rewarded with the highest military office in France—that of Constable. At Verneuil in 1424 the Scots fought to the last with stubborn determination, but the English gained a bloody victory. Soon after this the Scottish gentlemen were constituted the king's special bodyguard, and Archibald, Earl of Douglas, who had come over from Scotland at the invitation of the king, was created Duke of Touraine. Of the fifteen companies of men-at-arms, the beginning of a standing army, formed by Charles VII. two were composed exclusively of Scotsmen—'Les Gendarmes Ecossais' and 'La compagnie Écossaise de la Garde du Corps du Roi.' Subsequently Louis XII. solemnly recognised 'that the institution of the Scots Men-at-arms and the Scots Life-guards was an acknowledgment of their services and their great loyalty and virtue.' To the league against his father the Dauphin (afterwards Louis XI.) tried in vain to gain over the Scots Guards, and after his own accession to the throne Louis XI. rewarded their constancy by increased pay and privileges. And assuredly he had no cause to regret his favour towards them, for on two occasions he had them to thank for his personal safety; the first time, after the drawn battle of Montlhéry, when 'the Scots Guards, considering the danger the king was in, took his majesty, who had been in arms all day without eating or drinking, and carried him safe to the castle of Montlhéry;' the second time, when Louis XI. would have fallen in the furious night sortie of the Liégeois against the besieging forces of France and Burgundy but for the valiant defence of the Scots Guards. In the field of Seminara, when the French cavalry were *culbuté* and the Italian rear-guard had fled, the Scots still stood their ground, refusing to fly or surrender, and preferring to be hewn down, as they were to the number of 400. In the wars of Charles VIII., Louis XII., and Francis I. the Scots took a leading part.

After Scotland became Protestant the alliance with France naturally declined. Yet in the war of Richelieu with the Spanish monarchy we find, besides the Scots men-at-arms under Lord Gordon, the regiment of the *Gardes Écossaises,* Sir John Hepburn's famous regiment, Forbes's corps of infantry and cavalry, and Colonel Douglas' regiment—all purely Scottish; and under Louis XIV. the Scots continued to take precedence of the rest of the army, heading the French in all the great battles of that reign, Minden, fought on 1st August 1759, being the last in which they figured. After this time the regiments, though they retained the Scottish name, were recruited mainly by French youths; and at the Revolution Scots guards and men-at-arms were, of course, disbanded. Reinstated again in their old privileges, they finally disappeared with the old monarchy in 1830.

See Father William Forbes-Leith, S.J., *The Scots Men-at-Arms and Life-guards in France* (2 vols. 1882).

Scott, a great Border house whose pedigree has been traced back, somewhat dubiously, to one Uchtred Filius Scoti, or Fitz-Scot, a witness to David I.'s charter to Holyrood Abbey (1128), and thereafter to Richard Scot of Murthockston in Lanarkshire (1294), the cradle, however, of the race having been Scotstoun and Kirkurd in Peeblesshire. Anyhow, we find them possessors of Buccleuch in the lonely glen of the Rankle Burn, Selkirkshire, in 1415, and of Branxholm, near Hawick, from 1420–46 onwards. The then Sir Walter Scott fought for James II. at Arkinholm against the Douglases (1455), and was rewarded with a large share of the forfeited Douglas estates; and at subsequent periods his descendants acquired Liddesdale, Eskdale, Dalkeith, &c., with the titles Lord Scott of Buccleuch (1606) and Earl of Buccleuch (1619). Among them were two Sir Walters, one of whom fought at Melrose (1526), Ancrum (1544), and Pinkie (1547), and in 1552 was slain in a street fray at Edinburgh by Kerr of Cessford, whilst the other was the rescuer of Kinmont Willie from Carlisle Castle (1596). Francis, the second earl (1626–51), left only two daughters—Mary (1647–61), married at eleven to the young future Earl of Tarras, and Anna (1651–1732), married at twelve to James, Duke of Monmouth (q.v.), who took the surname Scott, and was created Duke of Buccleuch. After his execution in 1685 his duchess, who had borne him four sons and two daughters, retained her title and estates as in her own right. She afterwards married Lord Cornwallis. Her grandson Francis succeeded her as second duke, and through his marriage in 1720 with a daughter of the Duke of Queensberry that title and large estates in Dumfriesshire devolved in 1810 on Henry, third Duke of Buccleuch (1746–1812), the pupil of Adam Smith, and a great agricultural improver. Walter Francis, fifth Duke (1806–84), was the founder of Granton, and owned in Scotland 676 sq. m.—an area larger than that of half of the sovereign states of the German empire. The Harden branch of the Scotts (represented now by Lord Polwarth) separated from the main stem in 1346; and from the Harden branch sprang the Scotts of Raeburn, ancestors of the greatest of all that great line, Sir Walter.

See Sir William Fraser, *The Scotts of Buccleuch* (2 vols. 1879); and Mrs Oliver, *Upper Teviotdale and the Scotts of Buccleuch* (1887).

Scott, David, R.S.A., a painter of distinct originality and great imaginative power, was born in Edinburgh on the 10th or 12th of October 1806. He was a grave, silent boy, fond of drawing; probably a copy of Blake's 'Illustrations to the *Grave*' was not without effect in influencing the especial direction of his art. He studied in the Trustees' Academy, under Andrew Wilson, and was apprenticed to his father as a line-engraver. The impetus towards original work, however, was too strong to be resisted, and he determined to devote himself to painting. In 1828 he exhibited his first picture, 'The Hopes of Early Genius dispelled by Death,' in the Royal Institution, Edinburgh; and in the following year he was admitted a member of the recently formed Scottish Academy. The poetical subject of 'Adam and Eve singing their Morning Hymn' dates from 1829; and in 1831 he produced his vigorous personification of 'Nimrod the Mighty Hunter,' and his rendering of 'The Dead Sarpedon borne by Sleep and Death.' In the same year he published six etched plates, 'The Monograms of Man,' a series of profound symbolical inventions, and designed his twenty-five 'Illustrations to the *Ancient Mariner*,' etched and published in 1837, which seize with a wonderful force and intensity the weird conceptions of Coleridge's great poem. In 1832 he visited Italy, and remained in Rome for fifteen months, studying the old masters, and painting 'The Vintager,' now in the National Gallery, and other works. His impressions of the art of Italy were embodied in a series of papers published in *Blackwood's Magazine* in 1839–41. In his twenty-eighth year he returned to Edinburgh, and, amid much discouragement from the almost complete want of popular sympathy or interest in his work, he produced his 'Alchemystical Adept (Paracelsus) Lecturing' (1838), now in the National Gallery of Scotland; 'Queen Elizabeth at the Globe Theatre' (1840); and 'The Traitor's Gate' (1841), one of the quietest, most impressive, and entirely satisfactory of his paintings. The following year saw the completion of 'Vasco da Gama encountering the Spirit of the Cape,' a colossal gallery work, over 16 feet in length, now in the Trinity House, Leith. Meanwhile the artist's health had been failing, and the want of appreciation had been chilling him to the heart. Year by year his life became more withdrawn and saddened, and he died before he had reached the age of forty-three, on the 5th of March 1849. His forty designs to the *Pilgrim's Progress*, executed in 1841, were published in 1850, and eleven of his remarkable and daringly imaginative Astronomical Designs, drawn in 1848, were engraved in an edition of Professor J. P. Nichol's *Architecture of the Heavens* (1850). In spite of their frequently hurried execution and consequent faults of detail, Scott's works, on their technical side, have much of the large and powerful draughtsmanship and of the rich and dignified colouring that characterise the productions of the old masters. Their highest value, however, lies in their imaginative quality, in their power and originality as inventions. In his own words, Scott 'always judged painting by its sentiment, by its mental bearing, and thought most of new spheres of meaning.'

See the Memoir by his brother W. B. Scott (Edin. 1850); Selections from his Works, edited by his brother (Glasgow, 1866–67); and the monograph by the present writer (Edin. 1884).

His brother, William Bell Scott, painter and poet, was born at St Leonards, Edinburgh, September 12, 1811, and was educated at Edinburgh High School. He studied art both at Edinburgh and London, settled in London in 1836, but exhibited only twenty pictures from 1840 down till 1869. The subjects of these were mostly historical or poetical. From 1843 till about 1858 he lived at Newcastle, in charge of the government school of art there, and down till 1865 he acted as one of the South Kensington examiners. His most important work in painting was the series of eight large pictures illustrative of Northumbrian history at Wallington Hall, completed later by eighteen pictures devoted to Chevy Chase in the spandrels. He produced a similar series, illustrating *The King's Quair*, on the walls of a newel staircase at Penkill Castle, near Girvan. Here he died, November 22, 1890. He began early to write poetry, and published *Hades, an Ode* (1838); *The Year of the World* (1846); and the more important *Poems of a Painter* (1854). Later volumes were the carefully selected and revised *Poems* (1875), and the genial and delightful little volume of a hundred short pieces, *A Poet's Harvest Home* (1882). To the literature of art he contributed a *Memoir of David Scott* (1850), *Half-hour Lectures on Art* (1861), *Albert Dürer* (1869), and *The Little Masters* (1879) in the 'Great Artists' series. See the Memoir by Professor Minto (1892).

Scott, Sir George Gilbert, architect, was born on 13th July 1811, at Gawcott, Buckinghamshire, of which his father, son of Thomas Scott, the commentator, was perpetual curate. His education was neglected, but he had a good drawing-master; and his love of old churches suggested his being articled to a London architect (1827–30). His first start in life was as a designer of workhouses (1835); in 1838 he married a second cousin, Caroline Olfrid (1811–72), who bore him five sons, two of whom became architects; and soon after he built the first of several cheap and nasty churches. His 'awakening,' by the Cambridge Camden Society and an article of Pugin's, was in 1840–41; and thereafter, as a leading spirit of the Gothic revival, he built or restored 26 cathedrals, 9 abbey and 2 priory churches, 1 minster, 474 churches, 26 schools, 5 almshouses, 23 parsonages, 57 monumental works, 10 college chapels and 16 colleges, 27 public buildings, 42 mansions, &c. The Martyrs' Memorial at Oxford, St Nicholas' at Hamburg, St George's at Doncaster, the new Government Offices, Albert Memorial, and Midland Terminus in London, Preston town-hall, Glasgow University, the chapels of Exeter College, Oxford, and St John's College, Oxford, and the Episcopal cathedral at Edinburgh may be specified; but countless other notices of his work are scattered throughout this work under the different towns. He was elected an A.R.A. in 1855, an R.A. in 1861; held the professorship of Architecture at the Academy; and was knighted in 1872. He died 27th March 1878, and was buried in Westminster Abbey.

See his *Personal and Professional Recollections* (1879), and an article in the *Builder* for 6th April 1878.

Scott, J. R. Hope. See Hope-Scott.

Scott, Michael, a mediæval sage, who is said to have been astrologer to Kaiser Frederick II. (1194–1250), and to have translated for him, through the Arabic, some of the works of Aristotle, with Averrhoes' commentaries. His translation was apparently used by Albertus Magnus, and seems to have been one of the two familiar to Dante (see Jourdain, *Traductions Latines d'Aristote;* and the *Academy*, January 1892, p. 14). Dante, who died in 1321, alludes to him in the *Inferno* (canto xx., 115–117) in a way which proves that his fame as a magician must already have spread over Europe; and he is also referred to by Albertus Magnus and Vincent of Beauvais, and this really is all that we know of him. Dempster (1627) may be right in maintaining that 'Scotus' was the name of his nation, not of his family, in which case he would be probably an Irishman; but by Boece (1527) he was boldly identified with a Sir Michael Scott of Balwearie, near Kirkcaldy, in Fife, who went on two embassies to Norway in 1290 and 1310. Camden, again (1580), asserts that he was a Cistercian monk of Holme Cultram in Cumberland; and Satchells, that in 1629 he had examined at Burgh-under-Bowness a huge tome which was held to be his *grimoire*. In Border folklore the 'wondrous wizard' of Sir Walter's *Lay* is credited with having 'cleft the Eildon Hills in three, and bridled the Tweed with a curb of stone;' and his grave is of course shown in Melrose Abbey. Nay, the 'Jingler's Room' in Oakwood Tower, near Selkirk, is pointed out as his, though Oakwood dates only from the 16th century.

Scott, Michael, author of *Tom Cringle's Log*, was born in Glasgow, 30th October 1789, and, after attending some classes at the university, went to seek his fortune in Jamaica. He spent a number of years in the West Indies, but in 1822 established himself in business in Glasgow, where he died, 7th November 1835. In 1829 he published anonymously in *Blackwood's Magazine* the brilliant serial story, *Tom Cringle's Log*, which, like *The Cruise of the Midge*, another of his numerous contributions to 'Maga,' has been often republished separately.

Scott, Robert. See Liddell.

Scott, Thomas, commentator, was born the tenth of a grazier's thirteen children at Braytoft, in Lincolnshire, February 16, 1747. He studied hard in spite of drawbacks as a surgeon's apprentice and farm labourer, and received priest's orders from Bishop Green of Lincoln in 1773. He became curate of Weston Underwood, and in 1780 succeeded as curate at Olney the famous John Newton, whose characteristic Calvinistic theology he had already imbibed. In 1785 he became lecturer to the London Lock Hospital, and in 1803 was preferred to the rectorship of Aston Sandford in Bucks, where he died, April 16, 1821. His *Force of Truth* (1779) has great autobiographic interest, and *Essays on the Most Important Subjects in Religion* (1793) long enjoyed and deserved celebrity, but his name is best remembered by his *Bible, with Explanatory Notes* (5 vols. 1788–92; 5th and best ed. 6 vols. 1822). The prospectus of the 1850 edition stated that already £500,000 had been paid by purchasers for copies of this work, which is beyond doubt a remarkable monument of sound learning and exegetical sagacity.

His complete Works, including sermons and treatises doctrinal and controversial, were edited by his son, the Rev. John Scott (10 vols 1823–25), who also published a Life, partly autobiographical (1822).

Copyright 1892 in U.S. by J. B. Lippincott Company.

Scott, Sir Walter (created a baronet 1819), the greatest of Scottish men of letters, and probably the best beloved author who ever lived, was born in the College Wynd of Edinburgh on August 15, 1771. His father, Walter Scott, was a Writer to the Signet; his mother's maiden name was Anne Rutherford, daughter of Dr John Rutherford, professor of Medicine in the University of Edinburgh. Scott thus sprung from the professional middle classes, but on both sides he came 'of gentle blood.' When he blazoned his quarterings on the roof of the entrance-hall of Abbotsford three shields of the sixteen had to be left blank, through a difficulty about the pedigree of the Rutherfords of Hunthill. Nevertheless, he came of the best blood on the Border, Scotts, Swintons, and Rutherfords. His great-grandfather was the grandson of Auld Wat of Harden, who married the Flower of Yarrow in 1567, and whose son again married Muckle Mou'd Meg of Elibank. The facts of Scott's history are too universally known to be dwelt upon at length. A recent ingenious writer has tried to show that genius is a 'sport' or accidental variety of the consumptive and nervous temperament. It is certain that the first six children of Scott's father and mother died between 1759 and 1766. Locks of their hair, still glossy and golden, lay in Sir Walter's great desk, in his study at Abbotsford. Of the other six children only two, Walter and Thomas, left issue; the present descendants of Sir Walter Scott are the children of the Hon. Mrs Maxwell Scott, daughter of Mrs Hope-Scott, who again was the daughter of Sir Walter's daughter Sophia, who married Mr John Gibson Lockhart. The mother of Sir Walter survived all her children except the poet and Mr Thomas Scott. Scott himself, though one of the strongest men of his time, with a larger biceps, the Ettrick Shepherd tells us, than any man of the Rough Clan, nearly died in infancy 'in consequence of his first nurse being ill of a consumption.' At eighteen months he was suddenly affected with fever in teething, and lost the power of his right leg. In his third year he was sent to his grandfather's farm at Sandyknowe, where he was taught, not without difficulty, to read, and learned and shouted the ballad of *Hardyknute*. For about a year and a half he was at Bath, then returned to George Square, in Edinburgh, where he astonished Mrs Cockburn (a Rutherford of Fairnilee, and author of *The Flowers of the Forest*) by his infant genius. Still lame, he was taken to Prestonpans (aged eight), where he met a veteran named Dalgetty and Mr George Constable, from whom (and from himself) he drew Monkbarns, and heard of Falstaff. Thence he returned, 'a grandam's child,' to George Square, where he lived, always reading and repeating ballads and poetry. In 1779 he was sent to the High School of Edinburgh, where he suffered from the senseless Scottish system of giving 'removes' each year, and from the coteries formed in large classes. He amused the boys with tales; he was ready to fight, 'strapped to a board,' as he was lame; he made game of Burns's friend, the blackguard dominie, Nicol; he fought in bickers with Greenbreeks; he wrote some English verse; he learned some Latin from Dr Adam, the rector or head-master. His schooling was interrupted by a visit to Kelso, where he had the misfortune to become intimate with the Ballantynes. In Edinburgh the blind and venerable Dr Blacklock instructed his poetical taste, and he had his one famous meeting with Burns. He left the High School with a great knowledge of all that he had not been taught, but at Edinburgh University he did not improve his Latin, and, like St Augustine, he declined to learn Greek. His account of the studies of Waverley contains his regrets for wasted time, and his autobiography expresses his grief that he had turned away from Greek, 'considering what that language is, and who they were who employed it in their compositions.' Meantime his lameness was never cured, though he could walk thirty or forty miles in the day. His sweetness of temper did not suffer, as Byron's did from an infirmity which after all was not so great as to prevent Byron from bowling for Harrow. But Scott had not, like Byron, to feel that, but for this one defect, he would have been a perfect model of beauty. With red hair, an upper lip of unusual length, a brow like a tower, and rugged Border features, he had no temptation, as Byron had, to vanity. Yet a lady has left her evidence that 'young Walter Scott was a comely creature.' About 1785-86 he entered his father's 'office,' the weary 'office' which, like some fabled monster, gapes for the boys of Edinburgh. Here, at least, he learned to cover paper at such a pace as never man did, and in a hand which could put some seven hundred words on one side of a sheet of foolscap. He studied Scots law sedulously, though his long fishing and antiquarian rambles made his excellent father (described in *Redgauntlet*) fear that he would never be better than 'a gangrel scrape-gut.' As a lawyer's clerk, superintending an eviction, he first entered the Highlands, where he already knew Invernahyle, of the '15 and the '45, and many another veteran, whose legends appear in his novels. In Edinburgh he won friendships which only ended with life, and, in the heat of youth, according to his own account, he was at least sufficiently convivial. Of all his friends the world best knows William Clerk of Eldin, the original of Darsie Latimer in *Redgauntlet*. Even now, it seems, the romance of his life had begun, and he loved the lady whom he loved till the end. 'This was the early and innocent affection to which we owe the tenderest pages, not only of *Redgauntlet*, but of the *Lay of the Last Minstrel* and of *Rokeby*. In all of these works the heroine has certain distinctive features, drawn from one and the same haunting dream of his manly adolescence.'

In the autumn of 1796 that dream had gone where dreams go, but it endured where dreams endure, in the heart. On October 12, 1796, one of his friends, who knew the story wrote, '"Men have died and worms have eaten them, but not for love." I hope sincerely that may be verified on this occasion.' Scott did not die, only his heart, as his *Journal* records, was broken for two years, then 'handsomely pieced,' 'but the crack will remain till my dying day' (*Journal*, December 18, 1825). '*Humana perpessi sumus*,' he adds, in his *Journal*, towards the end of his life. A short poem, *The Violet*, is almost the only direct allusion to this affair in his works. Not wholly unconnected with his hopes as a lover was his first publication, rhymed versions of ballads by Bürger (October 1796). The poems were admired, but 'proved a dead loss.' The spring of 1797 was spent in yeomanry drill. In July Scott made a tour into Tweeddale, and met David Ritchie, the Black Dwarf. Thence he wandered to Gilsland, where he first saw Miss Charlotte Margaret Carpenter, a lady of French extraction, but of English education. They soon became engaged, and were married at Carlisle on Christmas Eve 1797. Though not a regular beauty, Mrs Scott had large dark eyes, and an engaging air, with plenty of gaiety and sense. Hogg describes her as 'a brunette with raven hair and large dark eyes, but, in my estimation, a perfect beauty.' The marriage, founded on sincere affection, was happy, though some of Scott's friends feared that the successes which left him unharmed might turn the head of Mrs Scott.

Already (1792) Scott had made his first raid into Liddesdale, and every year till 1798 he repeated it, gathered legends, studied characters like Dandie Dinmont, and 'was making himself,' as Shortreed said. His country home was a cottage at Lasswade, agreeably described by Mr R. P. Gillies in his *Recollections*. Scott made M. G. Lewis's acquaintance, wrote for a collection of Lewis's *Glenfinlas* and the *Eve of St John*, and translated Goethe's *Goetz von Berlichingen*. At the end of 1799, after the death of his father, he was appointed sheriff of Selkirkshire. In hunting for ballads he made the acquaintance of Hogg, of Leyden, and of his dear friend and occasional amanuensis, William Laidlaw. In 1800 he suggested to James Ballantyne that he should remove from Kelso to Edinburgh. At the same time he announced that he would give Ballantyne the printing of *The Border Minstrelsy*. The first two volumes appeared in 1802. In the autumn of that year, on Lady Dalkeith's suggestion, he began what he meant for a ballad. It became *The Lay of the Last Minstrel*, the first, perhaps the best, of his long poems. It was printed by Ballantyne in Edinburgh. The foundations of Scott's triumph and discomfiture were laid. The *Lay* made him at once the most popular author of the generation, and his share in the Ballantyne's business proved his ruin. From the moment that he entered as the secret but only moneyed partner into Ballantyne's business he was never free from financial complications. For these, and all the evil they wrought, it would be unjust to lay all the blame either on the Ballantynes, on Constable, or on Scott. Sir Walter was the last to shirk his own share of the responsibility. Perhaps an accountant can make sense of the controversy, in three pamphlets, between Mr Lockhart and the representatives of the Ballantynes (1838-39). To an ordinary reader it seems clear that Scott hoped to make money by the business of printing, and that he also had 'a kindness like an elder brother's love' for the Ballantynes. It appears quite certain that John Ballantyne, when he entered the firm with no capital, complicated it by his ambition as a publisher, and by a sanguine temper which would not face nor state difficulties. On the other hand, Scott had a century of literary inventions, editions and the like, which were often started to benefit poor working men of letters, but which nearly always failed, except when he himself was the editor. Thus the publishing business was overwhelmed with unsaleable 'stock.' Both Ballantynes were undeniably extravagant. John was recklessly so. Scott himself bought land, always at a price beyond its value, he bought curiosities, his hospitality was more than princely, his generosity was unstinted; he was the providence of poor literary men, and the guardian genius of his neighbourhood. Yet he has been too severely blamed for profusion. Up to 1821 his purchases of land had cost about £30,000, while his official income (as Clerk of Session and Sheriff) had been £1600 a year, 'and he had gained as an author £80,000.' Abbotsford is not 'a wide domain'—far from it—and the house was so far from being a palace that Mr Hope-Scott found it necessary to build a large additional wing thereto. The ruin came not so much from personal extravagance as through business conducted by London connections of Constable's house, in the wildest way, by 'bank accommodation' and bills, eternally renewed. James Ballantyne's own time was much occupied in the correction of Scott's proof-sheets rather than in attention to the details of his commerce. The value of his criticisms has been overestimated; his remarks on the proof-sheets of *Redgauntlet* are inept, and it cannot be said that he was a careful master-printer. Constable's own visionary character added to the complexities, and at last the crash came. Every one was in fault, every one was intoxicated by success. There is no more reason to doubt the uprightness of James Ballantyne than of Sir Walter, who finally paid his debts with his life. Admirers of Lockhart regret his tone towards the Ballantynes. To him it is clear they had ever been distasteful. He was as fastidious as Scott was almost over-tolerant, and the mere presence of the brothers must have been odious to him. But both had, with all their social defects and commercial demerits, a touching affection for Sir Walter.

We have anticipated the financial tragedy of Scott's life, or rather we have sketched its history from the moment when it began. Scott's prosperity never had a sound commercial basis. He was never really free from anxiety about money. How his sagacity and uprightness endured these bonds is a psychological mystery. In 1804 Scott, as sheriff of Selkirkshire, removed from Lasswade to Ashestiel, a small house beautifully situated on a wooded 'brae' above the Tweed, about four miles from the influx of the Ettrick. Had he been able to purchase Ashestiel, Abbotsford might never have risen from the swamps of 'Clarty Hole.' Early in 1805 the *Lay* was published, and met a deserved success. Scott now busied himself with articles in the *Edinburgh Review*, with his edition of Dryden, and with the commencement of *Waverley*. The early chapters did not please a friend, probably Erskine, and it was not completed till 1813-14. In 1806 Scott was appointed Clerk of Session, and withdrew from the bar. He discharged the duties for some years without the emoluments, which went to his predecessor in the office. In 1806 *Marmion* was begun. The plot is partly based on perfectly fictitious documents, foisted on Scott by Mr Surtees of Mainsforth. He never discovered the fraud. *Marmion* appeared early in 1808. A review, a most quibbling and unfair review, of it was written by Jeffrey for the *Edinburgh*. This attack, and the whiggery of the *Edinburgh*, caused Scott to break off his connection with that serial, and to busy himself in starting the *Quarterly*. Jeffrey did not injure *Marmion*, and its popularity outdid even that of the *Lay*. Scott, who feared to take another 'scourging crop' of verse off the soil, now occupied himself with editing Dryden, Swift, and other classics. He quarrelled with Constable (the publisher of the *Edinburgh*), or rather with his partner, Mr Hunter, and in January 1809 he tells Southey that 'Ballantyne's brother' (John) 'is setting up here as a bookseller, chiefly for publishing.' Ballantyne was to be in alliance with Mr Murray, but this arrangement did not last, and the publishing business only added to financial complications. In 1810 the *Lady of the Lake* was finished, and overcrowned even Scott's former triumphs. A Highland poem had long been in his mind, alternating with the scheme of a Highland romance in prose. Scott now visited the western isles, and schemed out *The Nameless Glen*, afterwards called *The Lord of the Isles*. He also reconsidered *Waverley*, but seems to have made no progress with it. In 1811 he received at last the salary of his clerkship, and came into a legacy of £5000. Now, too, he bought his first farm, and began to turn the cottage on it into a mansion. The year 1811 saw him busy with *Rokeby*, which proved a comparative failure. *Childe Harold* had appeared; popularity had selected Lord Byron for its new idol. For a wonder, Scott did not rate *Childe Harold* much above its merits, but he entered into a friendly correspondence with Byron. He had never been much galled by *English Bards and Scotch Reviewers*. In 1813 (after *Rokeby* and the *Bridal of Triermain*) he declined the laureateship in favour of Southey. In 1814 he finished his *Life of Swift*, and published *Waverley*, writing the last two volumes in three weeks. *Waverley* took the world by storm, and Scott, who did not acknowledge the authorship, might well suppose he had found the purse of Fortunatus. The cold reception of *The Lord of the Isles* did not discourage him, and in January 1815, by way of a holiday, he began *Guy Mannering*, 'the work of six weeks at Christmas time.' It was published by Messrs Longman, but, with rare exceptions, Constable, with whom Scott had been reconciled, published the rest of his Waverley cycle. From this point space does not serve to retell the oft-told tale of Scott's amazing fertility. In 1817 a violent illness showed him that even his strength was mortal, but no malady clouds *Rob Roy* or *The Heart of Midlothian*. In 1819 a return of his complaint endangered his life, and in paroxysms of agony he dictated *The Bride of Lammermoor*, which, when printed, he read as the work of a stranger. He did not remember a line of it. His health was in part re-established; he opened a new vein of gold in *Ivanhoe*, but failed to please his readers with *The Monastery*.

If it is na weel bobbit
We'll bob it again,

he said. Novels poured from his pen, society flocked to Abbotsford, he seemed to Miss Edgeworth 'the idlest man alive.' Yet he never neglected his official duties; he toiled like a woodsman in his plantations, and he entertained all comers. As he said of Byron, 'his foot was ever in the arena, his shield hung always in the lists.' He managed the king's reception in Edinburgh, he heard cases at Selkirk, he took part in raising volunteer corps, he conducted an enormous and distracting correspondence, he cared for the poor with a wise beneficence, he had a great share in starting the Edinburgh Academy, he presided at the councils of the new gas company, he began the *Life of Bonaparte*, and still the novels flowed on. In 1825 he commenced his *Journal*, and for all that followed the immortal pages of that sad and splendid record must be consulted. *Woodstock* was in hand when the commercial crash came. Scott bore it like a stoic. From that hour all the energy not needed for public duties went into literature. He sometimes toiled for fourteen hours a day, led on by the hope of paying every penny of his debts. His labour cleared them, though not in his lifetime. Before his wearied eyes and worn brain the mirage of his complete success used to float at intervals, and who could grudge him these dreams through the ivory gate! It is needless to repeat the tale of his last days, his desolation when his publisher, Mr Cadell, disapproved of *Count Robert of Paris*, the insults heaped on him by the Jedburgh radical mob, his last voyage, his continued work at *The Siege of Malta*, his return home, his death. Few out of all who have read Lockhart or the *Journal* can have studied these chapters with tearless eyes. It is said that on the last morning of his life consciousness returned. He asked his nurse to help him to the window; he gave one last look on Tweed and said, 'To-night I shall know all.' That night he was 'Heaven's latest, not least welcome guest,' September 21, 1832.

In a brief record of his life it is impossible duly to estimate Scott, as an author or as a man. The greatness of his heart, the loyal affection and kindness of his nature, are at least as remarkable as his astonishing genius. There is only one voice as to his goodness. He was the most generous, the most friendly, the most honourable of men. In no relation of life did he fall short of the highest excellence. The magnetism (as we may call it for want of a better word) of his personality endeared him not only to mankind, but to the lower animals. Dogs, cats, and horses took to him at once. He was even persecuted by the affection of grotesque friends, pigs and chickens. He is one of the few who retain, after death, this power of making us love those 'whom we have not seen.' Nor was he less sagacious, in all affairs but his own, than he was sympathetic. As a man of letters he was more than generous, far from being envious, he could hardly even be critical, and he admired contemporaries in whom the judgment of posterity has seen little to approve. In his lifetime the Whigs, as Whigs, did not love him. He was a Tory. With a sympathy for the poor, which showed itself not only in his works, but in all his deeds, and in all his daily life, he believed in subordination. All history showed him that equality had never existed, except in the lowest savagery; and he could not believe in a sudden reversal of experience. His tastes as a poet also attached him to the antique world. His ideal was, perhaps, a feudalism in which every order and every man should be constant to duty. Absentee landlords he condemned as much as callous capitalists. He had seen the French Revolution, he had witnessed various abortive 'risings' in the west country, and his later years were saddened by apprehension of a Jacquerie. He hated the mob as much as he loved the people, his own people, the kindly Scots. He was a sturdy Scotchman; but, says Lockhart, 'I believe that had any anti-English faction, civil or religious, sprung up in his own time in Scotland, he would have done more than any other living man could have hoped to do to put it down.'

As a writer it is a truism to say that, since Shakespeare, whom he resembled in many ways, there has never been a genius so human and so creative, so rich in humour, sympathy, poetry, so fertile in the production of new and real characters, as the genius of Sir Walter Scott. To think of the Waverley novels is to think of a world of friends, like the crowd whose faces rise on us at the name of Shakespeare. To say this is to say enough, but it must be added that scenes as well as people, events as well as characters, are summoned up by his magic wand. There is only one Shakespeare, however, and he possessed, what Scott lacked, every splendour and every glory of style. Of both men it might be said that 'they never blotted a line;' but the metal flowed from the furnace of Shakespeare's brain into many a mould of form, all magical and immortal in their beauty. Scott 'never learned grammar,' as he said, and his style is that of an improviser. Its recklessness, and occasional flatness, he knew as well as any of his critics. But again and again, in published work, as in unpublished letters, he owns himself to be incapable of correcting, and impatient of the labour of the file. In proofs he corrected freely, but seldom to improve the style. It is often lax, and even commonplace; it rarely approaches distinction. It is at its best, absolutely perfect indeed, in his Scotch dialogue. Nor was he more careful of his plots. In the Introduction to the *Fortunes of Nigel* he shows us exactly how he worked, incapable of laying down the lines of a plot, and sticking to them, following always where fancy led him, after Dugald Dalgetty, or Bailie Nicol Jarvie. Delay, painstaking, would not have made *him* a more finished writer, and would have deprived us of many a Waverley novel. Every man must do his work as he may: speed was Scott's way. The only real drawback to his unapproached excellence, then, is this congenital habit of haste, this quickness of spirit, which, as Lady Louisa Stuart said, made him weary of his characters long before his readers were weary. Yet his genius triumphs in his own despite, and what he wrote for the amusement of a generation is fashioned for immortality, living with the fiery and generous life of his own heroic heart. Scott's poetry suffers more from his 'hasty glance and random rhyme' than his prose, because from poetry more exquisite finish is expected. That finish is only to be found in his lyrics, the freshest, most musical, most natural and spirited of English verses. In his metrical romances he has spirit, speed, ringing cadences, all the magic of romance, all the grace of chivalry. Since Homer no man has written so much in Homer's mood, so largely, so bravely, with such delight in battle. But 'the grand style' is absent, save in the more inspired passages. Scott's lays are lighted with the Border sun, now veiled in mists, now broken with clouds: we are not here in the wide and luminous ether of Homer and of Hellas.

Wild as cloud, as stream, as gale,
Flow forth, flow unrestrained, my tale!

he exclaims, in lines addressed to Erskine, conscious of his fault, but impenitent. His fame must suffer in some degree from his own wilfulness, or, rather, from the incurable defect of a genius which was rich, but not rare; abundant, but seldom fine. It may suffice for one man to have come nearer than any other mortal to Shakespeare in his fiction, and nearer than any other mortal to Homer in his verse. His influence on literature was immense. The Romantic movement in France owed nearly as much to him as to Shakespeare. Alexander Dumas is his literary foster-child, and his only true successor. To him also is due the beginning of a better appreciation of all ancient popular antiquities, and a more human understanding of history.

The best source for information about Scott's life is, necessarily, Lockhart's biography. The best edition is the second, in ten volumes (1839). The *Journal*, in its complete form, may be procured either in one volume or in two volumes (1890). *The Ballantyne Humbug* and the *Refutation* may be studied, by people who must study them, in various editions of 1838-39. There is much interesting matter in Mr R. P. Gillies' *Recollections of Sir Walter Scott* (1837), and some amusing anecdotes in Hogg's *Domestic Manners and Private Life of Sir Walter Scott* (1834), though the Shepherd is a garrulous and graceless witness. Mr Carruthers' *Abbotsford Notanda* contains a few facts worth noting, and so does the Catalogue of the Centenary Exhibition. The Catalogue of the Abbotsford Library is a valuable index to his studies, and there are letters of some importance in *Archibald Constable and his Literary Correspondents* (1873). In 1872 Mr Hope-Scott published a reprint of Lockhart's condensed version of the Life, with a prefatory letter to Mr Gladstone. An interesting parallel between Homer and Scott is in Jebb's *Introduction to Homer* (1887).

Scott's works, especially the novels, have been translated into almost every civilised tongue, and he has had imitators in all languages. There are several French translations, of varying merit. In German the best are those associated with the names of Herrmann (new ed. 1876) and Tschischwitz (1876); the Life by Elze (1864) is notable. See also the articles in this work on Abbotsford, Dryburgh, Ballantyne, Laidlaw, Lockhart, Hope-Scott, Ballad, and Novels.

Scott, W. BELL. See SCOTT (DAVID).

Scott, WINFIELD, an American general, was born near Petersburg, Virginia, 13th June 1786. He was educated at William and Mary College, studied law, and was admitted to the bar at Richmond in 1807. Feeling, however, greater aptitude for military life, he obtained a commission as captain of light artillery in May 1808. At New Orleans he was court-martialled for disrespectful remarks about his commanding officer, and suspended for a year. When war was declared against Great Britain in 1812, Scott, being made lieutenant-colonel, was ordered to the Canadian frontier. Crossing the Niagara River in October, he fought at Queenstown, and was taken prisoner, but was exchanged after three months. In May 1813 he was wounded at the capture of Fort George, and in July 1814 at Lundy's Lane; from this battle his commission as major-general was dated. The attempts to invade Canada proved failures, but Scott's personal achievements were regarded by his countrymen as redeeming features in the record.

During the ensuing years of peace Scott framed the 'General Regulations' for the army, and introduced the French system of tactics. In various local troubles his tact in preventing outbreaks was shown, especially during the Nullification excitement in South Carolina in 1832, and in the dispute about the boundary of Maine in 1839. He succeeded to the chief command of the army in 1841. In 1847 General Scott was given the command of the army for the invasion of Mexico; and on 9th March, with about 12,000 troops, he invested the city of Vera Cruz. After a heavy bombardment, the city and the strong castle of San Juan d'Ulloa capitulated on the 26th. Scott then hastened to the tablelands, defeated Santa-Anna at the pass of Cerro Gordo, and captured Jalapa and Puebla. Here from May till August he was obliged to wait for and drill reinforcements. When he resumed the march the battles of Contreras and Churubusco opened the highway to the city of Mexico, but a vain attempt to negotiate a treaty caused some weeks' delay. On 13th September the castle of Chapultepec was carried by storm; Santa-Anna fled from the capital, and Scott entered in triumph on the 14th. Here he remained until the following February, when the treaty of peace was signed. On this war General Scott's fame rests; he boldly claimed that his campaign had been 'successful as to every prediction, plan, siege, battle, and skirmish.'

Scott had in politics belonged to the Whig party, and in 1852 was its candidate for the presidency, but was easily defeated, owing both to the disintegration of the party and to his own blunders as a politician. In 1855 the rank of lieutenant-general was revived in his favour. Scott was always a firm supporter of the Union, and in the crisis of 1860–61 remained true to his allegiance even when his native state seceded. Though crippled by the infirmities of age, he retained nominal command of the army until November 1861. He died on 29th May 1866, at West Point, and was buried there. Scott was a man of imposing presence, 6 feet 4 inches high. Though undeniably vain and pompous, he was a sincere patriot and of unblemished integrity. His military genius was evidently adequate for a grander field than that in which it was exercised. But his fame has been obscured by the glare of the civil war, in which the officers trained under him had greater opportunities to display their powers. His Memoirs, published in 1864, unfortunately rather emphasised his vanity than vindicated his fame. The biographies written by others are of little value; his own Memoirs are elucidated by General E. D. Keyes's *Fifty Years of Observation* (New York, 1884).

Scottish Philosophy. Scotsmen taught philosophy in Paris and other foreign universities during the middle ages and as late as the 16th century, and in some cases they returned to academic positions in their native land. When it is added that David Hume, the greatest name which Scotland has contributed to philosophy, is not included in the Scottish school, it will be apparent that the designation is not merely a mark of nationality, but expresses definite doctrines, or at least a definite tendency, in philosophy. The school may, for all practical purposes, be said to take its rise in the revulsion headed by Reid (1710–96) against the conclusions of the great sceptic. Antiquarian research has sought to place the foundation of the school earlier, in the teaching, for example, of Gershom Carmichael, who was professor in Glasgow from 1694 to 1729, or George Turnbull, Reid's teacher at Aberdeen, who lectured from 1721 to 1748. Francis Hutcheson, who succeeded Carmichael in Glasgow, and lectured from 1729 to 1746, is more frequently mentioned as the founder of the school, but he has a place rather among the succession of English moral philosophers, while the two other names are too obscure to be of any real account. Reid's answer to Hume appeared in 1764 under the title *An Enquiry into the Human Mind on the Principles of Common Sense*. Hence the current but somewhat misleading designation of Reid and his followers as the Common Sense (q.v.) school, which seems to imply an appeal from philosophical conclusions to the unreasoned verdict of ordinary consciousness. No doubt a certain warrant for this view of the Scottish philosophers may be found in certain passages of Reid himself, and still more in the diatribes of the lesser men, like Beattie and Oswald, who joined in the outcry against Hume. But common sense meant to Reid simply the common reason of mankind, as constituted by certain fundamental judgments which are expressed in the very structure of human language, and which are intuitively recognised by the mind as true. Reid's answer to Hume thus consists in traversing his reduction of experience to unconnected ideas. He attempts to show by a deeper analysis of experience that the having of ideas, or rather of knowledge, implies certain primitive or fundamental judgments as irreducible elements. This constitutes his attack upon what he calls 'the ideal theory,' that is to say, upon the presuppositions which he finds common to Descartes, Locke, Berkeley, and Hume; and in this, its most philosophical aspect, his theory may be compared with Kant's vindication of the categories as elements necessary to the constitution of the simplest experience. The weakness of Scottish philosophy has lain in its tendency to treat these rational elements as isolated intuitions. The reiterated appeal to 'the testimony of consciousness' is a short and easy method of disposing of an opponent, but it is apt to leave the opponent unconvinced. The natural dualism or natural realism which forms such an outstanding feature of Scottish philosophy asserts, against subjective idealism, that the object or the non-ego is given in knowledge along with the subject. But this important epistemological position degenerates too often into a crude metaphysical dualism of mind and matter as two heterogeneous substances.

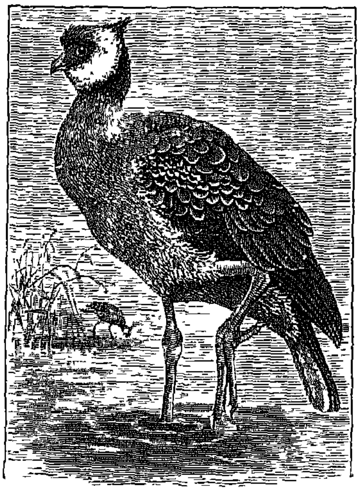
Scottish philosophy has not produced anything like a metaphysical system, but its inductive method of procedure has led to a large amount of valuable psychological observation both in the intellectual and moral sphere of mental activity. This is mainly what we find in Dugald Stewart (1753–1828), accompanied by a power of persuasive eloquence which made philosophy a force and a tradition in the national life. Dr Thomas Brown (1778–1820), his successor in the Edinburgh chair of Moral Philosophy, was led by his acute psychological analysis so far in the direction of English associationism that he can hardly be counted a continuator of the school. The most eminent successor of Reid and Stewart was Sir William Hamilton (1788–1856), who endeavoured to combine the traditional Scottish doctrine with the negative results of the Kantian critique of knowledge. Apart from his contributions to psychology and logic, his philosophy is in the main an assertion of the relativity of human knowledge, and the impossibility, therefore, of reaching a coherent metaphysical view of the universe. This position, however, has been disclaimed by M'Cosh and others as savouring too much of agnosticism, and as inconsistent with the original position of Scottish philosophy in regard to our immediate knowledge of mind and matter. Scottish philosophy has had a wide influence not only in Scotland and America, but also in France, through Cousin and his 'spiritualistic' followers.

See M'Cosh, *The Scottish Philosophy from Hutcheson to Hamilton* (1874); and the Balfour Lectures on *Scottish Philosophy*, by the present writer (1885).

Scotus. See DUNS SCOTUS, ERIGENA, SCHOLASTICISM.

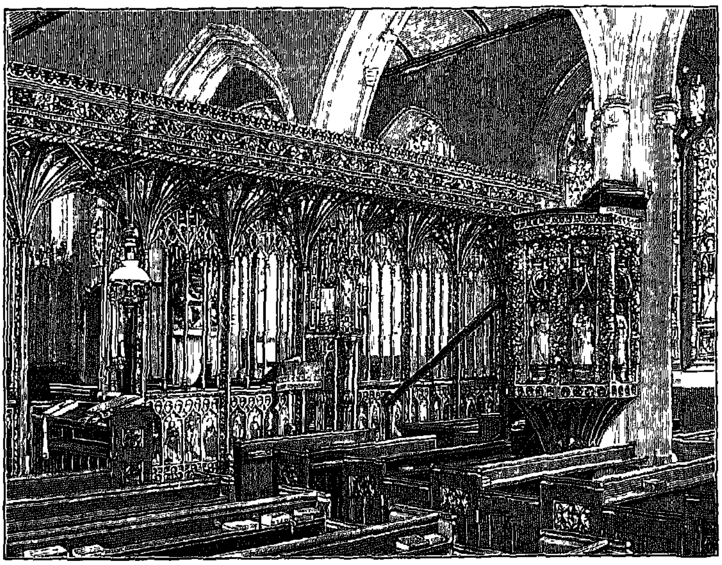
Scranton, the fourth city of Pennsylvania, and capital of Lackawanna county, is on the Lackawanna River, 144 miles by rail NW. of New York. It lies in an important anthracite basin, and is a busy railway centre. Its trade in coal and mining supplies is enormous; and it has car and carriage factories, and great iron and steel manufactories, turning out locomotives, boilers, machinery, stoves, and edge-tools. Scranton is well built, its streets wide, with many handsome buildings, including among its scores of churches a cathedral. It was founded in 1840, and became a city in 1856. Pop. (1860) 9223; (1880) 45,850; (1890) 75,215.

Screamer (*Palamedea*), a genus of birds of rather doubtful affinities, probably most nearly allied to the Anseres (ducks and geese). The bill is rather short, conical, curved at the extremity; there is a bare space around the eyes; the toes are long; each wing is furnished with two strong spurs. There are three species, sometimes referred to two genera—*Palamedea* and *Chauna*. The Horned Screamer, or Kamichi (*P. cornuta*), inhabits swamps in Brazil and Guiana, and feeds on the leaves and seeds of aquatic plants. It is of a blackish-brown colour, nearly as large as a turkey, and has somewhat the appearance of a gallinaceous bird. It receives its name from its loud and harsh cry. From the head, a little behind the bill, there rises a long, slender, movable horn, for which no use has been conjectured. The spurs of the wings are supposed to be useful in defence against snakes and other enemies.—The Crested Screamer (*Chauna* or *Palamedea chavaria*) is a native of Brazil and Paraguay, the head of which has no horn, but is adorned with erectile feathers. The plumage is mostly lead-coloured and blackish. The wings are armed with spurs. It is very capable of domestication, and is sometimes reared with flocks of geese and turkeys, to defend them from vultures, being a bold and powerful bird. Very closely allied to this is the Derbian Screamer (*C. derbiana*).



Crested Screamer (*Chauna chavaria*).

Screen, in Architecture, an enclosure or partition of wood, stone, or metal work. It is of frequent use in churches, where it shuts off chapels from the nave, separates the nave from the choir, and frequently encloses the choir all round. Such choir-screens are sometimes much ornamented, the lower part being solid, and the upper very often perforated. The rood-screen (see ROOD) is that on which most labour is usually bestowed. It derives its name from the rood or cross which stands, or in churches now Protestant once stood upon it. The rood screen usually forms the division between the nave or transept and the choir. It has generally an ornamental gateway in the centre.



Rood-screen in Harberton Parish Church.

In Catholic churches it may have an altar at each side, and is frequently a structure of some size, with a staircase leading to the rood-loft on the top, where the cross or crucifix stands conspicuous at the entrance to the choir. The loft is also used for certain religious functions and ceremonies. In England many beautifully carved screens in stone, enriched with pinnacles, niches, statues, &c., remain, such as those of York, Lincoln, Durham, &c.; and specimens in wood, carved and painted, are common in parish churches, that at Harberton, near Totnes, which is represented in our illustration, being one of the finest in the kingdom. In France the screen round the choir is sometimes the subject of beautiful sculptures, as at Amiens and Paris. In halls of castles and mansions there was usually a wooden screen at one end to separate the entrance-door and a passage from the hall. Over this was a gallery. The term 'screen of columns' is also applied to an open detached colonnade.

Screw. Under Rotation it is pointed out that the most general displacement which a rigid body can experience may be represented by a screw motion about and along a definite axis. The kinematic characteristic of screw motion is easily studied by help of any ordinary screw working in its nut. We may fix the nut and consider the motion of the screw; or fix the screw and consider the motion of the nut. In either case we find a certain translation associated with a proportional amount of rotation. The ratio of the translation to the associated rotation is called the *pitch* of the screw. In an ordinary single-threaded screw the practical measure of the pitch is the distance between the threads, and is simply the translation for one complete rotation. In dynamics it is more scientific to take the pitch as the translation for a rotation through the radian or unit angle (see Circle). The ratio of the scientific to the practical pitch is the same as the ratio of the *circumference of a circle to its radius*. The smaller the pitch, the less is the translatory motion for a given rotation; and when the pitch is made zero, the screw motion is reduced to a pure rotation. On the other hand, the larger the pitch, the greater is the translation for a given rotation; so that a screw of infinite pitch corresponds to a pure translation. Thus screw motion includes all possible kinds of motion, translation and rotation being limiting cases.

Dynamically, screw motion is said to be produced by a *wrench*, which is the most general quantity of the force type. When the screw motion is reduced to translation, the wrench becomes force in the usual sense of the word; and couple, which produces rotation, is the other limiting case of wrench. The simplest conception of a wrench is obtained from the combination of pushing and twisting needed to bore holes with a gimlet.

The screw is a very important element in machinery. In itself, however, it is not complete, being only half of the *screw-pair* or elementary mechanism to which it belongs. The complete mechanism is well illustrated by the combination of screw and nut. By making the pitch zero, we pass to the one limiting case known as the *turning-pair*; and by making the pitch infinite we get the other limiting case—viz. the *sliding-pair*. These three combinations form the simple elements of all machines.

One of the most important uses of the screw (as in the screw-press) is to apply or sustain a large pressure in the direction of its axis by means of a comparatively small couple acting about its axis. We shall suppose the couple to be applied by a force, F, acting at the end of a lever attached to the screw; and that the result is a thrust, P. If a is the arm of the lever, and p the pitch, the principle of work (see Energy) gives us the relation $Fa = Pp$. Hence the smaller the pitch the greater the pressure exerted by the screw for a given couple acting round its axis. The pitch is diminished by making the thread of the screw finer. But, as this also makes it weaker, we see that there must be a practical limit to increasing the advantage of the screw in this way. So far we have neglected friction, which must, however, be considerable in all screw-pairs because of the great pressures existing between the opposed faces of the threads of the screw and nut. The power applied, Fa, must, therefore, be greater than the effective work done. In some cases, when the pitch is small, the efficiency, or ratio of useful work done to work expended, may be reduced to one-third. If the pitch is very large the action of the screw may be reversed, the driving force being the thrust, P, and the resistance the couple, Fa, opposing the rotation of the screw. In most cases the pitch is too small for reversal, the couple brought into play by the friction always being sufficient to prevent motion. It is this non-reversibility that gives the screw its peculiar virtue in holding together parts of a frame or machine. For the screw-propeller, see Ships and Shipbuilding.

Screw Bean. See Mezquite.

Screw-nails, called in the trade 'wood screws,' are made from mild steel and iron; or from brass, copper, and zinc, when others would be destroyed by rust. Wood screws were in use long before the year 1760, when the brothers Wyatt obtained a patent for cutting screws by machinery. Before 1817, wood screws, being nearly all forged and then shaped by hand, were very expensive; but at that time a patent was granted to John Colbert, a German watchmaker, who made the first automatic machinery for this purpose. In the year 1854 a greatly improved machine was introduced from America, which may be said to have revolutionised screw-making. These machines are complicated, and expensive in first cost and also to keep in operation. The wire is supplied to the heading-machine, which cuts off a piece, and a blow from a die stamps a head on it. It is then turned and nicked, after which, in a worming-machine, a cutter passes several times along the blank and forms the thread and gimlet point. One person can attend to several of these machines. Considerable success has been attained in rolling the threads on screw blanks. Two reciprocating plates, or revolving discs, are made from hard steel, and grooved at an angle; the screw blank is rolled between them under great pressure, receiving the reverse impression of the grooves which form the thread. The annual consumption of wire for making wood screws in England amounts to 9000 tons. They are principally made in Birmingham, and one firm alone can produce 150,000 gross weekly.

Screw Pine (*Pandanus*), a genus of plants of the natural order Pandanaceæ, natives of the tropical parts of the east and of the South Sea Islands. Many of them are remarkable for their adventitious roots, with large cup-like *spongioles*, which their branches send down to the ground, and which serve as props. Their leaves are sword-shaped, with spiny edges, and are spirally arranged in three rows. In general appearance, when unbranched, they resemble gigantic plants of the pine-apple, whence their popular name. *P. odoratissimus* is a widely-diffused species; a spreading and branching tree of 25 feet high, much used in India for hedges. It grows readily in a poor soil, and is one of the first plants to appear on newly-formed islands in the Pacific. The male flowers are in long spikes, the female flowers in shorter branches. The flowers are frequently gathered before expanding, and boiled with meat. Their delightful and very powerful fragrance has made the plant a favourite everywhere. Oil impregnated with the odour of the flowers, and the distilled water of them, are highly esteemed East Indian perfumes. The seeds are eatable; and the fleshy part of the drupes, which grow together in large heads, is eaten in times of scarcity, as is the soft white base of the leaves. The terminal buds are eaten like those of palms. The spongy and juicy branches are cut into small pieces as food for cattle. The leaves are used for thatching, and their tough longitudinal fibres for making mats and cordage. The roots are spindle-shaped, and are composed of tough fibres; they are therefore used by basket-makers; and in Japan they are also used as corks. More valuable as a fibrous plant is an allied species, *P. sativus* or *P. Vacoa*, the Vacoa of Mauritius, which grows to a height of about 30 feet, but, from continual cropping of its leaves, is usually dwarfed to 6 or 10 feet. The fibres of its leaves are used for making the *Vacoa bags*, which rival in cheapness and usefulness the gunny-bags of India. The leaves are cut every second year. Immediately on being cut off the leaves are split into fillets, which are nearly an inch broad at the base, but taper to a point, and are 3 or 4 feet long. The aerial roots of the vacoa are so fibrous as to be used for making paint-brushes for coarse purposes.

Scribe (Heb. *sofer*), among the Jews, originally a kind of military officer, whose business appears to have been the recruiting and organising of troops, the levying of war-taxes, and the like. Later the Hebrew name *sofer* seems to have been especially bestowed on a copyist of the law books (Gr. *grammateus*). After the exile, under Ezra, apparently the copyist became more and more an expounder of the law (Gr. *nomodidaskalos*). In Christ's time the name had come to designate a learned man, a doctor of the law. Christ himself recognises them as a legal authority (Matt. xxiii. 2); they were the preservers of traditions, and formed a kind of police in the Temple and synagogues, together with the high-priests; and the people reverenced them, or were expected to reverence them, in an eminent degree. They were to be found all over the country of Palestine, and occupied the rank and profession of both lawyers and theologians. Their public field of action was thus probably threefold: they were either assessors of the Sanhedrim, or public teachers, or administrators and lawyers. Many of these teachers had special class-rooms somewhere in the Temple of Jerusalem, where the pupils destined to the calling of a rabbi sat at their feet. The calling of a scribe being gratuitous, it was incumbent upon every one of them to learn and to exercise some trade. Those scribes who were not eminent enough to rise to the higher branches of their profession, to enter the Sanhedrim, to be practical lawyers, or to hold schools of their own, occupied themselves in copying the Book of the Law or the Prophets, in writing phylacteries, contracts, letters of divorce, and the like. Much of the Halacha, Haggada, and Mishna was due to them. As a rule they were Pharisees (q.v.), and, in their zeal to keep the law pure from any foreign influence, even Chasidim (q.v.). Amongst famous scribes are to be reckoned Hillel, Shammai, and Gamaliel.

See Jews, Pharisees, Exegesis, Mishna, Talmud; also the histories of the Jews by Ewald, Graetz, and others; and Schürer's *History of the Jewish People in the Time of Jesus Christ* (Eng. trans. 1886-90).

Scribe, Augustin Eugène, a French dramatic writer, son of a wealthy silkmercer of Paris, was born in that city on 24th December 1791, and died there on 20th February 1861. Although educated for the legal profession, his whole life was given to the 'manufacture' of stage-pieces of all kinds. His first play that can be identified was a failure, in 1811, and it was not until 1816 that he had any success to boast of. From that time, however, his productions were so greatly in demand by theatrical managers that he established a sort of dramatic manufactory, in which numerous *collaborateurs* were constantly at work under his supervision. His plots are interesting and his dialogue light and sparkling; and not a few of his pieces have been adapted for the English stage. As literature they have little value. The best known are *Le Verre d'Eau*, *Adrienne Lecouvreur*, *Une Chaine*, and *Batailles de Dames*. Scribe also wrote various novels, and composed the *libretti* for a considerable number of well-known operas, including *Masaniello*, *Fra Diavolo*, *Robert le Diable*, *Les Huguenots*, *Le Prophète*, and *L'Africaine*. His *Œuvres Complètes* were published in 76 vols. in 1874-85. See Life by Legouvé, one of his assistants (1874).

Scriblerus. See Arbuthnot.

Scribner, Charles, publisher, was born in New York City, 21st February 1821, graduated at Princeton in 1840, and in 1846 joined in founding the publishing firm of Baker & Scribner. His partner died soon after, and the firm became Charles Scribner & Co. *Hours at Home*, first issued in 1865, in 1870 was merged in *Scribner's Magazine*, which was sold by the firm in 1881, and re-christened the *Century Magazine*.' Charles Scribner had died in 1871 (August 26), and the firm in 1879 became Charles Scribner's Sons; and these in 1887 began a new *Scribner's Magazine*, in addition to their large publishing (as distinguished from printing and publishing) business.

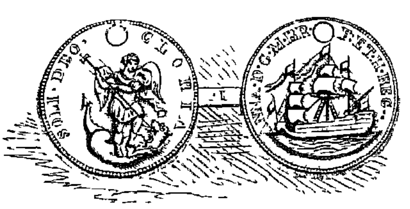
Scrivelloes. See Ivory.

Scrivener, Frederick Henry Ambrose, a distinguished New Testament critic, was born at Bermondsey in Surrey, September 29, 1813, and had his education at St Olave's, Southwark, and Trinity College, Cambridge. For some time assistant-master at Sherborne, he was head-master of Falmouth School from 1846 to 1856 (holding part of the time the perpetual curacy of Penwerris), and rector of Gerrans from 1861 till 1876, when he was presented to the vicarage of Hendon and made a prebendary of Exeter. One of the New Testament revisers from the beginning, he received a Civil List pension of £100 in 1872, the St Andrews LL.D. in the same year, and the Oxford D.C.L. in 1876. His *Plain Introduction to the Criticism of the New Testament* (1861) was at once admitted to the rank of a standard authority. Among his other books are *Bezae Codex Cantabrigiensis* (1867), *Cambridge Paragraph Bible* (1870-71), *Six Popular Lectures on the New Testament Text* (1875), *Codex S. Ceaddae Lat. Eccl. Cath. Lich.* (1887). He died at Hendon, October 26, 1891.

Scrivener's Palsy, another name for Writer's Cramp. See Cramp.

Scrofula is a term whose significance has varied much at different periods and in the usage of different writers. In its widest sense at the present day scrofula may be held to connote a disturbed condition of nutrition characterised by the occurrence of inflammatory or hyperplastic processes of a specific nature (see Germ Theory) in the various tissues of the body. The tissues most frequently affected are the lymphatic glands, joints, bones, skin, and mucous membranes. The affection occurs most characteristically in the young subject. The older physicians (Hippocrates, Celsus) restricted scrofula practically to an inflammatory swelling of the *lymphatic glands*, more especially about the neck. Though frequent attempts were made to widen its significance so as to include supposed kindred processes in other structures, the old view remained dominant both in lay and medical parlance till recently. But the discovery in many so-called scrofulous manifestations of the presence of the *Bacillus tuberculosis*—the essential cause of tuberculosis (see TUBERCLE, CONSUMPTION)—has gradually modified the older conception and led to a recognition of the identity or at least the close relation existing between scrofula and tuberculosis. Hence many pathologists nowadays regard the tubercle bacillus as the one essential cause of so-called scrofula, and hold the latter (when used in the more limited sense of Hippocrates) as synonymous with a *localised tuberculosis*. Strong evidence may be advanced in favour of this view. Other pathologists regard the scrofulous tissue as a pretubercular manifestation, and suppose that the depraved structures afford a suitable soil or *nidus* on which the tubercle bacillus, whenever it obtains access, flourishes and multiplies, giving rise to tuberculosis proper. This subject will be therefore more fully treated under Tubercle (q.v.). Scrofula is synonymous with struma.

This disease for centuries was thought capable of being cured by the touch of a king, and it was claimed that this power was of English growth, commencing with Edward the Confessor, and descending only to such foreign sovereigns as could show an alliance with the royal family of England. But the kings of France claimed the gift, and it was certainly practised by Philip I., although he was allowed to have lost the power through his immorality. Laurentius, physician to Henry IV., claims that the power commenced with Clovis I., and says that Louis I. added to the touch the sign of the cross. He tells us also that Francis I. even in captivity preserved the power. In France it did not fall completely into disuse till 1776. William of Malmesbury is the first to mention the gift of healing in England and to attribute it to that most miserable of saints, Edward the Confessor. From his time down to Henry II. there is no account of the practice, but it reappears under Henry II., John, Edward II., Edward III., Richard II., Henry IV., V., VI., VII., and VIII., its truth guaranteed by grave and credible writers like Archbishop Bradwardine, Sir John Fortescue, and Polydore Virgil. Henry VII. was the first to institute a particular service of ceremony on the occasion of the touching; that used in Queen Anne's time will be found in the contemporary Prayer-books. In Henry's reign also the presentation of a piece of gold was first generally introduced, usually the angel-noble; but after the reign of Elizabeth the size of the coin was reduced for the sake of economy. James I. and Charles I. both touched, and we are told that the latter sometimes gave as his touch-piece silver instead of gold. But the practice reached its greatest height under Charles II., who even touched 260 persons at Breda before crossing to England, and we learn from the *Charisma Basilicon*, the third part of the *Adeno-choiradelogia* (1684) of the royal surgeon John Browne (1642–1700), that no fewer than 92,107 persons were touched between 1660 and 1682. Yet we learn from the Bills of Mortality that more persons died of scrofula during this period than any other, the evil having greatly increased during the king's absence. Browne's work is the best contemporary account of the rite that we possess. It is interesting that Sir Thomas Browne does not allude to the royal gift of healing, although there are allusions in his domestic letters to the practice of touching and to his granting the ordinary certificate as a physician. James II. also touched for the evil, but William III. put an end to the practice. Anne renewed it, and we read how on March 30, 1714, she touched 200 persons, among them Samuel Johnson, whom, however, she did not heal. With the accession of the House of Brunswick the practice entirely ceased, but it seems that the Pretenders for some time attempted to maintain it, and we are told that the prince Charles Edward touched a child at Holyrood in 1746, which was healed within 21 days after. In 1748 the nonjuring historian Thomas Carte lost his subsidy from the Common Council of London for a note in the first volume (December 1747) of his *History of England* to the effect that a man had been cured of the king's evil by the touch of the Pretender at Avignon in November 1716. We find frequent allusions to the practice in Pepys and Evelyn, and indeed it was for centuries an article of popular belief, so that we need not wonder at the credulous warmth of Heylin, Sergeant-surgeon Wiseman, and Jeremy Collier. See T. J. Pettigrew, *On Superstitions connected with Medicine and Surgery* (1844).



SO GLORIA
MAG. BR. FRA. ET HIB. REG.

Touch-piece (time of Queen Anne).

SCROFULOUS or Tuberculous Diseases occur similarly in cattle, sheep, pigs, and less frequently in horses and dogs. See at CONSUMPTION the section on consumption in the lower animals.

Scroggs, SIR WILLIAM, synonym for an unjust, venial, and brutal judge, became Chief-justice of the King's Bench in 1678, and was specially notorious for cruelty and partiality during the trial of the unfortunates accused of complicity in the alleged Popish Plot (see OATES). In 1680 he was impeached by the Commons, but removed from office by the king on a pension. He died in 1683.

Scroll, an ornament of very common use in all styles of architecture. It consists of a band arranged in convolutions, like the end of a piece of paper rolled up. The Greeks used it in their Ionic and Corinthian styles, the Romans in their Composite; and in mediæval architecture, and all styles which closely copy nature, it is of constant occurrence as in nature itself.

Scrope, a famous family of the north of England that produced, amongst others, Richard le Scrope, Chancellor in 1378 and 1381–82; Richard Scrope, Archbishop of York, who joined in the conspiracy against Henry IV., and was beheaded at York in 1405; and Lord Scrope of Bolton, Warden of the West Marches under Queen Elizabeth.

Scrope, GEORGE POULETT, geologist, was born in London in 1797, and was educated at Harrow and Cambridge, and on his marriage in 1821 exchanged his own name, Thomson, for that of his wife's family. He made studies of volcanic phenomena at Vesuvius, in central France, and elsewhere, and expounded his views in *Considerations on Volcanoes* (1824) and *Geology of the Extinct Volcanoes of Central France* (1827; 2d ed. 1872). As member of parliament for Stroud from 1833 to 1868 he became famous as a writer of pamphlets in the interests of the agricultural labourer. A Fellow of the Royal Society and other learned associations, he died 19th January 1876.

Scrophulariaceæ (also called *Scrophularineæ*), a natural order, chiefly herbaceous and half-shrubby plants. The order is a very large one, containing almost 2000 known species, which are distributed over the whole world, both in cold and warm climates. Acridity, bitterness, and astringency are prevalent characteristics, and many species are poisonous. Mucilage, resinous substances, and essential oils are also products of many of the species. Some are root parasites. Some are admired and cultivated for their flowers; some are used medicinally. Digitalis or *Foxglove*, Calceolaria, Mimulus, *Mullein*, Antirrhinum or *Snapdragon*, Gratiola, Scrophularia or *Figwort*, Veronica or *Speedwell*, and Euphrasia or *Eyebright* are familiar examples. Very different from these humble herbaceous plants is *Paulownia imperialis*, a Japanese tree, 30 to 40 feet high, with trunk two or three feet in diameter, and flowers in panicles, about as large as those of the common foxglove; the tree is hardy in the milder parts of England, and is a beautiful ornament of shrubberies from London southwards.

Scrub. See AUSTRALIA, Vol. I. p. 589.

Scruple (Lat. *scrupulum*, 'a small, sharp stone') was the lowest denomination of weight among the Romans, and with them denoted the 24th part of an ounce (*uncia*), or the 288th of a pound (*libra*). As a measure of surface it was also the 24th part of the *uncia* (see OUNCE). In Apothecaries' Weight a scruple contains 20 Troy grains, is the third part of a drachm, the 24th of an ounce, and the 288th of a Troy pound. See WEIGHTS AND MEASURES.

Scudéry, MADELEINE DE, an interminable French novelist, was born at Havre in 1607, her father of Provençal origin. Left an orphan at six, she received a careful education from an uncle, and, still young, came up to Paris, where she soon became a notable figure in the brilliant society of the Hôtel Rambouillet. She was plain, if not ugly, thin, dark, and long-faced, full of vanity and prudishness, a 17th-century Madame de Genlis *plus* virtue, as Sainte-Beuve styles her. But blue-stocking as she was she had a woman's heart, and loved after the fashion of her heroines, with an exalted and chaste affection, the ill-favoured but learned Pellisson, in whom she had inspired a passion. Her half-crazy brother Georges (1601-67) left the service in 1630 to devote himself to literature, and, being gifted with fatal facility, posed as a rival of Corneille, and wrote many pieces long since securely forgotten. To Christina of Sweden he dedicated one poem, *Alaric*, of 11,000 verses. A kind of swashbuckler among men of letters, he wrote prefaces that read like cartels of defiance to any who had the temerity to doubt his genius. His sister used to help him in his writing, and Tallemant ascribes to her the entire responsibility of *Ibrahim ou l'illustre Bassa*, a romance in four large volumes, which he signed and published in 1641. Similarly *Artamène ou le Grand Cyrus* (10 vols. 1649-53) and *Clélie* (10 vols. 1654-60) both bore the name of Georges de Scudéry, although he contributed only the framework of the two, that is to say, the part which is the worst in both. Mdlle. de Scudéry lacked real invention, and took her figures from her acquaintance and from the society of the day, travestying them as Romans, Greeks, Persians, or Carthaginians—thus, she has half-painted herself as Sapho in vol. x. of the *Grand Cyrus*. Victor Cousin discovered a key (1657) which named all the figures definitely, as Artamène for Condé, Mandane for Mme. de Longueville, Parthénie for Mme. de Sablé, &c. But she had real skill in polished conversation, and, in later days when her stories had gone out of fashion, she reproduced ten volumes (1680-92) of these taken from her novels. Madame de Sévigné writes her daughter, 'Mdlle. de Scudéry has just sent me two little volumes of conversations; it is impossible that they should not be good, now that they are not drowned in a great romance.' The *Grand Cyrus* is one of the masterpieces amongst the *romans de longue haleine*, as their order has been felicitously named, but a modern reader seldom strays far into its 15,000 pages. The incidents follow in the most helpless monotony and lack of verisimilitude, but the naiveté of the reflections completely disarms the critic. The virtuous authoress prided herself on her ability to fathom all the depths of love without having sounded them in her own experience, and the famous 'Carte de Tendre' in *Clélie, histoire Romaine*, is a fantastic but pretentious attempt to construct an analysis and guide to the whole kingdom of Love. It was not an invention of Mdlle. de Scudéry, but due to the collaboration of the superfine ladies and gentlemen who frequented her Saturdays. She lived till the age of ninety-four, respected and honoured to the last, dying at Paris, 2d June 1701. The etherealised sentiment of her novels had already wearied the world, but the death-blow waited to be dealt by the hand of Boileau. Cousin calls her, but not happily, 'a sort of French sister of Addison.' As a woman it should not be forgotten to her honour that her brave devotion to friends like Mme. Longueville and Fouquet survived their fall; and none could ever be an object of indifference to the world of whom Madame de Sévigné could write, 'In a hundred thousand words I could tell you but one truth, which reduces itself to assuring you, Mademoiselle, that I shall love you and adore you all my life; it is only this word that can express the idea I have of your extraordinary merit. I am happy to have some part in the friendship and esteem of such a person. As constancy is a perfection, I say to myself that you will not change for me; and I dare to pride myself that I shall never be sufficiently abandoned of God not to be always yours.'

See Victor Cousin, *La Société Française au Dix-septième Siècle* (1858); Sainte-Beuve, *Causeries du Lundi*, vol. iv.; André Le Breton, *Le Roman au Dix-septième Siècle* (1890); and chapter iii. of Amelia Gere Mason's work, *The Women of the French Salons* (1891).

Scudo (Ital., 'shield'), an Italian silver coin corresponding to the Spanish Piastre (q.v.), the American Dollar (q.v.), and the English Crown (q.v.). It was so called from its bearing the heraldic shield of the prince by whose authority it was struck, and differed slightly in value in the different states of Italy, the usual value being about four shillings.

Sculling has two senses, a river sense and a sea sense. In its fresh-water acceptation sculling is the propulsion of a boat with a pair of sculls or light oars by one man (see ROWING). Among seafaring men, however, to scull is to drive a boat onward with one oar, worked like a screw over the stern.

Sculpin, a name given to the Dragonet (q.v.), and also in the United States to various marine species of Cottus or Bull-head—notably to *C. octodecimspinosus* and *C. scorpius*; the 'Daddy-Sculpin' being *C. grœnlandicus*.

Sculpture has been practised in all ages and by all races. There is no savage so untutored but can scratch a rude design upon a flat surface (the beginning of relief) or fashion a stone into the rugged semblance of a god. There are still preserved the rough experiments of palæolithic man, which in character and expression fall but little short of the misshapen images of archaic Greece. Such backward races as to-day remain in the state of barbarism from which the more highly developed emerged countless centuries ago still aim at the innocent realism of prehistoric times. But these furtive attempts have naught in common with art; their interest is anthropological; and the present article treats of sculpture as it has been pursued by craftsmen with a certain control of their material and a consciousness of the effect it is theirs to produce. The sculpture of India, for instance, is merely fantastic; its preoccupation is religious rather than artistic. When viewed in relation to the great stream of tradition which connects the work of Rodin or Gilbert with the colossal figures of Egypt, it is but a shallow backwater. But from the time when the great Sphinx was set up at Gizeh until yesterday a countless succession of men have expressed their ideals in clay, bronze, marble, and other more or less stubborn substances, with a deliberate intention and tutored sense of dignity or beauty which entitle them to be revered as artists and their works to be treasured as masterpieces. With their achievement we are alone concerned; the ingenuous scratchings of the savage—whether ancient or modern—and the fantasies of the Oriental mystic are for the curious to consider.

The material of sculpture is as various as the methods of its treatment. Wood, marble, basalt, granite, bronze, gold, and ivory are but a few of the substances which have been fashioned into beautiful and stately forms. Here at once we discover one determining element of style. An artist who works in porphyry or granite cannot express his fancy with freedom. A largeness and dignity is forced upon him by the rigid substance upon which he has chosen to work. So we find in the works of ancient Egypt a severe and monumental repose which would be out of place in figures of a modest size and more malleable material. It has ever been the supreme merit of the sculptor perfectly to adapt his means to his end. The Greeks of the 5th century expressed in marble the most beautiful lines and shapes which the material could suggest. Where there was no place for common or familiar ideas all was simple and restrained. On the other hand, the artists of Tanagra, working in the ready and pliant medium of terra cotta, did not venture beyond a scale and a technique which, though perfectly consonant to their purpose, have the grace and elegance of the masterpiece in little. The sin of taste which renders the bulk of modern sculpture vain and of base effect is ignorance of the material's limitations. The Italian of to-day who esteems marble the most apt substance for the presentation of lace-frills and waistcoat-buttons wrecks his craft upon the reef of cleverness. The artist does not carve and slash his marble as though it were paper, nor does he break up its surface into a thousand furrows as though it were putty; but, still within the bounds of taste and knowledge, he gives to his work a breadth and simplicity which are at war neither with art nor with nature. Indeed the problem of sculpture may be defined as the translation of the forms of the visible world into the language suggested by the material employed. Many of the grandest sculptures that time has spared were composed to fill certain spaces in wall or pediment. Their purpose being thus decorative, it follows that there is another force by which the artist is controlled. The variety of pose and contour which distinguish the Elgin marbles was suggested by the varying depth of the pediment they were destined to adorn. So also the flowing harmony of the Parthenon frieze proceeds from the subtlest adaptation of the design to the space. It is only necessary to contrast the masterpieces of Greek art with the outrages upon taste which have defaced Westminster Abbey since the 18th century to recognise how much beauty depends upon a sense of fitness. Realism, in brief, though the final aim of savage art, is but a snare to the artist in bronze or marble. To represent chosen aspects of animal forms which are in discord neither with their material nor with the site they occupy, this is the end of the sculptor, and in its attainment a sense of beauty must always conquer the interest of facts, a respect for tradition must forbid the play of ingenious artifice.

The Egyptians, as they were the first, were also the most prolific sculptors. Their temples and palaces were covered with reliefs; innumerable statues of gods and heroes stood upon their plains. The Sphinx (q.v.), which M. Maspero places many centuries before Menes—who flourished some 4000 years before Christ—is the product of an art already mistress of her resources. There is not a tentative touch in this noble monument; it is not an experiment like the seated figures from Branchidæ, which only preceded the efflorescence of Greek sculpture by a few centuries, but a work as finished in its grand impassiveness as the Theseus (so called) of the Parthenon. But Egyptian art, as it seems perfect in the beginning, knew no progress but decay. Its purpose was consistently the same. It did not advance, like Greek sculpture, from naïveté to accomplishment, from hieratic restraint to artistic enfranchisement. The school of Memphis is already a school of the decadence. And yet its artists are still for the most part bound in the chains of hieratic tradition. Their seated figures are always posed in the attitudes sanctioned by custom, the elbows firmly planted against the sides, the hands set forward upon the knees. Their reliefs also are stiff and archaic. While they display a knowledge of anatomy and an observation of the human figure in action, the head and legs are presented in profile, while the upper part of the body faces the spectator. This peculiarity was the result not of incompetence, but of a fierce conservatism. The reliefs, the figures of which either project from the ground or are depressed beneath it, were always coloured: indeed polychromy was invariable when the material was not naturally veined or coloured. But excavations at Boulak have shown that under the Memphis dynasty, despite the influence of the ancient school, realistic portraiture was practised with amazing success. Such a figure as the wooden *Sheik-el-beled* (see Vol. IV. p. 236) is neither stately nor beautiful, yet there is little doubt that it is a speaking likeness; and so much may be said for a dozen masterpieces treasured at Boulak. The first Theban school, which flourished from the 10th to the 16th dynasty, drew its inspiration from the school of Memphis. The same respect for tradition, the same interest in portraiture were piously preserved. Indeed Egyptian art clung to the ideals of grandeur and formality until the advance of Greece introduced a fresh science and a fresh civilisation. By its very austerity no less than by its balanced union of observation and convention the sculpture of Egypt displays a grandeur and impressiveness which it shares with no other manifestation of art. Its hybrid colossi and monstrous deities, hewn out of the stubbornest material, are still noble in spite of their ugliness; and that even the formal Egyptian was not incapable of representing graceful types the portrait of Menephtah and Queen Taia remain to show. And yet from the classical period the Sphinx alone survives (see figures in the article EGYPT, and at Vol. I. p. 22).

Assyrian sculpture, which grew out of the ruder art of Chaldæa, like Egyptian, knew neither progress nor development. Its earliest monuments date from the 12th century B.C., but the magnificent series of reliefs in the British Museum are not earlier than the 9th and 8th centuries, and they display the inflexible characteristics of the most ancient period. The kings and viziers, who figure in the reliefs, conform to an invariable type. The monarch is recognised by his square-cut beard and jewelled tiara. He is often represented, like the figures of Egyptian reliefs, partly fronting the spectator, partly in profile. There is no attempt at portraiture, not a suggestion of naturalism. But in the treatment of animals the Assyrian allowed himself complete freedom. The lion-hunts are masterpieces of observation and execution. The finest reliefs prove that even before the matchless frieze of the Parthenon there were artists who could model the horse with animation and understanding. The Assyrians delighted also in hybrid forms; the portals of their palaces were guarded by colossal winged bulls with human heads, admirable specimens of which may be seen at the British Museum from the palace of Sargon (721–705 B.C.). Assyrian art in fine, despite its many conventions and inveterate symbolism, lacked the grandeur and the nobility of Egyptian sculpture. On the other hand, the artists of Assyria display a sense of life and movement, especially in their treatment of animals, unknown before them (see figures at Vol. I. pp. 517, 519, 633).

The origins of Greek sculpture are still in dispute. Some there are who would have us believe that the art which culminated in Phidias derived directly from Egypt or Assyria; others assert that it was autochthonous. The question does not admit of a positive answer. That the archaic Greeks were influenced by the art of the Orient is incontestable, but it seems no less certain that, the influence being superficial, Greek sculpture followed a natural course of development. In the treasure-house at Mycenæ are certain scabbards and sword-hilts of eastern design, if not of eastern workmanship, and there is no reason why the Phœnicians, the bagmen of antiquity, should not have carried these precious wares to Argolis. The famous Lion-gate, too, is Assyrian in character, and many examples of primitive Greek art are conspicuously Oriental. But both history and common sense are opposed to the view that the early masters of Selinus or the authors of the primitive Apollo statues (so called) owed a direct debt to Egypt. It has been pointed out that Egyptian art, when we first meet it, was finished and complete; its ideal was attained in obedience to hieratic laws. The sculptors of archaic Greece were too naïve to be the mere imitators of a classical style. Their aim was realism, so far as their limited resources and control of marble or bronze would carry them. The early history of Greek art is shrouded by the Greeks themselves in a veil of legend. With characteristic anthropomorphism the ancient critics were wont to represent each epoch in the development of art by a purely mythical hero. The Cyclopes, the Telchines, Dædalus, Butades, and Kore, to whom the invention of modelling is ascribed, are one and all very pretty fictions. Even Rhœcus and Theodorus, the inventors of bronze-casting, and Glaucus, who invented the soldering of iron (*σιδήρου κόλλησιν*), are names and no more. Indeed it is impossible until a comparatively late period to connect extant works with the name of their authors. When we examine the archaic monuments, such as the earliest metopes of Selinus, which are as old perhaps as 600 B.C., we find a style awkward and ingenuous even to barbarity. While the figures of Perseus and Medusa front the spectator, the feet are planted from left to right, and the mason, so far from aiming at symmetry of design, was doubtless content with a vague semblance of humanity. The seated figures from Branchidæ, which may be as late as 540 B.C., are merely blocked out, and the seated Athena, ascribed to Endœus (550 B.C.), gives no promise of the golden age which followed less than a century later. The celebrated Lycian reliefs, known as the Harpy Tomb, mark a distinct step in advance. There is charm and dignity in their stiff elegance and beautiful drapery; and yet are they not still marred by the clumsy ingenuousness of the true primitive? At Athens art was born late and lived a brief, if brilliant, life. Nor is the *stele* of Aristocles much better than an archaic experiment; though the relief of a woman stepping into a chariot, which may have been a metope of the Hecatompedon, has at least the suggestion of freedom and mastery. There exists a group of statues—called Apollo—which were fashioned in obedience to the same convention. They are rigid and clumsy in handling; the arms are fixed firmly to the side; and yet the surface is treated with breadth and simplicity, and there is an unmistakable Hellenism in the flow of the lines. That of Orchomenus is probably the most ancient, and may date from the 7th century; the most advanced in style is the so-called Strangford Apollo—now in the British Museum—which is doubtless not much older than the Ægina pediments.

The marble statues which adorned the gable-ends of the temple of Athena at Ægina, and are now the chief ornament of the Glyptothek at Munich, form the first great monument of Greek art which has come down to us. Each pediment represented the struggle of two opposing forces over a dead warrior. Though there is an archaic touch in the spare proportions and rigid attitudes of the figures, they are evidently the work of a master who understood his craft, and it is possible that the stern handling and the archaic smile were deliberate. The author is unknown. The eastern pediment is freer, and possibly later than the western, and the historians have ascribed it to Onatas, a sculptor whose name is preserved in the texts. But there is not a shred of definite evidence, and we can only describe these fine statues as the best specimen of Greek sculpture half a century before the advent of Phidias. The style of Myron and Polycletus is known to us only by copies; that of Kalamis not at all, unless the Choiseul-Gouffier Apollo (so called) be a copy of his famous Apollo Alexikakos. All three were older contemporaries of Phidias, and concerning them all the ancient critics waxed eloquent. If we may believe a hundred epigrams, Myron aimed at realism and illusion rather than at beauty. His disc-thrower has been celebrated through all the ages, although, if the copy be accurate, Quintilian described it accurately as *distortum et elaboratum.* Polycletus, on the other hand, was a true academic, and would have imposed a canon on the world. The well-known *Doryphorus* and *Diadumenus* are copies of his works; and though we may not determine therefrom his technique, we may at least realise the square proportion to which he bade his contemporaries conform.

In Phidias the art of sculpture culminated. Born at the most fortunate moment of the world's history, the artist of the Parthenon was a worthy contemporary of Sophocles and Plato. To his personal genius must be ascribed the marvellous efflorescence of art which conferred a unique glory upon the 5th century B.C. Cupidity and barbarism have effaced the monumental Chryselephantine (q.v.) figures of Athena and Zeus, which antiquity esteemed his masterpieces. The bronze colossus—Athena Promachos—no longer stands upon the Acropolis to strike fear into the heart of invading Goths. But the sculptured decorations of the Parthenon have been preserved, though not unhurt by time, for our admiration. In style there is a profound difference between the metopes, which are marked by a dry archaism, and the magnificent works which are still the supreme expression of the art. Maybe the metopes preceded the rest by some years, and there is at least a mastery and sureness in their handling which separates them by a long interval from the Æginetan sculptures. But the frieze and such groups from the pediments as have survived the shocks and explosions of history are the work of a hand and brain balanced and complete. Here breadth, simplicity, and finish unite; there is ever an exquisite quality of surface; plane is related to plane with amazing subtlety; the accidental is rigidly excluded; nature and the convention of the art are happily blent; a sense of dignity, beauty, and control is everywhere apparent; not only is each figure perfect in itself, but each is perfectly adapted to the space it fills; the structure of the pediment compelled the sculptor to set his figures in exquisitely varied pose, so that the composition of the groups—which represented episodes in Athena's career—was at once flowing and coherent. The march of the frieze—a procession in the Panathenaic festival—is as large and stately as its details are exquisite (see Vol. IV. p. 293). Phidias (q.v.) is to-day, as at his advent, incomparably the greatest sculptor of the world; and his school handed on the torch he had given into their hands. The restrained elegance of the Caryatides of the Erechtheum, the graceful Victories, with their beautiful draperies, which adorned the temple of Nike Apteros, the refined grandeur of a dozen *stelæ*, the charming movement of the Phigalian frieze, are the outcome of Phidias' serene example. The sculptured figures of the temple of Zeus at Olympia, the shrine of the gold and ivory statue, are an interlude in the history of art. Legend in ascribing the east pediment to Pæonius (the author of the famous Nike), the west to Alcamenes, is almost certainly false; and, if judgment may be based upon style, these figures are earlier in date than the Parthenon. The so-called Neo-Attic school marks the decadence. Still beautiful in their decay, the works of Scopas (390-350), and of Praxiteles, his contemporary, have already declined from the austere and classic style of Phidias. Their works lack something of the repose and impartiality which distinguish the masterpieces of the Parthenon. Though both produced an immense quantity of works, we know little else than copies and the ancient texts can tell us. The one undoubted work of Praxiteles which still remains to us is the Hermes, discovered at Olympia in 1877; while the handiwork of Scopas may be seen in the sculptures of the Mausoleum. To the same period perhaps belong the incomparable Venus of Milo (see MELOS), and the grave Demeter of Cnidos now in the British Museum. Lysippus, the court sculptor of Alexander, followed with his new canon of small heads and jimp figures, and then the school of Pergamum, beginning the revolt against Attic repose, inflicted an irremediable injury upon the art of sculpture. The school of Rhodes, with its much bepraised Laocoon (q.v.), the school of Tralles, with its impossible Farnese bull, completed the glory of the unsculpturesque. The capital of art was then shifted from Athens to Rome, and the industrious band of *Græculi esurientes* fashioned for us the excellent if uninspired copies to which we owe so much of our knowledge of Greek sculpture. To catalogue their names were superfluous; they were not wont to sign them themselves. But they preserved for future ages such admirable works as the Amazon and the Doryphorus; and if the Apollo (q.v.) Belvedere and the Venus de Medici have since been monstrously overrated, their authors are not to blame. Lastly, mention must be made of Pasiteles, who, in the time of Pompey, made a determined effort—like the Pre-Raphaelites of England—to revive an archaic style, and even succeeded in establishing a school.

And then the art of sculpture suffered eclipse. In the early centuries of Christianity the attempt to model the human form was condemned as idolatrous, and such poor barbarous experiments as were made may be passed over in silence. In the 6th century a revival was inaugurated at Byzantium, and flatterers compared a monument erected by Justinian in 534 A.D., in honour of a victory over the Persians, to the masterpieces of Phidias. But the Christian spirit invading, Byzantine sculpture, truly the very lees of classicism, must needs take refuge in an elaborate symbolism. The use of gems and precious metals gave a certain splendour to the best examples of Byzantine art, and its influence was universal. No country in Europe escaped it, and until the 12th century its reign was undisputed. In the Gothic period sculpture was, as it were, rediscovered. Commonly somewhat rude and barbarous, often resigned to a vigorous realism, it was not an art deliberate and complete as was the sculpture of the Greeks. Its conventions grew up with its growth, and save in France it was rarely emancipated from the fetters of experiment. In England such monumental sculpture as belongs to the Gothic period is undistinguished and maladroit. William Torell's Queen Eleanor (13th century) will serve as an example as well as another, and the sculptured decoration of Henry VII.'s chapel at Westminster shows the Gothic style as it was before the Renaissance reached England. In France there is another tale to tell. The manifold figures which adorn the cathedrals of Chartres and Rheims, though Gothic in spirit, were produced under the influence of classical art. Their freedom and simplicity is a complete contrast to the barbarous productions of the previous century. However, there is no difficulty in the supposition that the French artists of the 13th century were familiar with Roman art, and to this acquaintance with a good school they owed their superiority both to their predecessors and to their contemporaries in other parts of Europe. The 14th and 15th centuries were a period of decline; the northern spirit gained a complete ascendency, and with the exception of the works of Claux Sluter, which may be studied at Dijon, there is little to note before the Renaissance. Germany escaped from the thraldom of Byzantium in the 12th century, but she produced little work in the Gothic period that is either beautiful or sculpturesque. Not until the 15th century, when Syrlin, Dürer, and Wohlgemut practised wood-carving, is there any notable advance. To Adam Krafft (1430-1507) a feeling of beauty and rhythm was denied. His figures are square and squat, his drapery is arranged after the German method in stiff, hard-cornered folds. The Visscher family—Peter Visscher (1455-1529) was the greatest—made no conspicuous progress. They were still true to the Gothic ideal, and though their best work, such as Peter Visscher's portrait of himself, displays a bluff realism, it was based upon an inartistic convention and possessed no vital inspiration.

In Italy the classical tradition did not die, and such Gothic sculpture as the Italians produced was either of foreign origin or tinctured strongly with a feeling of classicism. Niccolo Pisano, who was born in 1205, was a devout student of classical models. In much of his work the two styles were ingeniously blent—in the pulpit at Pisa, for instance—and he was profoundly influenced by Roman sarcophagi. Niccolo's son, Giovanni, followed in his father's steps, and, though still a primitive, conferred fresh glory upon the Pisan school, which the ingenious Orcagna (born 1329) brought to an end. Giacomo della Quercia (born 1374), the author of the celebrated Fonte Gaja at Sienna, marks the transition from the old to the new, from the middle ages to the Renaissance. A student of nature, he only half understood the possibilities of the great revival, but his design for the gate of the baptistery at Florence (1401) was placed next in order after the designs of Ghiberti and Brunelleschi, and therefore he may be said to have heralded the re-birth of art. In Italy, where the Goth had never dominated, the Renaissance was a development rather than a revolution. The spirit had always been the same, and Ghiberti (born 1381), the first master of the new school, may hardly be called an innovator. His famous gates at Florence occupied the larger part of his life. The first was begun in 1403; the second was not finished until 1452. The work is marked by a suavity of line and a certain elegance in individual figures. But it is entirely pictorial; the design is rarely thought out with reference to the necessities and limitations of the art of sculpture, and there is scarce a panel in either gate that is not overcrowded with figures.

In 1386 was born Donatello, by far the greatest sculptor of the 15th century. Endowed richly with the artistic temperament, learned in all the new learning, Donatello was also an indefatigable observer of nature and a master of design. His work is Greek in the best sense; large, simple, and restrained. He did not, like Ghiberti, overstep the limits of his art; he did not, like Michelangelo, a man of far rarer genius, use sculpture to express the passions of a violent brain. Content to aim at perfection in his art, he produced a series of masterpieces, which for feeling of rhythm, sense of proportion, and architectural adaptation may scarce be matched save in the golden age of Athenian sculpture. Simplicity of plane, breadth of style, harmony of line, dignity of pose—these are the qualities which confer everlasting distinction on his St George, his equestrian statue of Gattamelata, and his incomparable reliefs. Michelangelo (1475–1564) has been discussed at length under his own name, and no more need be said of him here than that his gigantic personality has dominated the modern world; that his knowledge of the antique was so profound, his technical mastery so complete, that nothing save restraint was impossible to him; that he produced a series of extraordinary masterpieces in paint and marble; and that he founded a school which, beggared of his genius, did but exaggerate his more obvious faults. Luca della Robbia, the author of the 'Singing Boys' (1399–1482), is better known as the inventor of the famous Robbia ware than as a sculptor; while Benvenuto Cellini (1500–71), though he modelled the Perseus, is chiefly eminent as goldsmith and swashbuckler. The school of Michelangelo culminated in that most accomplished craftsman and mediocre artist Lorenzo Bernini (1598–1680), whose love of exaggerated forms and fantastic devices rendered his indubitable talent of no avail, though the unbounded influence which he exerted upon his contemporaries easily compassed the triumph of lawlessness and vulgar taste. Meanwhile the influence of the Renaissance was felt throughout Europe. In the 16th century, while Goujon imitated Cellini in France, Torrigiano inspired the English with an admirable taste in decoration, and Adrian de Vries reproduced in Germany the unchastened vigour of Giovanni da Bologna. In the 17th century there followed a universal decadence. Bernini's theatricality bore abundant fruit. Coyzevox, Clodion, Adam, the Coustous, Pigalle, and the rest, in spite of their eminent talent, always suffered from lack of repose and the lust of effect. Yet are they by far the most distinguished sculptors of the 17th century. In England nothing memorable was produced save the still-life of Grinling Gibbons (q.v.; 1648–1721); while Andreas Schlüter (1662–1714) best represents the art as it was pursued in Germany. The flamboyant style lived through the first half of the 18th century. A group of foreigners—Roubiliac, Scheemakers, and Rysbrack—practised their trade in England with a certain success. But the one great artist of the age was a Frenchman, Jean-Antoine Houdon (1741–1828). This distinguished artist, despite his education, avoided on the one hand the dry frigidity of effete classicism, on the other the cheap ingenuity of the imitators of Bernini. A naturalist, he never surrendered the dignity of his art to catch a fleeting resemblance. Above all he was from first to last a sculptor. His modelling is always large and simple; and though in his bust of Glück he attempted to reproduce the texture of a mottled skin, he was justified by the event. He was the greatest portrait-sculptor of his own or indeed of any age; he invented the type of Molière, and the great men of the great age live to-day as he created them. And then came Canova (1757–1822), who drove sculpture back into an antique channel. Neglecting the achievement of the Renaissance, he revived the Græco-Roman style with an insipid triviality, which has been a law to several generations of industrious workmen. In England Gibson, Macdowell, Chantrey, Wyatt, and a hundred others proceeded from Flaxman and the new classic school. In France Chaudet, Pradier, and Rude (by far the most accomplished of them all) neglected Houdon for Canova. Thorwaldsen, relying upon this false example, built up an amazing reputation, which is already shattered. A tasteless imitation, an incapacity to observe, a flabby modelling mark out the achievement of the whole school as a warning to sculptors, and serve to prove that salvation never came by an unthinking adherence to a dead tradition. The 19th century, however, has revolted against Canova and all his works. In Alfred Stevens, the author of the superb monument to the Duke of Wellington, who to a profound study of Michelangelo added an unfailing sense of decoration, England found her greatest sculptor and the present generation has witnessed a sudden efflorescence. The France of to-day is also singularly rich in sculptors. Barye, the greatest *animalier* of modern times, belongs to a past generation, but, amid a mass of sculpture which is wholly unsculpturesque, the works of Dalou, Guillaume, and Rodin are evidence of a revival. M. Auguste Rodin exercises the most powerful influence. An artist of markedly individual talent and a master of technique, he would claim Donatello as his exemplar, but he has carried the art of sculpture further than the Florentine.

See Schnaase, *Geschichte der Bildenden Künste*, and Lübke's *History of Sculpture* (Eng. trans.); for Egyptian sculpture, Maspero's text-books; for Greek sculpture, Overbeck's *Geschichte der Griechischen Plastik*, and *Schriftquellen zur Geschichte der Bildenden Künste*, with Brunn's *Geschichte der Griechischen Künstler*, and Mr A. S. Murray's *History of Greek Sculpture*. W. B. Scott's *British School of Sculpture* will be found useful, as also Eméric David's *Histoire de la Sculpture Française*. For Italian sculpture the reader may refer to Mr C. C. Perkins's handbooks. See also the monographs cited in the articles on the great sculptors in this work.

Sculptured Stones, a general name given in Britain to a class of monuments of the early Christian period, many of them being mere unhewn stones, with sculpturings of rude inscriptions, or symbols, or *ornamental designs*, corresponding in style and patterns to the illuminated decorations of Celtic manuscripts of the Gospels. The rude stones erected for memorial purposes in pagan times (unless under Roman influence) are uninscribed and unornamented (see under STANDING STONES). The sculptured stones of Britain may be divided into two classes—those that are simply incised and those that bear sculpture in relief, the former being the earlier method. Sculptured stones of the incised or earlier class may be subdivided into two sections, inscribed or uninscribed, irrespective of their bearing symbols and ornamentation. The advantage of this division is that the inscribed monuments can be arranged in chronological order by their palæographical characteristics, and the uninscribed examples bearing similar symbols and ornamentation to those found on the inscribed examples will follow the same sequence. We know from palæographical data that the earliest lapidary inscriptions in Britain are in Roman capital letters, and that the minuscules, or small letters, do not make their appearance till about the 6th century. Hence we have a means of dividing the inscribed stones into an earlier and a later group according as they are written in capitals or minuscules, while those that are mixed or partly in capitals and partly in minuscules will represent the middle or transition period. But many of the inscribed monuments bear inscriptions which are written in a character peculiar to the British Isles, and known as Ogam (q.v.). Sometimes the Ogam inscription is associated with an inscription in Roman letters on the same stone, sometimes the monument bears an Ogam inscription only. In the latter case it is frequently associated with sculptured ornamentation in relief of the most advanced type, and therefore we have another means of dividing the inscribed stones into two groups, one of which is demonstrably later than the other. Of these four groups, which are (1) inscribed in Roman capitals only; (2) inscribed in Roman letters and in Ogams, or bilingual and biliteral; (3) inscribed in Ogams only; and (4) inscribed in Roman minuscules or small letters, the first and second have their chief development in Wales, and the third and fourth in Ireland.

Of the first group of sculptured stones there are sixty in Wales, twenty-three in England, six in Scotland, and none in Ireland. They are in general rude undressed pillar-stones or oblong boulders from 4 to 9 feet in height, the inscriptions generally incised vertically. They are always in the Latin language, and usually consist of the name of the deceased, preceded by one or other of the varieties of the distinctively Christian formula 'Hic jacet,' &c. The greater number of these stones are found in association with ancient ecclesiastical sites, and some bear also incised crosses of the earliest known type. A well-known example is the Cat Stane near Kirkliston, Midlothian (fig. 1), which stands in a cemetery of early Christian graves, and bears the inscription, IN [H]OC TVMVLO JACIT VETTA F[ILIUS] VICTI. One of a group of three at Kirkmadrine in Wigtownshire commemorates two priests, Viventius and Mavorius, probably of the church founded there by St Ninian in the 5th century. The greater purity of the forms of the letters and the style of the Latin of the inscriptions of this group indicates their closer proximity to the period of the Roman occupation. The characteristic of the second group of inscribed stones is that they bear two inscriptions, one in the Latin language and in Roman letters (capitals as a rule), and the other in the vernacular in Ogam letters, one inscription being always an echo of the other. Of these bilingual monuments there are eighteen in Wales, two in England (both in Devon), two in Ireland, and one in Scotland, at Newton of Garioch in Aberdeenshire. Two examples will show the general character of their inscriptions. One in Pembrokeshire has, in debased Latin capitals, SAGRAMNI FILI CVNOTAMI, reading from the top of the stone downwards on one face, and on one edge the answering inscription in Ogam letters, SAGRANI MAQI CVNOTAMI, *maqi* being the usual form in these inscriptions for son. Another in Carmarthenshire reads in Latin AVITORIA FILIA CVNIGNI, while the answering Ogam has AVITORIGES INIGINA CUNIGNI—*inigina* standing for daughter, and answering to the modern Gaelic *ingen*, as *maqi* answers to *mac*. The third group of inscribed monuments, those bearing Ogams only, lies chiefly in Ireland, where there are 186 examples. *There are only twenty-two in Britain*, of which twelve are in Scotland, six in Wales, and four in England. Twenty-three of the Irish examples are associated with early forms of the cross incised on the same stone. In Scotland six occur on stones bearing crosses or Celtic ornamentation of a late type, and in Wales six are on stones bearing incised crosses. From their nature these Ogam inscriptions are peculiarly difficult to decipher; but when the reading is clear they are usually of the same brief character as the bilingual inscriptions of the group previously described. The fourth group of inscribed monuments comprises those in minuscules or small letters of the Roman alphabet, chiefly in the forms of those letters adopted by the Irish scribes. Of such inscribed stones there are about 260 in Ireland, forty-two in Wales, twelve in England, and only three or four in Scotland. The largest group in Ireland is in the ancient cemetery of Clonmacnois, where there are over eighty examples, many of which can be dated by the names of the persons commemorated. They are chiefly undressed slabs laid flat on the graves, and incised sometimes with the inscriptions only, sometimes also with crosses, and more rarely with Celtic ornamentation. Of the names which can be identified from the Irish annals four belong to the 7th century, six to the 8th, twenty-eight to the 9th, eighteen to the 10th, and the same number to the 11th century. The earliest bear nothing but the inscriptions and plain crosses. Ornamentation does not begin to be added till the 9th century. In Ireland the inscriptions are usually in the vernacular, with the formula *oroit do* —— and its contractions, or *oroit ar anmain* —— and its contractions, meaning 'pray for ——' or 'pray for the soul of ——.' In Wales, however, the inscriptions of this group are usually in Latin. Though the majority of these stones are sepulchral monuments, others have been erected for different purposes, commemorative or terminal, to mark the boundaries of church lands or sanctuaries. In the Anglo-Saxon parts of Britain the inscribed stones bear

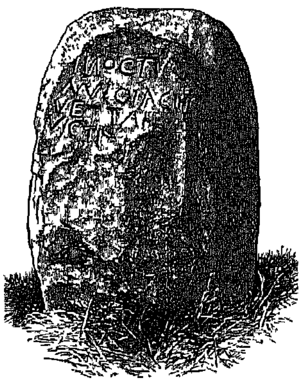


Fig. 1.—The Cat Stane.

inscriptions in Anglian runes, and in the Isle of Man and the northern and western isles of Scotland, colonised from Scandinavia, the inscriptions are in Scandinavian runes. The monuments with Anglian runes are chiefly sepulchral slabs of small size, incised with a cross and the name of the deceased. In a few cases, however, they are great commemoration crosses, covered with sculptured ornamentation, and bearing elaborate inscriptions. The finest of these crosses are at Bewcastle (q.v.) in Cumberland and Ruthwell (q.v.) in Dumfriesshire. The shaft only of the Bewcastle cross remains, 14½ feet in height; the Ruthwell cross measures 17½ feet in height. Both are so similar in design and in style of ornamentation that they must be attributed to the same period. Both have long runic inscriptions—that on the Ruthwell cross being associated with a series of inscriptions in Roman capitals descriptive of the scriptural scenes carved on the panels of its two broad faces, while the runes are on the borders of the long panels on the sides of the cross, enclosing scrolls of foliage. They contain twenty-one lines of an Anglo-Saxon poem—'The Dream of the Holy Rood'—which was not known to exist in any other form until a South Anglian version was discovered in a manuscript at Vercelli in 1823, and attributed to Cynewulf, though Professor Stephens of Copenhagen maintains that a line of runes on the top of the cross, now obliterated by exposure, gave the authorship to Cædmon. The inscription on the Bewcastle cross is less legible, and has been read as recording its erection in honour of Alcfrith, king of Northumbria, in the 7th century, though the opinion is gaining ground that the dates of both these crosses must be placed considerably later than his time.

The monuments included generally under the name of the sculptured stones of Scotland are for the most part uninscribed. But they are profusely decorated (as will be seen from the annexed figure of one of the most ornate, at Nigg in Ross-shire), and their chronological place in the general group of the early Christian monuments of Britain falls to be determined partly from the relations of their general system of ornamentation to that of the illuminations of the Celtic manuscripts of the Gospels of the 7th to the 10th and 11th centuries, and partly by the characteristics of the few inscriptions they do bear. Taken by themselves, they exhibit peculiar characteristics, which show that, although they form part of the general group which is peculiar to the British Isles, they have been affected by strong local influence. They present a peculiar set of symbols, not one of which is known to have occurred beyond the Scottish area, while the special form of the erected cross-bearing slabs, and the partiality to the representation of conventional beasts as part of their decoration, distinguish them from the English, Welsh, and Irish groups. The Scottish sculptured stones, of which over 370 are known, are divided into three varieties: (1) rude undressed pillar-stones or oblong boulders incised with unexplained symbols; (2) erect shaped slabs of headstone form, sculptured generally in relief, with a cross on one face and figure subjects and symbols on the other; and (3) high crosses with figure subjects and Celtic ornamentation similar to those of the cross-bearing slabs, but without the symbols. The rude pillar-stones of the first variety occur chiefly along the eastern side of Scotland from the Firth of Forth to the Orkney and Shetland Isles, being most numerous in the district between the Tay and the Spey. Outlying examples, however, occur as far south as Dumfriesshire and as far west as the outer Hebrides. The unexplained symbols incised on these stones are more easily represented than described. Those of most common occurrence are represented in fig. 3. Some of these are arbitrary symbols, to the development and meaning of which there is no clue. Others—such as the serpent, and the mirror and comb—are representations of existing objects, apparently used with a symbolic meaning. Some of the arbitrary symbols occur also on silver ornaments of the same period. On stones of the second variety, sculptured in relief, and presumably of later date, these symbols are associated with well-known symbols of the Christian faith, such as the cross and the fish, and with the ornamentation so characteristic of the illuminated pages of Celtic manuscripts of the Gospels. The figure subjects on the stones of this variety are partly scriptural and mostly related to the general cycle of early Christian symbolism. Among the scriptural subjects are the Temptation of our First Parents by the Serpent, Daniel in the Den of Lions, the Destruction of Pharaoh's Host in the Red Sea, the Raising of Lazarus, Jonah disgorged by the Whale, the Virgin and Child, &c. Along with these are hunting scenes, including the chase of the stag, wild boar, &c., and groups of animals evidently taken from the Bestiaries of the early middle ages, a species of natural history spiritualised, in which the characteristics of the various animals, real and fabulous, were set forth as symbolising the spiritual condition of man as related to the

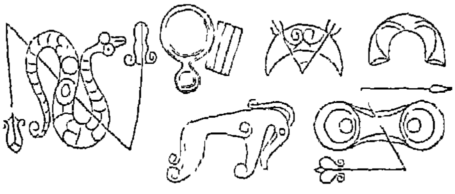

Fig. 3.—Symbols on the Sculptured Stones of Scotland.

scriptural plan of salvation (see BESTIARY). Of the third class of sculptured stones, the high crosses, there are but few in Scotland, and they are nearly all characterised by the presence of scriptural subjects. There are no data by which the age of the stones of the first variety, bearing only the incised symbols peculiar to Scotland, can be estimated. But there seems no reason for assigning to them a higher antiquity than that of the inscribed stones of the first and second classes, which seldom bear ornamentation or symbols, except the early form of the cross. The style of the ornamentation of the second variety, sculptured in relief and arranged in panels, is similar to the decoration of the illuminated Celtic manuscripts of the Gospels of the period ranging from the 7th to the 10th century. The third variety, consisting of high crosses with pure Celtic ornamentation, may range from the 10th to the 12th century. This form of monument—a high cross—with local variations and a remarkable development of foliageous ornamentation common to the recumbent sepulchral slabs of the same district, continued in the West Highlands from the 13th to the 16th century.

Scurf. See PITYRIASIS.

Scurvy, or SCORBUTUS, is a disease characterised by a depraved condition of the blood. In consequence of this morbid state of the blood there is great debility of the system at large, with a tendency to congestion, hæmorrhage, &c. in various parts of the body, and especially in the gums. It has probably existed from the earliest times, but the first distinct account of it is contained in the history of the crusade of Louis IX. in the 13th century against the Saracens of Egypt, during which the French army suffered greatly from it. In the 16th century it prevailed endemically in various parts of the north of Europe, and it seems only to have abated towards the close of the 18th century. It was in badly-fed armies, in besieged cities, and on board ship that its ravages were most appalling, and it is believed that more seamen perished from scurvy alone than from all other causes combined, whether sickness, tempest, or battle. For instance, only 1512 sailors and marines were killed in all the naval battles of the Seven Years' War; but 133,708 died of disease or were missing, and scurvy was the principal disease. Whole crews were prostrated by this scourge, as in the well-known case of Lord Anson's (q.v.) memorable voyage. It is now met with under similar conditions, though cases are comparatively rare (in 1873 only 19 cases were reported to the Board of Trade, in 1881 as many as 99), and also among the lower classes in large towns, navvies engaged in railway work, &c., when they confine their dietary to tea, bread, ham, salt-fish, &c., to the exclusion of fresh vegetables and meat.

The first effect of the disease is generally a decline in the general health, and the patient becomes depressed, is easily fatigued, and has a peculiar sallow complexion. After a variable period the more characteristic symptoms appear, the chief of which are hæmorrhages and sponginess of the gums. The hæmorrhages closely resemble those of Purpura (q.v.), and occur into and under the skin, where they give rise to red or purple discolorations which change colour like the marks of bruises; into the muscles and other deeper tissues, where they cause brawny swellings; and into internal organs or cavities. Hæmorrhage also frequently takes place from the mucous membranes of the nose and alimentary canal. The affection of the gums is still more characteristic, and is rarely absent, except in the very young or very old, who are without teeth. The gums are swollen, discoloured, detached from the teeth, and bleed extremely easily, while the breath becomes very fetid. This condition sometimes precedes but often follows the occurrence of hæmorrhage in other situations.

The cause of scurvy is now well known to be an improper dietary, and particularly an insufficient supply of fresh vegetable food. The disease is never known to have occurred in any one who had eaten freely and habitually of such articles of diet. Even preserved vegetables, if kept in a juicy condition, prevent the occurrence of the disease. In the absence of vegetables abundant fresh meat and in a less degree milk are antiscorbutic. But the most efficient protective if fresh vegetable food is not attainable is lemon or lime juice; and the constant use of the latter during long voyages undoubtedly prevents the occurrence of scurvy when it would otherwise be inevitable. It is more apt to affect those who are deprived of fresh air and sunlight, are mentally depressed, and have had their health enfeebled by previous disease. In what way the deprivation of fresh vegetables acts on the blood to produce scurvy is as yet unknown. Dr Garrod's theory, that the element wanting is a sufficient supply of potash salts, is not generally accepted; for it has never been proved that potash salts by themselves are sufficient to prevent the disease.

Although the virtues of lemon-juice in scurvy were known in England as far back as 1636, when John Woodhall, Master in Surgery, published *The Surgeon's Mate, or Military and Domestic Medicine*, this invaluable medicine was not made an essential element of nautical diet till 1795, the author of the change being Sir Gilbert Blane (q.v.). The effect of this official act may be estimated from the following numbers. In 1780 the number of cases of scurvy received into Haslar Hospital (a purely naval hospital) was 1457, while in 1806, as also in 1807, there was only one case. Many naval surgeons of the present day have never seen a case of the disease. The potato possesses almost equally great antiscorbutic properties, and fortunately potatoes when cooked are as active as when taken raw. Dr Baly (1814–61), to whom we are indebted for this discovery, states that 'in several prisons the occurrence of scurvy has wholly ceased on the addition of a few pounds of potatoes being made to the weekly dietary.' For the cure, as for the prevention of the disease, the diet is by far the most important agent; lime, lemon, or orange juice should be given freely. Sometimes the condition of the mouth prevents the administration of potatoes and other vegetables; but when possible they should be given freely. Washes of chlorate of potash, tannin, or Condy's fluid should be used for the gums; if they are severely affected solid nitrate of silver may be applied to them with advantage.

Scurvy-grass (*Cochlearia*), a genus of plants of the natural order Cruciferæ, having small white flowers and many-seeded pouches. They are annual or biennial, rarely perennial plants; of humble growth, with branched smooth stems, smooth simple leaves, and terminal racemes of flowers. They have an acrid, biting taste, containing the same pungent volatile oil which is found in horseradish, and are valued for their antiscorbutic properties. Common Scurvy-grass (*C. officinalis*) is sometimes a foot high; the root-leaves are stalked and heart-shaped, the pouches globose, ovate, or elliptical. It is a variable plant, and some of the other species described by botanists are probably not essentially different. They possess the same properties. Scurvy-grass is very common on the shores of Britain, growing both on rocks where there is little soil and in muddy places. It is also found on high mountains. It is a very widely distributed plant, and, being found on the shores of almost all temperate parts of the world, has often been of great benefit to sailors in times when the modern precautions against scurvy at sea were unknown.

Scutage, or ESCUAGE (Lat. *scutum*, 'shield'), a pecuniary fine or tax sometimes levied by the crown in feudal times as a substitute for the personal service of the vassal.

Scu'tari (Italian or Levantine form of the Turkish *Üsküdar*), (1) a town of Asiatic Turkey, on the eastern shore of the Bosporus, immediately opposite Constantinople, of which it is considered a suburb. It is built on the slopes of a hill, and bears a great resemblance to the Turkish capital, though its streets are wider. It contains several handsome mosques, bazaars, and baths, a royal seraglio, and a college of howling dervishes, and manufactures silks and cotton fabrics and leather goods. It has long been famed for its extensive cemeteries, adorned with magnificent cypresses, the chosen resting-place of many of the Turks of Constantinople from attachment to the sacred soil of Asia. The population is variously estimated at from 40,000 to 60,000. During the Crimean war the enormous barracks built by Sultan Mahmud on the southern outskirts of the town were occupied as barracks and hospital by the English troops, and formed the scene of Miss Nightingale's labours. On the cliffs bordering the Sea of Marmora stands a marble obelisk marking the site of the densely-filled English burial-ground. A white tower (90 feet high) near the shore, now used as a lighthouse, is known as Leander's Tower (see HERO). Scutari is the rendezvous and starting-point of caravans and travellers for the interior of Asia Minor. It occupies the site of the ancient *Chrysopolis;* and about two miles to the south lies the village of Kadiköi, the ancient *Chalcedon.*

(2) A town of European Turkey, situated at the southern end of the Lake of Scutari, in Northern Albania, 16 miles from the Adriatic, with which it is connected by the river Bojana. It is overlooked by an old Venetian citadel on a commanding height, has manufactories of arms and cotton goods, and carries on a considerable trade, especially in wool and skins. Pop. 25,000, of whom one-third are Greek Christians. They have here a cathedral and a bishop.

Scylla and Charybdis, according to the Homeric legend, were two sea-monsters who dwelt on opposite sides of a narrow sea-strait. Scylla possessed twelve feet, six long necks and mouths, each with three rows of sharp teeth, and barked like a dog. Charybdis thrice every day sucked down the water of the sea, and thrice threw it up again; she dwelt under a cliff on which grew a conspicuous fig-tree. Ulysses passed between these voracious monsters, and Scylla snatched six seamen from his ship. There are other versions of the myth. In later times the names were applied to a couple of 'races' or rapids in the Strait of Messina, Scylla being the one next the Italian shore. From the supposed difficulty of navigating the strait without getting into the one or the other of these dangerous spots arose the proverbial 'To shun Charybdis and fall into Scylla.' But the dangers of these 'races' have been very greatly exaggerated.

Scythe. See REAPING.

Scythians, a nomad race of Asia known to the ancient writers. The name bore two significations, meaning (1) the Scythians proper or Scolots, (2) all the nomad tribes (Sacæ, Sarmatians, Massagetæ, Scolots) who dwelt in the steppes from what is now Hungary to the mountains of Turkestan. Some modern authorities believe them (the Scythians proper) to have been of Mongolian origin; but the evidence for their having been Aryans, akin to the Sarmatians and to the Thracians, is growing steadily stronger. They inhabited the vast treeless plains that stretch from the Danube north-east and east to the Volga, were nomads, keeping herds of horses, cattle, and sheep, lived in tent-covered wagons, fought with bows and arrows on horseback, made drinking-skulls of the heads of their slain enemies, were filthy in their habits, never washing, and worshipped without images various gods like those of the Aryan Greeks. From the Greek colonies established north of the Euxine they learned something of the arts of civilisation; one of their kings, Anacharsis (q.v.), even went to Athens to learn at the feet of Solon. In the 7th century B.C. the Scythians (i.e. some of the nomad races of the steppes) invaded Media, and were only got rid of after ten years' occupation by Cyaxares making all their chiefs drunk at a banquet, and then slaying them. About the same period (626) certain fair-haired men from the north invaded Palestine and Egypt; these have been identified with the Scythians, and were the same, in all probability, as the riders and bowmen of whom the prophet Jeremiah speaks (chap. iv.-vi.). In 515 Darius crossed the Hellespont and went north over the Danube into the country of the Scythians (Scolots); but the difficulties and dangers of the wholly unknown country compelled him to retreat, suffering heavy losses. Shortly after the middle of the 4th century the Scythians (Scolots) in Europe were subdued and in great part exterminated by the Sarmatians. The Scythians of Asia, however, after about 128 B.C. overran Parthia (Persia), routed several Parthian armies, and levied tribute from the Parthian kings. They founded also in the east of the empire the kingdom of Sacastane, so that that part of Asia was long known as Indo-Scythia. During the first century before and the first century after Christ hordes of Scythians, having overthrown the Bactrian and Indo-Greek dynasties of Afghanistan and India (125-25 B.C.), invaded Northern India; and there they maintained themselves with varying fortune for five centuries longer. Their kings were warm supporters of northern Buddhism; indeed an attempt has been made to show that Buddha was of Scythian descent. The Jats of India, and the Rajputs, have both been assigned the same ancestry. Greek influence told strongly on the Scythian conquerors: Greek was even used as the official language of several dynasties in Bactria and the Punjab.

Sea. All primitive peoples appear to have experienced a feeling of dismay when they braved the dangers of the sea. The great majority of the civilised nations of antiquity took but little interest in the physical phenomena of the ocean. The few facts that were known with reference to the sea were limited to maritime nations like the Phœnicians. Among the learned men of antiquity two views were held with reference to the distribution of land and water. The Homeric school—to which Eratosthenes and Strabo belonged—regarded the old world as a single island surrounded by the ocean. The Ptolemaic school, on the other hand, looked on the Atlantic and Indian Oceans as enclosed seas like the Mediterranean, and held that the east and west points of the known world approached so close to each other that a ship sailing from Spain might easily reach the eastern coasts of Asia. This mistaken notion led, fourteen centuries after Ptolemy, to the discovery of America by Columbus. The discoveries of Columbus, Vasco da Gama, and Magellan, during the thirty years from 1492 to 1522, added a hemisphere to the chart of the world. These voyages doubled at a single bound all that was previously known of the surface of the globe, and in a special manner enlarged our knowledge of the sea. Down to the time of the *Challenger* and similar recent scientific expeditions all our knowledge of the sea might, literally speaking, be called superficial; it was limited to the upper layers of oceanic waters and to the shallower depths surrounding continents and islands. Owing to the recent introduction of improved apparatus and methods, the most profound depths of the ocean have been examined with precision and success, so that we now possess a large amount of definite information concerning the physical and biological conditions of all regions of the ocean.

Area.—The waters of the sea cover about 143,259,300 sq. m., or about five-sevenths of the surface of the earth. The areas of the main divisions of the ocean are estimated as follows:

	Sq. miles.	Per cent.
Pacific (from Arctic Circle to 40° S.)	58,100,000	40·54
Atlantic („ „ „ „)	30,150,000	21·04
Indian (southern boundary 40° S.)	18,100,000	12·63
Southern (from 40° S. to Antarctic Circle)	27,300,000	19·05
Arctic (within the Arctic Circle)	5,000,000	3·49
Antarctic (within the Antarctic Circle)	4,650,000	3·25
	143,300,000	100·00

Depth.—The solid globe or lithosphere, viewed as to its superficial aspect, may be regarded as divided into two great planes: one of these corresponds to the dry land or upper surface of the continental masses, and occupies about two-sevenths of the earth's surface; the other, corresponding to the abysmal regions of the ocean, is depressed over 2½ miles below the general level of the continental plane, and occupies about four-sevenths of the earth's surface. The transitional area, uniting these two planes, forms the sides or walls of the ocean basins, and occupies about one-seventh of the earth's surface. The depressed regions of the globe, represented by the ocean basins, are filled with sea-water up to within about 375 fathoms (2250 feet) of the general level of the continents, the average depth of the water in the ocean basins being on the other hand about 2080 fathoms (12,480 feet). Were the solid crust of the earth to be reduced to one uniform level by removing the elevated continental masses into the depressed abysmal areas, the surface of the earth would then be covered by a universal ocean or hydrosphere with a depth of about 2 miles. This depth of 2 miles below the present sea-level has been called by Dr Mill the mean sphere level. The average depths of the main divisions of the ocean are:

Pacific Ocean	2500 fathoms.	Southern Ocean	2200 fathoms.
Atlantic „	2200 „	Antarctic „	630 „
Indian „	2300 „	Arctic „	630 „

The greatest depth hitherto recorded is 4655 fathoms, in the North Pacific, east of Japan; the *Challenger* sounded in 4475 fathoms, also in the North Pacific, north-west of the Caroline Islands. In the South Pacific a depth of 4428 fathoms has been found, south of the Friendly Islands, and 4170 fathoms off the west coast of Chili. In the Atlantic the greatest depth is 4561 fathoms, off Porto Rico, West Indies. Ross records a sounding in the Antarctic Ocean where he found no bottom at 4000 fathoms. By far the larger portion of the sea-floor lies between the depths of 1000 and 3000 fathoms, equal to nearly 78 per cent., while about 17½ per cent. is found in depths less than 1000 fathoms, and about 4½ per cent. in depths greater than 3000 fathoms. The bulk of water in the whole ocean is estimated at 323,800,000 cubic miles.

Temperature.—The temperature of the surface-waters of the ocean varies from 28° F. in the polar regions to 85° or 86° in equatorial regions. In many places the surface-layers are subject to great annual changes due to the seasons and the direction of the wind. The temperature of the water at the bottom of the ocean over the abysmal areas ranges from 32·7° F. to 36·8° F. In some large basins separated from each other by low ridges the temperature may differ to the extent of one or two degrees, but the temperature is apparently constant at any one spot throughout the year. The great mass of the ocean consists of cold water—i.e. of water below 40° or 45° F.; at a depth of little over half a mile the water in the tropics has generally a temperature below 40° F. In the open ocean the temperature usually decreases as the depth increases, the coldest water being found at the bottom. In enclosed or partially enclosed seas, cut off by barriers from the great ocean basins, the temperature remains uniform from the height of the barrier down to the bottom; for instance, in the Mediterranean the temperature is about 56° from 200 fathoms down to 2000 fathoms; in the Sulu Sea, 50·5° from 400 fathoms to 2500 fathoms; in the Celebes Sea, 38·6° from 800 fathoms to the bottom in 2600 fathoms. In regions where there are heavy rains, or where rivers pour fresh water into the sea, alternating layers of colder and warmer water have been observed within a hundred fathoms from the surface.

Circulation.—The circulation of oceanic waters is maintained by the action of the prevailing winds on the surface-layers. In the oceanic areas the prevailing winds are governed by the large anticyclonic areas situated towards the centres of the North and South Atlantic and North and South Pacific. The winds blow out from and around these anticyclonic areas. For instance, in the southern hemisphere the warm salt water of the tropical regions is driven to the south along the eastern coasts of South America, Africa, and Australia, till on reaching a latitude of between 50° and 55° S. it sinks on being cooled, and spreads slowly over the floor of the ocean to the north and south. A similar circulation takes place in the northern hemisphere, although much modified by the peculiar configuration of the land-masses; for instance, the cold salt water at 30° F. which occupies the deeper parts of the Arctic basin is largely made up of the dense Gulf Stream water, which sinks to the bottom on being cooled in the Norwegian Sea. The water evaporated from the sea-surface is borne to the land-masses and condensed on the mountain-slopes. It is estimated that over 6500 cubic miles of this water is returned to the sea by rivers annually, bearing along with it a burden of soluble salts and earthy matters in suspension; in this way the ocean has in all probability become salt in the course of ages. The saltest waters are found in the regions of greatest evaporation; for instance, in the Red Sea, Mediterranean, and in the trade-wind regions of the great ocean basins. It has been shown that by the action of off-shore winds cold water is brought up from the deep sea to supply the place of the surface-water carried seawards off the west coast of Africa and America, and off Cape Guardafui on the east coast of Africa; and the absence of coral-reefs off these coasts is believed to be due to the great range and variation in the temperature of the water thus produced. The present writer has shown that a similar vertical circulation takes place in the lochs of the west of Scotland.

Composition of Sea-water.—It is probable that every element is in solution in sea-water; the great majority are, however, present only in exceedingly minute traces. If the average density of sea-water be taken at 1027, pure water being 1000, then the following would represent the composition of 1000 cubic centimetres of sea-water:

Sodium chloride	28·9980
Magnesium chloride	4·0568
Magnesium sulphate	1·7665
Calcium sulphate	1·3425
Potassium sulphate	0·9193
Magnesium bromide	0·8809
Calcium carbonate	0·1237
Water	989·7073
	1027·0000

Each base is probably in combination with each acid, so that there are really sixteen salts altogether from the mixture of the four bases and four acids. The total amount of sea-salts may vary greatly in different samples of sea-water, but it has been shown by hundreds of carefully conducted experiments that the ratio of the constituents of sea-salts is nearly everywhere constant, with one significant exception, that of lime, which is in slightly greater proportion in the water from the deeper parts of the ocean basins. Owing to the constant circulation in the ocean, the gases of the atmosphere, which are everywhere absorbed at the surface of the sea, are carried down to the greatest depths, and thus living organisms may flourish throughout the whole extent of the ocean. Nitrogen remains at all times and places nearly constant; not infrequently the proportion of oxygen is much reduced in deep water, owing to the processes of oxidation and respiration. Carbonic acid free or loosely combined is abundant, and plays a most important rôle in the economy of the ocean, combining with and rendering soluble normal carbonates of lime and magnesia to solution in the form of bicarbonates. Water, as is well known, is but slightly compressible, and almost any substance that will fall to the bottom of a tumbler of water will in time fall to the bottom of the deep ocean. Still the compressibility of water must not be neglected in oceanographical questions. In the deeper parts of the ocean the pressure amounts to four or five tons per square inch; hence, in an ocean with a depth of 5 miles, were the action of gravity suddenly to cease, the ocean waters would rise 500 feet above their present level from expansion. There is evidence of very extensive chemical action on some regions of the sea-floor, and it has been suggested that this action is much intensified by the great pressure in the deeper parts of the ocean. It is probable, however, that all the reactions here alluded to may be accounted for by the decomposition of organic substances on the sea-bed in the presence of the sulphates in sea-water, and the long periods of time to which the materials on the sea-bed have been exposed to the action of sea-water in regions where there is a slow rate of deposition.

Life.—The colour of pure sea-water is a light shade of blue; it has, however, frequently various shades of green and brown, owing to the presence of organisms and matters in suspension. It has been definitely established that life in some of its many forms is universally distributed throughout the ocean. It has long been known that marine plants and animals abound in the shallow waters surrounding continents and islands. Algæ disappear from the sea-bed at depths between 100 and 200 fathoms, but a great abundance of animals have been procured in the greater depths. A *Challenger* trawling in a depth of over a mile (1000 fathoms) yielded 200 specimens of living animals belonging to 79 species and 55 genera. A haul in about two miles (1600 fathoms) yielded 200 specimens belonging to 84 species and 75 genera. A trawling in about three miles depth (2600 fathoms) yielded 50 specimens belonging to 27 species and 25 genera, not counting Protozoa. Even in depths of over four miles fishes and animals belonging to all the chief invertebrate groups have been procured. The term 'Benthos' is now used for all the animals and plants which live attached to or creep over the bottom of the ocean, 'Plankton' being the term for all the plants and animals which live in, and are carried along by the currents of, the ocean. In the great body of oceanic waters life is most abundant in the surface and sub-surface waters down to about 100 fathoms. Pelagic algæ, such as diatoms and oscillatoria, are abundant in this region, and are the principal and original source of food for many pelagic and nearly all deep-sea animals. In the intermediate depths of the ocean life though present is less abundant. Within a few hundred fathoms of the bottom life again becomes more abundant, crustaceans and cuttle-fish being especially numerous. A very large number of the organisms which belong to the pelagic Plankton, such as diatoms, radiolaria, foraminifera, and molluscs, secrete silica or carbonate of lime to form their shells and skeletons; these in falling to the bottom after the death of the organisms make up a large part of the marine deposits in many regions of the ocean.

Deposits.—The explorations of the *Challenger* and other expeditions have resulted in a great extension of our knowledge of marine sediments, especially of those now forming in the deep sea. All marine deposits may be divided into two classes—viz. those made up principally of the debris from the solid land of the globe, laid down in greater or less proximity to the shores of continents and islands, called 'terrigenous' deposits, and those in which this continental debris is nearly or quite absent, laid down in the abysmal regions of the ocean, called 'pelagic' deposits. Commencing with the former, there are first the littoral and shallow-water deposits, forming around the land-masses from the shore down to a depth of about 100 fathoms, consisting of sands, gravels, and muds derived almost entirely from the disintegration of the neighbouring lands. The littoral deposits, laid down between tide-marks, cover about 63,000 sq. m., and the shallow-water deposits, between low-water mark and 100 fathoms, about 10,000,000 sq. m. Proceeding seawards from an average depth of about 100 fathoms, the deposits gradually change in character, the proportion of land detritus decreasing, while the remains of oceanic organisms increase in abundance, until at a considerable distance from land and in comparatively deep water the terrigenous deposits pass insensibly into truly pelagic deposits. The terrigenous deep-sea deposits—i.e. those formed at depths greater than 100 fathoms—may be briefly summarised as follows:

Blue Mud, the most extensive, is grayish or bluish in colour, with usually a thin reddish upper layer, and is characterised by the presence of fragments of rocks and mineral particles coming from the disintegration of the land, of which quartz is the principal species; the remains of marine organisms may be present in varying proportions, increasing with depth and distance from the land. Blue mud is found along the coasts of continents and continental islands, and in all enclosed and partially enclosed seas; in some places, as in the Yellow Sea, but notably off the coast of Brazil, the mud may be of a red colour from the large amount of ferruginous matters brought down by the rivers, and it is then called Red Mud. Blue mud is estimated to cover about 14,500,000 sq. m. of the earth's surface—4,000,000 in the Arctic, 3,000,000 in the Pacific, 2,500,000 in the Antarctic, 2,000,000 in the Atlantic, 1,500,000 in the Indian, and 1,500,000 in the Southern Ocean. Red mud covers *about 100,000 sq. m. off the coast of Brazil.*

Green Mud and Sand are similar to the blue muds, but are characterised by the presence of the mineral glauconite in isolated grains or in small concretions; the dead shells of calcareous organisms are usually filled with the glauconite, which gives the green colour to the deposits. The sands occur in the shallower water nearer the coast, and in them the grains are larger than in the muds. These deposits are found usually off high and bold coasts where no very large rivers enter the sea; for instance, off the east coast of Australia, off South Africa, and off the west coast of North America. Green mud and sand cover about 850,000 sq. m.—300,000 in the Atlantic, 250,000 in the Pacific, 150,000 in the Indian, 90,000 in the Southern, and 60,000 in the Antarctic.

Volcanic Mud and Sand are deposited around the oceanic islands of volcanic origin, and the name is derived from the presence of fragments and particles of volcanic rocks and minerals, which are larger and more numerous nearer the islands, when the deposit is called a sand, becoming smaller and mixed with a larger percentage of pelagic organic remains in the deeper water farther removed from the coast, when the deposit is called a mud. Volcanic mud and sand cover about 600,000 sq. m.—300,000 in the Pacific, 200,000 in the Atlantic, and 100,000 in the Indian Ocean.

Coral Mud and Sand occur similarly around the oceanic coral islands and off those coasts and islands fringed by coral-reefs, and are characterised by the greater or less abundance of coral fragments from the reefs. The sands are found in the shallower water nearer the reefs, as in the case of the volcanic sands. Coral mud and sand cover about 2,557,000 sq. m.—1,417,000 in the Pacific, 760,000 in the Atlantic, and 380,000 in the Indian Ocean.

Of pelagic deposits there are five types, four of organic origin, receiving their designations from the distinctive presence of the remains of calcareous or siliceous organisms, the fifth and most extensive being of inorganic origin.

Globigerina Ooze is so called from the presence of the dead shells of pelagic Foraminifera, those belonging to the genus Globigerina predominating, which live in the surface and sub-surface waters of the ocean, being especially abundant in tropical regions, and the shells of which after death fall to the bottom and there accumulate in moderate depths. The percentage of carbonate of lime in the deposit due to these shells and other calcareous fragments varies from 30 to over 90, and there is usually an admixture of minute mineral particles and remains of siliceous organisms. The depth at which Globigerina ooze is found varies from less than 500 to over 2500 fathoms, the average depth being about 2000 fathoms; but there is a marked difference between a sample collected in comparatively shallow water near land and one from deep water towards the central regions of the ocean basins, the point of union being the presence of a considerable proportion of carbonate of lime shells. Globigerina ooze covers about 49,520,000 sq. m.—17,940,000 in the Atlantic, 11,300,000 in the Pacific, 10,560,000 in the Southern, and 9,720,000 in the Indian Ocean.

One of the facts brought out by recent oceanographical researches is the gradual disappearance of these calcareous shells from the deposits of the deep sea with increasing depth in regions where they may appear to be equally abundant at the surface. In depths of over 3000 fathoms these shells are rare, and often there is not a trace of carbonate of lime even in lesser depths, the Globigerina ooze being then replaced by one of the other kinds of pelagic deposits.

Pteropod Ooze resembles Globigerina ooze in all respects, except that there is a greater abundance of the dead shells of pelagic Mollusca, such as Pteropods and Heteropods; it is usually found in lesser depths than the Globigerina ooze. Pteropod ooze covers about 400,000 sq. m. in the Atlantic.

The names applied to these oozes are not intended to convey the idea that they are wholly made up of the organisms indicated by the names, or that these organisms form a preponderating proportion, for no deep-sea deposit can be said to be strictly homogeneous. Neither is there a sharp dividing line between the various kinds of deposits; they merge insensibly the one into the other. Often it is difficult to locate a sample, one or other of the names being equally applicable.

Diatom Ooze is distinguished by the presence of numerous remains of siliceous organisms, principally Diatoms, though fragments of siliceous Sponge spicules and Radiolaria and Foraminifera are rarely absent. It is found in the Antarctic and Southern Oceans and also in the north-west Pacific. Diatom ooze covers about 10,880,000 sq. m.—10,000,000 in the Southern, 840,000 in the Antarctic, and 40,000 in the Pacific.

Radiolarian Ooze in like manner contains a varying proportion of siliceous remains, in this case principally Radiolaria and their fragments. Calcareous organisms and mineral particles are nearly always present in both these oozes, being usually more numerous and the mineral particles larger in the Diatom ooze than in the Radiolarian ooze, which latter generally occurs in greater depths than the former. The *Challenger's* deepest sounding, already mentioned, brought up a typical Radiolarian ooze, and it is found in the deeper water of the central Pacific and Indian Oceans. Radiolarian ooze covers about 2,290,000 sq. m.—1,161,000 in the Pacific, and 1,129,000 in the Indian Ocean.

Red Clay occupies nearly the whole of the deeper abysses of the ocean, occurring in its most characteristic form in the central regions of the Pacific, far removed from continental land. It is of a reddish or chocolate colour, due to the presence of the oxides of manganese and iron. Fragments of calcareous organisms are sometimes tolerably abundant in the shallower depths, but in a typical red clay there is usually not more than a trace of carbonate of lime. Siliceous remains are generally present, and there is a small proportion of minute mineral particles of volcanic origin, principally derived from disintegrated pumice. Mineral particles of secondary origin, arising from the decomposition of volcanic debris, are associated with the red clay, and in some regions of the central Pacific isolated crystals and spheroidal groups of phillipsite of secondary origin formed *in situ* make up a considerable quantity of the deposit. Concretions of manganese and iron are very characteristic of the red clays, and may be of all sizes, sometimes a large quantity of the size of marbles, and sometimes the size of potatoes, being procured. These concretions are formed around various nuclei, such as sharks' teeth, earbones of whales, and pieces of pumice. The *Challenger* sometimes procured over one thousand sharks' teeth and sixty earbones of whales in a single haul. The presence of the remains of vertebrates, some of them belonging to extinct species lying alongside others belonging to existing species, as well as the formation of manganese nodules and zeolitic crystals *in situ*, and the presence of metallic and chondritic spherules of cosmic origin, appear to indicate that the red clay accumulates at a very slow rate. Red clay covers about 51,500,000 sq. m.—37,230,000 in the Pacific, 5,800,000 in the Atlantic, 4,350,000 in the Southern, and 4,120,000 in the Indian Ocean.

See the articles in this work on the Arctic, Antarctic, Atlantic, Pacific, and Indian Oceans; those on the Red Sea, Dead Sea, &c.; also CHALLENGER, GULF STREAM, GEOGRAPHY, PHOSPHORESCENCE, POLAR EXPLORATION, SAND, SOUNDING, STORMS, TIDE, WAVE, WINDS, WRECKS.

THE SOVEREIGNTY OF THE SEA.—Blackstone lays it down that the main or high seas are part of the realm of England, as the Courts of Admiralty have jurisdiction there. But the law of nations, as now understood, recognises no dominion in any one nation over the high seas, which are the highway of all nations, and governed by the public law of the civilised world. Such a right has, however, long been claimed over the four seas surrounding the British Isles. It was strongly asserted by Selden, and denied by Grotius, and measures were taken to vindicate the right in the reign of Charles I. The Dutch claimed the supremacy of the seas in Cromwell's time, but were worsted by Blake (q.v.). Every nation has undoubtedly a right to the exclusive dominion of the sea within a certain distance from the shore, now fixed at three miles. This right of lordship includes the right to free navigation, to fishing, to taking wrecks, the forbidding passage to enemies, the right of flag, of jurisdiction, &c. By the law of England the main sea begins at low-water mark; and between low and high water mark the common law and admiralty have a divided jurisdiction, one on land when left dry, the other on the water when it is full sea. The right of seal-fishing in the Behring Sea has been the subject of lengthened diplomatic controversy and arbitration between the United States and Great Britain (see SEAL). *For inshore* fishery regulations, see FISHERIES. See further INTERNATIONAL LAW, BLOCKADE, ENEMY, NEUTRALITY, SEASHORE; also RULE OF THE ROAD.

Sea Anemone. See ANEMONE. In like manner for Sea-bream, Sea-otter, &c., see BREAM, OTTER, &c.

Sea-bass, a name applied to some perch-like marine fishes—e.g. *Cynoscion nobilis*, an important food-fish on the western coasts of North America; *Pogonias chromis*, abundant off the coasts of Carolina, Florida, and the Gulf of Mexico; *Centropristis fulvus* and *atrarius*, along the eastern coasts of North America.

Sea-bat (*Platax*), a genus of Teleostean fishes allied to the Pilot-fish, and included among the Carangidæ or horse-mackerels. The name refers to the very long dorsal, anal, and ventral fins.

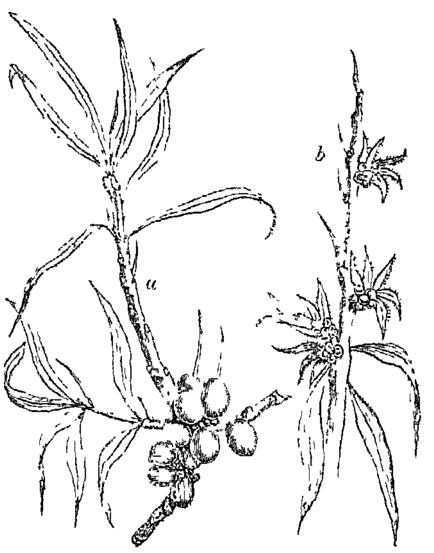
Sea-beaches. See BEACHES.

Sea-bear. See SEAL.

Sea-birds' Preservation. See WILD BIRDS.

Sea-blubber. See JELLY-FISH.

Sea-Buckthorn, or SALLOW-THORN (*Hippophaë*), a genus of the natural order Elæagnaceæ, consisting of large shrubs or trees with gray silky foliage and entire leaves. They have diœcious flowers: the perianth is tubular, becomes succulent, encloses an achenium, and forms an acid fruit. There is but one known species, *H. rhamnoides*, sometimes called the Sea-Buckthorn, a large thorny shrub or low tree, a native of parts of the sandy seacoasts of England and the continent of Europe, which is found also throughout great part of Tartary. It is sometimes planted to form hedges near the sea, growing luxuriantly where few shrubs will succeed. The berries are orange-coloured, and are gratefully acid. They are used for making fish-sauce, jellies, and condiments in some places.



Sea-Buckthorn (*Hippophaë rhamnoides*):
a, branch of the female plant, in fruit; *b*, branch of male plant, in flower.

Seabury, SAMUEL, the first Bishop of Connecticut, was born in that state, at Groton, 30th November 1729, graduated at Yale in 1748, studied medicine for a year at Edinburgh, and received deacon's and priest's orders in England in 1753. For some time he was a missionary of the S. P. G.; in 1757 he was promoted to the 'living' of Jamaica, Long Island, and ten years later to that of Westchester, New York. The Whigs, however, prevented his ministering, and once imprisoned him for six weeks at New Haven. He then removed to New York, where he made his medical knowledge contribute to his support, acted as chaplain of the King's American Regiment, and wrote a series of pamphlets which earned for him the special hostility of the patriots. In 1777 Oxford made him D.D. On 25th March 1783 the clergy of Connecticut met at Woodbury and elected Seabury bishop; and for sixteen months he waited vainly in London for consecration, the archbishops, though personally favourable, being timid and indisposed to move without the sanction of the civil authority. On 14th November 1784 he was consecrated in the upper room of a house at Aberdeen by Bishops Robert Kilgour, Arthur Petrie, and John Skinner, of the Scottish Episcopal Church, whose connection with the state had been severed nearly a century before. Bishop Seabury's jurisdiction embraced (by consent) Rhode Island as well as Connecticut, and he acted also as rector of St James's Church, New London. In 1792 he joined with three bishops of the English succession in consecrating a fifth, Bishop Claggett, through whom every American bishop derives from Seabury and the Scottish Church. Seabury's further services included the securing to the episcopate of its proper share in the government of the church, and the restoration of the oblation and invocation to the Communion Office (from the Scottish Office). He died 25th February 1796. See his *Life and Correspondence*, by Dr E. E. Beardsley (Boston, 1881; Lond.

'Eminent English Churchmen' series, vol. iii. 1884). The Seabury Centenary was celebrated in Aberdeen (October 7) and at St Paul's Cathedral (November 14) in 1884.

Sea-cat. See Wolf-fish, Chimæra.

Sea-cow. See Manatee, Rhytina.

Sea Cucumber. See Holothurians.

Sea-devil. See Devil-fish.

Sea-eagle. See Eagle, Osprey.

Sea-elephant. See Elephant-seal.

Sea-fan. See Gorgonia.

Seaford, a small and ancient watering-place on the Sussex coast, 3 miles E. of Newhaven by rail. It was a dependency of the Cinque Port of Hastings in the 15th century; and when it was disfranchised in 1832, had long been notorious for electoral corruption. Of late it has grown in size and prosperity. Pop. (1851) 997; (1891) 2425.

Seaforth, Loch, an arm of the sea, 14 miles long, on the east side of the island of Lewis-with-Harris (q.v.) in the Hebrides, which long gave the title of Earl (attainted in 1716) to the family of Mackenzie.

Sea-fox. See Fox-shark.

Sea-grape (*Ephedra*), a genus of shrubby plants of the natural order Gnetaceæ, closely allied to the Conifers, and sometimes called Joint-firs. The most notable is *E. distachya*, a small shrub very abundant in southern Russia, which produces sweetish mucilaginous berries, in some pharmacopœias called *Uvæ maritimæ*, which are eaten by the Russian peasants. In medicine they are regarded as astringent, and are used in putrid fevers and agues. The young tops of the shoots are also astringent.—The name of sea-grapes is also given to the grape-like clusters of eggs laid by Sepia and some other cuttle-fish.

Sea-grass, a name for Grasswrack (q.v.).

Seagull. See Gull.

Seaham Harbour, a seaport in the county of Durham, 6 miles S. of Sunderland. Founded in 1828 by the Marquis of Londonderry, it communicates by railway with neighbouring collieries, and has every facility in the way of docks and quays for the shipment of coal. There are also bottle-works, blast-furnaces, an iron-foundry, and chemical works, a seamen's infirmary (1849), and the Londonderry literary institute (1853). Pop. (1851) 3538; (1891) 8856.

Sea-hare, a name given to the genus Aplysia of nudibranch Gasteropods (q.v.).

Sea-hedgehog. See Globe-fish.

Sea-hog. See Porpoise.

Sea-holly. See Eryngo.

Sea-horse. See Hippocampus, Walrus.

Sea-kale (*Crambe maritima*; see Crambe), a perennial plant with large roundish sinuated sea-green leaves, found on the seashores in various parts of Europe, and in Britain. The blanched sprouts have become a very favourite esculent in Britain. It is commonly forced in the winter months in dark sheds or pits heated with fermenting manure or leaves, or with hot water circulating in pipes. The plants when to be treated thus are reared annually from cuttings of the roots or from seed; the latter is sown in March in rows 18 inches asunder, the seed being dropped, three or four together, at 15 inches apart, the seedlings to be thinned to one at each point. The cuttings are dibbled into the ground at the same distances apart, and by liberal cultivation they are quite strong enough to be forced the following winter. Of course the roots are lifted when to be forced in this way, and are thrown away afterwards. When they are to be blanched in the position in which they grow the rows are planted at 3 feet by 2 feet apart, the plants are covered with pots or boxes, which are also covered with leaves, tan, spent hops, or mildly fermenting manure. Plantations treated in this way last for several years. Darkness is essential to the proper blanching of the sprouts.

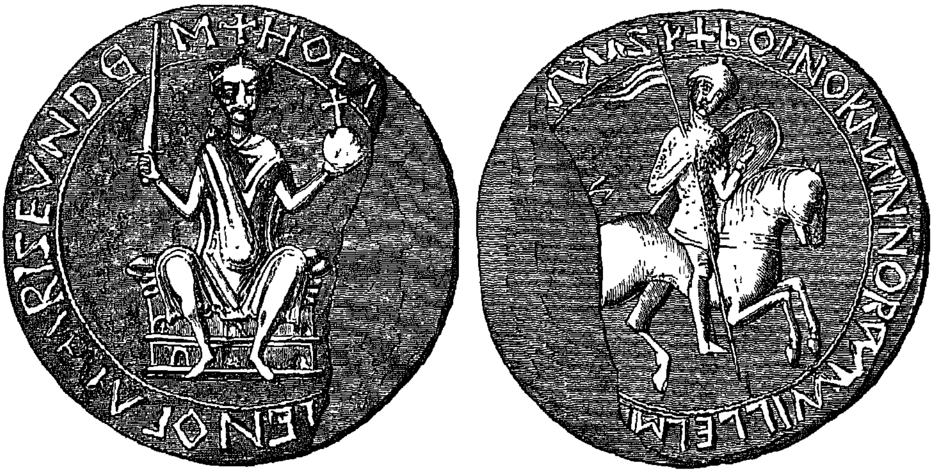
Sea-kale (*Crambe maritima*).

Seal (Lat. *sigillum*, Fr. *sceau*), an impression on wax or other soft substance made from a die or matrix of metal, a gem, or some other material. The stamp which yields the impression is sometimes itself called the seal. In Egypt seals were in use at an early period, the matrix generally forming part of a ring (see Gem, Ring). Devices of a variety of sorts were in use at Rome, both by the earlier emperors and private individuals. The emperors, after the time of Constantine, introduced *bullæ* or leaden seals, and their use was continued after the fall of the western empire by the popes, who attached them to documents by cords or bands. On the earlier papal seals are monograms of the pope; afterwards the great seal contained the name of the pope in full and a cross between the heads of St Peter and St Paul, while the papal privy-seal, impressed not on lead but on wax, known as the *Seal of the Fisherman*, represents St Peter fishing. In the 9th and 10th centuries we find Charlemagne, the Byzantine emperors, and the Venetian doges occasionally sealing with gold, and we have an instance as late as the 16th century of a gold seal appended to the treaty of the Field of the Cloth of Gold, between Henry VIII. and Francis I.

The most complete series of royal seals is that of the kings of France, beginning with the Merovingian dynasty. Seals were not much used in England in Anglo-Saxon times, but they came into general use after the Norman Conquest. The earliest regular great seal is that of Edward the Confessor, modelled on the contemporary French pattern. On the royal great seals was the king in armour on a caparisoned horse galloping, his arms being shown on his shield after the period when arms came into use; and the reverse represented the king seated on a throne. The great seals of Scotland begin with Duncan II. in the end of the 11th century, and have also for subject the king on horseback; the counterseal, with the seated figure, being used first by Alexander I., and the earliest appearance of the arms of Scotland being on the seal of Alexander II. In both countries there were also the privy-seals with the royal arms only.

Ecclesiastical seals first appear in the 9th century, and attained great beauty in the 13th and 14th. They are of the pointed oval form known as *Vesica piscis*, and have for subjects a figure of the bishop, sometimes of the Trinity, the Virgin, or a patron saint, seated under an elaborate architectural canopy. The arms of the bishop are often added.

Under the Norman monarchs of England sealing became a legal formality necessary to the authentication of a deed; and from the 13th century onwards the seals of all persons of noble or gentle birth represented their armorial ensigns. The seal was generally appended to the document by passing a strip of parchment or a cord through a slit in its lower edge; and the ends being held together, the wax was pressed or moulded round them a short distance from the extremity, and the matrix impressed on it. Occasionally the seal was not pendent, but the wax was spread on the deed. The coloured wax with the impression was sometimes imbedded in a mass of white wax forming a protective border to it. In England a seal is still an essential to all legal instruments by which real estate is conveyed; but since subscription has also become necessary the practice of sealing has degenerated into a mere formality. The custom was gradually introduced of covering the wax with white paper, on which the impression was made, and latterly wafers have been considered a sufficient substitute for seals. In Scotland, where sealing is not now required (see DEED), every freeholder was obliged by statutes of Robert III. and James I. to have his seal of arms; and among the Scottish armorial seals of the 14th and 15th centuries are some of wonderful beauty of execution. In most of the states of the American union neither wax, wafer, nor anything corresponding to a seal is required for deeds.



Great Seal of William the Conqueror.

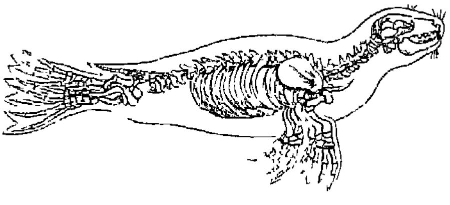
The use of corporate seals by towns and boroughs dates as far back as the 12th century. The earlier corporate seals bear the town gates, city walls, or some similar device; the use of corporate arms did not begin till the later half of the 14th century. The study of mediæval seals is of great importance and interest in connection with many branches of archæology, including heraldic and genealogical investigations. Seals are still customarily appended to various kinds of formal and official documents, ecclesiastical, academic, masonic, &c.

The *Great Seal*, the specific emblem of sovereignty, is appended only to the most important class of public documents, such as writs for summoning parliament, treaties, and official acts of state. A new one is made for each new sovereign (or on occasion of a change of arms or style), the old one being solemnly broken. The original custodier of the English seal was the Lord Chancellor (q.v.), but by-and-by the seal was frequently put into the charge of a special official called the Lord Keeper (q.v.). Since 1757 the Chancellor is the only keeper of the Great Seal; though the seal may be put into Commission, and entrusted for the time to Lords Commissioners. It was long a rule that the Great Seal should not be used for any document without prior authority under the Privy-seal (see below). When in 1642 the Lord Keeper (Littleton) joined Charles I. at York, he carried the Great Seal with him; whereupon the parliament (illegally, no doubt) ordered a new one to be made. Charles II. had one made for himself after his father's death. James II. on his flight threw the Great Seal into the Thames opposite Lambeth, but it was soon recovered. At the union with Scotland it was provided there should be only one Great Seal for Great Britain; but a seal is provided to be used in Scotland for grants concerning offices, commissions, and private rights in that kingdom only. This seal is commonly called, for brevity, the Great Seal of Scotland, and is now held *ex officio* by the Secretary of State for Scotland. No special provision was made after the union with Ireland.

The *Privy-seal* is the seal appended to grants which are afterwards to pass the Great Seal, and to documents of minor importance which do not require the Great Seal. The officer who has the custody of the Privy-seal was at one time called the Keeper, and afterwards the Lord Privy-seal. The Lord Privy-seal is now the fifth great officer of state, and has generally a seat in the cabinet. His office is conferred under the Great Seal during pleasure. Since the reign of Henry VIII. the Privy-seal has been the warrant of the legality of grants from the crown, and the authority for the Lord Chancellor to affix the Great Seal. Such grants are styled letters-patent, and the office of the Lord Privy-seal is one of the departments through which they must pass to secure their validity. Until recently all letters-patent for the grant of appointments to office under the crown, of patents of invention, charters, naturalisations, pensions, creation of honours, pardons, &c. required to pass from the Signet Office to the Privy-seal Office, in the form of Signet bills, verified by the Signet Seal and superscription; and on the Privy-seal being attached to them they were forwarded to the Lord Chancellor, by whom the patents were completed in the office of the Great Seal. By the Act 47 and 48 Vict. chap. 30, it is now unnecessary for any instrument to be passed under the Privy-seal, a warrant under the royal sign-manual duly countersigned being sufficient authority for passing any instrument under the Great Seal. There is a Privy-seal in Scotland, which is used to authenticate royal grants of personal or assignable rights. Rights such as a subject would transmit by assignation are transmitted by the sovereign under the Privy-seal. Several other minor seals are still in use in Scotland; the Quarter Seal, known also as the Testimonial of the Great Seal, pertaining to the Director of Chancery; the Signet, mainly used in initiating proceedings in the Supreme Court; and various Seals of Court.

See also the articles BULL, GEM, RING, DEED; and A. B. Wyon, *Great Seals of England* (1888).

Seal, the name commonly applied to all the Pinnipedia except the Morse or Walrus (q.v.). The Pinnipedia have many of the essential characters of the Carnivora (dogs, cats, lions, bears, &c.), in which order they are, therefore, classified. They may accordingly be described as carnivorous mammals adapted to a marine existence. They are not, however, so completely marine as the Cetacea, but pass part of their lives and perform certain functions—viz. the reproductive—on shores or on ice-fields. The structural peculiarities of the Pinnipedia are the following: The brain-case is smooth and rounded, the face small and short. The supraorbital processes are largely developed. The external ear is wanting altogether or very small. The skin is well covered with hair, which takes the form of fur in some species. The limbs are modified to form paddles for swimming, but still are capable of use in climbing out of the water and moving somewhat clumsily on land. The upper divisions of the limbs are shorter than the lower, and do not project beyond the skin of the body. There are five toes on each limb, and all are united together by strong webs extending to the extremities. The inner toe of the fore-foot is largest, the rest gradually decreasing, while in the hind-foot the inner and outer toes are both very long, and the intermediate ones somewhat shorter. The nails are straight, and may be reduced in number or wanting. The incisor teeth are pointed, and vary in number in the different genera. The molars and premolars are similar, and have not more than two fangs. There is a short, small tail, which is united beyond its middle to the hind-legs by the skin. The toes, particularly those of the hind-feet, are capable of being spread out very widely in swimming, so as to give great propulsive power.

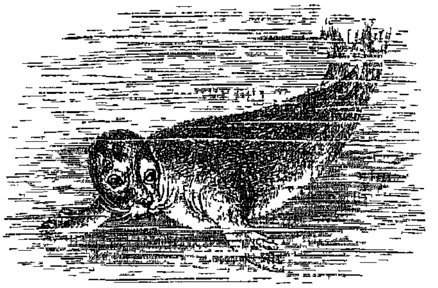


Skeleton of Seal, with outline of the figure.

The movements of seals in the water are very rapid and graceful; on land they are very peculiar, even the fore-feet in the Phocidæ being little used, but the body contracted by an upward bending of the spine, and so thrown forward by a succession of jerks; in which way, however, a seal makes its escape very rapidly from an assailant. The flexibility of the spine in seals is very remarkable, and depends on the very large intervertebral cartilages, formed of fibrous concentric rings. The muscles, which are connected with the spine on all sides, are of great strength. Seals have a remarkable habit of swallowing large stones, for which no probable reason has yet been conjectured. Their stomachs are very often found to be in part filled with stones. The stomach is quite simple; the gullet (*œsophagus*) enters it at the left extremity; the cæcum is short, the intestinal canal long.

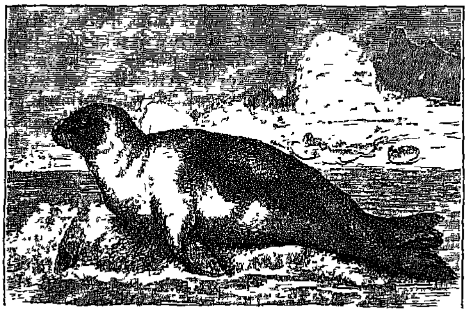
The respiration of seals is extremely slow, about two minutes intervening between one breath and another, when the animal is on land and in full activity. A seal has been known to remain twenty-five minutes under water. Their slowness of respiration, and power of suspending it for a considerable time, is of great use, as enabling them to pursue their prey under water. The fur of seals is very smooth, and abundantly lubricated with an oily secretion. There is in some species an inner coating of rich fur, through which grow long hairs, forming an outer covering. Another adaptation to aquatic life and cold climates appears in a layer of fat immediately under the skin—from which *Seal Oil* is obtained—serving not only for support when food is scarce, but for protection from cold, and at the same time rendering the whole body lighter. The nostrils are capable of being readily and completely closed, and are so whilst the seal is under water; and there is a similar provision for the ears; whilst the eye, which is large, exhibits remarkable peculiarities, supposed to be intended for its adaptation to use both in air and water. The face is provided with strong whiskers, connected at their base with large nerves. Seals produce their young only once a year; sometimes one, sometimes two, at a birth. Not long after their birth the young are conducted by the mother into the sea. Many of the species are polygamous. Terrible fights occur among the males.

Seals are very much on their guard against the approach of man where they have been much molested; but where they have been subjected to no molestation they are far from being shy, and approach very close to boats or to men on shore, as if animated by curiosity. They are much affected by musical sounds. A flute is said to attract seals to a boat, where they have not learned caution from sore experience; and the ringing of the church bell at Hoy, in Orkney, has very often caused the appearance of numerous seals in the little bay. Seals possess all the five senses in great perfection. The common seal and some of the other species are very intelligent; but there is considerable difference in this respect among the species. The common seal and some others have often been tamed, and are capable of living long in domestication if freely supplied with water. They become very familiar with those who attend to them, are very fond of caresses and of notice, recognise their name like dogs, and readily learn many little tricks, of which advantage has been taken for exhibitions.



Common Seal (*P. vitulina*); attitude when swimming.

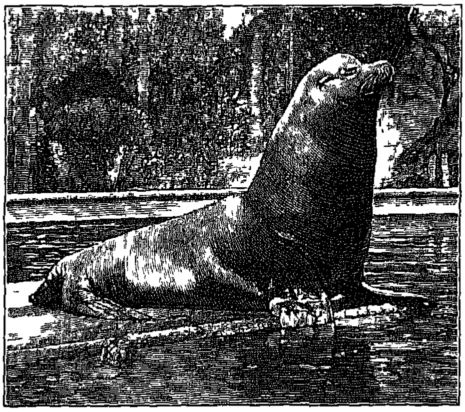
Seals, excluding the walrus, are divided into the two families Phocidæ, which have no external ears, and Otariidæ, which possess distinct though small representatives of these organs. The Otariidæ are, however, considered by modern specialists to be more closely related to the Walrus (Trichecidæ) than to the Phocidæ, notwithstanding the great tusks and peculiar dentition of the former. The Otariidæ, like the walrus, are capable of standing on all four legs, the hind-limbs being turned forward in walking on land, while in the Phocidæ the hind-limbs are trailed behind both on shore and in the water, and cannot be used to support the body when the animal is on land. The Earless Seals are commonly supposed to be monogamous, and, excepting the Sea-elephants, exhibit little difference in size between the sexes. They bring forth their young on shore or on ice-floes, but do not resort to special breeding-places nor remain for any length of time out of the water. The Eared Seals (the Phocidæ), on the other hand, are polygamous, and resort with invariable regularity to particular breeding-grounds, where they remain for months till the calves are able to travel; then they all depart and become pelagic for the rest of the year. The males are much larger than the females. The Common Seal (*Phoca* or *Callocephalus vitulina*) occurs on British coasts, and extends southward to the Mediterranean. It is common on the north-western shores of Europe and eastward along the arctic shores. It is very common in Greenland and on the arctic shores of North America, its southern limit on the western side of the Atlantic being New Jersey. On the east side of the Pacific it extends from southern California to Behring Strait, and probably occurs also on the western shores of the North Pacific. This species is always found on shores and not on ice-floes. It is hunted in Newfoundland and Greenland for its skins, which are much valued, though the covering is hair, not fur, and for its oil and flesh; but its numbers are not very great. The Harp-seal (*P. grœnlandica*), so called from a crescent-shaped dark stripe on each side of the back in the adult, ranges through the arctic regions of the Atlantic, and is said to occur also in the North Pacific, in Kamchatka. It is very abundant in Newfoundland and Greenland, and numerous on the arctic coasts of Europe—e.g. Finmark, Spitzbergen, and Nova Zembla. This species is very gregarious, and breeds on ice-floes in spring. Enormous numbers are killed annually for the sake of their oil and skins. The Harp-seal has been taken on British coasts. It grows to 8 or 9 feet in length, but its ordinary length is about 6 feet. The Bearded Seal (*Phoca barbata*) is another species of the North Atlantic which occurs on British coasts; it reaches 9 or 10 feet in length. The Ringed Seal (*P. hispida*) also occurs as a straggler on British shores, but normally lives on the arctic shores of both hemispheres. It is not of great commercial value, but is highly prized by the Greenlanders and Eskimos, who depend largely on its skin, oil, and flesh It is a small species. Seals occur in large numbers in the Caspian and Aral Seas, where they are regularly hunted by the Cossacks. The species of this region is distinguished under the name *P. caspica*. Another species, *P. siberica*, occurs in Lake Baikal, which consists of perfectly fresh water, and is situated at a great elevation above sea level. *Halichœrus grypus*, the Gray Seal, is confined to the coasts of Europe, occurring on the shores of Scandinavia, Ireland, and Scotland; it reaches a length of 8 feet. In Denmark, since 1890, an effort has been made to exterminate the seals, in the interests of the fisheries, and a reward of three kroner per head paid for all killed (810 in the first ten months).



Harp-seal (*Phoca grœnlandica*).

The distribution of the Phocidæ extends to the tropics. *Monachus albiventer*, called the Monk Seal, inhabits the shores of the Mediterranean, and of Africa as far south as Madeira. Another species of the same genus, *M. tropicalis*, exists in the West Indies, where it was formerly abundant, though now rare. *Cystophora cristata*, the Crested or Hooded Seal, has a remarkable dorsal dilatation of the nose, which can be inflated with air or depressed as the animal pleases; when distended, it extends backwards towards the top of the head. This species has the same geographical range as the Greenland or Harp Seal, but is not so numerous or so highly valued. Allied to the Crested Seal is the great Sea-elephant, which owes its name to its size and to the elongation of its nose, which forms a short curved proboscis. The males of this species reach a length of 20 feet, while the females never much exceed 10 feet. The Sea-elephant or Elephant-seal (q.v.; *Macrorhinus leonina*) lives on the antarctic islands and ice-fields, and is hunted for its blubber and skin. Another species of Sea-elephant (*M. angustirostris*) occurs in the northern hemisphere, having been formerly abundant on the coasts of California and western Mexico; it is now scarce. Other species of Phocidæ in the antarctic regions, called Sea-leopards, are *Stenorhynchus leptonyx* and *Leptonyx weddellii*.

The second family of Pinnipedia commonly called seals, the Otariidæ, are frequently distinguished as Sea-lions and Sea-bears, names corresponding to differences in their hairy covering; the former carry only long coarse hair, while the latter have in addition a short and soft, delicate fur, beyond which the coarse hairs project. It is this fur which, under the name of seal-skin, is so highly valued in commerce. Sea-lions are sometimes distinguished as hair-seals, and Sea-bears as fur-seals; but the former name would apply equally well to all the Phocidæ.



Sea-lion (*Otaria stelleri*).
(From a Photograph by Gambier Bolton F.Z S.)

The Otariidæ are about equally represented in the arctic and antarctic regions. By Dr J. E. Gray a large number of genera were distinguished, but recent students of the species unite them under one or two genera. The Sea-lions are as follows: *Eumetopias* (*Otaria*) *stelleri*, the Northern Sea-lion, inhabits both shores of the Northern Pacific from California and Japan northwards, and breeds on the Aleutian and other islands in the Behring Sea. The male is about 16 to 18 feet in length, and the female about half that size. *Otaria jubata*, the southern Sea-lion, inhabits the west coast of South America, the islands in the neighbourhood of Cape Horn, and the Falkland Islands. *Zalophus Gillespii*, the Californian Sea-lion, is considerably smaller than *E. stelleri*.

Of the Fur-seals there are two genera, one belonging to the northern hemisphere, Callorhinus, the other to the southern, Arctocephalus. Of the former there is but one species, the celebrated northern Fur seal, *Callorhinus ursinus*, which during 1885-92 became the subject of such complicated diplomatic controversy between the United States, the British Empire, and European nations. This seal is entirely confined to the North Pacific, no fur-seal existing in the North Atlantic. The habits of the northern fur-seal have been very thoroughly investigated by Henry W. Elliott, an American naturalist. This species breeds annually on two of the Pribylov Islands in the Behring Sea, and on two of the Commander Islands farther west, and it breeds nowhere else. The seals arrive on these islands in June and July, the males in the former month, the females in the latter, and they leave them with their young about the middle of September, not returning till the following year. During the breeding time they remain on the low-lying land bordering the sea. In 1870, after the transfer of Alaska from Russia to the United States, the Pribylov Islands were leased by the United States government to the Alaska Commercial Company for twenty years, and this company also rented the Commander Islands from Russia. The company were allowed to take not more than 100,000 seals from the Pribylov Islands per annum, and the seals killed were exclusively young males, not breeding males or any females. The company paid to the government $50,000 per annum as rent, and in addition a tax of $2 on each skin shipped from the islands. The value of fur-seal skins shipped from the territory and sold in the London market during the first twenty-three years of American occupation is reported to have reached nearly $33,000,000. In 1890 a new lease of the islands under similar conditions was granted to the North American Fur-sealing Company. In the earlier part of the year the vast herds of these seals, on their way to the breeding-grounds, pass the coast of Washington Territory and British Columbia, and were there hunted at sea in former times by the Indians. But British and American schooners now employ the Indians, and kill very large numbers. The schooners, both of these and of other European nations, also pursue the seals in Behring Sea. It was the attempt of the United States government to assume exclusive rights over the Behring Sea which gave rise to the diplomatic controversy. The killing of the seals in the ocean has developed to such an extent that it is feared the careful regulation of the slaughter on the breeding islands will not be sufficient to prevent the extermination of the species. In 1880 the total number of fur-seal skins taken by the pelagic hunting was 19,150, valued at $172,350, but the number had increased to 43,779 in 1890. In the summer of 1891 the British government and that of the United States agreed to submit the dispute to arbitration and to send a joint commission of experts to the seal islands to examine into the question, the killing of the seals both by British and American citizens being in the meantime prohibited until May 1892, with the exception of 7500 to be killed by the American Company.

The number of species of fur-seals in the Antarctic Ocean seems to be still a matter of dispute, but the following forms are the principal now distinguished. *Arctocephalus nigrescens* may be said to belong to the South Pacific, though it extends also into the South Atlantic. At the beginning of the 19th century this species was abundant on nearly all the islands off the west coast of South America from Cape Horn to the equator, and was killed in large numbers at Juan Fernandez, Mas-à-Fuera, St Felix, St Ambrose Islands, and the Galápagos. It was also abundant at the South Shetlands, Falkland Islands, South Georgia, Sandwich group, Kerguelen, and Heard Island. But at the present time these seals have been exterminated in most of these places, and are scarce in the remainder. Some are still obtained at the South Shetlands; and on Lobos Island at the mouth of the La Plata there is a small 'rookery,' protected by the government of the Argentine Republic. Fur-seals were also formerly abundant on islands off the west coast of Africa from the Cape of Good Hope northward. The seal in this region has been distinguished as a separate species under the name *Arctocephalus pusilla*. It is almost extinct at the present day. Fur-seals were also abundant formerly on Stewart's Island, Antipodes Island, and others to the south-east of New Zealand, but are now scarce. The skins of the fur-seal was at first imported into England for tanning, the wool and hair being scraped off together. It was in 1796 that Thomas Chapman invented a method for 'extracting by the root the whole of the inconceivable quantity of coarse hair that grows intermingled amongst the fur on the skin of the South Sea seal.'

A brief survey of seal-hunting as an industry is necessary to supplement the few indications given in the above account of the species. The largest 'seal-fishery' in the North Atlantic is that of the ice-fields to the east of Newfoundland and Labrador. The vessels engaged in this industry almost all belong to Newfoundland, some being sailing-ships and some steamers. There are somewhat more than a hundred vessels fitted out every year for seal-hunting. The season begins about the middle of March, and lasts for about two months. The crews land on the ice, and kill the young seals which are not old enough to escape easily by clubbing them with a 'gaff,' and then take off the skins, with the fat adhering to them, and carry them to the ships. The annual catch is about 500,000, valued at £425,000. The skins used for leather, and the oil made from the fat, are among the most important exports of Newfoundland. Seal-hunting on the West Greenland coast is mostly carried on by natives, and the meat, skins, and oil used for their own consumption. Fleets of sealers from Great Britain, Germany, and Norway annually visit the neighbourhood of Spitzbergen and Jan Mayen. The industry at Nova Zembla and in the White Sea, as well as in the Caspian, is carried on by Russian subjects. The hunting of southern fur-seals and sea-elephants in the antarctic was formerly more extensively carried on by American and English vessels than it is now. The method here is to land men on the islands when the surf allows, the vessels returning afterwards to take them off with their booty. The animals are killed with club and knife, or with the rifle. At the present day the total product from the antarctic regions is only a few thousand skins and barrels of oil. The fur-seal hunting in the North Pacific has already been mentioned. On the Pribylov and Commander Islands only the young males up to six or seven years of age, called 'holluschickie,' are killed. These young males are not allowed by the older males to breed, and they haul up on shore occasionally apart from the breeding-grounds. The native servants of the company drive them from the sea to killing-grounds near their villages, and slaughter them by blows on the head with clubs. The 'pelagic' sealers have of course a different method. The Indian hunters leave the schooners in boats, and paddle up to the seals as they sleep at the surface of the sea, and spear them. The barb of the spear is loose, and attached to a line, so that the seal cannot escape or be lost: if the animal is not killed by the spear, he is hauled in when exhausted, and clubbed on the head. This mode of hunting is, as before mentioned, carried on off the coasts of Washington Territory and British Columbia and northwards to Behring Sea.

Sealed Orders, in the Navy, are orders which are delivered to the commanding officer of a ship or squadron sealed up and only to be opened after the ship or squadron has put to sea, and proceeded to a certain point previously designated. When it is considered necessary to despatch a ship or squadron on any secret service, in order to prevent the destination and the object of the expedition becoming known the commanding officer is sent to sea under sealed orders. These orders may be sent direct from the Admiralty, or may be given by any senior officer. The officer who has to act under them is generally directed to proceed a certain distance out to sea, or to a certain latitude and longitude, before he breaks the seal and acquaints himself with the orders in question; he himself equally with others under his command thus putting to sea in ignorance of his destination or the nature of the service to be performed.
